THE ENGLISH HERBAL: OR, HISTORY OF PLANTS.

CONTAINING

I. Their Names, Greek, Latin, and English.
II. Their Species, or various Kinds.
III. Their Descriptions.
IV. Their Places of Growth.
V. Their Times of Flowering and Seeding.
VI. Their Qualities or Properties.
VII. Their Specifications.
VIII. Their Preparations, Galenic and Chymic.
IX. Their Virtues and Uses.
X. A Complete Florilegium, of all the Choice Flowers cultivated by our Florists, interpersed through the whole Work, in their proper Places; where you have their Culture, Choice, Increase, and Way of Management, as well for Profit as Delegation.

Adorned with Exquisite Icons or Figures, of the most considerable Species, representing to the Life, the true Forms of those several Plants.

The whole in an Alphabetical Order.

By William Salmon, M.D.

TO THE
QUEEN.

MADAM,

Account it more a Duty than a Presumption, to appear to Your Majesty, though with such a Trifle as the following Book; and therefore chose to break through that Difficulty, rather than to be guilty of such a Fault, of letting slip any Opportunity in which I might let Your Majesty know, with what a Profound Respect I approach Your Great Presence.

Our Great Island, which ever since the Memory of Man, has been divided into two distinct Kingdoms, of different Names, Powers, Governments, Religions, Customs, Affections and Interests, your Majesty has United and Made one. It was what your Great and Royal Ancestors, with all their Power and Industry, were never able to perform: But it was a Work, the Honour of which, the Supreme Powers reserv'd for You. This UNION of the British Nations, was an Undertaking so Great in its Performance, so Noble in its Kind, so Admirable in its Effects, so Defirable in its Good, so Singular in its Appearances, and so Profound in its Structure; that none could have been able to have done it, but a Greatness of Mind like Yours: One of a Superlative Prudence and Resolution, of an Unwearied Industry, of an Unmatchable and Unbaken Zeal for the Publick Good; of a Magnanimous Soul, Inspir'd with the Holy Spirit of the Immortal GOD.

You have Madam by this UNION, shut up the Back-Door, by which Great Britain was always liable to be Assailed; and thereby have added a Jewel more to the Imperial Crown; and Adorn'd it with an Illustration, the Greatest and most desirable
THE DEDICATION.

desirable in its Kind, which will be, both to the British Isles, and to Your Majesty also, not only an Important Security, but an Everlasting Ornament of Glory.

Surely Madam, You who could Unite Hearts in an Eternal Bond of Friendship, was the most fit Instrument to Unite Kingdoms in one Bond of Interest and Duty. To make those who were so different in Climate, Sovereignty, Religion and Manners, One People, in the Bonds of Nature and Affection: And to make them, with one Joint Design, Intention and Will, to become One United and Faithful People, to so Desirable and Generous a Mistress. But what might not be expected from such a Lady, so Great and so Good a Queen? Whole Conjugal Friendship was, and is still the Wonder of Mankind, (a Noble Pattern to all the Sex) which exceeded even to Admiration, whatever has been yet seen upon Earth: Who is it that has Sense and Gratitude in his Soul, would not even lay down his Life for such a Friend?

When I consider the Admirable Hand of Providence, which has brought Your Majesty to the Throne of the British Kingdoms, and has put their Crowns upon Your Imperial Head, which has made Glorious Your Reign, with a Series of Wonderful Successes, and even Amazing Victories, over the Most Formidable Tyrant of the Earth; rendering his mighty Attempts against You, Vain and Foolish; notwithstanding his Confederacy with Deception, his Covenant with Death, and his Agreement with Hell; to the Delivering You and Your People out of his Snare, and the Establishing of Your Just Title, upon Everlasting Foundations, against all Pretenders whatsoever: I humbly prostrate my self to that Tremendous Being.

What can I say, but that God is with You, and that You are an Eminent Object of his Care, who thus steadfastly holds You as in the Palm of his Hand: Your Sincerity, and Generous Love to Mankind, have prevail'd with that Almighty Power, who has given You a Transcendent Portion of Wisdom, to Conduct You through the Labyrinths of Dominion and Government; even whilst You have been Fighting the Publick Enemy of all Evil Rope; and putting a Hook into his Jaws, by which You have already Tamed the Monster, fill'd him with Shame and Contempt, and cover'd him with Confusion of Face.

What may I call the Instruments of Your Warfare, which have made You thus to prevail? Who is it that has set Your Feet
Feet upon the Necks of Your Enemies, and given You Strength to humble the Pride of the lofty? Who is it that has Established Your Strength, to break in Pieces the Invincible Powers, (as they were Foolishly called,) by which You have given a Demonstration to the World, of that Prophanity and Vanity? Who is it that has thus made Your Majesty to Triumph, and adorned you with the Palms of Victory?

’Tis the Great and the Holy One, the Mighty God of Jacob, who has done all these things for You; to whom I make my Daily Addresses, that he may yet defend and support the Righteous Cause in which You are engaged; Direct Your Counsels with Wisdom and Prudence; Prosper Your Arms wherever they are engaged; and that the Angel of his Presence may Attend and Conduct You in all Your Ways: So that making You the Restorer of the Breaches, You may Establish such an Universal Peace in Europe, as may Recognize Your Happy Reign, and cause it to shine with a most Splendid Lustre, to all succeeding Ages of Time.

You Contemn Madam, the Poor and Little Artifices of Tyrants; You have a Soul too Great to think of such Meanness, and a Spirit too Noble for the bare Thoughts of such Depraved Vileness: You act with the Magnificence of Grandure, made Illustrious with Piety, and an Unbounded Goodness, replete with all the Ornaments of Sincerity and Vertue, by which You will Live in After-Ages, and Tour Name be made Immortal. So that instead of the Diadems being an Honour to Your Majesty, You are become the Exalted Honour of Royalty, and the Glory of the Purple; which makes Tour Sovereignty Shine as the most Splendid Brightness, among the Heroes of Time.

God has not only made You a Great Queen, but even the Greatest of Princes; and Tour Early Piety, as it has advanced You above the best of Women Kind; so it has Exalted You above the Greatest of Crowned Heads. Your Vertues merit a perpetual Encomium, and your Excelling Goodness to your People, is that which is never to be forgotten; whom you have been pleas’d to Oblige with Transcendent Acts of Kindness; so Extraordinary and Superlative in their kind, as all succeeding Generations, under an Eternal Sense of Gratitude, will be forced for ever to acknowledge.

You carry with You Madam, Majesty and Honour, and Tour Sword determines the Successes of War, making with Tour Thunder, the World afraid; giving Laws as far as Tour
The Dedication.

Tour Dreaded Name does reach; which makes the Tyrants of the Earth, those Barbarous Murtherers of Mankind to tremble, and affrightens the Obsequious Slaves to Villany. Tour Triumphs are not in the Ruin of Nations and Kingdoms, not in Victories of Blood and Cruelty, not for Dominion and Sovereignty; but to give Freedom and Ease to Mankind, and set the World at Liberty.

May the High and the Lofty One, the Almighty GOD, He by whom Kings and Queens Reign, and Princes decree Justice, give Tour Majesty a Long and a Happy Life; may He Prolong it to an Accomplish'd Period, for the Good of Your People, to whom You have shewn Your Self so exceedingly Kind. May he Bless You with Prosperity, and give You that inward Consolation and Peace of Mind, which may as Infinitely exceed all the Enjoyments of this Life, how Great and Magnificent foever, as the Heavens are high above the Earth; and make Tour Great and Illustrious Soul, enjoy the Fullness of Satisfactions, to the Ultimate of whatever You can desire. So that Crowning You with Glory and Honour here, Tour may very late Ascend, as on Eagles Wings, to those Eternally Serene Habitations of Peace and Tranquility, where You may be for ever Transcendently Happy. So Ardently Prays

Madam,

Your Majesties

Most Humble,

Most Faithful,

AND

Most Obedient

Subject and Servant,

William Salmon.
THE PREFACE: OR, INTRODUCTION.

CHAP. I. Of the WORK it self.

I. We pretend not here to an useful History of Plants, but chiefly to such as are most known, and Virtuous, and Experimented, and Useful in Physick. The Work is chiefly for Physicians, Chyrugians, and Apothecaries, and for their Patients, and the Publick Good it was principally designed and intended.

II. As to the Authors made use of in this Undertaking, we shall not be so rash as to enumerate them all, 'twould be to no Purpose; and yet it will be Necessary for the Credit of the Book, to give you an Account of the Chief of those, in Treating of each Plant, whose Leaves we were obliged continually to turn over.

III. The Authors we made most use of in Composing this Herbal, were these following, viz. Bauhinus, Brunfelsius, Caraffinius, Camerarius, Clusius, Dioscorides, Dobsonius, Durandes, Fuchius, Johnston or Gerard, Lobel and Par, Lonicerus, Lugdunensis, Matthiolus, Parkinson, Ruelius, Schodler, Taberamontanus, Theophrastus, and Tragus: These, I say, were those which were chiefly consulted, and without whom, we passed not off from the Descriptions of any Plant: But we cannot say these were all, for occasionally as it fell in our way, and where some particular Occurrences required it, we had recourse to many others, more than voices that number befides, without the Help of which, we could not have so Compleately performed what we here pretend you shall see.

IV. As to the Historical Part, we could not much deserve, but were obliged to follow the most celebrated Authors of this Subject, viz. in their Names, Kinds, Descriptions, Places of Growth, and Times of Flowering and Seeding. In their Names, we have given you the most exact, and those chiefly by which the Plants (in all Ages) have been most known and called, whether Arabic, Greek, Latin, or English: in doing of which, we hope we have in some measure rectified the Latin Nomenclature, which, even in all our Deunts, has hitherto been very Foible and Improvish.

V. As to the Kinds of any Plant, we have not given you all that you will find in Parkinson, and many other Authors, because those which we have Omitted, an English Reader may not possibly come to the Knowledge or Sight of in many Ages, they growing in foreign and far-distant Countries, as Turkey, Peru, East India, the Moluccas, China, &c. Besides, having no known Virtues or Uses alligned to them, but only their Names and Descriptions, we thought they would only take up room, and rather encumber the Book, than add any real Excellency or Advantage to it, considering it was chiefly design'd for the benefit and Use of the Practical Physician.

VI. As to the Description, we say they are the same as in other Authors, little or nothing differing from those in Bauhin, Clusius, Dobsonius, Fuchius, Gerard, Johnston, Lugdunensis, Matthiolus, Parkinson, Ruelius, Schodler, Taberamontanus, and Tragus: But we have almost everywhere rever'd the Order of Describing; for whereas they many times begin at the top or upper parts of a Plant, and go downwards to the Root, we on the contrary, generally begin at the Root, first Describing it, and so ascend upwards to its Stalks, Leaves, Branches, flowers and Seed, or Fruit, which we take to be the most natural Order or Method.

VII. As to the Places of the Growth of Plants, they may be very uncertain, because, where they have been found to Grow in great plenty, in former Ages or Times, the footsteps of the same Plant is not to be found now. In some places where I have found several Plants to Grow as Names of the same, when I was a Youth, now in my present declining Years, there are no remains of them to be found. The Egyptian Arum, or Pseudocolocasia, which we now call the Carolina Arum, (because there every where planted) did formerly Grow plentifully in Egypt, which I suppose was its Natural place of Growth, and was there planted for their use in Necta, and for other uses: Now our late Travellers say, it has not for some Ages been known to Grow there at all. But 'tis possible that it has been neglected and disjuncted: Yet I am of Opinion, that if it were diligently sought after, some remains of it might be found again. It grows in soft places.
INTRODUCTION.

in Carolina, where it is a great part of their Food and Living, but it prosperous only as under the Plantation Lands, for should they neglect it, it would quickly be totally lost in that Country too.

VIII. We have every where given the various Qualities of each Plant, by which an Attainee may be given in Grafts, of their Virtues, and to what Diffuses they may be properly applied, or may be helpful against : The consideration of which above, is of mighty a Life to the Practical Physitian, because they indicate to the Mind or Understanding, to what various Purposes and Intents they may be answered, and in what Diffuses they may be speciously as.

IX. Here those Qualities are to be applied to Diffuses, may be easily exemplified: I know it may be objected by such as are Ignorant of Medical Qualities and Indications, that a great many Virtues are ascribed to wild Plants, for the Curing of Diffuses, which they can never perform, nor any Author before now esteemed: To which I answer, That I do not affirm nor say, that every Herb is a Specifick for the Cure of all Diffuses, which in the particular Preparations and Virtues thereof, I may ascribe to it, but that he who reads me, ought to read me with a Medical Mind, or Soul, and with a good Understanding, I will exemplify the Matter. Suppose it, to be a Herb of a seventh Quality, it is Hot and Dry in the third Degree, and that it is Cephalick, Nervous, Stomachick, Alcemiapharmick: from these Qualities, we conclude that it must be helpful against all cold and moist Diffuses, of the Head, Brain, Nervous, Stomach, and Poisons, then when we consider what Diffuses are apt to affill those parts, from a hot and dry Cause, we fix the Virtues to be such as may refill those Diffuses, not to be an abstract and specific Cure for the same, but to be very helpful in these Cures, and so may be drawn into Compositions, with other Ingredients for the same purposes. And thus I desire every Genuine Son of Art to understand me. What I have said in this Paragraph, may be of admirable Use, if it be rightly understood and applied.

X. Thro' the whole book in every Chapter, we have given you the various Preparations of each Plant, both Galenic and Chymick, which may be made of them, which is a thing never performed by any other Author before me. This being rightly considered, gives you the whole realt of the Plant, and in a few Words teaches you how it is to be used and prepared in all the Cures, and to all the Diseases to which it may be appropriated: But that this may be more perfectly understood, we particularly Exemplify the whole throughout, in this present Introduction, in those several Forms, both Galenic and Chymick, and to the Capacities of such as are ignorant of the Medical Arts.

XII. The last thing which I shall here take notice of, is more matter of Ornament, than any thing of Necessity, that I have done for the sakes of all such as are lovers of Flowers, and of a Flower Garden: It is a complete FLORELLGIUM, of as many or none of the Choice Flowers, which are Cultivated in England by our FLOISTS. This is not done as a particular Work by it self, but is incorporated to the whole book, each Flower in its proper Place of the Alphabet, where you will have their Culture, Choice, Increase, and several ways of Management, as well for Profit as Decoration, a noble Subject it is, but, never brought into any Herbal before this.

CHAPTER II.

Of the Greek Names of Plants.

A T first entrance upon this Work, I thought it would have given you the known Greek Names of all the Herbs and Plants described in this Herbal, in the order they were treated of before, but finding that it would have been too tedious a Labour, and an Undertaking that would not have answered the End, and that method, besides the taking up of room, it would have mightily encumbered the Diffuse, we in a manner wholly declined the Same: However, for the ways of all such as are Lovers of the Greek Tongue, and desirous to call the Species of each Plant by its proper Appellation in that Language, we have in the body of this Work, given you the Ancient Greek Name or Names of each Genus, and the various Latin Epithets, by which the differing Species of that Plant ought to be distinguished, by which, applying to those several and various Latin Epithets, (which are in this place ranked Alphabetically) the Greek Words answering to them, you will have the compleat Greek Names, as full and compleat, as if we had severally perfected them in the order of their several Chapters.

INTRODUCTION.

V.

TH E Qualities of Medicines are five-fold, according 1. To their Temperaments. 2. As they are Alteratives. 3. As they are Appropriate. 4. As they Diminish something. 5. As they Add or Restore something; all which Qualities we come now to explicate in order.

The Temperaments of Medicines are five-fold, confidered 1. As they are perfectly Temperate, viz. neither Hot nor Cold, Dry nor Moift. 2. As they are Hot. 3. As they are Cold. 4. As they are Dry. 5. As they are Moift. In the four last of which, there are said to be 4 Degrees, proceeding from their principal, viz. 1. A Herb which is Hot, may be hot in the first, second, third, or fourth Degree of heat. Again, from the four prime Qualities, they also proceed, viz. that a Medicament, 1. as it is Hot, may be hot, or dry, or hot and moift. 2. As it is Cold, also cold and dry, or cold and moift, and these likewise in all the four Degrees of Temperatures.

Temperate Medicaments are such which work no change at all, in respect of heat, coldness, dryness, or moisture. And these may be Temperate in some respect, 1. As being neither hot nor cold, and yet may be moift or dry. 2. As being neither moift nor dry, and yet may be hot or cold. Their Use is, where there are no apparent lesions of the four other Qualities, to preserve the Body Temperate, conserve Strength, and restore decayed Nature.

Hot Medicaments (and so also Cold) are considered in respect of our Bodies, and not of themselves: For those Simples are called Hot, which heat our Bodies.

Their Uses are, 1. To make the offending Humours thin, to be expelled by Sweat, or thus the Pores. 2. To help Coughing. 3. To warm and comfort the Viscera. 4. And by outward application, to disfigure Tumours. 5. Or raise Bladders, make Catarrhs, &c. according to the degrees of Heat.

Cold Medicaments are such, as cool our Bodies being over-heat, by any accidents or accidental Causes.

Their Uses are, 1. To cool the Parts or Bowels. 2. To condufle Vapours. 3. To thinke Humours. 4. To drive the Heat of Persons. To refresh the Spirits almost suffocated. 5. Alleviate Inflammations. 6. Reprefs Sweating. 8. Ease violent Pains.

Drying Medicaments, are such as make dry the Parts over-flowing with moisture. They are used, 1. To stop Fluxes. 2. To comfort and strengthen Nature. 3. To constringe a superfluity of Humours. 4. To fortify the Bowels. 5. To reduce in Consumptions, where great fluxes of the Bowels have been.

Moist Medicaments, are such as are opposed to drying, which moisten, loosen, are lenitive, and make slippery.

They are used, 1. To moisten an over dry and constringed Habit of Bowels. 2. To ease Coughing. 3. To help the roughness of the Wind-pipe. 4. To loosen the Belly. 5. To relax Parts constricted or hardened.

Things hot in the first Degree, gently warm the Body being over-cooled, and outwardly open the Pores. Hot in the second Degree as much exceed the first, as the first exceed Temperature, and those cut tough Humours, open Obstructions, and the Pores also outwardly. Hot in the third Degree, more powerfully heat, and are able (if much used) to inflame the Body, and cause fevers, provoke Sweat exceedingly, and resift the malignity of the Plague or Pestilence, and more powerfully also cut tough Humours. Hot in the fourth Degree, burn the Body if outwardly applied, raise Blitters, corrode the Skin.

Things cold in the first Degree, qualify the heat of the Stomach, and refresh the Spirit. Cold in the second Degree, are chiefly of use to subdue inflammations. Cold in the third Degree, are Repressive, and drive back the Matter, reprefs Sweat, and keep the Spirits from vomiting. Cold in the fourth Degree, quickly the Stomachs, ease violent Pains, and are used in extreme Watchings.

Things dry in the first Degree, Strengthen. In the second Degree, Bind. In the third Degree, stop Fluxes, and reduce in Consumptions. In the fourth Degree, stop Cataracts, and all Fluxes of Blood and Humours, are highly Stirrups, and dry up a super- abundance of moisture.

Things moist in the first Degree, are opposed to drying in the same Degree: They moisten the Body, and Parts dried. In the second degree, they Lendy, loosen the belly, and make slippery. In the third degree, they smooth the roughness of the Wind-pipe. In the fourth degree, they cure a constringation of the Bowels.

Thus Medicines alter according to their Temperature: Whose office Qualities are Heat and Cold, and by them Disposers are said to be conducted. The Puiffe are dryness and moisture, and they are subjection to Nature.

CHAP. III.

Of the First Qualities of Medicines.

INTRODUCTION.

V.

THE Qualities of Medicines are five-fold, according, 1. To their Temperaments. 2. As they are Alteratives. 3. As they are Appropriate. 4. As they Diminish something. 5. As they Add or Restore something; all which Qualities we come now to explicate in order.

The Temperaments of Medicines are five-fold, considered, 1. As they are perfectly Temperate, viz. neither Hot nor Cold, Dry nor Moift. 2. As they are Hot. 3. As they are Cold. 4. As they are Dry. 5. As they are Moift. In the four last of which, there are said to be 4 Degrees, proceeding from their principal, viz. 1. A Herb which is Hot, may be hot in the first, second, third, or fourth Degree of heat. Again, from the four prime Qualities, they also proceed, viz. that a Medicament, 1. as it is Hot, may be hot, or dry, or hot and moift. 2. As it is Cold, also cold and dry, or cold and moift, and these likewise in all the four Degrees of Temperatures.

Temperate Medicaments are such which work no change at all, in respect of heat, coldness, dryness, or moisture. And these may be Temperate in some respect, 1. As being neither hot nor cold, and yet may be moift or dry. 2. As being neither moift nor dry, and yet may be hot or cold. Their Use is, where there are no apparent lesions of the four other Qualities, to preserve the Body Temperate, conserve Strength, and restore decayed Nature.

Hot Medicaments (and so also Cold) are considered in respect of our Bodies, and not of themselves: For those Simples are called Hot, which heat our Bodies.

Their Uses are, 1. To make the offending Humours thin, to be expelled by Sweat, or thus the Pores. 2. To help Coughing. 3. To warm and comfort the Viscera. 4. And by outward application, to disfigure Tumours. 5. Or raise Bladders, make Catarrhs, &c. according to the degrees of Heat.

Cold Medicaments are such, as cool our Bodies being over-heated, by any accidents or accidental Causes.

Their Uses are, 1. To cool the Parts or Bowels. 2. To condufle Vapours. 3. To thinke Humours. 4. To drive the Heat of Persons. To refresh the Spirits almost suffocated. 5. Alleviate Inflammations. 6. Repress Sweating. 8. Ease violent Pains.

Drying Medicaments, are such as make dry the Parts over-flowing with moisture. They are used, 1. To stop Fluxes. 2. To comfort and strengthen Nature. 3. To constringe a superfluity of Humours. 4. To fortify the Bowels. 5. To reduce in Consumptions, where great fluxes of the Bowels have been.

Moist Medicaments, are such as are opposed to drying, which moisten, loosen, are lenitive, and make slippery.

They are used, 1. To moisten an over dry and constringed Habit of Bowels. 2. To ease Coughing. 3. To help the roughness of the Wind-pipe. 4. To loosen the Belly. 5. To relax Parts constricted or hardened.

Things hot in the first Degree, gently warm the Body being over-cooled, and outwardly open the Pores. Hot in the second Degree as much exceed the first, as the first exceed Temperature, and those cut tough Humours, open Obstructions, and the Pores also outwardly. Hot in the third Degree, more powerfully heat, and are able (if much used) to inflame the Body, and cause fevers, provoke Sweat exceedingly, and resift the malignity of the Plague or Pestilence, and more powerfully also cut tough Humours. Hot in the fourth Degree, burn the Body if outwardly applied, raise Blitters, corrode the Skin.

Things cold in the first Degree, qualify the heat of the Stomach, and refresh the Spirit. Cold in the second Degree, are chiefly of use to subdue inflammations. Cold in the third Degree, are Repressive, and drive back the Matter, repress Sweat, and keep the Spirits from vomiting. Cold in the fourth Degree, quickly the Stomachs, ease violent Pains, and are used in extreme Watchings.

Things dry in the first Degree, Strengthen. In the second Degree, Bind. In the third Degree, stop Fluxes, and reduce in Consumptions. In the fourth Degree, stop Cataracts, and all Fluxes of Blood and Humours, are highly Stirrups, and dry up a super-abundance of moisture.

Things moist in the first Degree, are opposed to drying in the same Degree: They moisten the Body, and Parts dried. In the second degree, they Lendy, loosen the belly, and make slippery. In the third degree, they smooth the roughness of the Wind-pipe. In the fourth degree, they cure a constringation of the Bowels.

Thus Medicines alter according to their Temperature: Whose office Qualities are Heat and Cold, and by them Disposers are said to be conducted. The Puiffe are dryness and moisture, and they are subjection to Nature.
INTRODUCTION.

Of the Second Qualities.

I. The second Qualities of Medicaments are such as are Alteratives, which alter the Habit, and Constitution of the Body, as it has a respect to the Blood, Lymph, Scurm, and other Humours of the Same; and these Alteratives are considered as they are Medicaments Internally used, or Externally applied.

I. Of Internal ALTERATIVES.

IV. 1. APERITIVES. These are such Medicaments as open the Obstructions of the Viscera, as Stomach, Lungs, Liver, Spleen, Glands, Mesolenting, Intestines, Breeches, and Womb. They are all but at least in the second Degree, for the most part in the third, and many times in the fourth Degree, of very fafful and thus Parts, for without heat there can be no rarefication, and without rarefication no opening of the obstructed Bowels.

V. 2. ABBRESTERIVES. These are cleaners, which after opening Obstructions of the affected Parts, cleanse them, by taking away the Remnants which obstructed them, being the superfluities of the Blood, Lymph, and other Juices, and without which work be done, all those Aperatives or Openers do, it is done in vain. They have a softening and tensility of Substances, and it is not any great matter whether they be Hot or Cold, by reason neither quality (if not excessive) hinder their Action. They also remove glutinous and clammy Humours in the Superficies, or adhering to the Parts of the Skin and Ulcers.

VI. 3. ASTRINGENTS. These are Binders, and they are generally dry in the second and third Degrees; whether they be hot or cold; they are Syrupicks, and in some measure confipulate the Bowels in Fluxes, dry up Fluxes of Humours, help Constipate, and strengthen the Tone of the Stomach and other Bowels, when they be Weak, or weakened by long Deffuictions, over much malfor, or the submercy of any incoherent Disfetes; and are therefore often given in the end of a Cure.

VII. 4. DIGESTIVES. These are such as Conoul the Food in the Stomach, and are all naturally hot, for it is Heat which causes Cancellation, and excites the natural Fermentation in the Stomach, by which a good Chylius is made, in order to Sangiferation, and Nourishment of the Body. Yet some things may cause Digestion, which are not naturally hot, but cold, and may excite the natural heat, by way of Antiperstibate, whereby the confpuraneous Particles in the Stomach are more fermented and hot, or set a boilin.

VIII. 5. INCITIVES. These are such things as pierce into and cut tough Matter, which is not easy to be broken, or separated into parts, such are Juice of Linons, Vinegar, and all and things which by their parts enter into and make a dissoin, not a distillation, whereby tough Viscous, and turgorous or viscous Matter, is prepared for Abjlifiers, and so made fit either to be perforated by the Mouth, or expulsed by Urine and Stool. These, whether hot or cold, are of very thin and fluid Parts.

IX. 6. CARMINATIVES. These are Medicaments which expel flatulencies, and expel Wind, and are generally hot and dry, and of very thin and fluid Parts: Well in Painst of the Stomach and Breeches, the Cheek, and other Inditions whatever caused of Wind, as Fopures, Hyperchondriack Pains, Hypochondriack Fits, &c.

X. 7. ANODYNS, or PAREGORICKS. These are easers of Pain; which thst they do not often Cure Diseaes, yet all, in order there, they regarding the Pain chiefly, while Sub-Cause and Bitchicks are remaining. They are all Parts, and are moderately hot, seldom exceeding the first Degree, and rarefaction, and so Digesting, Collecting, Difiprigning, Extremating, and in some measure Preventing, whatever Humour is thick, tough, or stiff, by it alkalical property absorbing the acridity of the Matter, contain'd in any Crude, or its Powr.

XI. 8. NARCOTICS. These are Opiumifying Medicines, and ease Pain, but by stimulating it, but by Starfufilions, not by taking away the Cause, but by Obliteration of the Animal Spirits for the time. Yet Stimul is something less than Infenilility, or the provocation of Sense: They are also called Hypnoticks and Somnificicks, because they induce Sleep: They being taken too liberally, or to excess, cause Death, as all Opiums, if moderately doted, they are to be administered at such times, when the Symptoms are so grievous, as to threaten a greater danger than the Disease.

XII. 9. BETCHICKS. These are such as stop or ease Coughing. And they are things which increaseth thin Humours, stop Defuictions, and so easy the Cough. Narcotics of the middle Kind, are agreeable to the Breff and Lungz, which if they are cold, they increaseth thin Humours, and stop Coughings, and especially such as are much Narcotic, or Stopping: But such things as are hot and of thin Parts, and extemating, which expellor, rough Humours, oftentimes ease it.

XIII. 10. SOLUIIVES. These are Loosening Medicines, not such as are Purging, but by their heat and moist Qualities, keep the Body soluble, they not only open the Parts of the Viscera or Entraits but in some measure removing Obfura.
INTRODUCTION.

VII.

II. Of External ALTERATIVES.

XVI. 1. SYPTICKS, HEMOPTICKS, or hemopteragogicks. These are such things as make Blood Bleeding in what part of the Body it may be. They are for the most part cold, at least temperate, exceeding drying and repulsive: For things which are cold, repel, and many of them conglutate, or thicken, and so if they have a calidra of Parts, or things acerb and auffle. And Medicines vehemently dryings, which are Astringents, repel also, because they thicken the Blood and Lymph. Tho' if oe by the fecond, parts, much conduc to their Subflance, it is either foul, cold, grefa, or tough, inor the parts, or near adjacent parts, which by reason of the obflation of the Parts, could not find a way out; besides, they are queerous or inoffinuous, and cannot or of the Subflance, not in the lefl Astringent. But there are some Culp Anodyns, which are such as give ease in Tumours, or Pains caused from great heat. Again, Anodyns are fad to be Poisons Improper. Proper are fuch as we have already been speaking of: Improper, are fuch as they call Narcotics, made of Opium, Henbane, Hammar, Mandrake, Nightshade, &c.

XIII. 3. REPERCUSSIVES. These are Repelling Medicaments, which drive back the Humour. They are generally cold and drying, and are generally of gross Parts, for that which is cold, repels, and if it has a calidra of Parts also, it acts with more force, as that which is scab or auffle. Tho' things also repel which are Astringent, if they have not a tenacity of Parts, for the thinness of their Subflance, does much conduc to Affi. And therefore other things which are Affective, by reason of the thinness of their Subflance, cannot penetrate the more remote Parts, precluding the Paffages. And hence Definatifs, and Interceptifs may be reduced, being Cold, Astringent, and Repulsive. Tho' by their Calidra, repel the Humour, and by their Astringency, strengthen the Part ailed.

XX. 4. DISCUSSIONS. These are fuch as refolute the Matter contained in the Part. They are moderately hot, with a tenacity of Parts, and very little refisent or drying: For as Discriminate severely and make them, causings the Matter to be dissipated, so exceffive heat does condensate and dry; whereas moderate heat opens the Parts, or Paffages, and deeply penetrating, by the tenacity of its Subflance, opens the Pores, attenuates the Matter, and to cafls the Pain. Their use therefore is,

1. To open the Parts. 2. To attenuate the Matter,
INTRODUCTION.

XXI. 6. ATTRACTIVES. These are
Draining Medicines, which attract or draw the
Humours from the Center to the Circumference.
These are of three Kinds: First, those which are
hot, attract; and that more strongly, if it has com-
posed with it a quantity of Parts. Those which are
hot and dry in the second degree, moderately at-
tract, and that more effectually, but most
those which are hot in the fourth, for the attraction is
according to the strength or degree of heat: Yet
some things attract Specifically, and not by any
mediat Quality, as Amicritica, Cathartic, &c.
These are contrary to Repulsives, for their
Nature is to drive from the Circumference to the
Center, but Attractives draw from the Center to the
Circumference. They are of use in Wounds, made
by the Biting of Bad Dogs, Serpents, and other
Venomous Creatures; in Burning, Pernicious and
Pustulent Wounds, &c., where it is absolutely ne-
cessary to draw the Poisons and Malady outward.
in order to the saving of Life.

XXII. 7. SUPPURATIVES, or Matu-
ratives. These turn into Matter, corroded Flesh,
and Humours, as also the Substances, of which man-
ny Tumours or Swellings consist, and bring it to
perfect repose. They are moderately hot, and
have a dangerous Cauterizing effect in this, that Sup-
puratives have an Emplastick faculty, where, by ob-
structing the Pores, they produce heat, most like
those of the Body, without any Contumacy or
Addition of Heat from an External Source. These are
friendly to Nature, and consist together with it, to
bring the superficial Matter to form, and to such a
form, as that it may be separated and cast off, and
the affected Part thereby cured.

XXIII. 8. PYROTICS, or CORROSIVES.
These are sublimate, 1. Cathartic, 2. Septic, or
Eaters. These are very strong, for they have their
corrosive Properties, consume Excrements, and eat
away and destroy Flesh. 2. Septics. They are
Corrosives, vehemently hot and dry, of three
Parts, and companion, which by their vehement
heat, destroy the Part, and are called Purificatives;
and in other Ops, they are called Purificatives. 3.
Cathartic, or Eaters. These are vehemently hot and burning, being the strongest
of all, so that they consume all they come near.
They cause Cramps upon the place they are applied
or make it thin and fluid. 3. To evacuate it
for the most part by Perpiration.

XXIV. 9. DIGESTIVES. These are
a kind of Medicaments, which bring loose and
well digested Parts, or Matters, into Complex or
contradected Wounds, and ill nurses empty Ulcers,
without which the Blood can neither be taken away,
or the Wound or Ulcer healed, or a stop put to
the eating. Of these we have largely discussed
in our Art Chirurgica, where you may find a ple-
tiful number of Precepts in exemplification there-
of.

XXV. 10. ABSTERSIVES. These are
Capers, which separate and remove the glutinous,
clumpy, or putrid Matters, adhering to Wounds and
Ulcers, which hinders their healing. They have a
power to esurate with sedateness of Substances, and
they may be either hot or cold, nor is it of any
great moment, which of them, by reason neither
Quality can hinder their action, except Excessive.
Yet some cause them chiefly hot and drying, with a
certain deficiency of Parts to compell the Humours:
And because they cannot be defined, by either heat or
coldness, since some of both parts cleanse, they
ought to be underhand to have a serene Substance,
which may take away the fifth with them; and must
a certain roughness, or nitrous Quality, to carry
away the complicated flux.

XXVI. 11. SARCOTICS, or Incur-
ratives. These generate Flux in hollow Wounds and
Ulcers; and fill up their cavities, as far as
Nature will admit. They are hot in the first de-
gree, a little definitive, and that without burning or
Affliction. Also moderately drying, viz., under the
second degree. And such as Impregnate, or breed
Fissure, are Healing, Affusiform, Impudere, attac-
atives, Resorbtive, or Specific, as Hemp-Seed, Poun-
der of Sarsaparilla, Kernel of the Indian Nut. They
dry, and change the Blood that comes to any part
into flux, Their degree of dryness must be accord-
ing to the Part: If the Ulcer happens in a dry
part of the Body, the Sarcoctic must be very dry,
and therefore some of them are drying, even in the
fourth degree. But if the part of the Body is moist
in which the Ulcer is, the incarceratives are to be
left drying: They ought not to exceed the first de-
gree, unless the Ulcer be very moist. They breed
not good wounds, and corrode the Integrat, and
infection is the interspersion of the place afflected; they only defend the Blood from
tall Symptoms, and the Ulcer from Corruption in
breeding Flux; for Nature in breeding Flux, proc-
duces either a Corrosive or purulent Reversions, and
these Medicines which cleanse and confine these
Excrement, by their drying Quality, are forced to
and breed kyst, because by their help, Nature performs
that Office.

XXVII. 12. AGLUTINATIVES. These are
such as join the Lift of Wounds, and
separated Parts together. They are also called
Symbitics, which is the reason that Confrey is cal-
called Symphitum, because of its glueing Quality.
They are generally drying in the second degree;
and are in a mean between the sharp and dry, and
Agglutinatives. They are not Affusiform, but
Adherent, and prohibit the Flux of Humours, to the Lift of
Wounds, Ulcers, and Lymphatic. They are temper-
ed, so as to remain of heat, and a brisk State of
their dryness; they absorb that humidity, which
intercedes between the Lift of Wounds, that there-
by they may be conjoined: And that is the true
Cure
INTRODUCTION.

Care of the Head, which comprises the sides of the Head, before brought together. And others require a greater degree of dryness than Wounds, not only to consume what these owe, but also what remains liquid in the Vesel.

XXX. 13. CICATRIZERS, or Epulotics. These are such things as skin a Wound, Sore, or Ulcer. They dry and bind without burning, absohbing the humidity of the Vesel, controlling it with a Skin, or a thin Callos like unto a Skin, and therefore are more drying than Incarnatures or Glutinators: For those bind, contract, compress, and indurate, being cold, and of a thick Subsistance. There is also a Jbrop and Jbrop Epulotics, which covers dead Flesh, as Catarrhickes, and a third sort, which dries without affettion. The first part of the Care of a Wound or Ulcer, is to cover it with Skin, and restore the place to its proper beauty: Now these Medicines, mende with the Vesel, no farther than to only convert it into Skin.

XXX. 14. COSMETICKS, or Beautifiers. These adorn the Body by adding beauty to it, by affhhering or cleaning it from deflemens, as Leplos, Lecce, Scabs, Itch, Fungus, Kinds, Wounds, Haemorrhages, Bums, Sunburning, and the like. Those which proceed from heat, are to be remedied by cooling things: If the defelem is impasted in the Skin, or extemating Medicine, it is to be coverd with a Cold, or Worms affett it, the Skin it self is to be affhhered by Plasters of Soap, or Oil of Tarrat per deliquium, diluted with Water, if Lepros, Scabs, or Itchickes, conffantly breaking out, the Cuticula must be taken off by Epulotics, &c.

CHAP. V.

Of the Third Qualities.

I. THE third Qualities of Medicines are such as are Appropriate, that is to say, which are appropriated to some principal and noble Parts of the Body, the knowledge of which Physicians have learned and obtained, either, 1. From the Signatures of the Medicaments themselves. 2. Or from a long journey of Practice and Experience.

II. And therefore as Medicines are said to be appropriate, to the most noble and principal Parts of the Human Frame, so from them they take their Denominations of Names, and accordingly are said to be, 1. Cephalicks. 2. Neuroticks. 3. Stomachicks. 4. Pulmonicks, or Pelorcials. 5. Plex技巧, or Plasicks. 6. Palmaricks, or Cutaneous. 7. Hispanicalls. 8. Splicemics. 9. Materiares, or Hypochonricks. 10. Nephriticks. 11. Hyperlacks. 12. Anthrickes. Of which in their respective order.

III. 1. CEPHALICKS. Those Medicines are said to be appropriated to the Head, and have respec chiefly to the Brain, the Medulla, orthonixia, and the Hippocrasis call'd Vice or Dart Matter, but have very little to do with the Tongue, for that is a very worthy Member. The Brain is the seat of Appreciation, Judgment, and Memory, and by Nature incomparably hot, and so is very com- phy affett by either too much heat or cold, but

chiefly by the latter, and for the most part by too much moisture, and therefore the Medicaments appropriated to the Head and Brain, are generally hot and dry, and of very subtle, thin, and volatile Parts, for otherwise they could have no affettion upon those Parts. To those some add Putmicks, and Sterminaries; its true, these will improve the Brain and Head from a world of putridness, cold, and moist Recrements, but these are not proper Cephalicks, for what they do, is by the Virtue of their violent heat, and strong attractive power. Whether there be any cooling Cephalicks a doubt, if cooling things affett the Head and Brain, they do it simply, either by their cold Quality, or by cooling other Parts over-loaded, which by Sympathy or Contag, affect the Head.

IV. 2. NEUROTICKS. These are Nervous Medicaments, and are all hot and dry, from the found even to the fourth degree, or from the third Subsistance and penetrative Part, without which they could not pierce and affett the Nerves, to cause the extraverted Pains, as in Cramps and Colics, to be more, and strengthen them, as in Echefias, &c. they ought to be very subtle and volatile, that they may agree with the Animal Spirit, and as it were recuperate them. Their use is both internal, given in some proper Medicine, and externally, being applied to the Parts affected, and all along down the Spine or Back-bone, from whence all the Nerves of the extrem Parts, as well as some others spring. They may be given either in their Qualities with Cephalicks, because the Rume or Original of all the Nerves thro' the whole Body, arise from the Brain.

V. 3. STOMACHICKS, or Stomach Medicaments. These are such as open Obstructions in the Stomach, ease its Pains, and strengthen its Tone. They may be either hot or cold, and so affett the Part, according to the Indisposition which attends it. 1. When it is obstructed, the Appetit is diminisched or depressed, with a kind of nausea& quality's commencement: And this is remedied chiefly by and Aperients. 2. When it is over-cooled, or in a thin Subsistance and penetrative Part, without which they could not pierce and affett the Nerves, to cause the extraverted Pains, as in Cramps and Colics, to be more, and strengthen them, as in Echefias, &c. they ought to be very subtle and volatile, that they may agree with the Animal Spirit, and as it were recuperate them. Their use is both internal, given in some proper Medicine, and externally, being applied to the Parts affected, and all along down the Spine or Back-bone, from whence all the Nerves of the extrem Parts, as well as some others spring. They may be given either in their Qualities with Cephalicks, because the Rume or Original of all the Nerves thro' the whole Body, arise from the Brain.

VI. 4. PULMONICKS, or Pelorcials. These are Medicaments appropriated to the Lungs, and have respec either to the Part afficated, or to the Mover afflicated. 1. Those which regard the Part afflicated, are such as if they fall into the Lung, or if any Veel is broken in the Lung, and by a Kind of Symp- trick Quality, have power to decongest or heal it, or if there be any Ulcer in the Lung, have the power of cleansing it, and healing it itself, which
INTRODUCTION.

IT does not require so great straights from the Stomach, that the pores of the Stomach are longer, and more open, than those of the Liver, so that they be very binding, they may be harmless to the Liver, and cause Obstructions.

X. 8. SPLENETICKS. These are Medicines appropriated to the Spleen. Splenetics are considered in a threefold respect above. 1. Such as open its Obstructions, and they are Aperitives, which ought to be so powerful, as to penetrate into its most inward recesses, for the whole Substance of the Spleen, is a kind of animal Honeycomb. 2. To relieve its Difficulties; and these in an Inflammation, ought to be cooling and dissipating, in a Scirrhous, to be highly Refolutive, and not in the least binding, and outwardly Emollients may be applied. 3. To strengthen it. And these are such as are temperate, in respect to heat or cold, for they ought to be so much augmenting, as to confirm its natural and healthy Tone.

X. 9. MESENTERICKS, or Hypochon- drick. These are Medicines dedicated to the Medullary Gland. Its great Failure is from Obstructions, which are either from visors or clammy Humours, or from Wind, which induce a profound Filling, or universal Confumption of the whole Body, and in the Liver (if not removed) Decays. Upon this Althea-tree, the whole Orb of Life turns: and when it breaks, the Man sinks, and the Body returns to its first Principles. And therefore the more powerful Decomposition or Aperitivs, are Splenetics, Mesentericums, and those in the Abdominal Kingdom, are deduced from Chalybeates. In the Animal, from Volatili-Salts, as Sal Volatile Oduos Sylvia: And in the Vegetable Kingdom, such things as have power to diffuse congelation of the Osseous, or Volatili Salts of bones, and of Tartar, or to cut the viscid and clammy Matter, as Caffeine, Horse-Radish, Rockee, its cold Mixture of Body, or Juices of Chiron, Limoni, or Lime Juice, and their Sarsaps, in hot Conjunctions joined with other proper Substances, which may have a power to penetrate into the most inward recesses of this Blemish. Add to these Cuminatrices, connected with Sylvius's Spiritus Anticholicks, where Wind seems to have the predominancy.

XII. 10. NEPHRICKS. These are Medicines appropriated to the Renis and Bladder. In the Renal Separation is made of the Serum from the Blood, without which Man could not live, and the Bladder, of a Sufficient magnitude, it is requisite to contain it. Therefore it is necessary by appropriate Medicaments, to keep those parts clear, and free from Obstruction, and to retain their strenght, that they may the better perform their Offices. The Difficulties affilling the Renos and Bladders, are chiefly, 1. Obstructions by a tannarous or viscid Mucilage. 2. Stones, Gravel, or Sand. 3. Infammation. 4. Pissing Blood. 5. Ulcers. The fifth, is cured by Aperitives and Veneticks. The second, by Lithripticums. The third, by cooling Diureticks, as Sal Prunella distilled in a Diuretick Wine. The fourth, by Syphylics and Auranticks, as Cathamon, and Opiates prepared with Beans, Mango, or other, by Basilimics, as Balsame of Calis, Gildeed, Perl, Captious, Vincet, Strabarch, and Chio Tarrettises, and sweet prepared Medicine, which transfixes all other things.

XIII. 11. HYSTERICKS. These are Medicines appropriated to the Womb. It is a Part
I N T R O D U C T I O N.

Purges, how strong a power, will not so well cleanse the Ventricles, as one proper and well-designed Emetic.

IV. CATHARTICKS, or Purging Medicines. These peculiarly cleanse the Entails, but without drawing the Pectoral Matter from all parts of the Body, to which use they have been found in some, who have for many Months left all the Utes of their extremum Parts, or Limbs, by violent and inconstant Rheu

IV. 2. CATHARTICKS, or Purging Medicines. These peculiarly cleanse the Entails, but without drawing the Pectoral Matter from all parts of the Body, to which use they have been found in some, who have for many Months left all the Utes of their extremum Parts, or Limbs, by violent and inconstant Rheumaticks, and Colombia, who by only Purging with proper Catharticks, have been forcibly restored, for which purpose, the Pulvis Osmatric has been notoriously known. They remove Obstruction, not only by opening the Pores of the Skin, but the interior Duclus of the Body, as in those things Nitrous and Bitter, owing to the same small attrition. They are also Adstringent in degree, for such things which open the Pores and cleanse the Passages, must have a power of Attrition, and a great to

IV. 3. SALIVATICKS. These are stimulating or partaking Medicines, which refering all the Lymph of the Body, into a purulent or serous Substance, it is conducted from all parts of the Body, and passing thro' the other Parts, is spit forth. This is only or chiefly performed by Mercury, and some of its Preparations, which melling the congealed juices, and carrying them with it, causes this Operation here, as it is to be performed, is not our Business here. They who would know more of this, may see what I have said at large upon this Subject, in the Third Edition of my Synopsis Medicine, in my Ars Chirurgia, and in my Praxis Medicinae, the Second Edition of my Annotations upon Dr. Sudemann's

CHAP. VI.

O F THE FOURTH QUALITIES.

I. The four Qualities of Medicaments are such as are Activative, to suit, such as by their Power or Operation, take away some thing from the Body; or from some of its Bourses or Parts.

II. And these receive their Names from the variety of their Operations, which they each perform in the respecvive parts of the Body, to which they are adapted; which are the Five following, viz. 1. Emeticks. 2. Catharticks. 3. Salivaticks. 4. Particks. 5. Emmenagogicks. 6. Diureticks. 7. Lithionticks. 8. Sedativa. 9. Venticles.

III. 1. EMETICKS, or Vomitories. These by giving a reliance to the nervous Fibres of the Stomach, cause their Relaxation and Stimulation, whereby afterwards as the relativity grows more and more, and the nauseousfens encreases, those nervous Fibres before relaxed, suffer a kind of Contusion, and the fore mentioned Mater upwards, or by the Mouth, whereby that Vitus, by such a discharge, comes to be refered to its pristine Health. Nor is the Stomach otherwise to be cleansed, for ten Catharticks, or
INTRODUCTION.

VIII. 6. DIURETICKS. These are Medicaments provoking Urine. They may be either hot or cold, but mild, liquid, thin, and easy generation, that they may exercise the quantity of Urine, as it were by Accident. 2. But in things cleansing, attenuating, and open, they open the Passages, and their potency may be, or may be so great, that they may embitter themselves to the Body, dried by too much heat. And these things, which by their potency expell the Secondine and dead Child, as also a Mela, or False Conception, which are fleshing, bitter, with Aerymonies, and thimings of parts, and are to be given often, and in pretty large quantities.

C H A P. VII.

Of the Fifth Qualities.

I. THE fifth Qualities of Medicaments are such as are Adductive, to suit, such as by a peculiar Property, add something to the Body, or to some of its parts or parts.

II. And these are such akeforely, or daily add to the principal Juices and Parts of the body, even to the whole Body, without which Human Life, or its Generative Powers, could not be continued; and they are, 1. Chylicicks. 2. Analepticcks. 3. Gastronomicicks. 4. Spermacomicicks. 5. Alexipharmacicks.

III. 1. CHYLIFICKS, or Breeders of the Nutritive Juice. These are such things as conserve the natural heat of the Stomach, so that it may be able to connect and digest the Food received in, without which a good Cyclus could not be bred. They are generally hot in the second, third, and fourth degrees, so that they may not only preserve but restore the Tone of the Stomach if hurt, and these are proper Stomachicks, hot, dry, and of thin parts, sharp and attenuating. But when the Stomach is overheated, and the Congestion is hurt, as also the Appetite in a great measure defiled. Then cold Chylicicks are to be chosen, which may allay the pretternatural heat, and reduce it to the just Temperament, and these are Concomitants, Lerturice, Porflane, and generally Acids, as all ripe Fruits, Lime Juice, Lemon Juice, Vingars, Spirits of Nitre, Sulphur and Phosphatis, all which not only the pretternatural, but also the nutritive Virtue, and help the Digestions.

IV. 2. ANALEPTICKS, or Reforcers. These are such things as breed a Restorative Cyclus, which is of absolute necessity in such as are in Confusions. The Stomach may breed Chyle, and thus plentifully, yet it may not be good, or referors, such a nutritious juice is to be educed from these things, which bane naturally in them a refering Virtue, as those which are called Stomachicks, or
or mixed with Stomachicks, so they ought to warm the Stomach if cold. They are hot in the first and second degrees, and of a hot or glutinous Sublunary, yet Spirituous nihthall, of this Kind are Meats made of Wheat Flower, as thick Milk, Holly Padding,或是 Pasteques, Turneps, Potatoes, &c., and a Liquid called Punch, these made.

Take a proper Bandy, fair Water, or each a Quart, Lime Juice, a Pint, or three quarts of a Pint, double refined Sugar, a Pound, mix and dilute: Of which the Confectioner may drink a Pint at a time, in the Morning, just before Dinner, at four in the Afternoon, and at Bed-time. To these things you may add Milk-meats, Cheefe-cakes, Custards, Oggers, &c.

V. 3. GALACTOGENETICKS.

These are things which breed Milk in Nurses. This is done partly by Meats, and partly by Medicines. For Food it is such as is Enzymicke, and Polytrophick, of good Juice, and of much Nourishment, a little better and drier than the Blood, if it is chilly and spirituous, but more moist, and left hot, ifoffitted with Choler. Medicaments breeding Milk, are hot and of this parts, and of affinity to these things which greatly provoke Urine. But such things as are strong, and provoke the Courses, hinder its Generation, and much else in the humour. Things also too cold, thickening, distilling, or drying, do the same.

VI. 2. SPERMATOCENETICKS.

These are things generating Sperm or Seed. They are hot, and not very dry, but flatulent and spirituous, and breed of the purest and most spirituous parts of the Blood, in such things as encrease a strong, and good Chylus, and from thence much and good Blood, encrease the quantity of Seed. It is also stimulat'd by things hot, volatile, thin of substance, penetrating and sharp, and hindered by things cold, insipid, non-nutritive, and disconsequent.

VII. 3. ALEXIPHARMICKS, or antidotes.

These are Medicaments adding Vigour to the Vital and Animal Spirits, to refiiff and overcome Feisjon, and are antipathetical to it. They are hot and dry in the second, third and fourth degrees, inflating and distilling to the Stomach and Heart, and homogenize with the Spirits, enforcing the Human Body. They 1. Strengthen Nature, that it may be the more able to encounter the Feisjon, and by oppose the Feisjon, left by its opposite Quality. 3. By their potency, volatility and expulsive force, they violently expel it. Vomits, Cathartic and Sudorifics, immediately set, and in this order, are good expeditants. If in the Stomach, Vomiting, in the Entraists, Purgings, but if in the Spirits, (as in the Plague) Sweating.

CHAP. VIII.

Of Preparations Galenick Internal.

There have been made a great number of them, and we have reduced them to the following ten Heads.

2. Infusions. 7. Laxatives.

5. Pouders. 10. Salts Elettoral.

I. JUICES. 1. They are to be press'd out of Herbs, when they are young and tender, or rather, when they are just come to their flowering, because then the Juice is in its greatest Vigour, and gathered without in a fair and dry Season. 2. They are made by beating the Roots, Herbs and Flowers, in a Stone or Iron Mortar, with a Wooden Pelle, and expressing the Juice with a Press. 3. They are either Flatulent, or dephlegmatising. 4. The Liquid is either from hot Herbs, and such as are volatile, or from cold. If from hot Herbs, they are to be sette 6, 8, or 10 Hours, then to be decanted from their settings, and put into a Glass or Bottle, putting Oil Olive upon them 2 or 3 Inches thick, to preserve them. 5. If cold Herbs, after setting, the clear is to be decanted, and clarified by boiling and from ming, or with Whites of Eggs, and then Bottled, with Oil put over the same. 6. Infipitale Juices, are never made from hot, dry, and volatile Plants, but from such as have a more glutinous or clemency Juice, such as Acantha, Alcost, Camboigium, Catechu, Confirm, Etatuer, Liquorice, Meconion, Opium, Scammony, Stoes, &c.

II. INFUSIONS. 1. They are made from such Plants, Roots, Bark, Leaves, Flowers, Seeds, which are of hot, dry, and volatile Plants, and of such a Substance, as being rare, easily yield their Virtue. 2. They are made from cold Herbs, and Plants, such as are of a thick Substance, and it may be Resinous without. 3. If their Substance is thin and rare, a cold Infusio, or Digestion, (if in Summer Time) may be.

4. But if of a more compoud, solid or tenacious Substance, after being reduced into a groat Powder, they are to be digested in a warm Oven, or in a Sand breast for some days, poaking them once or twice a Day, then being settell, the clear is to be decanted, and kept close stop for use. 5. The Infusion may be made in Water, Wine, or Vinegar, according to the Design and Intention of the Physician: If in Simple Water, it is then called by the bare Name of an Infusion: If in Wine, it is called a Medicated Wine: If in Vinegar, a Medicated Vinegar.

III. DECOCTIONS. 1. They are never made of hot, dry, solid, spirituous and volatile Plants, because, in boiling, all their active Virtues would be lost. 2. Or if they are decoll'd, it ought to be always in a Alemick, with a Receiver luted to it, to receive its spirituous and volatile Parts, that when the Decoction is made and clarified, they may afterwards be mixed therewith. 3. The Boiling is half an Hour, an Hour, or two, more or less, according to the crassitude of the Body: as they may be either Herbs, Roots, Bark, Woods, &c. 4. It is made either in Water, Brath, Wine, or Vinegar, according to the Inten'tion and Design, but for the most part in Water. 5. It is a Medicament for present use, and therefore there needs no Directions for its keeping or preservation.

V. STRUPS and JULEPS. They are made, 1. Of Infusions. 2. Of Decotions. 3. Of Juices, of Herbs, Plants, Vinous, Seeds, &c. 2. Thuse
INTRODUCTION.

2. Those made by Infusion, are chiefly from Flowers, or of Balantia, Elecampane, Coronationflowers, Dandelion, Bees-tea, Peach Fruits, Poppy's, Wild, Refolium, Saffron, Violets, &c. by being digested one whole Night close covered, either in the heat of a Bath, or Sand box, often repeating the Infusion. Those made by Decotion, are from such Herbs, Plants, Roots, &c. as will admit of boiling, as we have declared in the former Section. 3. Those by Juices, are made of all your favorite Herbs and Plants, freed from their faces or impurities, by settling or clarifying with White of Eggs. 5. The way of making. To every Four or six Inifusions, Decotions, or Juices, put two Pounds of Double refined Sugar, which mix together by melting only in Balloco, not at all boiling it. 6. All Syrups will keep a Year, if kept close in Flasks or Jars, but if open they are apt to break the Glass, only bind a piece of thin Leather, or Paper, with a few small holes over the mouth thereof. 7. If等候, or half Syrups, being made of Infusions, Decotions, or Juices, with but half the quantity of Sugar, and these will keep but a little while, viz. 2 or 3 Months, being apt to grow sour.

V. Pouders. 1. The Ingredients, whether Roots, Bark, Leavers, Flowers, Seeds, Roots, &c. are to be made every day, either by Sun, a warm Oven, or some other Artificial heat. 2. By the help of a proper Malt, they are to be ground into Powder. 3. But where a Malt is not to be met with, or it is but a small matter, which is to be reduced, it must be done by beating in a Broads or Iron Mortar, with an Iron Pistle, and then are made into pills three a fine Score, heating the remainder which will not pass, and fearing it, so long till it is all, or very near all past there. 4. Resinum Bodices, such as Scammony, &c. will not easily be reduced without the help of a little Oil, containing the bottom of the Mortar now and then, as also the end of the Pistle, with a little Oil Oiler, by which means it will mix with much easier. 5. Camphor, &c. it may be reduced with a few drops of Oil; yet it is much better done, by adding to it a very small quantity of Brandy, or Spirit of Wine, to grind it in the Mortar. 6. All Pouders ought to be kept in Glass Bottles, close stop, with good Corks, but rather with Glass Stoppers, otherwise they presently lose themselves, and will be good for nothing.

VI. Electuaries and Lozenges. 1. They are made of Jalabi, or Lepigone, or fine ground Powder, mixed with Honey, or a Syrup, of double refined Sugar, made into Syrup, with Water or Wine, of the thickness of Honey. 2. The Proportion for a good bodied Electuary, is 3 Ounces of Clarified Honey, to one Pound of Powder, or 3 Pounds of clarified Honey, or as much double refined Sugar dissolved and reduced to the Substance of Honey, to one Pound of Powder, which are well mixed together, either by beating in a Mortar, or over a very gentle Heat, till they be put into Gally-Potts, and to be tyed over with White Paper, and Leather, and so kept for use. 3. A Lozeng, or Licking Medicine, is only a thin Kind of Electuary, in which to every Ounce of Powder, there is to be put 5 or 6 Ounces of clarified Honey, or Sugar. They are used chiefly at Festivals, in all Differents, as the Great and Longs.

Electuaries. (If well look after) will keep nearly a Year, but Lozenges will keep twice that time.

VII. Lozenges. 1. A thick Musclage is to be made of Gum Tragacanth, with Water, or rather with equal parts of Water and Spirit of Wine, or Juice of Limes: This is to be thickened with Double refined Sugar in very fine Powder, and beat together in a Mortar, till it comes to a stiff Paste. 2. Or fine Sugar may be dissolved in Brandy to a Candy height, and then mixed with the Musclage of foregoing. 3. Lozenges are made either for Vomits, and then they may put to each half a Dram of Elixir, or Powders, or of one, two, or three Lozenges, according to Age and Strength. 4. Or the Lozenges are Ophates, in which one or two Grains of choice Opium in fine Powder, may be mixed, or a double half a Dram, or a Draught, to be given as a Dose, according to Age, Strength, Nervousness, and other Circumstances, in whatever Coughs, Coughers, &c. 5. Or as Common draughts, against Atomics, Yellowing, Infusion, Fortification, or or Syrups, to which Syrup, or Sugar, or Sugar, or Sugar, &c. may be mixed with the Musclage and Honey, or Sugar, in such proportion, as the Physician shall think fit. 6. Then being well beaten, or strength well, the Paste is to be rounded out into Pills or Coals, and so with a straight Rod, and a Knife, to be cut out into a quadrangular Lozenges, which are to be carefully dried, and kept for use.

VIII. Pills. 1. The Ingredients are several, to be reduced to a solid Powder, by strong beating in a Broads or Iron Mortar, and then to be molded into a fine Score. 2. To this Powder, to much choice Honey, or some proper Syrup is to be added, as may make it (by well beating it in a Mortar) into a Paste, of which a sufficient amount is to be made into Pills, which Paste, is to be hard or stiff as to crumble, or yet so soft as to fall flat, and not keep up the regularity of its form. 3. Some Gum-infusoria Bodices, as Aloes, Coachmen, Scammony, &c. being reduced into a fine Powder, are to be mixed up into Pills with fair Water, than with Honey or Syrup, for they shall as soon dissolve in the Stomach, and keep a long time without mouldiness: But then they are immediately to be formed into Pills, as soon as the Alms is made; otherwise it will grow hard, and not afterwards to be done.

IX. Troches. 1. These are in form like little Cakes, much about the signification of a Copper Kember, being longinsignificantly, that Pouders, which of themelves are not able to refit the interposition of the Air, might be kept a long time pure, and free from, or made, and placed in one of pure white Gum Tragacanth, put to it half a Piece according to the form of fair Water. 2. Let it stand warm for 2 Hours, till it becomes a Marshmallow, or Gelly. 3. Take the Powder them made soluble), and mix with this Musclage, by beating in a Mortar, so much as may make a stiff Paste, which roll out into thin Plates, and with a round hollow tube edged Brads, Sitters, or Small Instrument, to be cut out into little Troches, or Coals. 4. These you are to dry either in the Sun, or a warm Oven, after the thread is out, and being through dry, put them up into a Gelly Pot, or after proper Vessels, for safe,
Rv what ever with a Paper and Leather, to keep them from the Air.

X. SALTS ESSENTIAL. 1. Take a Plant when it is full of Juice, viz. in its Flowering time, a sufficient quantity, bruise it in a Wooden Mortar, with a Light Pestle: Water: Boil till half be confined: Strain the Decoction by strongly pressing it out; and then Boil it to the thickness of Honey. 2. Take this mucilaginous Magma, put it into a Glafs or glazed Vessel, and let it in a cold place for 9 or 10 Days; so call a Crystall Salts arise like Sal Gen, which gather, and mif it with the distilled Water from the same Plant, which dry and keep it for use. 3. This is made Salt of Cardamum, Magnolia, Wormwood, and other bitter Herbs; but of other Herbs with much difficulty. 4. But such as yield a finest Juice, give a plentiful quantity of Essential Salt, or the Sugar in the Essential Salt of that Plant; so also do Figs, Rations of the Sun, and other like fweet things; for Figs and Rations, when old and dried, will show that the great part of that Essential Salt on their outside, hard, dry, and of a white colour.

CHAP. IX.
Of Preparations Topical, or External.

TWO Authors have multiplied the Titles of these Topical Preparations, yet these following are all that we think necessary for External Uses, or outward Application.

I. LOTIONS, or WASHES. I. Waters are made 1. Of fair Water. 2. Of Infusions, or Decoctions. 3. Of Wines. 4. Of Vines, of which a choice is to be made, according to the Purposes or Design for which it is intended. II. The general Intention of Lotions, or Waters, are five-fold, viz. 1. To bearify the Skin. 2. To ease Pains. 3. To diffuse Tumours. 4. To change old putrid Sores or Ulcers. 5. To attract or draw forth any poison, Venom, or Malformation, in the Part. III. If fair Water is appl'd either firmly by its fleff, or hot as the Patient can bear it, either to bathe with it, or to let the whole Arm, or Leg, to lie in it for half an Hour, or quarters of an Hour, more or less, which regard as need may require, twice or thrice a Day: It opens the Pores, abates Inflammations, and abilgeres old putrid Sores and Ulcers, making them apt for healing. Or it is used with Calilce or Genus Soap, a Quarter of a Pound dissolved in 3 Gallons of it, by a gentle Heat. This opens the Pores, and abilgeres more patiently. IV. Secondly, Infusions or Decoctions These are made of fresh Herbs, as are appro priate to the intention, and which the Physitian builds agree, in which also Calilce or Genus Soap may be dissolved, and may serve for expelling of Toxins, discomforting of Oedematous Parts, and as a salve, or oile for the Parts: And if it is of use (viz. Red Wine) to cure the falling-down of the Fundament. But mixed with Camphir, a Draught or balsam, dissolved in a little Brandy, in a Quart of Wine, it will be yet more powerful to all these Intimations, as also to prevent a Mortification. VI. Lastly, Vinegar, simply if it selfs, used but, is excellent to ease Pain, Stopp Bleeding, &c. The away Deformities of the Skin, but used with Honey dissolved in it, it abilgeres putrid Ulcers, and heals Ulcers of the Mouth and Throat. If it is used with dissolved Camphir, an a Seldum Saturn, it not only cleanses the Skin, but cures most of its Deformities, and also beautifies it. These are some of the things which Lactases perform, and in imitation of these Examples, you may make a thousand others, which may have admirable Effects.

II. OILS. 1. They are made by - Infusion. 2. By Infusion. 3. By Boiling. II. These which are made by Infusion, are either Oil of Olive, which if it is made out of Ripe Olives, is to be temperate, in respect of heat, coldness, dryness, or moistness, or Oil out of Nuts, as Oil of Almonds, Sweet and Bitter, of Walnuts, Oil of Bin, which has that Property with it, never to grow Rancid, or Oils out of Seeds, as Arichet, Linseed, Rapeseed, &c. III. Oils by Infusion. Take Olive Oil, or rather Oil of Bin, a Gallon, of the Herbs or Flowers, or Seeds you desire to make the Oils of. 24 Handfuls well bruised; mix them, having the Oil in a Hell, or a Box, and set it in the Sun (in the finest Section) for 14 Days or more, stirring it every Day. Then having warmed it over a gentle Fire, pour out the Oil from the Leaves, and make a Pomm. Repeat this Infusion with more bruised Ingredients, three times at least, at left pressing out the Oil as before, let it stand to settle or decoct, and pour off the clear, which keeps in Glass bottles close stops for use. Where note, that Oils by Infusion, ought to be made only of Herbs and Seeds which are hot and dry, of every thin, brisk and volatile, which are easily diffused, like Camphir, Hyssop, Lavender, Marigold, Mint, Refersen, Sage, Savory, Southernwood, Thyme, &c. of Aniseed, Cardaways, Cor Top, Cloves, Kemm, Mace, Nermagas, Parly-fowl, &c. IV. Oils by Boiling. Take Oil Olive, or a Gallon, of the Herbs, Flower, Seeds, &c. bruised, 70 or 24 Handfuls: Boil all over a gentle Fire to Crispness, and pour off the Oil from the Leaves, and make the Pomp. Repeat this Pomp to Crispness, and expeffing at least 3 times: Then letting it decenter or settle for a Day or two, decant the clear Oil and keep it for use.

III. OINTMENTS and LINEMENTS. I. Ointments are made three ways, viz. 1st by making the Ingredients into an Oil by the former Section. Secondly, Of the Ingredients themselves by Infusion. Thirdly, Of the Ingredients by Cellion or Boiling. 2. The first way, by making the Ointment of the Oil. Take a gram Oil of the defanced Herbs, in Strasbourg, Venice, or Chlo Turpentines, Brie Wox, of each 12 Ounces.
INTRODUCTION.

Ointments: melt and mix them well together, and put them in Gally Pots for use. The second way by Infusion. Take such Roots, Herbs, Flowers, Seeds, &c. which are hot and dry, of very thin, fijel'd and volatile parts, bruised, eight Handsfuls; Hogs Lord, four Pounds; beat them well together in a Stone Mortar, with a Wooden Pestle, put the Mists into a broad Stone or Earthen Glazed Pot, eye it over with a Paper, and infuse it for 15 Days, so as for want of a hot Sun, digest it as in a mild Sand heat, that the Lord may be all that time perfectly melted, and robustly fixed on the matter by prefiging. Repeat this Infusion or Digestion 3 or 4 times, in the same manner, and at length, take the expressed Substances, and add thauera, Venice or Surgeons Turpentine, Beer Wax, of each 8 Ounces; melt and mix them over a gentle Fire without boiling, and keep the Ointment for use.

The third way, by Colloid or Blending. Take of the bruised Ingredients & Handsfuls, Hogs Lord, a Pound, and over a gentle Fire to crystallize, and strain out by prefiging; Repeat this working 3 or 4 times, and after, to the expressed Results, an equal Part of Turpentine, Beer Wax, of each 8 Ounces, boil and mix, and keep the Ointment for use.

Sometimes Powders are added to Ointments for particular Uses, the chief of which, are of Alum, Brinutation, Calomel, Scammony, Ointment of the Face, and Oil of Nigntin, &c. Lintiments, They are Soft Ointments, and made in all respects as Ointments are, having, that they are generally made without Wax, or without only the half quantity of Turpentine and Wax.

V. BALSAMS. 1. Those are Artificial, and made in imitation of the Natural, by mixing such Ingredients together as may constitute a body of equal Density or Subsidence. 2. Take Oyl of the Ingredient you would add to your Balsam, as strong Oyl of Hypocrate or stronger Oyl of the yellow of Orange Pechs by Infusion, 17 Pints, Oyl of Nigntin by Expartition, Balsam of Peru, choice Clio Turpentine, of each 4 Pounds; mix, well over a gentle Fire, and keep it close, or for use.

V. POWDERS. 1. Those intended in this place, are only such as are for external use, applicable to the Eys, lopping Blood, Wounds, Ulcers, &c. 2. They are made of Ingredients perfectly dry'd, and then reduced to a fijel'd kind of Viscam, either by grinding in a Mortar, or beating in a Mortar, and so packed third a fine Scourer, 3. Powders for the Eys, as Alkohol coloured and lanced, or Lapis Calaminaris coloured and lanced, or Vins colourts, beaten and lanced, any of which Powders being blown into the Eys, consume Pearls, Blins, &c. so also fine Powder of Root, which once Finger may be dosed and several times a day rubbed upon Visions, Pearls, &c. which in time, meals them off.

4. Powders for lopping Blood, are chiefly Catcho, Vitall coloured with fine Butter and Camphir, Powder of Cervical Balls, of Albae Blood, of Almonet Root, &c. 5. Powders for digesting, cleansing, and healing old Ulcers, or Alcers, of

VI. EMPLASTERS, AND CERATS, OR CERECLOTHS. 1. Emplasters are made by mixing: First, with Hogs Lord, or some other Fat or Grease, adding the proper Ingredients. 2. First with Oyl. Take Oyl of Oil, a Quart, some proper Gum or Guin, from 5 to 16 Ounces; add 5 Pounds of a Powder, and mix, and boil to the Conspisation of an Emplaster. 2. Where Turpentines, and any proper Powders of Vegetables are added, Bee's Wax will be needful, and if any proper Powders be added, it is to be boiled to the Consensus of an Emplaster. 3. Some Almonet Powders, as Red Lead, White Lead, Lixburge, &c. being added to the Oyl with Vinegar, will sufficiently bring the Oil to the Body of an Emplaster, without the addition of Gum or Wax, by a pretty long boiling and confinantly stirring, with a wooden Spatula till it is persed. 5. Seven with Hogs Lord, or some other Fat or Grease. It is made altogether as the former, just in the fat, 5 of 10 Pounds of fat, and a smaller quantity of Guins or Powders. 6. Cerats or Ceretic技. 3. They are for Emplasters, which will not work without melting in a Pan, or the Rop of fire, being for the most part made with Oyl of Oil, and in a much larger quantity. 7. The Emplaster bring brought to its due Consensus, it is then made up into Rollt, and so kept for use.

VII. CATAPLASMS, OR PILTICES. They are made with Oyl of Oat, adding the boiled Puffs of Roots, or Oyle, and the other proper Ingredients according to the Intention, as baked or boiled white Lilly Knotts, Turneps, Dill, Carthol, Leeks, Country Roots, &c. and so bringing it to a due Consensus with Vixen of Oatmeal, Butten-tree, Onion, Orthus-Mael, Grains of White Bread, Allits, &c. boiling all to a due degree. 2. Some Powders are made to diffuse Tumours which will not probably break, some to ease Pain, some to alloy Inflammations, and some to Maturate Tumours which tend to breaking; so that according to the Intention of the Cataplasm, each ought the Ingredients to be, to answer the same. 3. It ought to be lain on as hot as the Patient can well endure it, and to be renewed 2 or 3 times, or as often as the Nature of the Mody afflicting requires it.

VIII. CLYSTERS. 1. They are Liquids made with Pois drink, or Most Briths, with the addition of such other Ingredients as are proper to the Intention of Cure. 2. The chief Purpofes for which they are made are, 1st, to ease Pain in the Joints, from the Cold or Sharp Humors. Secondly, for the Cure of Fluxes of the Belly, and bloody Pains or thirst, to remedy Colicarts, Fourishly to purge the lower bowels. 3. Clysters for easing Pain, are made with Carminative Decoctions, or bloody flux, 3 quarters, or an Oume of Strasburgh Turpentine, well mixed with 1 or 2 Tales of Eggs, and then with the Decoction, and so exhibited something more than Blood warm, and sown. For the Carminative Decoction in Worms, a quarter Part of Brandy ought to be added, and the Clyster to be several times repeated, 5 or 6, 8, or 10 Grains more or less of Lannum, ought to be dissolved in the Brandy and mixt with the Decoction. 5. For an extrem Clyster, The Clyster ought to be made of Arbutics, as a Description of Athica Roots, in which

Rysin, of Scammony, of Tobacco, &c. which carry fail things are without comparison.
INTRODUCTION.

which a small quantity as 2, or 3 Drams of Castile, Bismac, or Venice Soap ought to be dissolved, or a quarter part of Oil to be mixed therewith, well strained with Table Salt. 6. For purging the Belly and giving Stools. It may be made of Carmine, Red Alum, or Red Oxides, or Fpoet-drink, in a small quantity of brown Sugar or Honey, and half an Ounce of Salt are to be added, and digested in the same, without the Addition of any Oil, because Oil will Obtain the points of the Salts, and hinder the Operation or Working. 7. As to the Quantity to be exhibited at a time, to little Infants, give a quarter of a Pint or 6 Ounces; to Children from 5 to 10 Years Old, half a Pint; to bigger Children from 10 to 16 Years Old, 3 quarters of a Pint; to Men and Women, from a Pint, to a Pint and half.

CHAP. X.

Of Preparations Chymical.

THE chief Chymical Preparations, as they may base respect to the present Work, are these ten here enumerated, viz.

5. Spirits. 10. Salts.

I. EFFENCES. 1. By Effences here, we do not mean those highly refined and sublime etherial Chymical Oils, which Perfumers and others use, and so call, but another Preparations which is taken from the whole Substances of the Plant. 2. Take Angelica, Balm, Mint, or any other like flowered Herb; beat it in a Marble Mortar, with a Wooden Veffel, to a Pulv or Mafs; put it into a Mortar or Bolt-head, which Seal up Hermetically, or (otherwise fop it up with Cork dip in Wax, then closed, and heated hermetically, and after a longer time, set it to digge in a Hufe Dunghill, or some other antiquit Heat, as Balneo, Sand, &c. for 40 or 50 Days; so with the whole be reduced almost to an uniform Substance; afterwards take out the Mastic, which is now more liqhid than it was before, or reduced into a Liquor, which preys from the Exces. Digge it again in a gentle Balneo, that the remaining grasse parts may sublime; deceased the clear Liquor, or Ether it is the Brown Paper, or Cotton, in a Glafs burn., From thence is the Brown Paper, or Cotton, in a Glafs burn. And from the former Excess, being dried and calcin'd, extract a fixed Salt, which add to the first Salt, this is Le Chatel's Effence of Plants; and may be given in any proper Vehide, from one Spoonful to two, or three.

2. Some add to this Effence, when it is for long time used, to be dissolved, or a quarter of a Pint of the best Brandy, or Spirit of Wine. 3. But if you would exalt this Effence to a higher degree of purity and excellency, the said Le Chatel's Effence of Plants and a small quantity of any other excellent older, added to assistance, or given in a Glafs of Decrippet Common Salt, made

per deliquium, of each equal parts; put them into a Mortar or Bolt-head, which Seal up Hermetically, or fop it up as before; Digge it in the Sun, or in Balneo, or a Sand heat, for 40 or 50 Days more, so will this foilse Liquor, without any other Operation, separate all the bittersweet and fiery Matter, or the volatile part of it, and bind it by its nature to the Plant, which separate and keep for use. This exalted Effence, may be taken from hard in a Spoonful to a Spoonful, Morning and Night, in a Glass of Canary, or other proper Wine. 5. The Effences of Cold Herbs. Take the whole Plant well beaten in a Mortar, Juice and all, and add it to an equal quantity of Spirit of Wine, or Brandy; put them into a very large Bolt-head, which fop close as before, so that nothing may breath forth; set it to digge in hermetically, or its equal heat in Balneo, or Sand, for 40 or 50 Days, or more; then strain out all the Liquor by hard pressing, which put into the Bolt-head again; being fop close up as before, digge in a gentle Sand heat for 40 or 50 Days more, so with the Effence added, separate the Excess, and give five, which decant and keep for use, adding it to the first Salt of the Preparations. Dose from one Spoonful to three, in some proper Vehicle.

II. TINCTURES. 1. There are several sorts of Tinctures, which are to be drawn out with such Menstruums, as are most proper to the Diffuse chief; the chief ingredients of which are the Vessels, the proper Spirit, and Way, to put into the Bolt-head again; being fop close up as before, digge in a gentle Sand heat for 40 or 50 Days more, so with the Effence added, separate the Excess, and give five, which decant and keep for use, adding it to the first Salt of the Preparations. Dose from one Spoonful to three, in some proper Vehicle.

1. The Acid Tincture. The Ingredients being prepared as in the former, affuse thereon the dealished Spirits, either of Nitre or of Salt, Sulphur or Vitriol, so much as to fopparate 4 or 5 inches; digge of before, then decant the clear Tincture, and keep it in a Glafs close fop for use. Dose 1, 2, or 3 Drops, prepared from Alum.' 2. The Acid Tincture. Take the Ingredients as before directed to be prepared, which put into a Mortar, or Bolt-head, and affufe thereon pure etherial Oil of Turpentine, so much as may over-top the Ingredients 4 or 5 Inches, shake them well together, and fop the Vessel very close; digge 20, 30, or 40 Days; the longer the better, in a place naturally warm, or in a gentle Sand heat, shaking the Vessel once every Day; then decant the clear Tincture, and keep it close fop for use. Dose 1, 2, or 3 Drops, prepared from Alum. 3. The Acids Tinctures. Take the Ingredients as before directed to be prepared, which put into a Mortar, or Bolt-head, and affufe thereon pure etherial Spirits, either of Nitre or of Salt, Sulphur or Vitriol, so much as to fopparate 4 or 5 inches; digge of before, then decant the clear Tincture, and keep it in a Glafs close fop for use. Dose 1, 2, or 3 Drops, so much as to give the Vehicle a little acidity. 4. The Oily Tincture. Take the Ingredients as before directed to be prepared, which put into a Mortar, or Bolt-head, and affufe thereon pure etherial Oil of Turpentine, so much as may over-top it 4 or 5 Inches; digge of before, then decant the clear Tincture, and keep it in a Glafs close fop for use. Dose 1, 2, or 3 Drops, so much as to give the Vehicle a little acidity. 5. The Oily Tincture. Take the Ingredients as before directed to be prepared, which put into a Mortar, or Bolt-head, and affuse thereon pure etherial Oil of Turpentine, so much as may over-top it 4 or 5 Inches; digge of before, then decant the clear Tincture, and keep it in a Glafs close fop for use. Dose 1, 2, or 3 Drops, so much as to give the Vehicle a little acidity. 6. The Oily Tincture. Take the Ingredients as before directed to be prepared, which put into a Mortar, or Bolt-head, and affuse thereon pure etherial Oil of Turpentine, so much as may over-top it 4 or 5 Inches; digge of before, then decant the clear Tincture, and keep it in a Glafs close fop for use. Dose 1, 2, or 3 Drops, so much as to give the Vehicle a little acidity. 7. The Oily Tincture. Take the Ingredients as before directed to be prepared, which put into a Mortar, or Bolt-head, and affuse thereon pure etherial Oil of Turpentine, so much as may over-top it 4 or 5 Inches; digge of before, then decant the clear Tincture, and keep it in a Glafs close fop for use. Dose 1, 2, or 3 Drops, so much as to give the Vehicle a little acidity.

Take Spring Water, 6 Quarts; Spirit of Alum, 2 Pounds; Sulphur, one Pound, mix.
xviii

INTRODUCTION

...days, days, or Oils but this an Copper Spirits then distil be y. 4. in this Diftill be y. and after distil be y. then be y. to a Cel...
in like manner to more prepared Prets. 6. Oils from Spices. Brave them grofsly, (for Powders yield few Oils,) distill them 8 or 10 Days in the Menstruum you intend, adding Nitre, Salt, or Tartar: then distil in a Velica, fo will you have fresh Water and Oil, which separate: evaporate the Water upon the Exces severals times, fo will all the volatile Oil ascend: The Water refer to make more Oil with, upon fresh Spices. The vquality Oils (as of Common) will separate from the Water, in 12 or 16 Days, by heating to the bottom. 7. Oils from Aromaticck Woods, as Caf- 
tria, Longe, Cedar, Cypress, Juniper, Rhodium, Sandle-Wood, Saffron, Myrolete, &c. "Take their raisings, or let their Chips be exceedingly well bruised in an Iron Mortar, which distill a good while in Water, then distil by a Velica: cob- 
habate, let them distill & thicker, fo it is more fit for old Sores and Ulcers. 2. Hence it appears that as Oils are the more thin, pure, and external Oils, fo they rise first in Diffillation, from the Matter they are separated from; but the Balsam is that other thicker Oily Matter, which by the force of a stronger Fire, ascends next after the former pure, external, volatile Oil is drawn off, which as it is of a thicker body, fo it is also of a deeper color. 3. Balsams Chymical, are often- 
times also made in Refinition of Chymical Oils, when drawing off the thin, subtle, volatile Parts, or Oil, the thick Balsam is left at bottom. 4. But they are properly Balsams which (the thin Oil be-
ning drawn off in a Velica) are afterwards drawn from the Chymophy by a Retort, &c. 5. Take the Chymophy, and continue distilling after the Oil is drawn from Redolins and Turpentine, put it into a Retort, and dis- 
still with a gradual Fire, first soft and gentle, then greater, and fo encreasing the Heat, till the Chymophy has gotten up all its Oils or Balsam parts, which will be of a body thick and red, and this is that which is properly called Balsam; which if it be retifled again in a Glafl Retort, in a Sand-beat, will be much more fine and pure.

VIII POTESTATES, or POWERS. 1. Take the retifled Spirit of the Plant, fuppofe of Myrolete, fuppofe of Plant, or Pennyroyal, a Pint: Chymical Oil of the fame Plant, an Ounce, or as much as the Spirit will absorb, or fufficent: mix them together, and keep them for use. 2. But if you take the

first Salt of the fame Plant, and grind it with an equal quantity of the volatile Oil Aromamick, fubliming and refubliming, it will be much more powerful to all the Intention for which the said Vaterfaftes are used. 3. And many times for 

som of the particular Spirit of the Plant, whose Powers you would make, the best retifled Spirit of Wine is used as a Succedaneum, to which many 

also be added, if you please, the volatile Salt of the fame Plant, or a volatile Salt of Tartar.
INTRODUCTION.

CHAP. XI.

Of the Virtues of Medicines.

1. THAT some Plants heal, some cool, and some dry, and some moisten, is manifest; and this is from their first Qualities, which are found out, felt by their Taste. Secondly, by their Smell. Thirdly, by their Operations, or Effects. Fourthly, by Experience.

2. THAT some Plants open Obstructions, and some stop, as in Catarrhs and Pains of Blood, some Bind, and some Relax, some Attract, and some Repel; some make the Volumes, and some Ab- sorbe, &c. These Virtues, which are their second Qualities, they draw from their first Qualities, but are more perfectly known and found out by Experience, and a continued Series of Observations.

3. THAT the Appropriation of Medicaments to the several principal Parts of the Body, has been found out partly by their Signatures, and partly by Experience, and sometimes by both of them together: And so this Appropriation of them to the Head and Brain, Nerves, Stomach, Lungs, Pleura, Heart, Liver, Spine, Mammae, Reins, Womb, and Joints, is called their third Qualities.

4. NOW if a Plant be hot and dry, it naturally follows, that it must relish and be helpful against Dyes of frost, proceeding from cold and moisture: So also if a Plant is cold and moist, it must relish and be helpful against Dyes of heat and dryness: The same may be said of Plants hot and moist, or cold and dry, which double relish and are helpful against Dyes proceeding from the opposite Qualities.

5. THIS being laid, if we consider what Dyes are affluous to the principal Parts of the Body, and from what Plants they proceed, it follows that those Plants, which are endowed with those first Qualities, and which are in the predicament of the third Qualities, must generally relish and be contributory in the curing those Distempers, affluating those particular Parts; and therefore in giving you the Virtues of the Medicaments, I there are an almost every Plant, and in the Virtue of their Preparations, a great number of Dyes enumerated, against which they be Good or Hateful, yet we do not intend thereby, that they are Specifics, and absolute Cures for all the Dyes there named, but chiefly helpful against the same, and in Combinations framed against such Maladies, may as a Vir duplicata, add to their Force and Effects.

6. AS FOR Example, take Angelica, Lavendar, or any other Plants, which are hot and dry in the second, third, or fourth degree, as to their first Qualities, and which are appropriated to the Head, Brain, and Nerves: We say that those Plants, and their Preparations, are good for and helpful against all the Dyes of those Parts, proceeding from cold and moisture, and accordingly we enumerate them, as Cataracts, or Deliriums, Migrains, Vertigo, Appellations, Epilepsy, Lethargies, Gars, Coma, Paffion, Convulsions into the Eyes and Nose, Swellings of the Head, weakness of the extremum Parts, third the hurts of the Nerves, &c. more especially if the Heat of the Blood be cold and moist too. These and other like Dyes of those Parts, proceeding from a cold and moist Cause, we say, those and the like Plants are proper for, and helpful in their Cure, that we do not say they will absolutely do the Work: And yet a great deal is to be said, if Alternatives be given in a full Dose, admirably used, not by his and girls, and continued for a great length of time, for so Nature acts in conjunction with the Medicine, and the Cure is performed and perfected at length, which otherwise could not be either expedit or hoped for.

7. VII. AGAIN those Plants which are in the fourth Qualities of Medicines, are Adjuvatives, which afford to take away all superfluous Humours, Remnants, and Excrements out of the Body, as Ventives, or principal Vifera, and Vefels, which are Emetics, Cataracts, Salivatics, Putridicks, and Sudoricks, and there are said to be Cataracts, as well helpful in Curing all Dyes of Repletion.

8. VIII. THE KIND of the Adjuvative is to be chosen, according to the fire of the Part, or Parts afflicted; and nature of the Dyes affluting. So if it be the Head, staff with pituitum, cold and moist Humours, Putridicks are to be chosen: If the Stomach, by Surfets, Vifera, Obftructuans, sharp Humours, &c. then Emetics. If the Intestines, with sharp Humours, Cataracts, and Excrements, if there be a Coleman of Urines, then an Obfuscation of the Reins, and Urinary Vefels, then Diuretics. If the Whole Body are contaminated, as in the French Dyes of Lepra, Leucoderma, &c. then Salivatics. If the Worms are obftructed, or the Car- sers flux, then Emetics. If there be a repletion of Urns, then an Obfuscation of the Reins, and Urinary Vefels, then Diuretics. If Gravel, Stones, &c. in Reins or Bladders, then Litho- uraticks. If Unusual Obftructions over the whole Body, with a repletion of Watery Humours, in Diuretics, then Catharticks fuel, and Sudoricks afterwards.

9. IX. AND SO the Dyes proceeding from Re- pletion, are enumerated according to the Part or Parts afflicted, and accordingly the proper Adju- vatives are applied, which are either relieving, or causing, or some ways contributing to those Dyes, those particular Medicaments according to their Kind, are said to cure, or be helpful, or contributory to the removal, or cure of those Dyes.

10. X. THOSE HERBS or Plants, which add some- thing to the Body, or its principal Parts, are in the fifth Qualities of Medicines, and are Adjuvatives, and said to cure, or be helpful in curing, all Dyes of Airlation, viz. such Dyes as are caused from the want of some Nour-ishment, Juices, or Humours, in order to the conservarion of the whole Body, or of some particular and refractive Parts. And so they are said to be Citytics, Analeptics, Galactogenetics, Spermatogenetics, and Alexipharmicks, that is to say, to cure, or to be helpful in curing, all Dyes and Wasteflkes, caused by a deficiency of what Nature supplies, for perfection of the Body and its Principal.

XI. AND THEREFORE the Kind of the Adjuvative
INTRODUCTION.

is to be chosen, according to the nature of the
Ailment or disease, the Part affected and the ap-
ppealing Evils to be feared: So if the Tone of
the Stomach is hurt, that it cannot breed good
Chylus, whereby an Atrophy or Fasting may be
feared, Strychnia may be administered, which
are useful to Stomachick, or Stomachics are to
be added to them. If a grand Wafting of the Elef-
be, as in a Phthisis, or deep Consumptiun, Amo-
lepicks are of use. If a Deficiency of Milk, then
GalaCologenicks. If a Deficiency of Seed, then
Spermaprogenicks. If Toxin be taken, then the
Vital Powers are to be strengthened and aug-
mented by Alctapharmicks.

XII. AND SO the Disposa proceeding from Ab-
lation, are enumerated, according as the whole
Body, or its Parts may be affected, and accord-
ingly the proper Adjuvants are chosen, which
adding to Generating. or encreafing the Nutri-
ment, or Jaifes deficient, are said either to cure,
or to some extent contribute to the cure, of the
pre-
tening Unflices, either present, or impending upon
the Patient.

XIII. THIS IS the Method joined with Expe-
riences, and a long Series of Observations, there-
all preceding Ages from the first beginnings of
the Art of Physick, by which the Virtues of Me-
dicaments have been investigated and found out,
and according to the Virtues ascribed to Herbs and Plants in this our Harbdt, are rati-
nally to be accounted for.

CHAP. XII.
Of Dofs, Ufes and Applici-

I. THE DOSES of Alternatives. 1. Powders, if
temperate, or hot, or cold in the first de-
gree, may be given from one Dram to two Drams
in the second and third degree, from half a
Dram to a Dram, or more. In the fourth degree,
from half a Scruple to half a Dram. 2. Infu-
fions, Decoctions and Waters, from two Ounces
to four, fix, or eight. 3. Extracts, from one Dram
to two Drams. 4. Elecutaries, from one Dram to
four, or half an Ounce. 5. Elixirs and Po
ers, from 30 Drops to 60, or 6c Drops. 6. Clysters,
a Pint at a time to a Man or Woman, but to In-
sants and Children, from a quarter of a Pint to
half a Pint.

II. DOSES of Alctaphrakis. 1. Emeticks, if of
Antimony, or Tartar Emetick, from three Grains
to eight: If Iatifions of Crocus Metallorum, Vi-
trum Antimonii, or Regulus Antimonii, from half
an Ounce to an Ounce; and if strong, from an
Ounce to an Ounce and half, or two Ounces: Em-

tick Decoctions of Herbs, from half a Pint to
three quarters of a Pint, or Pint. 2. Catharticks,
if Powders, from a Scruple, or half a Dram, to a
Dram, or Dram and half, according to the streng-
eth of the Parties, and the Age and Strength of the
Patient, the Strongest may be given from half a
Scruple to half a Dram. 3. Lente Emeticks,
from half an Ounce to two Ounces: Purging
E-

etickks, from half an Ounce to an Ounce. 4. Pur-
ging Infufions and Decoctions, from an
Ounce to four Ounces, according to their Strength,
the Strong, from an Ounce to four Ounces, the
Strong, from an Ounce to two Ounces. 5. Pur-
ging Extricks, from half a Scruple to two Scrup-
lices. Purging Pills, from a Scruple to a Dram. 6.
Purging Salts, from half an Ounce to an Ounce,
or half an Ounce. 7. Salivickks, according to the
Difcretion of the Learned Physitian. 8. Com-
menagogicks, if Infufions or Decoctions, from a
quarter of a Pint, to half a Pint, or more. 8.
Thins or Elecutaries, from two Drams to three
Drams, or half an Ounce. 9. Diuretics and Lith-
ontripickks, if Powders, from a Dram to two
Drams: If Infufions or Decoctions, from a quar-
ter of a Pint to half a Pint, or more: If Salts,
from ten Grains to a Scruple, or half a Dram. 10.
Sudorickks, if Infufions, from half a Pint to
three quarters of a Pint, or more: If Elecutaries,
from a Scruple to a Dram, two Drams, four
Drams, or an Ounce. But if an Opium, you
must be regulated according to the quantity of
Opium which is in it. If Salts, from half a
Scruple to half a Dram.

III. BUT IN ALL these Cases you are to depen-
d, that these Rules, nor any other, can be abso-
lutely General, but that different Accidents which
may be, as in the Age, Habit, and Strength of the
Patient, Recovery or Inactivity of the Diseafe,
together with the different Strengths or Weak°es
of the Medicine, may cause some Exceptions;
or particular Caufes and Observations nece-
sary to be known, and which we could not com-
prehend in these general Directions; so that not
withstanding the Limitations of this Difes of in this
place, they must be proportioned from hence, ac-
ording as the Accidents may be, in relation both
to the Patient and the Preparation, giving to
Grown Perfons the larger and more compleat Do-
ses, while to Weak Perfons, Children and Infants,
they are to be diminifhed, according to their
Weakneffs, Defabilitv, and tender Years.

IV. THE USES of Internal Medicaments. And
they are to be confidered, 1. AS to the Time of
Giving, FIRST, as to the time of Exhibition, Alter-
 natives may be given in the Morning Eating,
but without doubt, all Alter natives are half given
at Night, (but upon Empty Stomach) because
there will be the left for the next Day of tak-
ing Cold. Catharticks and Emetickks, are half
given in the Morning, because as the Stomach is
then half Empty, so they will the eafest all upon
the Offending Matter, and the Sooner Operate.
Besides, the better Attendance may be given, in
the time of their Working.

V. SECONDLY, As to the Way and Manner of
Giving them, and this is taken for the most
part from their Form. 1. Waters Diftilled, Syr-
ups, and Juleps, are used chiefly as Vehicles,
to convey other things down the Trachea in. 2. In-
ftuions, Decoctions and Waters, are generally
given by themselves, dulcified with White Sugar, or
some proper Syrup, and Elixirs and Juleps are
generally mixed with some proper Syrup, or with
Wine (as the nature of the Diseafe may require)
favoring with White Sugar, Honey, or Syrup.
4. Tinctures, if Spirituous, Nectar, or Oil, are
almost always given in a Grains of dulcified Wine.

But
INTRODUCTION.

But Saline Mixtures, are generally given in some
Directick, Decoction, sweetened with Syrup of Arb-
unas, or of Parxes, Winter Cherries, &c. 5. Pow-
ders and Extracts, if so, are made into Bolus's
with Honey, Pulp of a Bølted Apple or Pear, or
some proper Lozenges. 6. But Extracts, if still
enough to be made into Pills, (Cobble Recent) are
faftened as Pills by themselves: If kept till they
are hard, they will freely dissolve in the Body,
but must be reduced to a fift Eclaffy. 7. Troches,
are to be reduced into a Powder, and
made into a Bolus with some proper Syrup, or Ho-
ney. 8. Lozenges are held in the Mouth, and
faftened down only as they melt. 9. Elecltric-
tics are faftened either as a Bolus, or difinbued
in some proper Infuſon, Decoction, or Wine,
sweetned with some Syrup, Honey, or Sugar.
10. Pills are faftened by themelhves, washing
them down with some proper diſfluted Water, In-
ſuſon, Decoction, Wine, Julep, Poſset-drink, or
Broth. 11. Splitts are diſfuled with some pro-
per Syrup, or mixt with Wine faftened with Sy-
rap, or White Sugar, and fo taken. 12. Potatutas
and Elixirs, are always given in a Glib of
diſfluted Wine. 13. Oils and Balſams, are always
dispit into a Wet White Sugar, and film well mix-
ited with it, then put into a Glib of some proper
Wine and fo drinck. 15. Salts Efficient, Elemen-
tary, or Vexx, and Viallatt, are generally diſfluded
in some proper diſſipated Water, Infuſion, Deco-
tion, or Wine, and diſfuted with Syrup, Honey,
or Sugar, and fo faftened.

VI. THE APPLICATION of Topics or Excr-
erns. 1. Lotions are either for hattin in or for Wul-
ving old Sores and Ulcers, for Gargarys, for
Sore Novels and Throat, or for Inflammations into
Fistulas, the Turt, or Womb, to be ufed with
proper Syrung. 2. Oils, they are to be amated
upon the Parts afflicted, rubbing them well in,
Morning and Night, or two or three times a
Day. 3. Ointments and Balſams, these may be
amated vith all, also they are spread, upon
Pledges, and applied to Green Wounds, Old Run-
ing Sores and Ulcers. 4. Poultices: these
are either mixed with some Ointment or Balſam, and
so applied, or similarly freeced upon the Wound,
Sore or Ulcer. 5. Emplastures and Cerates, are to
be fered upon proper Cloth or Leather, and
so applied, simply freeced upon the Turt, Wound,
Sore or Ulcer, or laid over Pledges, dress or
armed with Balſam, to keep them on. 6. Cata-
phlewis are put upon Cloth or Leather, to be ap-
plied to Tumours and Affections, to diffeafe, fepaf
or fuppurate. 7. Clyfers are to be used either
with a Clyfter-Pipe and Bleeder, or with a
 Clyfter-Syringe, to force it up the Inte'llumum rbcrud,
by the Anus.

VII. WHERE NOTE, that Clyfers are either
Americk, or Healing, or Purging: If Americk
some choice Opium is diſſipated in it. If Healing,
they are mixed either with Spirit of Wine, or some
Oil, Balſam, or Liquid. But if Purging, they
have always a proportionable quantity of Brion
Sugar in them, with some Common Salt: but no
Oil or oily body by any means, because they always
burn the points of the Saline Particles.

Conclusion of the Intro-
duction.

I. THUS HAVING given you a short Ex-
planatory Introduction to our History of
Plants, without the KNOWledge of which, this Work
could not well be understood, and upon which prin-
ciples a great part of the PRAffics of Physick is foun-
ded and built, the Observation of which, is truly a
practifying according to Art, and not a going hand
over head, but a doing of Things in all Adventures,
as Empiricks do, by which the Life of a Patient
is not only put into Danger, but by such Empirical
Praffics, a thousand Misereages are daily com-
nitted, to the great prejudice of the Sick, and dis-
reputition of the Medical Arts.

II. MANT GREAT things have been per-
formed by simple Medicine and Preparations; and
by that prime and simple Praffics, the Qualities and
Virtues of Simples were first investigated or found
out. This was the first step of Art. Afterwards
when the Expericnt and Virtuas of many Things were
discovered, the succeeding Praffics began to add
one thing to another, which they thought to have
the Virtues, believing, that some things of equal
strength being conjined, the Power and Force of
that Medicine must be doubled, and indeed it many
times succeeded according to expectation.

III. FROM THESE beginnings, Artifs be-
egan to redouble their Forces, and to multiply In-
gredients, making continually Complex Compo-
lation, and from the belal of a Vix unita, to form
Compounds, which in præce of many Ages, be-
came a Magazine or Store-House, as it were, of Re-
medes for all Diseafes, which they formed into a
method of Preparations, and under proper Titles,
and particular forms of Preparations, they made at
length a Repository for general Praffics, confid-
ing of a great number of Preparates, serving for all
Inculcations, and for the cure of the most com-
mon and reigning Diseafes, which they called by the
name of a Pharamacopia or Dispensatory.

IV. THUS THE Medical Arts, under this
natural and primitive Simplicity, continued for many
hundred Years, and obtained the name of Hip-
ocractic and Galenical Physick, without any con-
derable or manifest advantage, alteration, or ad-
vancc of Reputation, except in forming a Farrago
of not only Compound, but decomposed Receipts,
which being a Hodge-Podge of Complications,
tended rather to the Deterrnent and Reprouch of
our Art, than the adding of any Honour or Glory
to it, and thereby reduced the Science from Natu-
ral and Simple Empirics, into an Artificial and
Reputable Art of Quackery.

V. THE ART THUS growing under this
Latentimes of Monfortans, by the ill Praffics of
Informed Learned Men, or rather Empiricks, be-
gan to sink under the Burthen, and indeed would
in a short time have been reduced into the most
profound Absurdity of Empirics, or Quackery, but
had not pleased God, to make the Light of Cli-
smry to Arise and Shine upon us, by the Atoms
of that wonderful Spirit, and great Man, Paracelsus: who not only heal'd the weakness of Empiricism, but by the very absurdity and perverseness of the opinions and practices of Galenick Medicine, and Materia Medica, but astonish'd and brought the Arts of Medicine into a new light, and set them in a true light, for the general Good of Mankind.

VI. IF IT BE OBJECTED, that Chymistry was in being long before Paracelsus was born. To this we answer, so was the Circulation of the Blood before our Great Harvey: But as it was Harvey, who first brought the Circulation to Light, for the reforming, and more full elucidating the Art of Physics, so we say, that it was Paracelsus who brought the Light of Chymistry to arise, and shine in our Horizon; and let us into its Secret Recesses, showing us all its hidden Treasures, and brought them forth for the Glory of our Art, the increase of true Medical Knowledge, and an Universal Good.

VII. LET US NOT SAY, that the Old Physick is wholly to be cast away: There are not a few, (the Simple) excellent things in it, which, by a Skilful and Prudent Physician may be excepted, and call'd together; and which if join'd with the Chymical, open into a great Field of Knowledge, and wonderful Productions, that not only they shall be the Goods of the Generick, but also Analysis of all natural things; and with what an amazing Harmony they sympathize with Human Bodies, and how admirably they conjoin to Operate in Mankind, to the extirpation of Diseases, and support of Life, again what may be opposite to Health, and the well-being of a Living Man.

VIII. THE NEXT thing then which the Physician had in his View, was the Composition and Structure of the Human Frame, that thereby he might know how the Body grew, and was nourish'd, and by what means it might call to decay, and fail. And since the Growth and Nutrition was from the Matter receiv'd in the Mouth into the Stomach, they considered that there was an innate Property in that Viscous, etc. Natural Spirits, to convert the receiv'd Food into a kind of nourishing Juice, which the Greeks (our first Physic) were pleas'd to call Chylus, which being more refined in the Embrace, was there conjoin'd by proper Vegetables, and convey'd to the Heart, there being convey'd into blood, it was thence by the Arteries distribur'd over the whole Body, to contribute to its encrease of Vigour, and nourishment of all its Parts, that it might not fail to decay. The Meanders, or Ways, by which this Bloody Juice pass and reflow, was discover'd by Delfilixation of the Human Carcasse, from its first from the Heart by the Arteries, to supply every individual Part of the Body, for its Nutrition; and how, what was more, than was fit for that Particular, was return'd by the Veins to the Heart again; which for that reason seems to be the Fountain of the Vital Spirits, and so by a perpetual Circulation, conferves the Alcmenia in a habitual State of Life and Strength. And by the same Art, they came to a discovery of the Nervous System, (which Original is in the Head) by which the Animal Spirits, generated in the Brain, were convey'd to the whole Man, giving Life, or Feeling, Life and Motion, to every part of the same.

X. THE BODY being thus embellish'd with Diseases, it was natural to believe, that they could not be without their proper Signs, by which they might be known, as also several attendant Symptoms, all which may be called; Causae, or Causes, the Signs of which Causae, (which they call Diagnosticks) they daily learn'd from Observation. These Causes, whether Original or Accidental, they gradually search'd out, that the Sources whence they were deriv'd, as the more at length discover'd. All which was absolutely necessary towards the investigation of the Cure: for that without the Cause was known and remov'd, the Effect thereof, viz. the Disease, could not cease, or be taken away. At Diseasie then appeared in the World, they observ'd the Signs accompanying them, and the Symptoms which many times accur'd, which they set down in Writing, under the Names of those several Diseases. And enquiring into the Cause of the Patients Life, and what Accidental Matter might also happen, at the Introitum of the Diseasie, the antecedent Causes of the Misery, became in some measure manifest. Whence by a great number of Remarks, not only the Antecedent and Remote Causes came to be discover'd, but also those which were clown and nearer, more at length brought to light, from whence the Diagnostick parts of the Art, received its Illustration. Again, from the Greatness or Lightness of the Causes; from the impending Symptoms, as they seem'd more or less important; and from attending to the end of the Diseasie, through a long Series of Observations, being all rationally consider'd together, the Prognostick Precepts were establisht. And if the Diseasie was thought Carabell, the
xxiv

INTRODUCTION.

Indications of Cure, voluntarily shewn from the
muttering State of the Sick, which proceeded 1.
From the Causes Antecedent and Present. 2. From
the nature of the Disease, whether Similar, Orga-
nick, or Common. 3. From the Symptoms, as be-
ing Dangerous, or not. 4. From the Vital Powers,
respecting the Strength or Weakness of the Dis-
seased Body.

XI. ART BEING by these' Advances, and so many Degrees, or Steps, brought on towards Perfection, what remains for the Learned Pro-
sector to do? Truly to know what Disease it is
which afflicts the Person, and by the Causses, and
unwholesome Symptoms, to make his Medical Prognos-
tics, whether the Patient be Curable or not, i that
he may do every thing for the Reputation of his
Art, and for himself. So that if he sees the Sick
puff hopes of Recovery, he may decline his At-
tacks, and let the Relatives and Attendants know
the Danger impending. But if there be Hopes of
Life, (the last small) he may make his Artful and
Magick Precepts, according to the Indica-
tions of Cure, which with a Rational and Modest
appearance, he may hope and conclude, will not go
without their desired Effects.

XII. LIKE AS THE Art of Rhetorick
was not the foundation of Oratory, or of the
first Orators, Demophobes, Cicero, &c. but the
Orators the foundation of the Art, so of whose
unexampled Orations, all its Precepts and Rules
were Excerpted, or Gleaned, and by Wise Men
reduced into the form of an Art, by which all
 succeedent Rhetoricians regulated and made their
Ordinances: So the Medical Art, and all its Rules,
even the Fabric of the whole Art, was Reared
and Built out of Empiricks, or Quackery, and its
Original or Foundation, was laid by Empiricks, or
Quacks, (as the Learned are pleased to phrase it)
and that the first Physicians were no other than
Empiricks, Quacks, or Tyers of Skill, out of
whole Treats, Observations and Prolifics, some
Wise Men collected a Set of Precepts and Rules,
which being reduced into Method, we now call the
Art of Physick. But all the to be deplored
Misfortunes of the Art is, that it makes not a
great many Real Physicians, but too many Ignorant
or Conceited Doctors, and too great a number of
Famous and Battle-headed Empiricks or Quacks.

XIII. WHAT WE have further to say is,
to commend the sincere Lovers of Art, to the
good Providence of God. That in their Search
and Enquiries into Physick, and unravelling (as it
were) the Rules and Precepts of Physicians, they
may find the Answer of their Expecations, and
beneath their Minds or Souls, enlightened with the
Splendor and prevailing Excellencies, of true
Wisdom and Knowledge, so as to be able to per-
form the Great things, wrought up in the Mysteries
of this Science, they are Professors of, for the
Good of the Sick, their own Benefit, and the Repu-
tation of the ART of PHYSICK.

Black-Friers, London.

W. SALMON:

ADVERTISEMENT.

I Request all those Gentlemen and others, who send Letters to me, about their
Concerns, to be so Civil, as to pay Potlidge for them; or else they may expect to
go without an Answer. It is not reasonable that I should be at Charge for Perasons, I have no
Acquaintance with all, and the Basons their own. I should not say this, was it but now
and then a Letter. But to receive about two thousand Letters a Year (as I have formerly
done) upon other Peoples Affairs, or some trilling Matter, and to pay Potlidge for them,
makes a considerable Sum. And besides, it is as Burthenome and Troublefome to Answer
them, as it is Chargeable to Receive them.
BOTANOGIA:
THE HISTORY OF PLANTS.
Liber Primus.

OF ENGLISH HERBS AND PLANTS.

CHAP. I.
OF ADDERS-TONGUE.

I. THE NAMES. It is called in Greek Ἡσπίδος, in Latin, Lingua Serpentinis, Lingua Serpentina, Lingua Vulgaria, Argentina, Lucis Cerifli, Herba Lucidio, Ophioglosso: in English, Adders-Tongue, and Serpents-Tongue.

II. THE KINDS. There is properly but one species, which is sometimes misspoken, and therefore are called the Common and Mistaken: and differ only in one or two things; the latter has sometimes two or three stalks, and sometimes but one stalk; and sometimes two or three Crooked Tongues.

III. THE DESCRIPTION. The Root is small and Fibrous, abiding under Ground all Winter, from which rises up but one leaf, which with the stalk, or else not above five or six inches from the Ground, being flat or thick, and of a fresh green colour, not much unlike in form to the beak of a broad Javelin, or rather the leafe of Water Plants, but little, without any middle rib in it; from the bottom or bottom of which leaf, on the inside, rises up ordinarily one small slender stalk, about two or three, and sometimes four inches long, the upper part of which is someway bigger, and dented with small round dents, of a yellowish green colour, much resembling an Adders-Tongue (whence the name) which never shows any other flowers, and vanishes away without yielding any seed.

IV. THE PLACES. It grows in most Meadows in most parts of England, in the Meadows by Coldbrook, in the Fields in Waltham-Foreste, in a Meadow near Burton, as you go from Oxford to Stone Wood, in a Clove near Blety on the West-side of Oxford, and in many Meadows in Kent, Sussex and Surrey, as also near London, and several other parts of this Kingdom.

V. THE TIMES. It is in its Prime in April and May, and blossoms sometimes till the beginning of June: but a little heat quickly makes it vanish.

VI. THE QUALITIES. It is hot in the first degree, and dry in the second degree. It is Clysing, Altringent, Scurvy, and Traumatick, or Vulnary, by appropriation, it is Arthritis and Hepatrick. It is also an Alternative, and Antifebritick.

VII. THE SPECIFICATION. It is Valerian, good to heal Wounds, broken Bones and Ruptures. Dr. Ray saith, that Baptifla Sardus affirms that the Powder of the Herb, being given inwardly for some time, will Cure all Ruptures whatsoever. And Matthias in his Epitome says, that the fourth leaves being applied, not only heal Wounds after a wonderful manner, but also Cure Ruptures, Burnings and Scaldings.

VIII. THE PREPARATIONS. There are no Preparations of it kept in the Shops, but if you please you may
The Virtue

IX. The Juice Clarified, cleanses Ulcers outwardly, and heals Ulcers in the Lungs, which is the foon-
cer performs, if digested with Spirit of Wine: it al-
so haps Vomiting, and a little Nitre being diffol-
v ed in it, it is profitable against the Gout, and so
drunk inwardly takes away the heat of Fevers.

X. The Powder of the flowers, &c. given from half
dram to a dram, stops bleeding inwardly, over-
flowing of the Farts, as also bleeding at Mouth
and Nose, and other fluxes of Blood, being appli-
ced; thrashed upon Ulcers, it cleanses and drys them,
and dries up them to healing.

XI. The Tincture of the dried Herb in Spirit of
Wine, heals Wounds admirably, being washed there-
with mixed with Wine, and dries up Ulcers; so al-
lo being taken inwardly from a Dram to 2 Drams.

XII. The Saline Tincture, drawn with Spiritus
Universalis, always all inflammations, and diffuses hot
Tumors: taken inwardly it is good against burning
Fever, is Traumatick, and heals all inward Wounds
and Ulcers, as also bruises of Bred, Stumach, and
other Viscera.

XIII. The Oily Tincture, drawn with Oil of Tur-
pentines, Cures not only all Green Wounds of the
Nerves and Tendons, but also a Cold Gout, as also
Aches, Pains, and Lamecams, from a cold Caule by
appointing therewith: it also diffuses Tumors and
the beginning of Apoplexy, and puts a Stop to the
Irish, and spreading Ulcers.

XIV. The Essence. It is Valoratory, good against
the bitings of Mad Dogs, Serpents, or any other
venomous Creature. It relives Poylons, and all sorts
of burning Fevers. Dose from a quarter of an ounce
to half an ounce, mixt in any proper Vehicle.

XV. The Ointment. It is made by boiling the
green leaves fired 2 Pounds, Sheep Suet, Oil Olive,
of each half a Pound, till the Herb be crisp, which

preis out, putting in as much more fresh Herbs, boil-
ing and pressing out as before, then adding to the
strained matter 12 Ounces of Turpentine, which mix
gether. If Cures not only Green Wounds but also
clamens and heals Inveretate and Putrid Ulcers;
also Burnings and Scaldings in a very short time.

XVI. The Balsam, made of the Juice, and Saras-
burgh Turpentine, is as good a Vulnary as can or-
daturally be used, for it commonly heals any Simple
Wound at first dressing: and applied with a Trufi is
good against Ruptures, the Powder of the Herb be-
ing also given inwardly.

XVII. The Cataplafs, made of the Green Herb,
and pure Yellow Sweet Palm Oil, Cures the Gout,
or any Pain in the Joyns, being applied for some time.

CHAP. II.

OF ADONIS-FLOWER.

ADONIS

I. The Name. It is called in Greek Αδώνις, in Latin, Erasumum, Adonis, Pla Adoni-
dis, & Pla Adonis; in English, Adonis flower, Red
Common, Red Mouth, Pheasant Eyes.

II. The Kinds. It is numbed among those Herbs
which are femeate made polyformes: and it fefms
there are two chief Species of it, viz. that with
Red Flowers, called Pla Adonis flcre Rubra, the
other with yellow Flowers called Adonis flore Luteo.

III. The Description. It has a root with very many
flender, weak, foul, and threads flying, perishing ev-
evy year; from this root rises up several slender weak
Stalks, trailing or leaning to the Ground, set on every
part with fine jagged leaves, very deeply cut, like those
of Canna, or rather those of Asphodel, upon which
Stalks, arising a foot higher or better, do grow small
red flowers, compifying of 6 or 8 round leaves, almost
like Field-Crofses, bearing a blackish green head, or
pointed in the middle, for round about with many blac-
kish threads, without any smell at all, after the flowers
are poll, there grows up heads with many roundish
white seeds at the tops of them, set close together, very
like
like unto the heads or seeds of the great Orr Eye, or not much unlike to a little Bunch of Grapes; The Plant rises of an unseeded again, many times before Winter, which will slide till the next year. That with the yellow flower is much like the former, but its stalks and leaves are of a more dilute Green.

IV. The Places. The Red grows in the Welf part of England amongst Corn, just as Mayweed does in other parts, and is blue-hive an enemy to Corn, as Mayweed it: from thence (for the beauty of the flower like) the Seed has been brought into some Gardens. The Yellow is a stranger in England, unles Nunful up in Gardens.

V. The Flower. They flower in the Summer Months, as May, June, July and August, as the Year falls out to be early or late: and the seed is ripe soon after, and presently falls away, if not Gathered.

VI. The Qualities. They are hot and dry in the first degree, but Balsam and Terebenthanes say they are hot and dry in the second; yet by the table we can hardly judge of. They are Digestive, Digestive, and Carminative, and by appropriation they are Stomachick, Hepatick and Nephritic, and of the kind of Alternatives.

VII. The Specification. They are said to be Specicks against Colick, and Stone, which Parkinson says has been confirmed by Experience; a dram of the Seed being given in some Specicks Vehicle.

The Verdict.

IX. The Pouder of the Seed. It powerfully expels Wind, is good against Griping of the Bowels and Colic, and expels Seed and Gravel from the Reins and Bladder: it also strengthens the Stomach, and cauth a good Digestion.

X. The Saltpetre Tincture. It is made of the Seed of these Stomachick and Carminative good against pains of Head, Stomach and Belly; helps in the Vertigo, and cures a violent Flux. Dose from one Dram to two Drams in some fit Vehicle.

XI. The Saline Tincture. And it is made both of Seed and Herb, and has all the virtues of the former: besides which it is an excellent thing against most Difficulties of the lower Ventricle: it powerfully opens all Wuritions, and expels both Wind and Water out of the Bowels, and has a more singular and Specicks force against Stone and Gravel, whether in the Reins or Bladder, or any other matter obstructing those parts. The Dose is from half a dram to a dram, or dram and half in White Wine.

XII. The Clinical Oil. It gives present cafe in the Stone and Mope of Urine, if given from six drops to twelve in a Glass of White Wine, or Farley or Arimurt Water. Drop it first into Sago, which mix well together, and then mix it with the Liquor, and so let it be taken morning and evening. It provokes Urine powerfully, gives immediate cafe in the Pain, expels the Gravel, and is an admirable thing against the Colic.

XIII. The Efficence. It has the Virtues of the Seed, but not altogether so powerful: daily taken, it strengthens the Stomach, and is good against the Scurvy in a cold Habit of Body: Dose one Spoonful better, in Ale, Beer, Wine, or in some proper Water.

XIV. The Bath. It is made of the Herb boiled in a sufficient quantity of Water, in which both a little Salts or Venice, or Gumbo Soap is dissolved. It opens the Pores, cleanses the Skin, and is good against a Rheumatism, and pains of the Bowels and Joints, by li-
and smell of this much surpasses the common, or being aromatic and aromatic.

V. The Agrimoniode, or Blood Agrimony has a root foot, reddish and Woody, adding all the Winter Sals to her root, but not having the root of any hurts, which are cut and divided into many parts and leaves, so that for the most part, three or even five, are running into one, as much to Common Agrimony, yet somewhat rounder than they, and all of them further detailed, and sharper pointed, of a dark green Colour upon the upper side, and greenish underneath. Amongst these Leves rises up several Stalks, not fully standing upright, but leaning downwards, on which are placed very sparingly such leaves like or before deflected, but smaller and rounder, into small pieces at the points of every of them. At the Top comes forth three or four hairy green leaves like Cops, divided at the Brain, out of which comes forth a small yellow Honor, like in Common Agrimony, yet sometimes, fearely appear above the bushes, in which, after they are fallen and pull, fossil long and round Seeds appear the Grace of Worm, two standing together, like in False Lamps, which fall out of the bushes themselves where they are ripen, leaving the bush empty and gaping. The Taste of the Plant is bitter and drying, and smells like Sweet Agrimony.

VI. The Plantations. The Common grows near the sides of Hedges in Meadows, and by Borders of Groves and Coples, in most parts of England and Germany, and in many other Countries. I have found both the Common and sweet Scented, growing Wild in the Plantations of South Carolina. The sweet Scented grows with us only in Gardens, but is natural to Italy in many Places.

VII. The Ballards is found in some places of this Land by dry Ditch sides, where the Earth is light, hollow, loofo and landly: Columns found it in Naples and Bithynia Bay he found it in many Places of Italy: It grows generally in UralidT places, among Brains, Brambles, and fuch like.

VIII. The Threes. The Common and Sweet Scented Flowers in July and August, and their Seed is ripe, in a short time after, but in wanner Climates it comes to its Perfection much sooner, The BALLARD flowers in April and May, and comes to Perfection on the latter end of August, or beginning of Jume, and the Seed is ripe soon after.

IX. The Qualities. They are all of them hot and dry in the full Degree, but the Aromatic Fern a little hotter, and the sweet Scented more Diflusive, Aperitive, Cleansing, a little Affrangent, Tumbratic or Valvulent, and Strengthing: And by appropration, Stomacket, Hepatic, Splenetic, and Nephritic: and of the Signs of Alleviations.

X. The Specification. They are Specificks in curing old Ulcers, Pilling Blood, and the Hepatic Flux: and indeed are good against most Difficulties of the Liver, for which reason they are accounted Noble Hepatics: The BALLARD is said to be excellent in drying up Catarrhs, its Fume (burnt green) being received into the Mouth and Throat by a Funnel.

XI. The Preparations. The Shops keep of the Common Agrimony. 1. The dried Leves and Tops. 2. A Diffluent Water of the whole Plants, gathered in June and July. 3. A Dried Leves. But besides that you may make from all the Plants, the following Preparations. 4. An Infusiate or Liquid Juice of Leves and Flowers. 5. An Essence of the whole Flowers and Leves. 6. A Powder. 7. A Syrup. 8. A Saline Tincture. 9. An Oily Tincture. 10. An Alum. 11. A Fixed Salt of the whole Plant Calculated.
Chap. 4.

English Herbs.

Stone, and oblation of the Reins, Ureters and Bladder, and may be given from \( x \) drops to \( xx \) in a Glass of White Wine.

XXI. The Balsam. It cures green Wounds sometimes at first dressing, more especially if to it \( j \) ounces of the Balsam de Chilli is mixed, and so applied to the Part, the Blood and Filth being wafted away with a little Spirit of Wine or Brandy. It cures also old Sores, Ulcers, Scour, Morhour, Inveterate Scabs, Ulcers and rebellious Fiulks, and other like afflicts of the body parts. It draws forth Nulls, Thorns, and Splinters of Wood, or other things gotten into the Flesh, strengthening much the Nerves, Ligaments and Joyns; it is a singular thing to cure wounds of the Head.

XXII. The Fixed Salt. It Purifies the Blood andmixed Eupatonum Ath the butdrams, mean and Water. The added and The Scurf, like XV, cleanfes and Plalhes, alfo little. It is about Thoje attenuates the from It is is about An 1. and gentle confining Piece. Our draws Stone, Head. Morphew, times Vehicle. Of Kind. Butch torium which which is is About of Male, of Agrimony. is is About the Male, of which it is the Genus to

**C H A P. IV.**

**Of Water AGRIMONY. the Male Kind.**

**Water Agrimony male.**

II. The kinds. It is of the third Species of Agrimony, and of the Water Kind it is the firft, which is the Male, of which it is the Genus to three other Kinds, viz. 1. Our English Male Water Agrimony. 2. The New-England, or Hemp-like Agrimony. 3. The Virginian Kind.

III. The Description. The Root is full of thready springs of a mean Bignefs, from whence spring up long round Stalks and branches, and terminated with a leaf high or more, which are befted with long green Leaves, indented about the edges, whereby you fhall commonly find five or seven, hanging upon one Stipe, like Hemp Leaves, but yet fparser. The Flowers are at firft of a pale reddish Colour, conflifing of Round fift Tube, which fland upon the top of the Sprigs, and at length wafted away into Down.

IV. The New-England Kind, is like the former, but has a hairy brittle Stalk, and narrow Leaves, fome denfed, and fome not, two, three, or four inches long a Piece, and half as much broad, or less: the Flowers elfh of Muthe pale Threads on every Branch, out of fmall green Huds or Heads, which with the Seeds is almost incalculably carried away with the Wind, fo that one would think it to have no Seed at all.

V. The Virginian has a great, hard, fold, brown, round Stalk, of three, four, or five Foot high, is wonderfully full of Long Branches, from the bottom, yet with foyngs, spotted red, on the younger green ones, with large green Leaves on them, bearing five Leaves on a Stalk, thoſe upwards but three, yet larger than the former, the Flowers and Seed are also larger, not rough but smooth, blackifh, and flat, without thrapaft of Tufes.

VI. The Places. The English grows about the brink of Ditches, and in Puddles, as also on the edges of wet Grounds, and standing and running Waters, almoft every where.

VII. The Times. It Flowers in July and August, and in Winter the Stalks and Leaves wither away, but the Root is fiad to continue.

VIII. The Qualities. It is hot and dry in the fifth Degree: Is Aperitive, Alkific, and Vulnerary: It is by approbation Hepatick and Splenitick, and of the number of Alteratives. But the Root as Gijjner thinks in Emitters.

IX. The Specification. I am informed by a Worthy Gentleman, that it particularly cures the Kings-Kind, and all forts of Ulcers and Ekytles: which peculiar properties he knew it had by Experience.

The Virtues.

XI. The Juice. It attenuates and makes thin gros Humors, cleanses and purifies the Blood, is good againft the Scorpions in Men, and the Rickets in Children. Dofe from 1. Ounce to 3. mixt with Ale or Wine, in the Morning Falling: It is also good againft Terrian Agues.

XII. The Powder. It has the fame Virtues, and may be given from 1. dram to 3. dram, Morning and Evening, in a Glass of new Beer or Wine.

XIII. The Decotion. It is Traumetick, more especially it to every Pint of it 1. or 2. ounces of strong Cinnamon Water be added, and then be drank Morning and Evening from 4. ounces to 5. ounces.

XIV. The Balsam. The Juice being infipidate to the thickness of new Honey, is mixt with an equal quantity of Turpentine and incorporated with a little Oil, over a gentle Fire. It is Vulnerary, and cleanses and heals Wounds, either inward or outward, admirably.

XV. The
V. The Place. It grows in cold Grounds, by Ponds and Ditch sides, as also by running Waters; and sometimes you shall find it to grow in the very Water it fell.

WATER AGRI-MONY.  

Water Agrimony, 

V. The Times. It flowers in July and August, and the Seed is ripe not long after the fading of the Flower.

VI. The Qualities. It is hot and dry in the first Degree; it is opening, cleansing, Pectoral, and Traumatick; and by inspiration is Hepatick, and Palmonick, or Pectoral, it is Sudorific and Alterative.

VII. The Specification. It is said to be a peculiar cleanser of the Blood, and refoner of its Cruds, and has a singular Property in curing of old Ulcers and Fissures.

VIII. The Preparations. The Shops prepare nothing from it; but there may be made thereof: 1. A Decocation. 2. A Juice. 5. A Balsam of the Juice. 4. An Essence. 5. A Spirituall Tincture. 6. A Saline Tincture. 7. An Oily Tincture. 4. Afters.

The Virtues.

IX. The Decomination in Wine. It is Traumatick, and a refoner of the Blood, avanmating and makes thin, gros, tough, and vulous Humors, and is a singular thing against Scales, Ich, and other Sal Humors, being given from 3 ounces to yj. morning, noon, and night.

X. The Juice. It provokes the Terms in Women, and taken with the Juice of Furniture, rectifies the faintness and sharpness of the Blood; it is good against Scales, Ich, fits and sharp Humors, Apoplectic or Petorall, and gives rise to the Stomach.

XI. The Balsam. Take of the Juice yj. ounces, Tarrentum viij. ounces, Old viij. ounces, Dead Wax viij. ounces, Rosewater half an ounce, mix and make a Balsam, by Exaporating to a Confidence, or till the every part of the Juice is gone. It is an excellent thing, for the curing of Ulcers, old running Sores and Fissures; Fills Ulcers with Flath, and brings them to a speedy healing. Applied also in the...

C H A P. V.

OF WATER AGRI-MONY, the Female Kind.

I. T HE Name. It is called in Greek, Θερμιάνος, from its warm, dry nature, In Latin by Fulcius, Epateratum Adhominum by Geber, Epateratum Aquaticum, by Malothes, Epateratum Violaceum, by Lellis, Epateratum Cannabinius, by Roalhaimus, Cannabina aquatica from the plant of the Root, boiled in Wine, and the Wine Drunk, gave him in an hour time one Stool, and afterwards ten Vomits, whereat he said he art much Flegm, that it works (Gyselle) like white Henncbor, but much more easily, and that it did him much good.

II. THE KINDS. This is the Second Species of Water Agrimony, to wit, the Female Kinde, as you may fec, chap. 2. Sect. 2. following.

III. THE DESCRIPTION. The Root consists of many long slender Strings, and is of long constancy, from whence Stalks grow up about two and a half, or higher, and are of a dark purple Color. The Branches are many, growing at distance nearly equal one from each other, the one, from one fide of the Sixth, the other from the opposite Point. The leaves are winged, and much indented on the edges. The Flowers grow at the Top of the Branches, of a brown yellow Color, spotted with black spots, being a Sublime within the middle of them, like that of a Daisy. If you rub them between your Fingers, they will smell like to Gunpowder, aloes or Cinnamon, when they are burnt. The Seeds are long, and easily stick to any Wooden thing. It plainly differs from our Common Agrimony, because it wants the intercepted little Leaves; and its Flowers are much unlike.
Chap. 6. English Herbs.

the Gout, it abates the Tumor, and gives ease in a little time.

XIII. The Spiritual Mistletoe. It is singular good against Agues, taken to the quantity of an ounce: it also heals all green Wounds and old Sores, inwardly taken, and outwardly washed therewith.

XIII. The Saline Tinctor. Taken inwardly it is good against the Stone, opens Obstructions of the Liver and Spleen, and is good against Leprosies, Cachexies, Dropitie and Yellow Jaundice: it removes Stoppages of the Lungs, provokes Urine, and prevents against Gravel and Tarragon Matter, whether in the Reins or Bladder. Dose from 1 dram to 1, or more, in Ale or Wine.

XIV. The Oily Tinctor. It is good against the Stone in the Reins, being taken from iv. drops to xx. in a Glass of Ale, Wine, or from Nephritick Water, as Partly, or Annum water. Outwardly used, it is of Excellent Service against a Cold Gout, and all manner of Aches and Pains proceeding from a Cold Chafe, in what part of the Body ever, it warms and Comforts the Part, and prevents a Gangrene and Sphacelus, and is good against Stiff, Morphew, Lech and the like, being anointed on the Part.

XV. The Effenter. It is Traumatick, and an excellent thing to open Obstructions of the Vifera, cleanseth the Blood, and heal Ulcers of the Lungs, and has been approved of by home to be good against the Leprosy, inwardly taken from j. ounce to j. twice a day in some proper Vehicle: things proper being also outwardly applied for the same purpose.

XVI. The Fixed Salt. It Diffuseth Tartar in the Blood, and Urinary Paffages, abbotts and evapoartures harsh and malign Humors, which are the cause of Stitches, Lich, Leprosy, and other breakings out of the Skin: it also cures and makes thin those Humors which are tough and thick. Dote j. Scrupule in a Glass of White Wine.

C H A P. VI.

Of ALCEOOF, Great, Small, &c.

I. T H E Names. This Plant is called in Greek, Χανδρινυος, Μεροσινοθαλε, & γραντασεια. In Latin, Hedera terrifera, Chamaecypar, Carona Terra: and in English, Ground-joy, Alehoof.

II. The Kinds. There are four sorts, 1. The Common Ground-joy, or Alehoof, calleada Χανδρινυος, Μεροσινοθαλε. 2. Hedera terrifera, Carona Terra, common of Large Ground-joy, or Alehoof. 2. Χανδρινυος, & γραντασεια. 3. Hedera terrifera, Carona Terra, common of Large Ground-joy, or Alehoof. 2. Χανδρινυος, & γραντασεια. 3. Hedera terrifera, Carona Terra, common of Large Ground-joy, or Alehoof. 2. Χανδρινυος, & γραντασεια.

III. The Description. The large Alehoof has a very large and threadly Root, from which rises many Stalks of an uncertain height, from 6, to 12, or 15. Inches long, it being but a few Herk, creeping and spreading upon the Ground, bither and thither, all about: the Stalks are slender, somewhat cornered, and green, sometimes a little reddish: from whence grow Leaves somewhat broad and round, hairy, and a little nicked in the edges, for the most part, two Leaves out of every Jynx. At the Jynx likewixse with the Leaves, towards the end of the Branches come forth below long Flowers, gaping at the ends, of a brownish purple colour, not much unlike to those of Germander, with white spots upon the Label or

IV. The Inner Alehoof is altogether like the former, save that the Leaves are every way smaller, the Flowers of a paler blew colour, the Plant itself is shorter or sooner threne, but more upright.

V. The Mountain Alehoof is like the first kind, but yet larger in all the parts thereof, es Stalks, Branches, Leaves and Flowers, but the Leaves are more rough and hairy, and the Flowers of a more deep purple colour.

Alehoof Stone

Lips which hang down: the whole Plant is of a strong Scent and bitterness Taste.

VI. The Stone Alehoof grows and spreads all about the Ground, with its slender weak Branches, set with Leaves like the former by couplets, but larger and
Salmon's Herbal. Lib. I.

and were unequally dented, or rather curled at the edges: the flowers which stand at the joints with the Leaves, are larger, the buds larger, and of a rather purplish colour than the former.

VII. The Places. The first sort grows under Hedges, and by Ditch Sides, High-ways, and by Hedges and Treffils, in the borders of Meadows, and other waste Grounds in most parts of the Kingdom. The second Kind is found at the foot of old Trees in England and Germany, and many times in old Orchards. The Mountain grows upon Hills and Mountains. The last kind grows in Northmore and Provence in France, and in some places of Somersetshire, as Labor says.

VIII. The Times. They all begin to Flower in April; and continue flowering for a long time, even till the Summer is far spent, and remain green not only in Summer, but also in Winter, and blooming the Winter, if it is not too vehement or sharp.

IX. The Qualities. They are all of one nature, hot and dry in the first degree: but the two latter are dry in the second degree. They are Apatricial, Meteorific, Bethielectric, Atropatic and Vulnerary; by Appropriation, they are Peçtonal, Nepyrthick and Arthritic: and operate only as Alteratives.

X. The Specification. They are peculiar against want of Blood. In the Cataracts; the Mountain prevails against the Gout, and the Saxatile against Stone and gravel.

The Virtues.

XII. The Juice. It is bitter, cleansing and opening the Oldiftructions of the Vifera: put into the Ears, it helps the Nolile in them, as also their Ringing and Deafness, and is protectable against the Jaundice. A Catarrh and Rheumaticall, it has Cured many (says Hoveller) at point of Death. Dose from 1 ounce to 4 ounces, according to Age and Strength.

XIII. The Infusion. Made in fair Water, or a weak Lime Water, and Drank three or four times a day, from 4 to 8 ounces, it Cures Coughs, Colds, Spittings and Wheezings.

XIV. The Decoction. It is a good Venerable and Bethielectric, more especially if 2 ounces of Spirit of Wine or Brandy be added to every pint thereof: it dispels old Sore, running Ulcers and Fiftu's to a healing. Dose from 1/4 ounces to vi. 3, or 4 times a day.

XV. The Syrup. It is peculiar against an old Cough, and other Diffemps of the Breast and Lungs, as Cataracts, Wheezings, Affections, Ulcers of the Lungs, fpitting of Blood, &c. Let it be often taken with a Liquorice Sticks: or it may be taken a large spoonful at a time, as oft as need requires.

XVI. The Conserve. Take of the Juice 1 ounce, Honey 1 ounce, burnt Alum 1/4 dram, purified Verdigris half a dram, mix them well together: It Cures Sore Mouths and Throat, Ulcers of the Gums and Teeth, and all other Ulcers and running Sores in other parts of the Body.

XVII. The Conserve. It opens the Breast and Lungs, and gives relief in Coughs, Colds, Throatfuls of Beeing, breathing cold, and Coldness of both Breast and Scorbut.

XVIII. The Liqueur. It is made of the clarified Juice, mixed with clarified Honey in equal proportions: and is good against the most vehement and violent Coughs, powerful against Pithickums, or Uterations of the Lungs, causeth a quickly healing, let it be taken with a Liquorish Sticks sometimes in a day.

XIX. The Ale. You may put ij. large handfuls of the green Herb to every Gallon of Ale, whilst Working: It is fald to clarify and make fine the Drink in about 24 hours time, from whence came the name of Ale-bowf, or Tan-bowf; and in Old Time supplied the use of Hops: it makes the Drink very opening and Diuretic.

XX. The Powder. It is made of the dryed Leaves, and is given from half a dram to a dram: it may be taken in li. or v. ounces of its own diffiluted Water: it is said to Cure the Yellow Jaundice in 7, 9 or 12 days, and in 40 or 50 days the Skelact.

XXI. The Typlers. They are of the Powder afo foregoing, with Angliced and White Sugar Cassy: and are of excellent Use against Coughs, Colds, Pithickums, Contusions, Wheezings and Rheumats of Breast, being held often in the Mouth, and suffered gradually to difsolve, the Sick also drinking Milk every day, in a very large quantity.

XXII. The Balsam. It is made of the Juice Boiled to the thickness of twelve fine Ounces, mixed with Turpentine of Chf, and Oil of finger Almonds, of each 2 ounces. It heals green Wounds, running Sores, old Ulcers, Fiftu's, &c. after an admirable manner, being applied to the Part.

XXIII. The Cupplam. Take Turpentine 4 j. ounces. Take of three new-born Eggs, mix them well together; then add of the green Hen's egg, cast faffil and beaten in a Mortar, 4 or 5 large handfuls, mix and apply it: it gives excellent Relief in the Gout, and other Pains of the Joyns; applied hot to the Region of the Liver or spleen, it calls their Pains: and upon the Abdomen, it is said to be a pre- ferve Remedy in the Colics.

XXIV. The Effence. It is excellent good against weak and aching Backs, Coughs, Wheezings, Attacks, Rheumats of Breast and Lungs, and is singular good for all Wounds, inward or outward, it cleanses and rarifies, and is good against any gripping Pains, or windy Cholerick Humours in Stomach, Spleen or Belly; it helps the Yellow Jaundice, by opening the Oldiftructions of the Vifera, and is good against Poison and Plague; it provokes Urine, and the Terms in Women, and be- tribs with Wine for some confufion; it is said to Cure the Scatias, as also the Gout in Hands, Knees or Feet, difolves and diffieres the Pecuent Humors, and to gives ease. Dole from 1 ounce to 6 ounces in Wine, Meat, &c.

XXV. The Spirituos. Tincture. It prevails against Cataracts, coldness of the Stomach, fpitting Blood, Wind, Pains, Gripings, and other like Diffemps of Stomach, Liver, Spleen and Kidneys. Dose from 1 dram to 4 drams, in its own diffiluted Water, or other in Vehicle.

XXVI. The Saline Tincture. It helps the Yellow Jaundice, opens Oldiftructions of the Vifera, provokes Urine and the Counties, facilitates the Birth, expels Poifon and the Plague, and has all the Virtues of Oily Tincture, but operates more by Urine. Dose from 1 dram to 2 drams in any li. Liquor.

XXVII. The Oily Tincture. It is good for the Scatias or Hip Gout, as also the Gout in any other Parts, proceeding from a cold Crafse, being anointed very hot upon the part twice a day.

XXVIII. The
Chap. 7. English Herbs.

XXVIII. The Distilled Water. It is made from the Green Herb in April or May, and used chiefly as a Vehicle with most of the former Preparations.

XXIX. The Spirit. It is made of the Fermented Juice, and is of singular Use against the Scurvy, whether in a hot or cold Constitution; it strengthens the Stomach, and causes a good Appetite. Dose from half an ounce to 1 ounce, mixed with Wine, or with the Syrup of the Juice.

XXX. The Elixir. It Cures Difficulties of the Bladder and Urinary, and opens Obstruction of the Reins and Womb. Dose 1 dram or more, dissolved in Sack. It contributes as a Traumatick to the healing of Wounds and Ulcers.

XXXI. The Footed Syrup. It is Diuretick and Nephritic, opens Obstructions of the Reins, Urethra, and Bladders, dissolves Tartaryous Humors in those parts, or in the other Viscera; and is found by Experience to be good against Stones, Sand, gravel, &c., being given from 3 drams to 24 drams, in its own distilled Water, Parfley Water, Arum or Onion Water, and repeated twice a day.

XXXII. The Opobalsam, or Eye-Wash: Be Juice of Achick in manner, Juice of Celandine, Juice of Daffies, Rose Water, Honey of each,ucose, macro and dissolvo, then drop it into the Eyes. It helps all Inflammations, Spots, Pin and Web, itch, Swelling, and most other Difficulties of that part; and Cures, tho' almost Blind. Use it 5 or 6 times a day, or other.

CHAP. VII.

OF ALEXANDERS.

Alexanders

IV. The Cretick or Candy Alexanders has a Root almost round, yet a little long withal, white on the outside, which afterwards grows thicker and longer, and greaftest at top, ending round, and perishing after it has borne Seed. From whence rises up Leaves like some kind of Sclerum, the whole Leaf being large, and more divided into smaller parts than the former, as if it were four great Parfley, of a dark green husking colour, and denoted above the edges, from the middle of which Leaves rise up a stalk, round and stiff, fine and not bottom, 3 feet high or higher, having commonly at all its Joynts round and almost round Leaves, yet something longer than round, and here and there cut into on the edges, of yellownish green colour, which do not so much compase the Stalk, as at the bottom of them, as that the Stalk in a manner grows through them: from the Tysons little wise, riseth by Branches, with the like yellownish round Leaves on them, and the Stalks running thus to the top, resembling Through-wax, or Through-leaves, where fluid thick

C

THE Name. It is called in Greek 'Tepsoeics, in Latin Hippopotamus, Supremus, Equinum, Othe straw (from making the Pottage black) in English Alexanders, Alfsinders, and Horse Parfley.

II. The Kinds, or Species. It seems to be a Species of the Apis or Pervis, this being the largest of all, and therefore called Hippopotamus or Horse Parfley. This Species is said to be twofold, 1. The Common or English Alexanders, to The Cretick, or that which grows in Cony, but with us in Corne Gardens.

III. The Description. The Root is great, thick and long, blackish on the outside, and white within, of a hot and bitter Tafle, spreading under Ground from thence rises up a Stalk or Stalks, thick and round, a Yard high, more or less, with sordid Leaves on them, parted into smaller divisions. From the Tysons little Branches, from whence, upon foot, Stalks proceed Leaves, cut out into many parts, some with roundish Smalhsh, but greater, broader and rounder, and more cut in about the edges; forthwith arise, and of a deep green colour, having a fomemuch hoar and Spicy Tafle, and a little bitter within. At the extremities of these Branches, grow large rafts or umbles of white Flowers, after which come great blackish Seed, almost round, but a little firster at the back, of a hot Tafle, not much unlike that of the Root.

Smyrn. vm.
Salmon's Herba!.

Lib. I.

V. The Place. They are commonly Sown in Gardens throughout the whole Europe, but the first is also found Wild in several Places in England, as at Profby, an Island on the North of Angelsey, on the Rocks near the Sea-thwart in many places, in some places on the Rocks near the Scotch Shores, not far from Berwick, and about Scarborough Castle.

VI. The Time. It Flowers in June and July, and the Seed becomes ripe in August, but Gerard will have it, that the Seed is not ripe all the second year, which I confess I have not observed. Yet being an annual Plant, I fear not why its Seed should not be annual.

VII. The Qualities. It is hot and dry in the third degree. Attering, Calculative, Diuretic and Lithontrippic: by Appropriation, it is Stonumatic, Hydratic and Nephritic, and operates as an Alterative.

VIII. The Specification. It effectually provokes Urine, helps the Strangury, and prevails against gravel and Tartar Matter in Reins and Bladder.

The Virtues.

X. The Powder from the Seed. Being taken from half a dram to 1 dram in white Part or Rhine private Water, or distilled Water of the Plant, it powerfully provokes the Terms, expels the Births, moves Urine, helps the Strangury and Cholick, breaks Wind, and is good against the bites of Serpents, Mad Dogs, or other Venomous Creatures.

XI. The Decoction. It opens Obstructions, provokes Urine and cleanses the Blood admirably: it is good also for such as have floppages in their Urine, or are troubled with the Strangury. Dose from iv. to vii. ounces.

XII. The Exspressed Juice. Given from iii. to vii. ounces mixt with Rhine Wine, or Oint, it is a Specific against Stone and Gravel, eases the Strangury, and brings away Urine or Matter obstructing the Urinary passages, when almost all other things fail.

XIII. The Confit, or Pickled Roots. They are often raw as a Sallet, with Oil, Vinegar and Pepper, they strengthen the Stomach, create a good Appetite, cause Digestion, refill Crudities, and expel Tartar and Venous Jiles from the Stomach.

XIV. The Balsam. It is an excellent Vomitive, curing all sorts of green Wounds in a short time: it cleanses running Sores, and old rotten and purrid Ulcers, and eases them speedily to heal.

XV. The Compotis. It is made of the bruised Leaves, and applied hot to the part afflicted, being made of the Leaves boiled, it dries up Sores and facid Ulcers, without any pain, and heals them; and either diffuses or removes Scrofulous Tumors: if it is made of the raw Herb, beaten in a Mortar with the Yolks of Eggs, and applied cold, it flows bleeding Wounds no more.

XVI. The Distilled Water. It may be Distilled either from the Seed, or from the whole green Plant: it is a Specific against Gravel and floppage of Urine.

XVII. The Distilled Oil of the Seed. It is given from iii. drops to x. in any convenient Vehicle, and comforts and warms a cold Stomach, strengthens it, creates a good Appetite and Digestion, expels Wind, gives ease in the Colick, provokes the Terms in Women, and facilitates the Birth; opens Obstructions of the Body, Lungs, Liver, Spleen, Reins and Womb, helps Obstructions of Breath, and comforts the Head, Brain and Nerves, being singular good against Megrim, Vertigo, Lethargies, Apoplexies, Falties, Constructions, and the like; you may give it in Extremity, as also morning and evening.

XVIII. The Spirit. It is weaker than the Oil, but much plaftisater, and has all the fame Virtues; but operates not in so powerful a manner. It is Cunnitive and Cordial, and given against fainting Fits.

Dose: 1 ounce.

XIX. The Spirituous Tincture. The Virtues are the same with the Oil, but more penetrating, and is indeed much more powerful than the Spirit, for that it abounds much more with the Sulphur of the Vegetable: it may be given in the distilled Water, from i. dram to ii. dram, morning and night.

XX. The Spirituous Tincture. It is a Lithontrippic, or Stone-breaker, opens all Obstructions of the Reins, Urines and Bladder, alternates, cleanses, brings away Sand, Gravel and Tartar Shine, opnus the Womb, provokes the Terms, and strengthens that part, fo as to cause Fruitfulness in Women, and brings away both Birth and After-birth: it eases the Spleen, and removes its sloppages.

Dose from i. dram to ii. dram.

XXI. The Only Tincture. It has the Virtues of the former, but is particularly good against the Palfie, being outwardly anointed on the part, and inwardly taken from vi. to xx. in a fit Vomite.

XXII. The Salt of the whole Plant. It is Diuretic and Nephritic in a peculiar manner, provokes Urine, brings away Sand and Gravel; and is good against Difficulties of the Brain and Nerves, by powerfully...
Chap. 8.

English Herbs.

fully opening Obliteration. Dote from x. grains to j. tablespoon, in its own distilled Water.

XXIII. The Essence. It prevails against Phlegm, and a Pilgrimage of the stomachs, cleaves and purges the Blood, warms a cold Stomach, is Carminative, provokes the Contents, and brings away both Bich and afterbirth. Dose 3. to more or lea, according to the necessity and age of the Patient, in a Glass of Wine.

CHAP. VIII.

OF ALKANET.

Alkanet.

I. The Plant. It is called in Greek Αλκάνετον, in Latin, Amocha, Ooxeda, Bulgois, Alkane, and in English Alkanet.

II. The Kinds. It is said to be a Species of Bulgois, but of this there are several kinds, as 1. The great yellow Alkanet, called Simply Alkanet, 2. The lesser Alkanet, with purple Flowers, called Alkanet altera. 3. The small Alkanet, with yellow Flowers called Alkanet virgins, 4. Alkanet Lignofior, Woody Alkanet. 5. Alphanum humilis Graecus, Low Alkanet of Greece. 6. Alphanum arboreum, Great or Tall Alkanet. Of these, we shall only discourse of the third, as being only useful for our purpose.

III. The Description. The first kind has a great and thick Root, of a dark reddish colour, with many Branches from the same. The Leaves are long, narrow, hairy and green, like the Leaves of Bugloss, which lie very thick upon the Ground; the Stalks rise up, and are composed round about thick with Leaves, which are fewer and narrower than the former, they are tender, and slender, not much above a foot and half high, of the same coloured hand (made yellow Flowers) with a small Leaf at the foot of every flower, which are somewhat long and hollow, very like to Comfrey Flowers, but a little opening themselves at the brims like unto Bugloss Flowers, with a Fourteen in the midd.

after which come in other places, fault. 1. Bugloss, Binche, Alkane, not unlike to Bugloss and Comfrey Seed. The Root is as big as a mere Finger or Thumb, and about two Mingers long, whole covered Bark is somewhat thick, and of an excellent orient red colour, ready to colour once Hands and Fingers with its red colour, if bundled: its inner Fili is white and woody, and the whole Plant is of a Spotrick or Afterglow Style.

V. The second kind has a Root, pretty large and thick, and of a dusky red colour, with many Branches from the same; the leaves are greater and longer than the next kind, narrow, hairy and green, like Bugloss Leaves, and somewhat like in the former, but yetetter and narrower, but more plentiful, as well those which lie upon the Ground, as those which rise up with the Stalks, which are many, slender and tender, of about a foot and half high, these Flowers are like the others, save that they are of a redish purple colour, and the Seed following more grey, the whole being of a rough and Afterglow Style.

V. The small yellow Alkanet is like unto the first, having a Root great in respect to the Plant, red, and tender whilst it is young, but growing blackish and woody when it is old, and lives and abides after Seed time, which some others do not, its Leaves are narrower and floweret than the first, and covered with an hoaryfe, as are also the Stalks, which in some are but a foot, in others a foot and half high, with smaller Leaves thence, the Flowers are yellowish and yellow like the first, but tender, the Seed also is like to the Seed of the first. These Plants are famously known throughout all Europe, for the beautiful red colour contained in the Roots, which will colour White Wine of the delicate colour of deep Claret.

VI. The Places. They are nourished up with us, chiefly in Gardens, but the second of them, Label toys, grows near Rochester in Kent, as also in the West of England, as in Devonport, and Cornwall.

VII. The Flowers. They flower in July and August, and the Seed is ripe not long after; and the Roots yield their glorious red or purple Juice or Tincture in Harvest time, as in July and August.

VIII. The Qualities. It is Temperate as to heat and cold, but a dry in the second degree. It is Reproductive, Alkane, Spotrick, Alkane and Traumatick or Valorous. And by Application it is Somatick, Cardiack, Hydrick and Nephritick: of the Stock of Alkane.

IX. The Specification. It is peculiar in refilling of Phlegm, of all kinds, and fluxes, Fluxes.

The Virtues.

XI. The Root. It is used to colour Wines with, Syrups, Waters, Elixirs, and such like things: and boiled in Wine, and taken with sweet Bitter, it helps Bruises by falls, &c.

XII. The Essence of the whole Plant. It is binding and strengthening, and stops fluxes of all kinds, and allays the heat of Choler; by its Euphysick and Traumatick Property, is good for the healing of Wounds, running Sores and old Ulcers, prevails against the Yellow Jaundice, the Splen, Agues, and Difficulties of the Kins and Bladders: it is good against all sorts of Infammations, burning Heats, Erythrasma, and the ings of Venamous Beasts, it strengthens a weak Back, and is good against Fits of the Mother. Dose 3. or 12. ounces.
Salmon's Herbal. Lib. I.

XIII. The Juice. It has the Virtue of the Efiges, but not so pleasant to be taken, because it is not a solid juice like a honey; it may be kept either in a balsam of or infused, as is the Spanish Juice of Liquorice.

XIV. The Freedom. It has the Virtue of the Apple, but not so powerful; it is of good Life in the Yellow Juice, and stopping Fluxes of the Bowels or of the Wounds. Dose: in 3v or 5v. ounces, sweetened with treacle refined Sugar.

XV. The Wine. It is made by Infusion of the Root, either fresh or dry, so long as fo often, till the Tincture is as deep as Blood. It is a Specifick in the Hepatick Flux, and in stopping all other kinds of Fluxes whatsoever. It is also a most singular Wound-drink, scarcely inferior to any other. It is good against the bitings of Mad Dogs, Serpents, and other Venemous Creatures; it strengthens a weak Back, and stops the Whites in Woman, and helps to bring forth the Maules and Small-Pox in Children. Dose: in 3l. or 4v. ounces.

XVI. The Vinegar. It has the Virtue of the Wine, but is peculiar against Morphiie, Scarifi, Leprifie, and other Discontents of the Skin: and prevails against the bitings of Venemous Creatures, being inwardly taken, and outwardly applied: Dose: 3 or 4ii. ounces in any for Vehicles.

XVII. The Spiritual Tincture. This is made only of the red part of the Root, and has all the Virtues of the Efiges and Wine, but is much more fit in cold Contusions, and where the Plague of any other infectious Disease is feared. Dose: in 3l. or more oftens in Wine.

XVIII. The Saline Tinctures. It is made from the whole Plant, and has all the Virtues of the Plant in it, but this is more peculiar in opening some Obstructions, chiefly of the Reins, for it brings away Sand and Gravel, kills Worms, and is good against Fits of the Mother. Dose: 3 or 4ii. ounces.

XIX. The Oil. [Oil Olive 3 parts, Oil of Spice 1 to 3 ounces, Oil of Juniper 6. 2 ounces, Allamen Roots 6 ounces, made with Oil of a gentle Digestion, in a Smooth-till till it is very red. It is an excellent thing for deep Punctures, Wounds made with pointed Weapons, and Punctures or Wounds of the Nerves.

The Cataplaft. Takes of the red part of the Root 4 ounces, but it is a Stone Mortar, then add to it Oil of Mace by Exprefion, 6 ounces, Albiztram 6 ounces, of Spice half an ounce, mix them. It is an excellent thing against deep Punctures, chiefly of the Nerves. A Cataplaft made of it with Whey or Cream, is good against Blisters.

The Ipecax. This is a precious Being made of the Pulp of the Root with a Little Oil and Wax, Cures old Ulcers: and made with Barley Meal, it prevails against an Erythelas, Leprosy, Tumours and Ringworms.

The Peffon. A Peflly being made of the Root, 6 ounces of its pulp, with Wax, Tarantune and Barley-flower, it is said to bring away the Dead Child, and the Afterbirth.

Sanguis Vermis. It is thus made: [Oil Olive 3 parts, Allamen Root 3. 2 ounces, Earthworms cleafed and purged, number 40, boil them well together, then strain out what is left, and keep it close for Use. This was invented by John Archet, and is a most singular Vomitory in deep Wounds and Wounds of the Nerves, made with Thrills, Stabs or Pricking with any pointed Weapon, &c. It calls the Pain, and prevents Convulsions.

Chap. IX.

Of Clowns A-LL-HEAL.

Clowne, Allcalete.

The Names. It has no known Greek Name, but is called in Latin, Panex Coxs, Panex Horsemam Alericus: and in English, Clowns Albeald, and Clown Wound-mort.

II. The Kinds. It is accounted one of the kinds of Sideritis, and is, with Horehound, the fifteenth, called in Latin Sideritis Anglica Strongin Radice, or English Iron-mort with a Lucorous Root.

III. The Description. The Root is composed of many long Stems, with fomewhat long kindy commonly growing among them, of a pale yellow, or whitish colour, from whence grows up four square, green, rough Stalks, half a yard or two foot high, furnished in, a little upon every square, the Stalks flowering somewhat for a flower, with two very long and fomewhat dark green Leaves, bluntly deltated above the edges, and sharp pointed at the end: the Flowers stand close together, compassing the Stalks at the {9} {10} stigds, and do so thrive of Hothouse, but end in spotted Stigds, which Hothouse does not bear long and much growing beds of a purplish red colour, with yellow {11} orous in them, standing in somewhat rough Heads, wherein afterwads stand black and brown Seeds. The whole Plant is of a fissing Smell, not much unlike to flowering Horehound.

IV. The Place. It grows almost every where in England, by several Brooks and Ditch sides, and sometimes by the Path-ways and borders of Fields, as in Middlesex near London, by the Path-ways, in Eddis going to Chelsea and Kedington, by Hackney, in the Ditch-side of a Field called The Shouder of Shott at Southfields, and in Sarry in St. George's Fields, and in the Meadows by Lambeth, and near Stansgate: in Kent by Southfleet, and on the back-side of the Church-yard of Nettlefield, and in some places near the foot of Shooters-hill: in Esex by the Ditch- sides, and on the Ditch-sides on the Left Hand of the Highway beyond Stratford Row., as also in Cam-bridge.
Chap. 10. English Herbs.

bridge, Hertfordshire and Suffolk, in all which it grows plentifully.

V. The Hogs-lard. It flowers in June and July, and sometimes in August, and its seed come to ripeness from the end of August to November.

VI. The Cautis. It is hot in the second degree, and dry in the first; it is Aphrodisiac, Althentic and Vulnerary; and by application, it is Neuritic and Articular, and of the kind of Alternatives.

VII. The Specification. It is absolute for healing of Wounds whether inward or outward, and that by the first Inagination.

The Virtues.

IX. The Juice. It is Thmaurick and contributes to the Curing Wounds (whether outward or inward) being taken from it. Ouance to Sit in a Glass of Alcoar, and it also it is good for Ruptures, Blood- Roe, Valleting, Spritting and Pilling Blood.

X. The Efficacy. It has all the former Virtues, but much more effectual to all those Inagination, and taken inwardly to fit Ouances, or more, it alters the habit of the Body, makes the blood Balfamick, and destroys the Cancerous humor, when spread over the whole Body.

XI. The Powder. It is given in Ruptures of the Peritonum, as also in lamenting and vomiting of blood, for it stops the bleeding, and condensates the broken Veins. Dose from half a dram to 3. in any fit Vehicle, and outwardly being brewed upon Wounds it stops their bleeding, and many times heals at the first Inagination: It is made of the dried herb.

XII. The Vitt-drink. It is made by boiling the Herb in half Wine half Water; or by Tunning it up with new Drink, four large handfuls of the herb bruised to every Gallon of new Ale or Beer, put up into a bag with a stone in it to make it sink, and fo to work with the Drink, which after 2. or 3. days may be drunk. It is an excellent thing to be taken a good draught of it at night, morning, noon and night, by wounded people, and such as have Inagination running Sores, old Ulcers and rebellious Fultus upon them; it alters the whole habit of the Body, and dispises the Wounds, Ulcers, &c. to a speedy Healing, and a perfect Care.

XIII. The Spiritsious Tincture. It has all the Virtues of the former, but is much better for inward Wounds, broken Veins, and Ruptures, &c. because it more easily and speedily enters into the Mafs of Blood, and brings it to a Balfamick Crass. Dose from 3. to 5. drams in Alicant.

XIV. The Sulphur Tincture. This is better for the Cleansing, Heating and Curing of Wounds and Ulcers of the Reins, Uterers and Bladder, because the Alspurk is more easily and readily conveys the Virtue of the Medicated Tinctures, than any other; it is also Alterative, and Clarifies those parts of Sand, Gravel, or any Tartarous matter lodged in, or adhering to them. Dose from 3. to 5. drams in Smallage or Par- taker Water.

XV. The Oil, made of the Green Herb with Oill Olive and a pinch part of Oil of Turpentine: It is Viscous, and heals Wounds of the Nerves with much speed and facility.

XVI. The Balsam. It Cures Wounds and Ulcers: the first it does by the first Intagination: the latter, by Digegting them, Cleansing them, and then Healing them up as a Green Wound.

XVII. The Cataplasm. It is made of the Green Herb, by chopping and boiling it in a bone Mortar, and then beating it up with a little Hoggs-lard: This applied heals up Wounds by the first Intagination, closing up the divided parts, without bringing the Wound to matter. With this Cataplasm a Country-man who had cut his Leg with a Sife to the Bone, healed it perfectly in seven days.

XVIII. The Plaster, made of the Juice Inagination to the thickness of New Honey, the Pouder of the Herb, with Frankincense and a little Oill Olive: It is good against Ruptures of the Bowels, and is probably applied to both Anemia and Vomits; more especially if Comity root is also added to it.

CHAP. X.

Of Common All-Heal.

All heal. Panax rectentorum.
Salmon's Herbal.

Lib. I.

we treat in this Chapter, 6. Panaxes Hungarici et Tartarum, Hungarici et Tartarum Albeth, of which we have nothing here to say. 7. The true, which is called Panax Heracleum Verum, the true Heracleum set and rare, which long both at the top and the root, is much also the proper place, viz. in Chap. 577 following.

III. The Description. The first Kind, viz. Panax Heracleum altum, or Hercules (his common Albeth, has a Root somewhat great, growing deep down into the Ground, with 2 or 3 long branches from it, of a yellowish yellow on the outer side, and more white underneath, full of a yellow Sap coming from it, if it is cut open, of a little green juice, and not bitter taste more than either Leaf or Seed: from this root springs many large wedge Leaves round about upon the Ground, most of them very fast long, consisting of four, five or six Couples of rough wedge Leaves, set against each other in a round great footstalk, surrounded on the upper side, each of them consisting like those of three or four Couples of rough but large, fair, fresh, yellowish green Leaves, and one at the end, round below, and growing narrower to a point at the other end, the one side of the leaf next its footstalk, being altogether longer than the other side, and finely dentèd about the edge, tending a little box and biting in the mouth, and yielding forth a yellowish juice in the Summer, called Opopanax, much more Gum, and a seed behind the fruit, from amongst the leaves rises up a strong, green, round, green flash, 4 or 5 feet high or more, with some flowers and leaves thereon, and a few branches towards the top, breaking forth in the month of October, many flowers of flowers, which after wards yield either yellow, yellow, flat, short Seed. Note. Lobel appropos this to be the Panax Syriacum Theophrast, which yields the Gum Opopanax, and not without some ground of reason for it, because (as he) a famous Apothecary in Antwerp found in a parcel of the Gum Opopanax certain Seeds, which being Sow'd by him in his Garden produced the very Plant.

IV. The second Kind, or Americanis has a great and white Root with sandy long fibres, and a path in the middle, not enduring after Seed time, which is sometimes the second year after its springing up, and sometimes the third. From this Root springs up a Plant much like the first, bearing such like wedge leaves, set in the same manner, and the stems with 4, 5 or 6 Couples of Leaves, but differing in Greatness and Colour for the whole plant is more of a white or greenish but not the leaves above half so great in length or breadth, but rather somewhat shorter, and of a deep green Colour, very much shining on the outer side, but of a paler green Colour on the inner side and deeper in light than the former, (and not bitter) drawing Water into the mouth. The stalk is fiddle thorn a yard high with three or four branches, and more branches towards the top than the other, and bearing larger number of flowers of a yellow Colour, succeeded by flatish, but almost round Seed of a pale brown Colour. This is supposed to be the American Lepidoptrum, or Lepidoptrum which yields a kind of Ada tuber.

V. The third Kind, or Costus like All-beal, differ not much in form from the second, but in its greatness, and in the substance of its yellow juice, which this has not, and therefore is not of that Kind: this has such large wedge Leaves, set in the same manner together, but less, each leaf aboved is larger then a Great Albeal, rougher and more crampet, also a little denteed about the edge. The stalk is small and about a yard high, full of points and softer leaves set at them, branched towards the tops, and bearing rather few flowers, after which stops, and sometimes round Seed: The Root is Sappy, with a thick fibrous Bark, and of a shining All Colour, bitter and sharp in taste.

VI. The fourth Kind, or Caster-bearing All-beal, has a Root of the thickness of ones Thumb, and very long, from whence rises up a round, pathy, brownish, purple flashes, set at the leaves with large leaves, divided into many parts, usually by three at a place, a little tender and breaking in the mouth, and larger than the leaves and at the more inner sandy branches, many sorts of flowers, made of small threads, like Vine Blossoms, at the first greenly, but other afterwards, which turn into small branches of green berries, and some afterwards to be of a dark red when they are ripe, full of a pleasant juice, with many Seeds therein. It bears both Seeds and Leaves every year and they springing up new again after Winter: the whole Plant, Leaves and Roots are eaten as Potatoes and Sallets, by the Indians, where it is natural, as also by our European which dwell among them, and taste more pleasant than the Fruit it self.

VII. The fifth Kind, or Panaces Molchatum Americana: The Root is long, white, and a little sharp and bitter, from abundance springing up its first desire, which are large, and about a foot long, only dented about the edges, somewhat like the Coturnix leaves, lying on the Ground, and compifying the long white root or a little with these which broken in a deep cut in: that they reach to the middle of about the middle: the flake rises to the about a yard high, without any leaves thereon, flow only upon the middle, where it has a Root and a branch, to a foot far forth, of a differing form from the roots: the top branches are of the kind, much laden and umbles of white flowers, that before they open, they hang down their heads, which have so admirable harrier or anther, and of which the petals, that it is in divers sense, musk and may be a most good way from an open: the place where it grows: the leaves taste sharp and a little bitter, the Seed is like the first Kind, but more broad.

VIII. The Place: The flake grows in Italy, and generally in our Gardens in many places as in the Physic Gardens at Oxford, Wellesley and Chelsea: The second was brought from America, and is now Nourished in our Gardens also. The third grows on Mount Garganus in Apulia. The fourth and fifth grow in America; as in New-England, Canada, New-York, New-England and Virginia.

IX. The Time: They all flower in the latter Summer Months, and their Seed is perfected in the end of the same Year.

X. The Flavour. The herb, as also the Gum Opopanax, has a bitter and day in the footstalk, the leaves have no smell, some Authors will have the Gum to be hot in the 3d degree, which I do not believe. The herb, as also the Gum, attenuate, Rousing, Dryness, Deprive, are not capable of making the blood thick and phlegmatic, but they are very temperate: and as to the propagation they are Cephalick, Stimulating, Pectoral, Splenetic, Hysterick and Arthritic. And are accounted among the number of Alternatives, yet the Gum has been found sometimes to purge, the root very gently, for what reason, it is often mixt with Carthureckicks.

XI. The Specifics: * Both Herb and Gum aresingular Valourous, and are known to Cure Wounds and Ulcers before most other things in the World. The Gum also is speickick in Diseases of the Spleen and Stomach, removing Vapours and helping Rises of the Mother, as also outwardly to blains or resolve hard Tumors or Swellings, (if reducible) in what part of the Body you ever.

The Virtues.

XIII. The Powder of the Seed. This drunk in Warmwood Wine, from half a dram to 3, dram, is good against Poyfor, and the blights of all Venereal Diseases.

XIV. The Tincture of the Herb. It is good against Pains and Ulcers of the Bladder, and helps against the Strangury, or difficulty in making Water; it expels Worms, is good against the blights of all Dogs, or any other Venereal Disease. Dose 3 ounces.

XV. The Essence. It is Cephalick, Peliform, Hybernic, and Venereal, curing most Difficulties of the Heart, Metastasis, and Worm, and is very contributory to the healing of Wounds, on any old Sores, or running Ulcers, helps Pains and Stitches in the side, hardenings in the Spleen, and afflictions of the Mother, provokes the Courts and expels the Birth. Dose to 1 ounce in any proper Vehicle.

XVI. The Syrup of the Tincture. It has all the Virtues of the Tincture and Essence, but not altogether to powerful and effectual, but something more pleasant, and may be exhibited to 1 ounce more or left in Wine, or Ararat Water.

XVII. The Spirituosum Tinctura. It has all the Virtues of the Essence, but is much more fit for cold Infirmities; it cleanses the Brain, Nerves, and Sensible Parts, warms a cold Stomach, and is good against all cold Difficulties in those Parts. Dose from 3 dram to 1, in Ale, Must, or Wine.

XVIII. The Oily Tincture. It is good against the Colic, and Windiness of the Bowels, and is said to expel the dead Child: It heals Wounds by the Root, or in the Heart, if strength comes weak, and Sensible Parts, even to the Toothach, (held awhile in the Mouth) old Sores, ulcers of the Limbs, Pustules, &c. outwardly applied, by anointing therewith, and may be given in a drachm from 3 to 5, or 6, drops in Ale, Beer, Must, Wine, or some proper Liquor.

XIX. The Decotion of the Herb. In water or Wine, may be taken as a Diet-drink for the curing of Wounds, old Ulcers, and old Cholera, and to heal internal Ulcers in the Lungs: Dose 3, 4, or 6, ounces at a time, two or three times a day; it is said gently to evacuating Choler.

XX. The Oil. It is only an Infusion of the Herb in Wine, and is something more powerful, at least more proper than the Decotion, for all the same purposes in cold Constitutions or Habits of Body, to ease cold Difficulties of the Head and Nerves, and gives ease in the Lungs: Dose 1 or 2, or 4, ounces more, or two or three times a day.

XXI. The Oil. It is Venereal, and heals Wounds after an admirable manner; anointed it diffolves Ointments, and cold Tumors in any Part. Diffuses hard swellings in the Joynts, and gives ease in the Court, Spleen, and other Pains from a cold caule, being anointed on the Place.

XXII. The Ointment. More excellent for the curing of Wounds, and commonly performs the Work by the first Intention, it cleanses and heals Ulcers, and is a singular thing for the curing of Filth, being injected reddish hot into the heart. It gives ease also in the Gout, and in all Aches and Pains from a cold caule: And covers naked Bones with Flesh.

XXIII. The Distillation. It softens the hardness of the Spleen, and is of good use in dissolving or diffusing hard swellings of the Kings Evil.

XXIV. The Carpathia. It is Difflusive, Refolutive, and Analysy; and an excellent thing to be applied to Kings evil swellings, or any hard Tumor in any part of the Body: The Green Leaves beaten into a Carpathia with Honey, and applied, cures Wounds and Ulcers, incarnates, and covers naked Bones with Flesh.

XXV. The Crot or Empyema. It is Diffusive, Refolutive and Analysy; and applied to any weak Part or Joint, it is strengthneth it, as hindereth the Sallie of Humors to that Place: It is also good against Spasms and Cramps, and numbness of the Limbs, helps the pain, swellings, and hardnes of the Spleen and Hypochondriac, being spread upon Leathers or new Cloths and applied.

The Virtues of the Gum Opopanax.

XXVI. The tinctured or purified Gum. It is a Gunny Joyce flowing from the Root of Panax. Herbaecum, being cut or wounded, which is afterwards infused or brought to a thick liquor, and is then called in the Greek, African, and Latin, Opopanax: It is a fine fragrant Gum of a reddish, or reddish yellow color outwardly, but inwardly of a whitish yellow: It comes out of the Plant white, and in round leaflets, and is white within, but being glutinous it sticks together in Lumps, and by degrees it becomes thick, and of a Gold color on the out face, but being distilled is almost Milk: It diffuses Wind, purges Pieces which is thick and tough, even from the remote parts of the Body, as from the Head, Brain, Nerves, Joynts, Reins and Womb: It diffuses Terrestrial moulds in the Brain, Lungs and Membranes, and Repells Tumors, and is a good thing against all Old Cough, furpses of Humors, sterneces of Breath, difficulty in breathing, and other obstructions of the Colog. It is depurated by distilling it in Vinegar, distilling and purifying it: It may be given in a drachm to a dram or more, corrected with Ginger, and Nutmeg. Distilled in Vinegar and drunk an hour before the Fit of an Ague, it is said to cure

XXVII. The Pills of Opopanax. Take Opopanax made fast with Syrupus Catharticus prepared as in our Pharmacopoea Chorographica: 8 ounces: Secondly take Powder 3 ounces: Gum Arabic: a sufficient quantity: Oil of Lunter 3, drops: mix and make a mass of Pills. Dose from xvi. grains to xxxi. grains half a dram. They purge all Humors, and from all parts of the Body, without making sick, or griping, dissolve and expel teratures and sharp humors out of the Bowels, which are the original Causes of the Gout, Stone, hardenings of the Spleen, Hypochondriac Malignancy, and in the Mother: and have profit of the Virtues of the Gum at Sext. 27. foregoing: They are an excellent Medicine, not enough to be valued, and may be taken twice or three times a Week.

XXVIII. The Volar Oil. Spirit. It is made of the Gum by distilling it in a Glass Retort either in Sand, or Balsame Moris, as we have taught in Our Sophism; 1b. 9. exp. 40. sect. &c. It admirably opens the obstructions of the Lungs, Liver, Spleen, Bowels, Reins, Uteras and Womb: brings down the Courts, eases Urine, and prevails against Va...
The Virtue of Panax Coilfinum

XXXIV. Its Qualiites. It is completely hot and dry in the third Degree. It opens, cleanses, warms, and makes things, and by approbation it is Cephalick, Pectoral, Hepatic, Splenick, Hydrick and Nephritic: performing its operations altogether as an Alternative.

XXXV. The Specification. It is prevalent against the mischief of the Colders of the Head and Brain, and the Cholick, or Griping of the Guts.

The Virtue.

XXXVII. The Essence. It is an admirable thing against cold Diseases of the Head, Brain and Nerves, at Headaches, Vomits, Falling into the Nerves, Cramps, Convulsions and the like: it is good against Coughs, Cold, Throat, Headaches, obstructions of the Lungs, Liver, Spleen and Throat. Dose 1 dr. or 1 dr. powderful in Wine or Spleen, Mix with Olive or other proper Liquor.

XXXVIII. The Spirituous Tincture. It Wears a cold Stomach, is good for Nerves obstrued, and chills through Cold; and is prevalent against the Falling into the Nerves, and Hydropneumatic. Treats all diseases.

XXXIX. The Saline Tincture. It has all the Virtues of the Essence, and Spirituous Tincture, but has not so powerfully; however it better opens obstructions of the Vessels, provokes the Stomach, repels the Fins of the Mother, cleanses the Womb, kills Worms, expels the Urine, Birth, Deathbirth, and Afterbirth, and dissolves Tartarous Concretions, as Stone, Gravel, firm matter, &c. Dose from 6 to 18 dram to 1 oz. in Pasty Water.

XL. The Only Tincture. It comforts the Nerves, provokes Urine, helps in Difficulties of the Reins and Bladders, and prevents against Cramps, Convulsions, Gouts, pains and aches proceeding from Cold, Pallas, Rheumatism, being outwardly applied, and inwardly taken from 3 to 6 drops to 1/2 in some convenient Vehicle.

XLI. The Decoction. It opens the pipes of the Nerves, dissolves the Tartarous Matter which breeds the Gout, and carries the matter of the Morbidcause by Urine. Dose from 4 to 8 ounces.

XLII. The Wine. It expels Wind, strengthens the Stomach and Bowels, and is good against the Cholick, or Gripings of the Guts. Dose 1 or 2 ounces, morning and evening, or in Extremity.

XLIII. The Cataplasm. It is made of the Herb beaten in a Mortar, and mixt with Hogs-Lard and Turpentine, of each of the two a like quantity. It gives ease in the Gout, or any pain in the Joyners proceeding from a cold Cause, is good against Cramps, and the shrinking up of the Sineus, by reason of violent Convulsions.

CHAP. XI.

Of ALL-HEAL OF Aculaplius.

I. The Names. It is called in Greek Μελανος, in Latin Panaceas & Panacea Aegleipius, and in English, Aculapius his All-heal.

Allheal Aculapius

II. The Kinds. Gerard says it is a Peruvaceum Plant; of which there are said to be five Kinds.

1. Panax Aegleipius Lophi, Labbe his Eculapius All-heal. Panax Aegleipius Matriolus, that of Matthiolus. 3. Panax Aegleipius Coloma, That of Columna. 4. Panax Aegleipius Dechamplin, That of Dechamplin. 5. Panax Aegleipius Angustifolus & Camerarius, That of Angustifolus and Camerarius. Their differ not much one from another, being all Peruvaceum Plants, except that of

Tracheliums; and are much of a Nature, but not easily to be gotten except the first, and of that we shall only treat in this Chapter.

III. The Description. The Root is long, white, and of a strong smell, growing deep, nor choking after its giving Seed. from whence springs up a slender Stalk, of about a foot and a half high, erect and pointed, and from these Stems proceed Leaves, by the side of Flowers, and all very slender, and of a strong smell: at the Tops of the Branches grow Umbels of Flowers, which are yellow, after which comes a broad and flatish Seed, not so small as that of Fenel, but more like to that of Fenel, and of a quick tallis and small.

IV. The Place. It was first found growing in Libya, but now is nourished in our Gardens in England, as also in Gardens in most places of Europe.

V. The Times. It Flowers in June, July and August, and the Seed is ripe not long after, or in September, after which the Stalk with its Leaves falls.

VI. The Qualities. It is hot and dry in the second Degree. Astringent, inciting, abstractive, binding, strengthening, and Venerary, and by application is Sudorific, Aperient, and Arknictic. It is also Alkapharmac and Alterative.

VII. The Specification. It refills Poyfon, and is found by long experience to be a famous healer of Wounds.

The Virtues.

IX. The Juice. Inwardly taken and outwardly applied, it is a good Venerary, healing, conglutinating, and drying up Wounds.

X. The Essence. It not only heals and conglutinates Wounds, but cleanses old and running Sores, purifies Ulcers, and cathersick or ill conditioned Frislands. It may be given inwardly from 1/2 to 1 oz. per day; and Clothes wet in the same may be applied to the Sores or Ulcers: if it is a Frisland, it is to be infused in pretty hot, twice a day with a Syring. towards the Saline Tincture. It cuts, makes the Ulcers clean, and carries off ills thick and tough humor, cleansing the Breast and Lungs from all cold phlegmatic humor. Dose it, 1 drachm or more.

XII. The Oily Tincture. Drop into Wounds of the Nerves and Tendons, and pleases the same in the same, and applied upon the part, it heals them commonly at first dressing.

XIII. The Decotion in Wine. It is an Antidote against Poyson, and is profusely drank against biting of Serpents, as Vipers, Rattle-Stakes, &c., and other Poysonous Creatures. Dose 1/2 or 1/4 of an ounce.

XIV. The Spirituous Tincture from the Flowers and Seed. It refines the Habit of the Body, makes the Blood Balalland, and gives it its due Color, inducing the healing of green Wounds, removing Sores, old Ulcers, and other external breakings out in the Skin. Dose it, 1 drachm, morning and evening in a draught of the Decotion.

XV. The Oil. It smooths the Skin, takeway Whales, Pustules, Scabs, Morthew, and other breakings out, being anointed therewith, heals Wounds, cleanses Ulcers, and brings them to a speedy cure.

XVI. The Balsam. It is made of the Juice contained in the thickkins of New Honey. It ounces, mixed with Gum Elmi, Balsam Caperi, and Stuart-

Burg Tartarina, Oil of Ben, of each 1 oz. or more. It heals Wounds of the Head, Joints, Nerves, Tendons, &c. by the first Intention, cleanses Ulcers, Frislands, &c. Incarnates, and suddenly cures them.

XVII. The Cataplasm. It is made of the green Herb bruised and beaten up with a Bird's Honey. It cleanses Ulcers powerfully, and is good against fretting and running Sores, Cancers in the Mouth, Pustules, &c., being applied.

XVIII. The Greate or Emplastr. It is made of the Balsam, by adding to every vj. ounces, Frankincense and Balsam's Wax, of such j. ounces, mixing them over a gentle fire. It heals green Wounds, and incarnates Ulcers and heals them after cleansing.

CHAP. XII.

OF ALL-SEED.

I. The Name. It is called in the Greek, θυμαρισμα, in Latin, Polyfermon, and Polyfermonium Cellar Ben. in Arreippix Syphilitis; and in English, Alleseed, or Wild Arereh.

II. The Kinds. It is of the Kind of Bites, and of the Wild sort, of which it is singular: But Some Authors account it among the number of Arerehes, and therefore call it Arreippix Syphilitis, but it is none of those Plants.

III. Seed.

...
Salmons

V. The Place. It grows Wild, in many places in England, and in many Gardens as a weed, where it is Weeded out.

VI. The Time. It Flowers and Seeds from June to the end of August, or the beginning of September, the Seed being ripe not long after the falling of the Flowers.

VII. The Qualities. It is cold and moist (according to Coles) in the second Degree. It is something opening, affluvent and emollient: and by appropriation Utérine and Arthritis: being of the Stock of the Alternatives.

VIII. The Specification. Its chief intention is to cool inflammations, and soften hard Tumors.

IX. The Use. It cools inward inflammations and plagues the heat of Fvers, and is good inwardly taken against an Erythelas, and other like heats and opers the obstructions of the Liver. Dose from 1/2 to 1 oz. ounces sweetened with Sugar.

X. The Juice. It has the Virtues of the Efficac, but cool more, and is good to Gargle with in a Quantité, and is probable against heat of the Stomach, and inflammation of the Lungs. It clears the Womb, and makes the Belly Soluble. Dose 1/2 or 1 oz. ounces in any fit Vehicle. Outwardly it is good to bathe with in an Erythelas.

XI. The Decotion. It is good against heat in the Reins, and Edding of Urine in making Water: and if a little Nitre is dissolved in it, it not only takes off the burning heat in filling, but opening all the Obstructions of the Urinary passages, it causes a plentiful making of Urine, and takes off the heat of any Burning Fever tho' never so great. Dose 5j or 7j ounces well sweetened with Sugar, in which half a dram of Nitre, or more may be dissolved: it may be taken twice a day.

XII. The Ointment. It cools inflammations, eases pain of the Gout, and other aches proceeding from a hot caus, and is good against Scurf, Morœph, Scœlæ, Pimplæs, and other breaking out, and deflemants of the Skin; and anointed is good to soften hard Tumors.

XIII. The Gartagyn. It is made of the Herb beaten in a Stone Morter, to every handful of which 1/2 dram of Nitre in fine Powder is put, and diffused, and brought to a consistency with Barby Flower. It gives present ease in the Gout, and all other pains proceeding from a hot Cause. It is good in an Erythelas being spread thus, as also Scurf, Morœph, Leprose, and is to be renewed two or three times in twenty four Hours.

XIV. The Powder of the Seed. It is cooling, affects the Stomach, Reins, Bladder and Womb, taking away any pretermental heat in any of those parts; and being taken from half a dram to 3 dram, it is said to be an effectual cure for the Yellow Jaundice, and to prevent the overflowing of Choler.

Chap. XIII.

Of Garden Anemonies.

I. THE NAME. This Plant is called in Archebisch, Jackisch, Alchemon, Scabich, Manrie: in Greek Anemone, in Latine Anemone, & Herba Venter: in Italian, Anemone, & Herba Venere: and in English, Anemone and Windflower.

II. THE KINDS. Some Authors will have them of the Stock of Carewroot, by reason of the shape of the Leaf. But to me it seems to be a peculiar Plant of it self: and is divided into three principal Kinds, viz. The Garden, the Wild, and the Bafroid. The Garden Kinds are almost innumerable, at leastwise not easis to be reckoned up; and for my part I believe, it would puzzle the most experienced Floris, to give a just enumeration of them, and therefore I shall not here attempt it, but give you the Description of the few following. 1. The Single Anemone, which is purple, red, blood-Colored, black, yellow, white. 2. The Double Anemone, which is red or scarlet, purple, crimson, blowlw, orange, green, white, etc. to which we add the following Wild Anemonies, viz. 3. The great Wild or Wood single Anemone white. 4. The smaller Wild or Wood single Anemone, purple, yellow, white. 5. The Wild double Anemone, purple, red and white. The last three we Treat of in the next Chapter. The third Kind are the Bafroid Anemonies, which tho' they may be accounted as one of the Kinds of the same Tribe; yet by reason the English Name, which is Pericô-Flower, falls not in the preceeding Letter of the Alphabet, we shall refer you to its proper Place and Letter, which will be in Chap 572. following.
Chap. 13. English Herbs.

here is to be noted that the yellow Anemone differs much from all the rest of the single various Colored Anemones, for its Leaf is much like to a Common Onion Leaf, but not quite so flat, and its Flowers are on the top, and somewhat reddish underneath; its flowers are yellow, and the Head or Thrum in the Middle is yellow also. In all these Colored single Flowers, when the Flowers are None away, there remains a Head, whereas the Seed, besides small and black, or blackish, is inclosed in a Kind of Soft Wool or Docket.

IV. The Double Garden Anemone. The Root is thick and Tuberous much like to the Root of the former, and indeed the Roots, Leaves and Stalks much resemble the former single Anemones, but the Leaf is not altogether so finely cut and Divided, as the red or Purple-tinged single ones; and of the three flowers there stands a fair Flower either red or scarlet, crimson, purple, azure, orange, tawny, yellow, or white, or mixt with some of these, consisting of divers broader Leaves with several roots of narrower Leaves each within another, which together make a very fair and beautiful Flower, the middle Head being rich dressed either of a greenish, or red or crimson, or white or red Colour. These are either white with black, or various according to the Colors of the Flowers. After the Flowers, there follows the Heads which contain the Seeds of the former. Here note, that the double yellow Anemone has much broader rounder Leaves, and the single kind, but somewhat larger flowers, and the Stalks are fuller with larger Leaves, more deeply cut in on the edge, and the Flowers are of a more pale yellow, with four purplish white, or the color mixt, and there is before these, to give a variety of mixt Colors, in this Kind of Anemone, with broad Leaves arising every year from the rooting of the Seed of some of the Common, that it is wonderfull to oppose, not only the variety of single Colors, but the mixture of two or three Colors in one Flower, besides the diversity of the bottoms of the Flowers, and of the Thorns or Teeths in the Middle. But in all these various Colored double Anemones, we may observe, that the beauty of them is in the variety of double Flowers, that arise from the other single ones, some having two or three rows of Leaves in the Flowers, and some few stalks of Leaves, growing round, or double Crown-foot, and of the same general Colors that are in the single Flowers, that it is almost impossible to express them all, nor is it possible to be more double in one year, where either are left double in another year, yet very many being constantly double as at first. This we thought good to advertise in General, that it may be applied to each variety, and every Kind of Flower of each variety in particular, to bear the farther trouble of needless Descriptions, and a needless multiplication of Words to no purpose.

V. The Pheas. These were somewhat brought to us from Constantinople, some from Italy, and some from Germany, but now they are inhabitants, and Natives of our own Country, and may be found almost everywhere in Gardens, especially in Physic-Gardens, and the Gardens of Inlandous Embas.

VI. The Times. They Flower from the beginning of January to the end of April, and when they begin to fade, the Seed, where there is any, is carried away with the Wind. If you plant them in September, you will find the Seed which is thus spread, it must be carefully gathered, but yet not before it is thoroughly ripe, which you may know by the Head, for when the Seed with the Woolstings begins to rise little of it will fall, at the head, it must then be presently gathered, and laid to dry for a Week or more, which then being gently rubbed with a Cloth, the Seed will fall, and cause the Seed to be somewhat better dispersed, tho' not partially from its Down or Woolstings, that encompasses it; within a Month at the most after the Seed is thus gathered and prepared, it is to be Sown, for so you will bring it to a Year in its growth, more than you would do, if you Sowed it in the next Spring. If there is any Woolstings in the Seed, they are to be separated from it as well as may be, and then dry poner thin, not too thick, upon a plain smooth bed of fine Earth, or rather in Pots or Tubbs; after the Sowing, fright or gently throw over them some fine, good, thin Mould, about an inch deep at most for the first time: about a month after their first springing up, five or six of them in like manner, another inch thick of fine Earth, and in the Weather proves dry, you must water them gently and often, but not to over glut them with moisture: thus doing, they will spring up before Winter, and grow so strong, as to be able to withstand the next Winter, tho' in their Infancy, but you ought to take some care in covering them loothly with Straw, Horse-lvaves, or hay-like, to keep them from the extremity of cold, which yet must not be close up on them, not too far off neither. The next Spring after Sowing, you may, if you so please, remove them, but in my Opinion it will be better to lay till the next August, when you may remove them, let them in order by rows, with a sufficient distance one from another, where you may keep them till you see what kind of Flower each Plant will bear, which you may afterwards distinguish. According to my mind: many of these Plants thus ordered (if your Mould is fine, loose, fresh and Black Earth, not Stony, Clayish, &c.) will bear Flowers the second year after Sowing, and multiply all of them the third year, if the place you put them in is in a clear Air, free from the Smoke of Chimnies, Forges, Breers or Dyers Earth, Mould or Lye, &c, in which they will never multiply. The ordinary time to Plant Anemones in August, and then they will be in flower sometimes before Winter, but most commonly in February, March and April, few of them abiding until May, but if you keep some Roots out of the Ground unplanted, until February, March and April, and Plant some at one time and some at another, you shall have them bear Flowers, according to the Planting: those which you Plant in February will flower about the middle or end of May, and so the rest accordingly, as to the time you Plant them in; and thus you may have the pleasure and variety of these Flowers, out of their natural Seasons, which is scarce to be had in any other Herb. Nature not being so apt to be provoked or forced in other things, as she is in this. But in keeping your Anemone Roots out of the Ground for this purpose, you are to keep them neither too dry nor too moist, that they may neither wither, sprout nor rot, and in Planting them, you must not fix them in too open or funny a place, but where they may have something of shadow.

VII. The Qualities. They are hot and dry in the third degree. They Attenuate, Incite, and vehemently Attire, and by Application are Cephalick, Luminous and Arthritisick; and are only Alteratives in respect to Heat or Cold.

VIII. The Specification. It is peculiar against Apoplexies, Epilepsies, Lethargies, Madness, Vertigo's proceeding from a cold and moist Humor, or Distemper of the Head and Throat.

Salmon's Herbal. Lib. I.

The Virtues.

X. The Roots, Stalks and Leaves. Thefe boiled in Water, chewed the Roots, or Roots and Leaves, till each time as their very and bitter Taste is mostly gone, and being eaten as a Sauce, with a little Butter, Sulphur and Vinegar, are laid to excite Milk in Nurfas.

XI. The Juice. Being frufped up the Nofe morning and evening, but chufily at Bed time, it mightily purges the Head and Brain, and brings awa'y abundance of cold, molt, fegmatick Humors, and thereby frees the Patient from Apoplexies, Epilepticks, Leuthangies, and molt other cold Diftempers of the Head, Brain and Nerves, caufed by tho' Humors lodged in the Head, in the Cavities of the Brain, or between the Membranes thereof, viz. between the Fafe and Pura Mater.

XII. The Efficacy. It has the fame Virtues, being used as an Erinthe, but is chufily given inwardly to provoke the Terms, bring away the Birth, Attac'h the Dead Child, defolved into running Sores, old Ulcers and Fiftu'fa's, it admirably cleanses them, and dipsofes them to healing. Dofe from half an ounce to 1 ounce, in any proper Vehicle.

XIII. The Decoction. If it is made of the Leaves with half Water half Wine, it powerfully provokes the Terms, and brings away the Dead Childe, and the Body or Places affected being bathed therewith, it Cures Sun-burnings, Tumors, Scarf', Morfeoph, Lepropfe, Scabs, &c. Dofe iv. ounces twice a day.

XIV. The Mifticatory. The Root chewed in the Mouth, draws out a Flux of cold Rheum, by which the Tooth-aches, Headaches, Megrick, Apoplexies, Epilepticks, Cufes, Leuthangies, and other Breepy Diftempers proceeding from a cold or molt caufe, are Cured.

XV. The Garraff'm. It is made in equal parts of the Juice and Deco'tion mixt together, in which, to every iv. ounces of the Mifture, 12 drams of Nitre are added and dissolved. It has all the Virtues of the Juice and Mifticatory, and purges and cleanses the Head and Brain fo admirably as to Cure all tho' Diftempers afore-named of those parts, and more by thefe means together, but arg only lefened from a coldness of the Head and Parts adjacent, a Sleep, and being washed with cold flégmatick Humors, the life heroic now and then prevents their coming, and frees the Patient for the future.

XVI. The Poifey. It is made either of the Root cut into form, or of the Juice made up with melted Wax and Barley Flower, put up into the Womb or Vagina, is a very violent Venet of the Womb, and by its attractive force, provokes and draws down the Terms; but it ought to be several times renewed, taking proper things alfo by the Mouth.

XVII. The Ointment. It is made of the green Herb or Juice. The Eye-lids being anointed there-with, it helps Ophthalmies or Inflammations of the Eyes, and applied to running Sores, old Ulcers, parrel Fiftu'fa's, and other malign and corroding Diftempers, it perfectly cleanses them, strengthens the Part Affected, and promotes their healing.

XVIII. The Cataracta. It is made of the green Herb beaten with Hogs Lard, in which a little Alum and Nitre, in the Powder, are mixt and diffolved; applied, it caffes Pain in any Part, and Cars Scarf', Morfeoph and Lepropfe, being used for some confiderable time.

XIX. The Saline Tincture. The External Parts of the Body being wash'd with it, it removes all Kinds of Diftempers, cleaning the Part, and killing the Humor, by destroying the Fermant which breeds it. Mixt with double quantity of Juice, it becomes an excellent Gangriffin or Liquid Erinthe, purging the Head and Brain of all cold Humors. Let Phyaricians talk what they pleafe, alfo the Cephalick or Head-purging Pills in the World cannot purge the Head and Brain like to powerful Erinthes,Gangeriffms or Mifticatories.

XX. The Oily Tincture. This is indeed truly benefical for all fick as are troubled with Oedemum's, cold Tumors, Pains and Ach's in any part of the Body from a cold Caufe, as alfo for fick as are afflicted with Spasms, Cramps, Convolution, weaknes of the Nerves, Trembling, Nummehes, Palls, and the like, being anointed effectually twice a day upon the place affected, (and in Falls, along the Back Bone alfo,) and continuing the life there-of, for some considerable time.

CHAP. XIV.

Of Wild ANEMONES.

Wild ANEMONE, great.

1. The Native. This Plant is called in Greek, 'AnemoneHasMaxLengthe', in Latin, Anemone Synoehris, Anemone Nemorum, Herba Versi Synocris; and in English, Wild Anemone.

II. The Kinds. They are two-fold, 1. The single Anemone. 2. The double Anemone. The single Anemones Wild are, 1. The Greater or Broad-leaved Wild White Anemone. 2. The Common or Smaller-leaved Wild Anemone, Purple, Cornation, Yellow, White. 3. The Wild double Anemone, Purple, Red, White.

III. The Description. 1. The Greater or Broad-leaved Wild White Anemone. The Root confifts of a great number of long black Strings, encroving very much by running under Ground, and mounting up in divers places, from whom springs forth divers broad green Leaves, eaf into dayfhe, and dov'd along; very like unto a broad Leaf'd Crowfoot, from among which...
V. 2. The Wild double-flowered Anemone. This double kind is very like unto the single white kind before described, both in its long running Roots, and its thin jagged Leaves, but somewhat larger: the Flowers wherein are very thick and double, but small, of a faint sweet Scent, which are of a purple, red, or white colour after they are blown, for five or six days; the purple and red are of a fine light colour towards the tops of the Leaves, but the bottoms of the Leaves of a very deep colour of the kind; and the White-flowered are very white when first blown, but afterwards they become a little purplish on the inside, but of a fairer and purpler kind. The Stem is a little Head like the former kinds, but felter or never give any Seed, especially the White kind.

VI. The Place. The first broad-leav’d grows in divers places of Africa and Hungery, but with us, is not much up in Gardens; the other kind

tells up a Stalk, having some such like our Leaves in the middle thereof, as grow below, but smaller, on the top thereof stands one large white Flower, confiding of six Leaves for the most part, and four yellow Threads in the middle, standing about such a green Head as you see in the Garden Anemones, which growing greater after the Flowers are past, is composed of many small Sides, wrapped up in a white kind of Down, which as soon as they are ripe, raise themselves up from the bottom of the Head, and fly away with the Wind, as the Garden kinds do.

IV. 2. The Common or Smaller-leav’d Wild single-flower’d Anemone. It has a long long and small, sharpened into the Roots of Polypond, creeping under the upper crust of the Earth, from whence rises up one or two, and sometimes more small, round, naked Stalks, bearing about the middle of them, small, soft and tender jagged Leaves, deeply cut in and indented on the edges about, from above which also does grow the Stalk, bearing small Flowers, Purple, Carnation, Yellow or White, not much unlike to a Crow-foot, (sanding upon weak foot Stalks) with some Threads in the middle.

ANEMONE.  

Wild  

Small  

Wild Anemone.

The Virtues.

XI. The Juice. It is aingular good Erthine, for by pouring it up the Nosal running and evening, it Purges the Head and Brain of cold, thick and tough Humors, whereby it prevails against Apoplexies, Epilepsies, Carus, Lechanties, Vortigo’s, Migrins and cold Head-aches, proceeding from a cold Carb.

XII. The Essence. It has the same Virtues used as an Erthine, but is most commonly given inwardly, from 3 grains to half an ounce, mixed with a draught of Malt, Wine, or some proper Water, to open Obstructions of the Womb, and to bring down effectually the Terms in Women, as also to haften the Birth, and bring away the After-birth.

XIII. The Decotion. It is not so hot as the former, and therefore not so strong, but yet is effectual for the same things the Essence is, but may be given in a larger Dose, as from 6j. ounces to iij. sweetened with White Sugar.

XIV. The Gargary. It is made of the Juice or Essence, mixt with an equal quantity of the Decotion, to 8 ounces of which you may add 3i. grains of pure Nitre, diffusing thereunto. Used as a Gargle, it powerfully affects cold and moist Humors out of the Head and Brain, and Parts adjacent, and do is good in the Cure of those Difficulties, the Juice is said to be good against

XV. The Saline Tincture. It more powerfully opens the Womb than the Essence does, and is used in invertebrate Obstructions thereof when the Essence is not found powerful enough. It also opens Obstructions of the Relics and Blether, provokes Urine, and expels Sand and Tartarous Matter. Doze from 3. grains to 3. in some fit Vehicle.

XVI. The Oily Tincture. This may be used inwardly, yet its chief Use is for External Application against Weakness and cold Affections of the Nerves, Tendons, Ligaments and Jouris; against all forms of Aches and Pains proceeding from Cold, or an Afflux of cold Humors, as also against Numbness, Tremblings, Cramps, Convolutions, Palsy, and the like Difficulties of the Nerves.

XVII. The Ointment. It has the Virtues of the Oily Tincture, but not so powerful but it is better for cleansing old running Sores,Sord Ulcers, malign and rebellious Filthe’s, and taking away Scabs, Itch, Rust, Measles, Morphew, and other like Deformities of the Skin.
Salmon's Herbal. Lib. I.

XXIII. The Caftapane. It has the Virtues of the Grogan, opens the Pores of the Skin more, and prevail against Scabs, Scurf, Morphoie, Lepraiformes, &c.

XX. The Alkannet. It has all the Virtues of the Gargaffin, but is better to be used by fick as cannot away with the other. It's made of the Root.

XX. The Pellitory. It is made either of the Root or Juice, with Wax and Barley-flower, and is put up into the Woods, to bring down the Courtes.

CHAP. XV.

Of Garden Angelica.

I. The Name. It is called in Greek, Ἀγγελίκα, (and yet some Authors say it was unknown to the Greeks, unless by some other Name) in Latin Angelica, and so also in English: and by this Name it is called in almost all European Nations, so far as their Distel will admit. Corvis will have it to be Panze Herbaetin, but this I much question, yet according to its Virtues, it may very well be accounted among the number of the Alkaliates: but its confidential Juice is no Opponex. Others, as Doganin and Lancang, will have it to be a kind of Lapisperum, or Laphyperum, but of that see * $. cap. 115. and 116. of this present Work.

II. The Kinds. There are four several Kinds of Angelica. 23. The Garden Angelica. 2. The Wild. 3. The Water Angelica. 4. The Mountain Angelica, of which Half we shall say nothing in this Book.

III. The Description. Our Garden Angelica has a Root, which is great and large, something pulpy before flowering; but after flowering it becomes soapy, extending it self into many and long Arms or Branches, which perish after Seed-time; but if the Plant, by being done cut down, beays from feeding, the Root will then endure many years together; this Root, if cut or bruised, juicet sprong, and discharge...
X. The Seed. The Seed has the same Virtues, but not all out fo powerful: the Pound thereof may be given to 1. dram or 1. dram and half to Sweat up, and to clear the Heart, Spirit, and Liver against Pain, and is a good preservative against Putrefactive Infection.

XI. The Distilled Water from the whole Plant. It is Bezoarick and Alexipharmick, good against Sickness at Heart, which it can either cut upon the spot, or be mostly used as a Vehicle to convey other preparations of this Plant, and others of like Virtues in.

XII. The infipitute juice of the Root, and also of the Herb. It warms, comforts and restores, incites and accelerates thick humors, relieves Poyson, and is good against the Plague, or malady of any other midsticks and internal Diforders. In the bithings of Mad Dogs, Serpens, &c. and is Pectoral, good against Wind in the Bowels, Coughs, Heartburns, Phthisics, Affirmes, Inflamed Breath, Prolapses of the Bladder, and Lungs: outwardly applied, it warms, diffuses, and resolves hard Tumours, and therefore is good in an Oedema and other like swellings of the Joyness. Doe inwards is, from 1. dram to 1. dram and half, diffused in Wine and drink.

XIII. The Extract with Spirit of Wine. It is made of the Cupar Mort. of the Herb and Plant after Distillation, &c. given from 1. dram to 3. drams in Sack, it provokes Sweat powerfully, and is an Antidote against the Plague or Poyson, Mollses, Small-Pox, Spotted-Fever, Poyson inwardly taken, or outwardly given by the biting of any Venomous Creatures. It Cures Rickets.

XIV. The Condited Root. It is a pleasant thing, and being often taken is good against Coughs, Heartburns, and Strenghtens, heals and comforts a cold and weak Stomach.

XV. The Distilled Oil which accedes with the Water. It is very powerful against the Pleasae, Obstructions, and Swellings in the Bowels, the Colick and Gripes, all Kinds of Pains, and the Infection of the Plague or Poyson: It is also good against most Dificets of the Breth and Lungs, and has all the Virtues of the Injuristic Juice of the Root, both inwardly and externally, both in all Mammalian and External Infections: It opens all Obstructions of the Urinary Pusses, provokes Urine and the Coursres, and expels both Birth and Afterbirth. Doe from liij. drams to 1. dram and half to Sweat upon.

XVI. The Balsam with Oil of Nutmegs. Take Oil of Nutmegs or Mace made by expression in 1. ounce: Balsam of Peru, 1. dram: Oil of Angels 1. dram and half, mix them. It eases all pains of the Head, as Head-Aches, Megrims, &c. proceeding from a cold cause, being anointed thereon. inwardly taken to 1. dram, in a Bat, Mithridateth and therewith to Sweat upon, it has all the Virtues of the Oil already mentioned: besides which, being put into an hollow Tooth, it eases the pains thereof.

XVII. The Aciit Salt of the whole Plant. It is a particular thing against the Plasmas, Peripneumony, Plague, or any Peltulential Infection, the Colick, Strangury, and Stoppage of Urine, for it abolishes the acid and acrimonious or malighum humors, which is the cause of the Colick and Gripes in all Diseases, and causes a pleasant and speedy Circulation, and withall it opens all Obstructions of the Lungs, and eases a free breathing. Doe from liij. Scruple to 1. Dram, to the Distilled Water, or in Wine, or other Vehicle.

XVIII. The Syrup. It is Pectoral, good against Coughs, and all sorts of inward Obstructions of the Viscera, chiefly of the Lungs, but is used mostly as a Vehicle to convey other Medicines in. Doe from 1. Ounce to 1. Ounces.

XIX. The Decoction. Taken from liij. Ounces to 3. Ounces, it is good against所有 Dificets of the Blood, wherein the Stomach, and is effectual against the Suffocation of the Mother. It makes an excellent Wound-drink, for such as have Gunshot or Cutted Wounds, old Sores, running Ulcers, feared and callous Fihid's, dippings them to a speedy healing.

XX. The Wine. It is to be made of the roots and stalks, (as is also the Decoction) and has all the Virtues of the Decoction, save that this is much more powerful to all the said Intention. Doe from liij. to vi. Ounces twice or thrice a day.

XXI. The Spirit. It is called Simple or Compound. The Simple is a most famous Cordial, fit for any other Vegetable Cordial in the World: it removes Sickness at Heart and Stomach, prevails against Fainting, Sweatings and Convulsions, whether in Old or Young, warms and conserves the Cold and weak Stomach, and as much as may, restores old Age. I cannot speak enough in the praise of it. It relieves Poyson, whether inward or outward, and the Contagion of a Putrefactive. Doe either by 1. dram to half an ounce, well dipppted with treable refined Sugar, and then it may either be taken alone, or in a Glass of Wine. The Compound Spirit you may have for Compositions, Preparations and Virtues, in our Pharmacopoea Londinensis, Lbd. 4. Cap. i. Soll. 2. to which you are referred.

XXII. The Spirituums Tinctura. It is a great Cordial Restorativ, and an excellent thing for such as are wounded, and have old running Sores or Fihid's about them, which have been of long standing, and not easily cured: for it alters and changes the disprsy of the Blood, and makes it more Bullfick, as also the other Jures: it contributes to healing, besides it has all the Virtues of the Spirit, and indeed much more powerful. It may be taken morning, noon and night, for some considerable time, from 1. dram to half an ounce, in some proper Vehicle.

XXIII. The Saline Tinctura. It is a good Venerial, and carries off much of the Mortlack excruciations and Def outcomes by Usury. The Virtues of all the Viceras, takes away Heat, Bumings, is good against the Strangury, stoppage of Urine, and other Difficulties of the Reins and Bladder. It is good against all the therms of Breathing, because it dissolves the Tarantous Maslure of the Lungs, &c. Doe from 1. dram to liij. drams in the Distilled Water, or in Mead or White Wine.

XXIV. The Oily Tincture. It is good to anoint with in the Gout and Sciatica, and all Pains and Aches of the Nerves, Tenours and Joyness, proceeding from a cold Cause, against Convulsions, Cramps, Numbnesses, Labour and Pains, and the Scoury in a cold Contitution. You may anoint with it outwardly twice a day, and take it inwardly as often, from iv. drams to xvij. or xx. in any proper Liqueur.

XXV. The Potatoles or Powders. They have all the Virtues of the Oil and Spirit, to which you are referred: as true they are not altogether to be confused with the Oil, but they are more powerful and penetrating, and more pleasant to be taken. Doe is from 1. dram to liij. drams in the Distilled Water or Syrup, or in a glass of Wine, twice a day.

XXVI. The Effleece. This is used necessary and useful of all the Preparations made of Angelica, and is made of the Juice of the whole Plant. It is good
Salmon's Herbal. Lib. I.

against the Plague, and all sorts of malignant Inflam-
ations and Pellaginous Fevers; it refills Poyons of all
kinds, as the bites of Mad Dogs, Vipers, Rattle
Snakes, or any other Venomous Creature. It de-
scends the Vial and Animal Spirits, and is a great
prevalent against all kinds of Pellaginous Inflam-
ations. It gives ease in all Pains and Tumors coming
of Cold, and is a most admirable thing against
Biliousnesses or Inflammations of the Lungs and
Pleurisy. It is a great Pelotous, opening all ob-
stacles of the Brest and Lungs, and thereby
gives relief in coughing and old Coughs, Hoarf-
worth, Alburn's or difficulty of Breathe, throatish
of Breath, and Phthisicks. It gives present aid in
the Colic, Provokes the Tumens, haffens and facili-
tizes the Brest, and brings away the After-birth
and dead Child. It open all obstructions of the
Liver, Spleen, Gall, Bowels, and Mefenteric, dif-
coubs inward Tumors, and Cures Agues, if given
several times, so as to heat well upon it. And as it
is very efficacious in the Stomach, fo is it one of
the best things against a Suffocation in the
World, a Vomit or Emetic being given before
hand. Drops into the Eyes it cleans them from
Clouds, Flamas, Specks, Petals, &c. and strengthens
the Sight. Drop into the Ears, it helps their pain
and deafness, nose and ringing in them. It heals
Wounds and Breaches, dissolves congealed Blood, and
is one of the best remedies against a Cold Scurvy.
Lastly, it is a most Singular Vulnery, not inferior
to any of the Athlete, all Bawdy, or Wound Herb.
and being given inwardly discreetly it is interior
to no Kind of Wound-drink whatsoever, for after
an admirable manner, it dissolves all Wounds, of
what kind so ever, (if cumulato, as above running
Sores, old Ulcers, and Pulpit's, to a very freely
healing. Dose of 1 ounce to 11/2 or 4 ounces.
two or three times a day, according as you fee
the occasion requires.

XXVII. The Balsam for Wounds. Take of the
Juice of the Root and Stalks infusified to the thick-
ness of new Honey viij ounces, Gum Eleimi viij ounces,
Balm Coproph, Balsam of Peru, of each i ounce,
Chio Tarpeutick i ounce, Wine and water together,
and stir them till they are nearly cold. Or take Oil
Olive a Pound and a half, of the Roots Stalks and
Leaves well bruised together, in handfulls, but till
the Oil be full cold, and press out the Oil, this work
repe times three, with the same quantity of Bruised
Roots, sec. Lastly, Preb forth the Oil: then to every
viij ounces of this Oil, add Gum Eleimi vi
ounces: Balm Coproph, and Peru, Emphiter, of
each 1/2 ounce: Chio Tarpeutick ounce, mix
them well. These Balsams whether the first, or
second, can all simple Wounds by the first Intent
on: Cleanse running Sore, old Ulcers, and Pulpit's,
of all their filth, then incantate, and in a ve-
short time heal them, almost to a wonder. Ap-
plied this, they give ease in the Gout. And in Ul-
cers, where the Bone is bare, the Powder fixed
on, and the Balsam apply'd over that, covers the
Bone with Flesh, and heals it up.

XXVIII. The Scentor. It has the Virtues of the
Balsam, but not altogether so powerful: yet a
singular Vulnery, heals Wounds and Ulcers, and
casts vils in any part being anointed thereon.

XXIX. The Concoction. It is made of the Roots
and Stalks saved small and beaten to a Pulp, mixed
with Hogs Lard, and Crums of Whureen Bread, till
it is of a Consistency. It is good against the Gout,
Sciatica, or any External pain from a Cold Castle,
and is of singular use being prettily apply'd to the
bloody of Mad Dogs, Serpents, &c. to draw forth
the poison applied to the Region of the Spleen,
and relieve the pain therefrom.

XXX. The Curative or Emptisher. The Powder of
the Root is made into a Plaster, with the Joyce of
the Roots Inflated so thickness of Honey, and
Pitch added to it, with sufficient Quantity of Bees
Wax. It draws strongly, and therefore is good to
be apply'd to the bites of Mad Dogs, Vipers, &c.
as also to the Scabies, and the Gout whether in
Hands or Feet.

XXXI. The Concoction. It is made of the
Efficace and Decoration mixed in equal Quantities,
with a third part of Vinegar. It heals Ulcers and
Sores in the Mouth, and attracts cold Humors and
Rheums, from the Head and Brain, it may be used
morning and evening.

XXXII. The Emetic. It is made of the fresh
Joyce drawn out of the Root and Stalks, in vi.
ounces of which six drams of Sal Auro in fine
Pounder is diluved. Being drawn up in the Nefritis
evening and morining, it admirably purges the Head
and Brain of Cold, thick Flegm, and other Humors,
which are the foundations and Causes of many pe-
niculous Diseases.

CHAP. XCVI.

Of Wild ANGELICA.

I. T HE Name. It is called in the Greek,
"Aγγελικη Αίγις" in Latin, Angelica Syn-
epheris: and in English, Wild Angelica.

II. The Kind. It is the second Species of
Angelica before enumerated in chap. 19. sect. 2. along-
side: and of this there is a greater and lesser sort.

Wild

Angelica

III. The Description. The greater sort. The
Root of this is nothing so great as the former,
either are the strings so great or long, but it is of a
blackish Colour on the one side, of a pretty strong
flavour, but nothing near so Aromatick, as the Garde-
kind: from this Root rises up large spread Leaves
on the Ground, having smaller Stalks, and lesser Divi-

smaller foyets and leffer Leaves thereat, at the tops grow Umbles of Flowers, but leffer also, and white, like the Garden kind, which turn into smaller Seed, and of a darker Color on the out-side.

IV. The smaller sort, has a great thick Root, from whence rises up Leaves not much differing from the other, but only in being smaller and not so much divided, from whence arise one or more Stalks, lower or than the former sorts, at the tops of which come forth Leaves not much unlike the Garden Angelica, except in the Magnitude, the Stalks all growing redish, at the top of these Stalks grow Umbles of white Flowers, yet leffer than the other, after which comes the Seed, which is thinner than the former, and something longer.

V. The Places. Those grow Wild in many places of this Kingdom, in Essex, Kent, and Middlesex, particularly at Kentish-town near London, and in other places.

VI. The Times. The Roots are in their Prime in February, March, and April, they flower in July and August, and their Seed is ripe soon after.

VII. The Qualities. They are hot and dry in the second Degree. Are opening, inclosing, astringent, digestive, diaphoretic and tincturific, and are appropriated to the Head, Stomach, Heart, Womb, and Joints: they are also Alexipharmick, Alterative and Venerary.

VIII. The Specification. They are peculiar Antidotes against Plague and Poyson, Specifics against the Goat, and singular Bland Herbs.

The Virtues.

X. As to the Virtues of the Wild Angelica's, they are exactly the same with the Garden kind, which we have largely delivered before, and we were the more willing to be explicit in the Garden kind, there, because we intended to say nothing of the Virtues here. For every Preparation of the Wild kinds has the same Incidences and Uses with those of the Garden, and therefore to them you are referred. Yet here is one thing to be taken notice of, viz., That the Virtues of both Garden and Wild kinds are one and the same, yet the Garden kind much exceeds the Wild in Strength and Virtue, and therefore is rather to be chosen (where it may be) before them. These are dryer than the Garden kind, and ought to be put into all Diet Drinks for Wounded Perns.
greater than the Garden kind, and somewhat redder at the Tongs, from whence the Leaves by a large foot-Stalk rising, white lower part, seem to enclose the whole Tongs, and to be of a reddish Color also. These are of as deep a green Color as those of the Garden sort; from this Stock, a foot or more, and very much branched, coming forth as an Bunch or Casket, not much unlike the common Garden Daffocks, at the top of which Branches come forth Daffocks of white Flowers, very like to those of the Garden kind.

After the Flowers come the Seed, broader, longer, thicker, and of a much darker Color than the Garden Daffocks; and the smell of the Flower is much like the same.

Salmon’s Herbal. Lib. I.

IV. The Plant. It grows naturally in England, in moorish and watery Ditches and Ponds, from whence it took its Name; and in particular in the Marsh Ditches by Redditch.

V. The Times. It Flowers also in July and August, and its Seed is long after, but its Root is in its prime in March and April.

VI. The Qualities. It is hot and dry in the second Degree: is Inhaling, Astringing, Appetitive, Digestive, Diffusive, Attractive, and Alleviative: it is Calciferous, Stomachick, Cardiack, Urinary and Voluntary.

VII. The Specification. It is a thing peculiar against the Scurvy in a cold habit of Body, and one of the greatest Vulnifcaries among Vegetables.

The Virtues.

IX. The Efficacy. Setting Scurvy-Sores aside, I can speak by singular Experience, that I know nothing among Vegetables so effectual for the curing of the Scurvy in a cold habit of Body: and as a Vulnifcarious, I have used it I believe above an hundred times, with such success as is admirable.

Again in Diseases of the Womb, I know this to be more prevalent than the Garden, in cleansing it, in expelling the Vapors, and helping pangs of the Mother. I remember I once gave this to a Woman, who had a break of the Baby birth in the Womb, with a Tumor as big as a small Ostrich Egg, which almost continually bled, with very great pain, but not continually: this same Physician and Chirurgians determined to bathe the Cancer of the Womb, and to uncur it: it was dubious what to do, and the Distick feared difficult to cure, if at all Curable in this manner: however I advised her to the Plentiful use of it: for some time: she took its oozes of it, morning, noon, and night, and continued it for six Weeks, at the end of which time the blemish became perfectly well, and by the use thereof, the violed great quantities of hard clotted Blood.

X. The Liquid Juice. Either alone, or with a little Nitre dissolved in it, is an excellent Elixir, to be bruised Blood-warm up the Nostrils, till it comes out of the Mouth; it purges the Head and Brain of much cold, catarrhal Humors, taking away headache and heaviness of the head.

XI. The Decoction in Wine and Water. It is an excellent Hydrick and Voluntary, and may be of good use to such, who cannot be obliged to take either the Junce or Elixer. Dofe, of or twice a day.

XII. The Saline Tincture. It is an excellent thing in a Scorbate, where the whole Malodour Blood is tainted, and the Patient begins to be Corpulent, its Stools, Leaps, Caeca, &c. departures the Humors, and carries off their Piquancies effectually by Urine.

Dofe from 1 dram to 3.

XIII. The Diet Drink. This is chiefly intended for Wound-ed People, and such as have In-veterate and running Sore Ulcers, and Plasters thereof, yet it is of as great service for such as are afflicted with the Scurvy, have an obsturations, pain or tumor of the Splenic, or any grand dissection of the Womb. It is drank daily Spring and Fall as ordinary Drink and at any other times when occasion requires it. It is also found by experience to be good against Hypochondriack Melancholy.

XIV. The Cataplasm. It is useful against a cold Gout, to diffuse tumors, ease pains, and all those fishy running Sores and Ulcers.

XV. The Balsam. It carries simple Wounds, which are without Collecture of the Bone or Constitution by the first intention: it also cleanses foul Ulcers, incarnees and heals them.

XVI. The Canse or Emplajier. It has an attractive force, incarnees and heals, galls pain, and strengthens the part it is applied to.

CHAP. XVIII.

OF ANISE.

I. THE Name. It is called in Greek Anisos; in Latin, Anisum: And in English, Anise. I am apt to believe it is called Anis in the Greek, because it is not to be over-come, which, I suppose, is in respect to its extraordinary Taste and Smell, which overcomes the Taste and Smells of all other Vegetables in the World.

II. The Kinds. It is two-fold, 1. The Common, of which we shall Treat in this Chapter. 2. The
III. The Description. It has a small long Root, with some two or three Birds, which is Perishable every Year, from which rises up a Stalk round and hollow, about two or three feet high, (seldom higher, for it is a tender Plant) which is divided into divers small Branches, set with Leaves next the Ground, some whitish and downed in about the edges, but those which grow higher are more jagged, much like a thigh of young Parsley, but Whiter: the higher Leaves are also looser than the lower, of a whitish green color, and of a good facet to the Touch and Smell: the higher the Stalk the rounder it is, and spreads not into Branches, fowing near the top, where it thins it falls forth into several spike rambles or tufts, on the top of which, Umbels of white Flowers do stand, which afterwards do give some roundish long seeded of a white grey color, and very sweet, and of a quick, per pleasant Smell and Smell, and more in Quantity than any other Umbelliferous Plant whatsoever.

IV. The Places. It grows plentifully in Egypt, Syria, Candia, and other Eastern Countries: it grows also in England in the Gardens of Herbals, where it has well enough thriven, and brought forth Seed perfectly ripe and good.

V. The Times. It is Sown with us in England in May, and the Seed is Ripen in August. But you may Sow Aniseeds here, in England, in February, when the Moon is at Full, or any time between the Full and the Change: if by reason of Salt, you cannot take the Full Moon, you must take the next Opportunity, and call them into the Ground, raising them well in; after which, Strew fresh or new Horsetail, thinly upon the Ground, and from the Frits, to Will these and be ripe about Barbotometoe-side: Then Sow again in the Full Moon in May, thaf, if the Weather be kind, may be ripe sooner than the former. Aniseed will also come well up, if they be Self-Fow, only the Ground is to be broken up to near to and about them, when they begin to ripen. The time of their Flowering does continue four or five Months, so that, at one time, you may find the Plant in full Flower, and the Seed near to its full Growth, as you often see in Vannet, Ditl, &c. That Ground which you would Sow in February, you ought to break up about Michaelmas, and to let it lie and Cumble at Winter, or when you intend to Sow it, you must stir it up again, that it may be mellow; for the mellower, the better; and a black, rich, mellow Mould is the best, for they delight in a well dugged rich Soil.

VI. The Qualities. It is Hot in the second Degree, and Dry in the fist: The Seeds are Opening, Inducing, Attenuating, Digestive, Diffusive, Carminative and Anodyne; and by their Appropriation, they are Cephalick, Stormatick, Pectoral, Hyperiace, Neiphrilic, and Aristick: They are also Laetogenetical, Sperrmategenetical, and Alterative.

VII. The Specification. They have a peculiar property against Coughs, Shortness of Breath, Difficulty of Breathing, and the Colick.

The Virtues.

IX. The Seed. Schroder says, it is milder when green, Artematis, Diffusive, provokes Urine, breeds Milk, is Pectoral, and good for the Stomach, and to open Obstructions in the Lungs; it is given in Pousder to those who have their Bubbles frothing with Wind: A sprinkle given to a Child, Purges and Vo- mitis gently, and carries off those great External, which in those little ones cause Gripings, vehement Pain, Fickness at Stomach, and frequent Colisons: It is a Specifick also in curing a Rubbous Chicough.

X. Aniseed Confits. They are good specifick Coughs, open the Lungs, expel Wind, and give ease in the Colick.

XI. Aniseed Confits Laxative. They are made by a Maceration of the Seed in Water, in which Scrammony has been Diluted, or by mixing the Pousder of Scrammony with the first Coverings of Sugar, or by Macerating them in an Infusion of Viraum Antimonii. The former Purges gently, without any Pain, Griping or making Sick; the last both Purges and Venoms; but they all carry off Sharp Corrodings, Slimy, Elemtic, and Tantarous Humors, help Digestion, empty the Lungs of the matter Odfrothing them, and Cure the Colick. Dose from half a dram to 1. drams.

XII. The Diluted Water of the whole Plant, or of the Seed. It is a good Vehicle to convey other Medicines in, besides which it expels Wind, is good for Sour Eyes, and encreases Milk in Nurses. Dose from 1/2 to 1. Ounces.

XIII. Aniseed Water Dilisffilf off from Aqua Vitae, or Spirit of Wine. It confures the Stomach, opens the Lungs, helps Obstructions of the Liver, expels Wind, causes Diſgeltion, and prevails against the Col- lick. Dose 1/2 Drams to half an Ounce, now and then upon occasion.

XIV. The Chymical Oil. It is an admirable Pe- corial, Curing most Disaffes of the Breast and Lungs, as Coughs, Cold, Afflma's, Raynec, Wind- ines of the Stomach, Purticilik, Colick, and indeed all Diffakes proceeding from Cold, and Wind, is
provides Luft, and is often given with good Success in Fiss of the Mother in Epilepsies, Apoplexy, Vertigo, Megrimus, Head-ache, Lethargies, Drows, and other Dilatations proceeding from Cold Miasmatic Humors. Dose from ½j. Drops to x. in dose in Vehicle or Liquor.

XV. The Food Salt. It is an admirable Peptolae and Nephastick, it Diffolves Tarrazous Matter in the Lungs, Reins, Ureters, Bladder, or Womb, opens all Obstructions of such Parts, provokes Urine, and brings away Sand, Gravel, or whatever creates a Stoppage in those Parts. Dose ½ Scrapel to half a Dram.

XVI. The Green Herb. The Decoction in Water and Wine, being drunk several times a day increses Milk in Nurses, and Bolts in Oil of Roses, and drop into the Ears, takes away their Pains, and removes the noise in them. The planting this Herb near Bees, is the best means for the keeping of Bees, and it makes the Great Store of Honey; for nift it yields an innumerable company of Flowers, and is continuall in flowering for Four and sometimes Five Months, or more. It is Seasonable, and their Flowers yield much Sweetness and Honey, and carry a Scent so pleasant and grateful with them, that the Bees rather chuse to feed upon it, than upon any other Flower whatever; besides they contain an excellent Sweetening Ferment, by which the Dew is converted into a more Thick and Sweet Substance, by many degrees. A small Dew, which contains within it a Stachiniu Milk, which the Bees greedily refer to it, and with, and with which they load themselves: But the main excellency is the long duration of its flowering time, so that it will afford them a supply, the greatest part of their gathering-time, whereas the Blossoms of Fruit-trees, and Flowers of other Herbs, are only at a peculiar season, and of small continuance. The Green Herb being taken, and the inside of the Hive, as also the Onices thereof being rubbed therewith, will so much delight the Bees, that when their Swarming time comes, which will be Three Times a Year, if they feed on this Herb, they will certainly enter into them, and go where else. But in cafe when they Summer, they shall settle upon some Tree, or other Place, the fault may be helped by rubbing the inside of the new Hive with Green Anise, and holding it on the Top of a Pole to the Bees for by the Sweetness or Smell of the Anise, they will be allured, to enter therein, of their own accord. It is reported, that a certain Lord of Ausrriais so thrived by this Secret, that he furnished many Countries with Hony and Wax, whereby he Accumulated to himself vast Wealth, and a very great Estate.

XVII. The Essence. Whether it is prepared of the Herb, or Green Saw, or both, has all the Virtues of the Chymical Oil, but not all our powerful, for which reason this is to be given in a much larger Dose, as from 1. Ounces to 2. Ounces, or more, it powerfully opens Obstructions of Liver, Spleen, Lungs, Reins, and Womb, and is singular against the Falling-Blooms, Convolutions, and Colic: It powerfully provokes Luft, is good for such as are Importunate, Vomitive, for it mightily encreases Seed in the Seminal Vessels, as also Milk in Nurses, and provokes against Poison, and the Bitings of Mad Dogs, or any Venous Creatures.

XVIII. The Petrifates or Powders. This Preparations has all the Virtues both of the Oil and Essence, and is much more pleasant to be taken, and in particular is a singular thing against Vapors, the railing of the Mother, Frenzy, Madness, and other like Distempers of the Brain; you may give from 1. Dram to ½j. or 2. Drams, in any convenient Vegetable, it is very good against Convulsion fits, and Cures (outwardly by Bathing the place with it) all kinds of Pains, Aches, and Cramps, proceeding from a cold Caufe: It is good also to Prevent and Cure After-pains of Women in Child-bed, being inwardly taken, and outwardly bathed upon the Region of the Belly, a warm Flannel dipt alio in the fame being laid over it.

XIX. The Spirituous Tincture of the Seed. It has the Virtues of the Oil and Powers, but scarcely to strong; and cattles an Expectoration of Flegm in such as have Coughs, Colds, Shortnesses of Breath, Althma's or Difficulty of Breathing, and all kinds of Pains, Aches, and Cramps, proceeding from a cold Caufe: It is good also to Prevent and Cure Rhinolites, Hiccoughes, and all kinds of Catarrh, and for all sorts of cold Spleens, or Liver, or the like. Dose from ½j. Dram to ½j. Drams, in some convenient Vegetable.

XX. The Saline Tincture. It is a Speciñck to dissipate both the Wind and Water in the Dropsey. Tympanizates, or Mils in Nurses, facilitates the Birth, brings away the After-birth, and dissolves Tarrazous Matter, whether in the Lungs, Womb, Reins or Bladder, and therefore powerfully Provokes Urine, and expels Seamen from the Body, &c. Dose from 1. Dram to ½j. Drams, or more, according to the Age and Necessity.

XXI. The Oilly Tincture. Altho' it is good in Difficulties of the Reins, Lungs, and Bladder, and may be given inwardly, for many Difficulties of the Liver, Bile, and Spleen, yet it principal use is in External Applications, for being Administered upon the Part, it cures Cramps, Old Aches and Pains, Goats, Numbness, Lamenlous, Tremblings, and Palsies, proceeding from a cold Caufe, and Vipers and Tarrazous Humors, jest in these very cafes it may also be taken inwardly from v. or ij. Drops, to x. or xij. in Wine, &c.

XXII. The Decoction of the Seed. It is peculiar for breeding Milk in Nurses, and if made in Wine, it opens Obstructions of the Liver, and is very proïcular in curing the Dropsey, Affises, or Amaurica; it stops the Hicough, helps Digestion, puts up Luft, is good against Coldness, Scrophulous, and Bitings of all Venous Creatures, helps a Steeking Breath, Provokes Urine, and Expels Wind in any Part, whether Head, Stomach, Spleen, Bowels, Melenery, or Womb, and from this it is very efficaciously for two or three Times a Day.

XXIII. The Balsam. It has all the Virtues of the Oilly Tincture, being outwardly Applied, and Cures Wounds, though of the Nerves, by the first Intention.

XXIV. The Cutepifain. If it is made of the Seed, either Green or Dry, and applied to the Eyes which have any thing fallen into them, it quickly draws it forth, and being applied to any place Bitten with a Mad Dog, it provokes Nerves, and Cures in a moment, thirst at the Nerves, as the first Intention.

XXV. The Extract. If it be made of the Seed, or Oteous, and applied to the Eyes which have any thing fallen into them, it quickly draws it forth, and being applied to any place Bitten with a Mad Dog, it provokes Nerves, and Cures in a moment, thirst at the Nerves, as the first Intention.
CHAP. XIX.

OF LOVE APPLES.

I. THE Name. It is called in English, as Angliarius says, Amoramus, & Amorum: in Latin, Pomum Amoris, Pomum Aurosum, Malum Amoris, Malum Aurosum: And in English, Love Apple.

II. The Kinds. There are but two sorts thereof, viz. the Greater kind and the Lesser kind: and of the Greater, there are also two sorts; but they differ in nothing but in the colour of the Fruit, the one being of a Fair Reddish colour, the other of a pale Yellow.

III. The Description. The Root of the Greater kind, which is Small and Thready, roots forth into many small Strings, and larger Branches, under ground, which pierce at the first approach of our Winter, from whence springing forth very round Stalks or Branches, but and Full of Juice, trailing upon the ground, not able to sustain it self upright, by reason of the weakness of its Stalks, and also of the great weight of its Leaves and Fruit, whereby it is loaded. The Leaves are many, long, and angular, viz. many Leaves set on both sides a middle rib, four greater, others left, deeply jagged or dentated about the edges, of a greyish, over-green colour, somewhat rough and hairy in handling; from among these Leaves and Branches come forth long Stalks, with many Yellow Flowers set thereon, upon several short foot Stalks, clustering together in Bunches, consisting of Six, and sometimes of Eight small long yellow Leaves, with a kind of Prick in the middle. After the Flowers are fallen, there comes in place the Fruit, which is about the bigness of a Golden Pippin, very fair and pleasing, attarly scented, succulent, and breakable in many places, (there being formerly any which are completely round without these Bunches) of a fair, or bright flaming pale reddish colour, and sometimes deeper; and of the yellow kind, not much unlike to a pale Orange colour. The Pulp or Meat is very full of moisture, soft, gelatinous, or yellowish, of the sub stance of a White Stem Plant, in which the Seed brain, which is small, white, roundish, flat, and somewhat rough. The whole Plant is of a rank smell.

IV. The Lesser kind has a Root like the former, which pierces in the manner every Year, from whence comes long trailing Branches, bestill with such like Leaves as the Greater Kind, but smaller in every part; the Flowers also stand many together on a long Stalk, and yellow as the former, but much smaller; the Fruit are also small, viz. round, yellowish, red Berries, not much bigger than great Grapes, in which are contained colour, round, flat Seed, like the former, but smaller. If you would have them every Year, you must new Sow them every Spring, or else let them Sow themselves, so will they rise without any further trouble.

V. The Places. They grow naturally in hot Countries, as in Ethiopia, Barbary, Egypt, Syria, Spain, Italy, and other hot Countries: Some report they were first brought to us from Persia, and I have seen them grow in Carolina, which is the South-East part of Florida, but with us in England they grow only in Gardens, where being nourished, they bring forth their Fruit to perfection.

VI. The Uses. The Seed is grown in the beginning of April, in a Bed of hot Hork-dung, after the manner of Macc Alems, and such like cold Fruits; they Flower in June, July, and August, and the Fruit is ripe for the most part in the middle or end of September.

VII. The Qualities. The whole Plant and Apples are Cold and Moth, almost in the fourth Degree; but not so Cold as Mandarines, they are Caphallik, Stomachick, Nephritick, and Urturine; of an Attenuating, Curing, Reparative, and Anodyne Quality; and operate only as Alteratives.

VIII. The Specification. They are peculiar to al lay the heat of Inflammations, but more especially of an Erysipelas.

IX. The Preparations. The Shops keep nothing of this Plant, but you may have from 1. The Apples themselves. 2. The Juice. 3. An Elixir. 4. A Cauphem. 5. An Oil. 6. A Balsam for Wounds.

The Virtues.

X. The Apples. In Spain, and those hot Countries, they use to eat the Apples prepared and boiled in Vinegar, with Pepper and Salt, and served up with Oil, and Juice of Limes; and newly they eat them raw, with Oil, Vinegar and Pepper, for Sweeney to their Meat, as we here do Cucumbers, but they yield not much nourishment, but only pleas and cool or quench the Heat and Thirst of hot Summers.

XI. The Juice. Applied upon Inflammations, but especially bathed upon an Erysipelas, and Linnen Cloths wet in the same, laid thence, abate the Inflammation, and take away the prevalent heat.

XII. The Elixir. It reprehends Vapors in Women, as good against Fits of the Mother, opens the Obstructions of the Urine, taking away the heat and Kahnling thereof; is good against Sand, Gravel, and the Stone, and gives eafe in all Pains proceeding from a hot Cattle. Dose from 3 to 10 ounces.

XIII. The Cauphem. It is good against the Head, all, Megrim, Gout, Sciatica, and all Pains which ever proceeding from a hot and dry Cattle: In outward Applications it ought to be renewed twice a Day.

XIV. The Oil. It Cures all manner of Burns, and Scollings, whether of Fire, Water, Oil, Lead,
Salmon's Herbal. Lib. I.

Of MAD APPLES.

I. The Name. This Plant has no known Greek name, (except *Mala uniflora*) may be taken for it, which is more properly the name for *Salmonia hurtifolia*; but to supply the place, we may call it *Mala uniflora*. Pl. Mala uniflora; 2. In Latin, *Malus uniflora*; 3. In English, *Allspice*, and *Mall Apple*, and *Mad Apples*.

II. The Kinds. There are three Kinds, 1. The Syrian. 2. The European. 3. The Ethiopian, of which we shall say nothing in this Work.

III. The Description. 1. Of the Syrian. It has a Root composed of many strings, some great, others small, and running down deep into the ground, which continues not all Winter, but perishes with the first Frost. From this Root rise up a great, hard, round, purplish, or brownish green Stalk, two feet high, divided from the bottom into divergent Branches, wherein are so many hairy, broad, rough Leaves, somewhat nastily on the edges, and somewhat hairy, in the middle, and somewhat spotted, in others a pale, but deadly purple Colour, with yellow threads in the middle, which, going away, there comes forth large, somewhat long, and round Fruit, in the warm Countries as large as a Cucumber, but in colder Countries fomewhat bigger than a large Duck or Goose Egg, set in the same Husk or Cup, which before contained the Flower, whose Colour is in the inside is usually according to the Fruit it bears, either of a milky Green, more yellowish, or of a purplish red Colour, or of a Pale or Wan purplish Colour, with a very thin Skin or Peel, and full of a milky pulp, and Juice, having so many small flat whitish Seeds within it, somewhat greater than those of the Love Apple.

IV. The Malta Infima Fitrnta, borne a Root hermaphroditic, and mix much differing from the former, and perishing every year, after Seedling time; from whence grows an upright round Stalk, about the thickness of a man's Finger, and about a foot and half high, from whence spring forth in several Parts, sometimes on the one side, and sometimes on the other, divers long, and somewhat broad green Leaves, unequally cut in on the edge, and ending in a long point, three for the most part coming together, each of them upon a short Foot-Leafs at the tops of the Stalks, come forth the Flowers, confliting of so few several Leaves, after which succeed the Fruit, which are round reddish Brown or Apples, about the bigness of a Plum, and very full of Seed.

V. The Flowers. The first grows in Syria, and Egypt, where it grows plentifully and Wild, and in most of the East Indies, where the Fruit grows to the bigness (as Beleiius reports) of a great Cucumber; it also grows with us in our Gardens, where it bears Flowers, and as Gerard says, in a temperate or warm Year, Fruit also, which he favours of the bigness of a Goose Egg, but came not to ripeness. The Euroopean grows in shady places upon the Appenine Mountains, and has been transplanted also into our Gardens.

VI. The Times. The Seed must be sown in April, in a Bed of hot Host Dung, as Musk Melons are, and then it will Flower in August. It bears Flowers in August, and if the Summer is warm, its Fruit comes to perfection in September.

VII. The Qualities. They are cold and moist, according to the fourth Degree. They are Curing, Repulsive, and astringent, and nourish the Joints and Viscera. And by Appropriation are dedicated to the Head, Stomach, and Joints; and acting as Alternatives.

VIII. The Specification. Their chief use is for cooling an Excessive, and inflammations, eating Rains proceeding from vehement hot and sharp Humors, and healing of Wounds, but they cause no Magdeis, as the name would seem to import.

IX. The Preparations. The Shops keep nothing of this Plant, but you may have therefrom, 1. The Apples themselves. 2. A Pinc. 3. An Essence. 4. A Catepholin. 5. An Ool. 6. A Balsam.

The Virtues.

X. The Apples. They are boiled in Fat Broths, or rather in Water and Vinegar, and so eaten, being found to purify both the Blood and the Blood. For this at Genoa is a great Difie. From this Eas, there is a superabundant coldness and mustiness in them, as there is in Cucumber and Alyssum, but the beauty...
houry of the Fruit, and the wonderful delight they give to the Palate, also their Inciting to Venery, (which most Windy things, as these are, do) are the great Motives which incite to the eating of them. Wherefore in Italy, and other hot Countries, where they come to their Full Maturity, and proper Ripen, they eat them with more Define and Ripen, than we do Cucumber, and therefore Prepare and Dress them in divers manner, some eat them Raw, as we do Cucumber, some Roast them under the Embers; some first Boil them, then Pare and Slice them, and so Eat them as first related; some stew Flower over them, and Fry them with Oil or Butter, and serve them to the Table with Pepper and Salt; and some keep them in Pickle, to spend in Winter, and the next Springs. Yet Auct.-anna. lib. 2. cap. 455. Concerns them as burned things to the country, Apocrapha Commands them. I believe it is true, that they yield but little Nourishment, and breed much Wind, whereby it's possible they may provoke Boothy Laff. At Tobaco in Spain, they eat them with great Define, being Belted with Fat Fift, then putting thereto some Scrapped Cheefe, then keep them in Honey, or Vinegar and Salt Pickle all Winter, to eat as Winds, when they have a mind to it, to procure Laff.

XI. The juice. It cools the heat of the Reins, and the Stinking of the Urine, taken to 3 ounce in Aridt Water: Applied upon Inflammations, and bathed in an Erysipelas, and Lasso Cloths whereupon being laid thereon, it abates the heat of the Inflammation, and cures the Erysipelas: It is also of singular use against BURNSs and Scaldings, of what kind soever: If the Skin is not broken, diffine in it a good quantity of Salt, and lath thereon.

XII. The Effence. It is an excellent thing against hot vapors of the Womb, and Fits of the Mother; and is good against Sand, Gravel, and Tartarous matter obstructing the Urinary Passages. Dose from 3. to 4. ounces.

XIII. The Cataplasm. It is good to be applied upon Burns and Scaldings from what caule ever, it takes out the Fire, and allays the Heat and Inflammation: It may be good alio in an Erysipelas, being often renewed, and is prevalent against the Heat of Heaves, Wofls, Hands, Fingers, Legs, Feet, Toes, or any other Pain or Ache, proceeding from a cold Caule; and is good to be applied to a slight Contusion or Blow, being laid before any other Articles.

XIV. The Oil. It is good against all sorts of Burns and Scaldings, with Fire, Water, Soap Loses, Oil, Pitch, Tar, Lead, Gumpoysor, &c. being anointed therewith, and taken within the body, Cataplasm aforegoing properly after applied, and often renewed; and kish all the Viruses of the Cataplasm, except in the case of an Erysipelas, where Oily Bodies rather inflame, than do any good. It gives ease in the Negrain, and Head-ache, from a hot Caule, and takes away the black and blew Marks which arise from Blows, Falls &c.

XV. The Balsam. It is a singular Valuerary, prevalent, and allays Inflammations in Wounds and Ulcers, coming from what accident Fever: It cleants Ulcers and Fistula's, and speedily heals them afterwards.

CHAP. XXI.

OF THORNE APPLES.

I. THE NAME. It is called in Greek, Hesperi-

Delicolos. (See also in Apocrophya, Cucumber; &c. A Night casting.

Drolhick:;) In Latin, Stramonium, Melleforsis, Alatam Spiniferum, Pomum Spiniferum: In English, THORNE Apple, and THORN Apple. Matthioli thinks this to be the Aue Betch of the Arabians.

II. The Kinds. It is twofold, 1. That generally grows with us in England. 2. That of Peru. And of the first Kind, there is both single and double, with very much Colours in the Flowers.

Thorne Apple of Peru.

Stramonium

III. The Description. The Root is small and thra-

days, from whence springs up, one great STalk, four, five, or six feet high, seldom higher; and two or three Inches, or more; thick in Diameter, and sometimes four or five Inches thick, upright and straight, having very many Branches, and sometimes but few, upon jointed Stems; on which do grow Leaves, smooth, very broad, and eat up, or jagged about the edges, long and broad almost as a Spinage Leaf; and not much differing from the shape of Goose-foot. The Flowers come forth of long Toothed Caps, great, white, and of the form of a Bell, or like the blower of the great Sundew, which firearms in hell in Hedges, but altogether greater, and wider at Mouth, and sharp cornered at the brims of a strong small, so that it offends the Senet; after the Flowers follows the fruit, singling of the fashion of an Egg, set about on every side and part with sharp Prickes, almost like Thorne, within which Shell is contained very much Seed, of the bigness of a very small Tar, and almost of the same fashion, and of a blackish brown, or black Colour.

IV. The Thorn Apple of Peru has a Root thicker than the former, with some thick Branches, from whence runs several small springs, and out of which springs one pretty thick upright Stalk, about four or
or five feet high, seldom higher, nearly two inches thick, having very few Branches, sometimes none at all, from which Stalks and Branches (where there is any) grow forth every large Leafts, foweth and even, little or nothing inclosed about the edges, longer and broader than the Leaves of Nightshade, or Had Nightshade: from the bottom or foot-stalks of the Leaves growing forth long Toothed Carpels, out of which come the Flowers, great, white, and of the form of a Bell, or the flowers of the great Belladonna; but greater and under at Mount, and sharp cornered at the base, like the farmer, which contains white Thieves or Thieves in the midst, of a strong Pomfick Sourness, offending the Head when it is smell'd to: When the Flower is open, the fruit comes forth, of the biffes of a fmall Walnut with the green on, this fruit is fall of Thieves, within the Shell are a great number of Seeds, of the biffes of Scanty, or Seeds of Mandrakes, and of the same form. The whole Herb is of a fharp Sourness, and smell'd to it caufes Drowsiness.

V. The Places. The first was brought from Constantinopile, and now grows with us plentifully in our Gardens; it also grows Wild and very plentifully in the South Carolina. The latter was found growing in the Mountains of Peru, from whence the Seed was sent to Manardus in Spain: and from thence it was conveyed unto other parts of Europe; and now it is nourifh'd up in forc of our Gardens in England.

V. The Times. The first may be sown in March or April, and it brings forth ripe Seed in September, flowering in the Months the latter is sown in a hot Bed of Horse Dung, as we do Cucumber's and Mark-Melons. Authors fay, of both these fruits, there is a greater and a leffer Kind, and that the greater Kinds are plentiful enough in our Gardens, and ftrain out, and give us ripe Seed; but the leffer Kinds are very rare, because they fail commonly to come to maturity, and fo we are every Year to seek for new Seed.

VII. The Virtues. These Plants are fad to be cold and moifl in the fourth Degree: and to be Recuperative, Narcotic, or Stupefactive, and Vulnerary: and are by approfition, Cephalick, Hypnotic and Anthropic, and operate only as Altematives by their cold and moifl property.

VIII. The Specification. Manardus fays, that the Indians commend these Plants for provoking Urine, and expelling Sand and Gravel from the Reins and Bladder: and by Gerard's account, it is a famous Wound Herb outwardly used.

IX. The Preparations. There are taken from it, 1. The Seed, 2. The Soap, 3. An Eflence from the fame. 4. An Oil. 5. An Ointment. 6. A Cream or Emplifier. 7. A Cataplasm.

The Virtue.

X. The Seed. It is of great Eminence in the Indians both by the Spaniards and Indians themselves, in that it provokes Urine, and expels Gravel and the Stone both in the Reins and Bladder, for which it is most commended: it is fad to break the Stone in the Bladder, it is too hard and INurate, or may be any medicine, but diffolved, of which there has been many proofs, as Manderanfis, has been declared to his great admiration: For, as he fays, he did not think that the Stone in the Bladder could be diffolved and expelled by any means whatsoever, and that the Cure thereof could only in Cutting it out by a skillful hand: but it was fad of this Seed, that it was found in any Fir and convenient Water for that purpofe, that it would by little and little diflolve the Stone into small Gravel; which after it is expell'd, or driven forth, would again stick together and Grow into a hard Stone.

XI. The Juice of the Herb. It is Singular good to bath with in all Sorts of hot Inflammations and an Eflence, by laying Cloths dip'd in the Juice upon the fame, and often repeating the Application.

XII. The Eflence of the Juice. Drought into the Eyes, it allays the Inflammation thereof, and removes hot and Sharp Rheums. Mixed up the Womb it is good against the continual running of the Whites, strengthens the Part, and cools any Inflammation of the fame, or of the Sacref; it also is good against all Sorts of Inflammations in Wounds and Ulcers.

XIII. The Oil, made by boiling the bruifed Herb in it till it is crisp, is good against all Sorts of Inflammations, Blisters and Scaldings, and gives relief in a hot Gang, and Pains and Aches, in the Head chiefly, proceeding from a hot Caffa and Humor.

XIV. The Ginnet, made of the Juice or ifbruifed Herb, boiled to criptif, and twice thrice reperted, in Hogs Blood, and then prifed forth, cures all Inflammations whatsoever, and heals all manner of Burning, Scaldings, whether of Fire, Water, Oil, mixed Lead, Gun-Powder or Lightning, and that in a very short time: This was proved upon a Man which was at Coldfeather, who (after the use of many other things in vain, and when all hopes were fail) being gravely burned was bewildered with perfect cures.

XV. The Emplifier. It is made of the bruifed Herb, boiled in Oil, or to criptif, and prifed forth, and three times reperted, and then brought to a body with Turpentine, Rohn and Wine of each a sufficiency. It cures maligla Ulcers, and Apoafms, helps a hot Slump, and prevails againft leath and Green Wounds, and old Sores and running Ulcers, especially upon the Glandulours parts of the Yard, and other places where they are hard of Cure.

XVI. The Cataplasm. It is good against Scanty Bruises especially upon a bony part, to allay Inflammations, and eafe the Gout and other Pains proceeding from a hot Caffa.

CHAP. XXII.

Of Red ArchangeL

I. T H E Names. It is called in Greek, AmboFvop. in Latin, Lamium purpuracum, Urtica inners purpurea, Urtica morus rubra: in English, Red ArchangeL, or Red Dead Nettle.

II. The Kinds. It is twofold, 1. The Sweet, called simply Lamium purpuracum. 2. Stinking, Rausora, Rausor, Rausor, Rausch, and in Latin, Lamim purpureum, Urtica inners firit, Urtica morosus flaves, Urtica Lacent, stinking Dead Nettle or Hedg Nettle. And of this Stinking kind, there are divers forts, as, 1. Galepeis vera, The true stinking Dead Nettle, or Hedg Nettle. 2. Galepeis altera pollida, pale stinking Dead Nettle. 3. Galepeis altera innes, Henry stinking Dead Nettle. 4. Galepeis innes Datomepium, Yellow stinking Dead Nettle.

III. The Description. 1. The Sweet kind. It has a hot fland and threatening, periuring every Year, from whence rifer divers below figure Sketch, somewhat Huies, with Jovies at a good distance, one from another, and also two red green Leaves, dwnted about the edges, for opposite one to another, the lowermost upon long Foot-Stalks, but without any towards the 102.
Archangel red flowered.

IV. The Galeopfis Vera, has a Root composed of many stringes, flowing out fresh heads every Year, and thereby increasing very much, from whence come forth divers flowers, soft, and hairy Stalks rising up to be two or three feet or more high, according as the Ground is in goodness, as at the Joyns whereof grow two Leaves a piece upon Foot Stalks, not much unlike to Nettle Leaves, but that they are soft and more hairy, and not at all stringing, of a strong unpleasant smell, especially if growing in floodway places, but nothing so strong as growing in the open fields: at the top of the Stalks grow the Flowers, free in Bundles, free or few at a space, and many of them one above another in manner of a staked head, every one standing in a greenish Hack, like unto those of the other more pleasant scented Dead Nettles, but not so great, nor of so sad a red or purplish Color, especially the Heads or upper parts, but the lower Labels or Lips base some white spots in them: after the Flowers are fallen, there grow within those Hacks, small round, but somewhat Seed, four of them for the most part stand together, which are of a black Color when ripe.

V. The Pale flinking Dead Nettle, has a pretty thick Root and full of stringes, from whence rises up a long, square, hairy Stalk or Stalks, out of which comes federal pale green broad Leaves, set upon long hairy Foot Stalks, and higher up, such like the last leaves therein, with slender small pale yellowish Flowers, set together at spaces, which turn into small round pointed Heads, with small blackish Seed in the middle, this Plant is of a strong flinking smell.

VI. The hairy flinking Dead Nettle, has a Root much like to the former kinds, from whence come Stalks square, soft, and hairy, but shorter, very slender and neat, creeping as it were by the Ground, with two Leaves set by the Joyns like before, soft and hairy, but more hairy and rough, and not so large as the first kind of Galeopfis, the top of the Stalks end in a long spike of purplish Flowers, set in Bundles as in the other, after which comes the Seed, Black afoe at the former.

VII. The yellow flinking Dead Nettle, has much such a like Root as the others, whence comes forth flowers low Stalks, not above a Cubit or a Foot and a half high, much long Leaves set therein by couples, very like unto Nettle Leaves, smaller below next the Ground, then up higher upon the Stalks, being hairy, but not so flinking as the first, yet flinking very strongly, the Flowers grow in long stakes in the manner, but are all yellow when fully blown, consisting of two Leaves, the uppermost whereof is not so much hoode as the former, but is as it were a cover to the lower, and turns it up foul, having some yellow threads in the middle, but while it is in the bud, it is somewhat reddish, after which comes forth the Seed in the same Hacks.

VIII. The Places. Red Archangel grows almost ever where, by Ditch and Hedge sides, throughout all the whole Kingdom. The first Galeopfis grows very frequently in England in divers Counties, as at Hamstead, going from the Town to the Church, and many other Places from Hamstead Heath to London, as also at Greenwich in some places not far from the Park. The second Kind, grows also wild by Hedge and Ditch sides, and as a Weed in many Gardens. The two last Kinds, are not found to grow wild at all with us, but only nurished up in Gardens.

IX. The Times. They flower for the most part all Summer long, beginning in May, and all June and July, and the Seed is ripe not long after the Flowers are past.

X. The Qualities. Red Archangel is hot and dry in the first Degree, but the Galeopfis are hot in the second Degree, and dry in the third Degree, much of the temperature of Horsebrawn. They are all Astringent, something Reparative and Affrighting: and by Appropriation, they are Galphatick, Splenetick, Hysterick and Arthritisck, and operate only as Alternatives.

XI. The Specification. They dry up meffy Humors in Ulcers and Fistula, Lymphaticke, and stop the overflowing of the Terms in Women.

The Virtues of the Red Archangel.

XIII. The Powder of the Seed. It is dry and blinding, and of good use in Hoping Fluxes of the Bowels, as the Diarrhoea, Dysenterick, Litchenia, and Hepatick Flux. Dole from half a dram to 4 dram in Red Wine.

XIV. The Confection of the Flowers. Eaten meanly, noon, and night, the quantity of a large Walnut at a time, it has been found by Experience to be effectual against the over flowing of the Coules, and all Fluxes of Blood whether from the Mouth, Stool, or Urine: but this more especially, if to a
Pound of the Cones, 12 ounces of Crown martins Albrigens be added.

XXV. The Juice of the Plant. It is Antiphlegerick, reprefents vapors in Women and Fie of the Mother, roots of the receiver of the Liver and Splenic, and is good for Wounded Perions to Drink. Dose by, or 12 ounces in Wine.

XXVI. The Decollition. It is good to be made in Wine, and drunk to vi. or viij. ounces: it is good to wash Ulcers, Sore and evil running Sores with it, to make them dry, and to irritate the Ulcers to healing. Dose from 12 ounces to 12 ounces:

XXVII. The Jufes. It has all the virtues of the 

XXVIII. The Spirituos Tinncure. It drops Fluxes of the Belly of what kind ever; and the overflowing of the Courts in Women, quickens and chorts the Spirits, drives away Melancholy, makes the Humours to sicken. Dose 2 drams.

XXIX. The Oily Tinncure. Taken from vi. Drops to 10, or vi. ounces, according to Age and Strength, in some proper Vehicle, it has been found to be good against Opynum Agues. Orally applied or anointed, it is good against all Pains and Aches, as also the Gout in any part proceeding from a cold Cause: it strengthens the Nerves, and is good against the Palsies.

XXX. The Distilled Water. It is used chiefly as a Vehicle to convey the other Various preparations of this Herb by: Dose 1 to 3 ounces.

XXXI. The Decollition. Made in Wine, and Drink, to vi, or viij. ounces: it strengthens the Bowels much, it is good to open obstructions, and strengthens the hard parts of the Spleen: Formerly all hot with the fame upon the Region of the Spleen: or applying the hot Herb all thereon, for some time.

XXXII. The Ointment. Made by boiling the bruited Herb in Old Olive, &c. It is good to diffuse or resolve cold and hard Sores in any part of the Body, Chiefly the Nape in the Neck and Throat proceeding from a Kings-Blow.

XXXIII. The Guminate. It has the same Virtues, befores which it is very good to diffuse Infumations, and heal all green Wounds by cleansing them, drying, and cloathing up their Lips.

XXXIV. The Cerate or Emollient. It heals also green Wounds, cleanses old Ulcers, and refihes their Maladie, puts a frop to their fretting, corroding, and speaking, and brings them to a speedy healing.

XXXV. The Cauptolin, made with the beaten Herb, and Hogs Lard, Vinegar and Salt, boiled to a solutions and conflency, and then apply'd to hard and Scrofulous Tumors whether in the Neck or other parts, it helps to diffuse and resolve them, gives eafe in the Gout, Scolia, and other Joyn-Aches, strengthens the Nerves, and eafe their Pains, caused by Stamps, Convulsions, &c. It is good against Infumations, and the Maladie of old running Sores. A Cauptolin of the raw Herb beaten up with Vinegar, being apply'd to the Nape of the Neck, helps healing in the Nape: and helps Whiters, being apply'd to the roots of the Nails.

The Virtues of the stinking Archangel, or Dead Nettle.

XXVI. The Decollition. It is good to bath places Swelled with hard Kernels, Warts, Infumations, or Scrofulous Tumors in the Neck, under the Ear, Jaws, Armpits and Groin, and if the Decollition is made in Wine, and drunk to vi. or viij. ounces for a Dofe, it is good a Traumaktick, and wonderfully helps all inward Wounds, Hurts, Bruises, Falls, or the like, and is singular good for the Spleen and the Diffufals thereof.

XXVII. The Jufes. It has all the aforegoing Virtues, besides which being applied warm with Vinegar, to the Hemorrhoids or Piles, when they are very painful and much Swelled, it gives eafe, and diffufes the Tumor. It is good also againft Warts, Piles, Crife, Coughlyrama, and the like which grow in the Head and Fundament. Dose inwardly from 12 ounces to vi. or viij. ounces.

XXVIII. The Efence. It has all the Virtues both of the Dead Nettle and Jufes, and may be used as a Wound Drink, for which purpose it is a moft singular thing, and contributes very much to the healing of Ulcers, Filthia's and other irritations and running Sores, which afflict most other Remedies. Dose from 12 ounces to vi. twice a day: Outwardly it is good also to wash Sores, Ulcers and Filthia's with, and clarifies them from their rife.

XXIX. The Syrup. It may be a Vehicle to mix with the Eftence for all the purpofes afofied, as also againft Fulfings, Vapors, and fits of the Mother, or Hypochondriack melancholy.

XXX. The Ointment. Being anointed upon the Region of the Spleen, it eafe the pain, and removes the hardness thereof, and anointing on the Fundament, it is good againft Clifes, Warts, Piles, and other Swellings thereof. It diffufes or Cuts Ulcers, Kernels, and hard and Scrofulous Swellings of the Neck and Throat, and other hard and Oeumematous Tumors in any other part of the Body.

XXXI. The Baffam. It is of singular use, and much Commendated againft Gangreous, Cancers, Corroding Filthia's, and all manner of other running Sores, irritations and feptic Ulcers happening in What place Mrsone.

C H A P. XXXIII.

Of the White ARCHANGEL.

I. T H E Names. It is called in Greek, pantos albus: Luminum albulm, Urtica inerea Alba, Urtica morius alba: and in English, White Archangel, or Dead Nettle.

II. The Species. Of Archangel there are three special Kinds, viz. 1. The Red. 2. The White. 3. The Yellow. This than which we Treat of in this Chapter is the second Species, to wit, that of the White Kind.

III. The Description. It has a Root White and Threaded, not persisting every year, from whence rises divers four Square Stalks somehow bary, about a Foot and a half, or two Feet high, and sometimes more, as the ground on which they grow is in sunneis and goodsoils, leaning this way and that by reason of the Weight of its Head and Leaves, Brancles and Flowers, at the Springs whereon bares two Leams, larger and more pointed than the Red, almost in flower

The Nettles, but not stinging, and denoted about the edges, greater also than the Red, and somewhat felt, as it were, and hairy and downy. At the joints with the leaves small, larger and more gaping Flowers than those of the Red, in Hooks, and encompassing the Stalks at certain distances, like as those of the Herb wood dill, enough given to be a Species, but not having such a bulk of Rocks and Flowers, so closely set at the Tops, as they are in the Red. These flowers are white in Colour, and shaped like to little gaping Fruits, or Helmets, after the Flowers in the same Hooks grow small roundish Seeds, which, when ripe, becomes black, or of a blackish Colour. Its Root grows not downward, but forward and causeth under the upper Craft of the Earth, and abides many Years, shall increasing. The whole Herb has a smell pleasant enough, and much differing from GalEEPSS, or the Stinking Kind.

Dead Nettle or
Archangel.

CHAP. XXIV.

Of Yellow Archangel.

I. THE NAME. It is called in Greek, Archangellon. In Latin, Lumen Luteum, Urtica lutea, Urtica lutea latera, Urtica moraine latera, and in English, Yellow Archangel, or Dead Nettle.

II. The

The Virtues:

The Virtues of all these Preparations are the same with those of the Red, in the Chapter foregoing, from Sect. 14. to Sect. 26, and may have in all the same Cures; there being much difference in their strength and good effects; but if any should be preferred, those of the White may be said rather to excel in Virtues; but this difference there is between them in the Flowers, that the Red seem to be the better, to stop the Reeks, or overflouring of the bowels, and Loches in Women; the Flowers of the White are said to be the best, in stopping the Whites, or White Flux in the same Sex, for which reason the Shops in many places keep the Converse of the Flowers in a readiness, upon any occasion.

X. The Converse of the White Flowers. It is given for the purposes aforesaid, and to strengthen the Womb, from vi. drams to an ounce and a half, Morning, Noon, and Night. And it will be more effectual, if the Powder of dead Turpentine be added to it, iv. ounces to every pound of the Converse; thus Prepared, it is truly an excellent thing for the purposes intended.

Archangel
Yellow
II. The Roots. It is the third and left Kind of the Archangel and Dead Nettles.

III. The Description. The Roots hereof are much like to those of the White, but are not suffered to creep so much under ground as they; from whence arise sung bayy Stalks, and large green desit Leaves, very much like the White Archangel, but that the Stalks are more fraight and upright, not bending downwards, and the Joints, with their Leaves, are further asunder, and the Leaves are somewhat longer than the former. The Flowers also are larger, and were springing, growing in Roundly about the Stalk, of a fair Yellow or Golden Colour in soff, and in some more faire, exactly of the shape of those of the White Archangel but gaping wider. After the Flowers follow the Seed in the same black, little or nothing differing from that of the White.

IV. The Places. It grows usually in Woods, and wet Grounds in Woods, and sometimes in drier places, under the shad of trees, in many parts of our land; Gerhard found it under the Hedges on the Left hand, as you go from Hexfield near London, to the Church, and in the Woods thereby, as also in many other Places about Lee in Ely, near Watford and Bulby in Middlesex, and in the Woods belonging to the then Lord Cobham in Kent.

V. The Time. It Flowers from the beginning of May, and all June and July, and the Seed ripens gradually in the mean Summer.

VI. The Qualities. It is hot and dry in the second Degree: Astringent, or making thin, Digestive, Reductive, Vulgar, and Laetive; and is appropriate to the Head, Stomach, Liver, Spleen, Womb and Joints.

VII. The Speciation. It is observ'd to be a more peculiar Vulgar than any of the other kinds.

The Virtue.

IX. This has all the Virtues both of the Red and White aforesaying, and much of the same strength and goodness, and therefore as to the Uses of the various Preparations thereof, we shall wholly refer you to what we have said of the like Preparations of the Red, In Chap. 22, from Sect. 13. p. 26.

X. The Conserve. To Take of the simple Conserve 30 ounces; Temper it boiled in Water, till it will Powder s. ounces: take Powder of Catechu 1. ounces and half, mix them. Take from 1. drams to 1. drams, Morning, Noon and Night, for some time, taking the Essence also: Inversely: A Spirituous Tincture of the dried Flowers, taken from 1. dram to 1. dram, does all the same thing.

XI. The Balsam. It heals green Wounds, claret Old Ulcers and Fuidal's, stabes their Maligancy, and stops their trenting, corroding, and spreading, especially where they are Insecutive, very Filthy, and Corrode, and where Fuidal's are Cavernous, with many Wounds in them: First wash them with the Essence, by injecting it in Blood-warm, then introd into the hollows, some of this Balsam melted, and lay a Peggy dip in the same over the Mouth thereof, and over all the Cuture or Emplast, letting the Patient also, in the mean time, take the said Essence inwardly twice or thrice a day, as the manner is in wounded Persons, to you will find a wonderful and hidden Cure. This for a Vulgar use is much more powerful than any of the other Archangel.

Points like an Arrow, with two Feathers at the Head, and sharp pointed at the end of the Leaf, of a yellowish green Colour, and as it more burned over with Fire or Meat, or rather small white Sand, especially when young, the Stalk likewise is Mealy, or rather Sandy, bearing many Branches, with small yellow Flowers on them, which turn into small Leslie Seed.

Garden Arach

IV. The Lesser White Kind is altogether like the former, and differs nothing from it, unlesse in the magnitude, and the Sandy Flowers, which seem to be smaller than the former: but I am apt to believe that these two are but one kind, and differ only in respect of the Ground they grow on, this growing upon a more sandy, lean, or poor Soil: the richer the Earth, the greater the Plant, the poorer the Soil the lesser.

V. The Purple Arach is in its Roots, Stalks, Branches, Leaves, Flowers, and Seed, and manner of growing, and indeed in all things like unto the White, except only in the Colour, the Stalks, Leaves, and Seed being of a Mealy, or Sandy Purplish Colour.

VI. The Places. They grow chiefly in Gardens, as their names do specify, very rarely Wild.

VII. The Times. They Flower and Seed from June to the beginning of September, their Seed ripening all the time of their Flowering.

VIII. The Qualities. They are Cold and Moll in the second Degree; but Schroder will have it only in the first Degree. They are Alterative, Appetent, Atterfive, Emollient, and Expulsive, and are appropriated to the Lungs, Liver, Womb, and Joints.

IX. The Specification. They are peculiar against the Jaundice, and Difficulties of the Bowels and Joints.

X. The Preparations. You may have therefrom,

The Virtues.

XI. The Juice. It cools Inflammations, and is good to be applied in an Essence, Linen Cloths being dipt therein, and applied thereto, and taken from iij. to ij. or iv. ounces, it loosens the Belly, easies the Bowels; and fortifies the Expulsive Faculty.

XII. The Essence. It is good against the Yellow Jaundice, and cleanses the Womb of all Impurities; and is an excellent thing to open Old Ulcers of the Liver, and help Difficulties of the Bowels and Lungs.

Dose iv. Iponials.

XIII. The Decotion, has the same Virtue, but is weaker, and, drunk plentifully, is a singular good thing against the Poison of Carambola, and Strychnia. Tumors, Swellings in the Throat, or other pains; and admirably reprieves Choler. Dose from i. to viij. ounces, twice a Day.

XIV. The Syrup of the Juice made with Honey. It is an excellent Pectoral, opens stoppages in the Bowels and Lungs, and prevails against Colds, Coughs, Asthma's, or Hiccups of Breath, and Difficulty of Breathing. Dose from j. ounce to j. ounces, Morning and Night.

XV. The Cataplasm. The Herb bruised and applied as a Cataplasm, is excellent to ease Palms and Aches, from a hot Caife, and Arrowsome Humors, and to give relief in the Gout. A Cataplasm made of the boiled Herb, is good to be good (being applied) to difficult hard swellings in the Throat.

XVI. Note. This Herb is used as a Pocher, or rather boiled for a Sulphur, (as they boil Spinae) and to be eaten with Butter and Vinegar, Pepper and Salt, in which way it proves very grateful to a hot Stomach. And the Seed, drunk with Meat to a Drum, is good against the Yellow Jaundice; and Marasmus Eys, it purges both upwards and downwards.

Salmon's Herbal. Lib. I.

Wild Arach the Greater.

IV. There is another of this larger Kind, but it is lower, and lesser in every part, it is also narrower, and a little waved on the edges, and parting every Teil, as the former does.

V. The Places. It is found by Hedge and Ditch sides, and often times on or near Dung hills in most places of this Kingdom.

VI. The Times. It Flowers in June and July, and the Seed Ripens in the mean time: and if the Year is warm, it is sometimes in Flower in May.

VII. The Qualities. It is cold and moist in the second Degree: Alterative, Attenuating, Digestive, Emollient, and Cleansing: and in its appropriated Uses of Balsam, and Arach.

VIII. The Specification. It is a peculiar remedy against an Eryfelters, or Poison Scur, as they call it, and Fits of the Mother.

The Virtues.

X. The Seed. Given from half a dram, to a dram and half, in Powder, in Ale, Mead, or Wine, it purges upwards and downwards, troubles the Stomach.

and Borealis, evacuates Choler, and is helpful in the Yellow Jaundice.

XI. The Juice. It is in effectual thing against all sorts of inflammations in what part of the Body forever, and injected up the Womb, with a Wound, either, it is prevalent against Fits of the Mother: Suiteth on an Eryfelter, and Cuts up therein, being also laid thereon, it is said to cure that Disease.

XII. The Balsam. It cleanses the Womb of its filth, is good against Vapors, and Fins of the Mother, and a vehement heat of the Spasm: Does from i. ounce to i½ ounce mixt with White Port Wine.

XIII. The Syrup. It opens Obstructions of the Lungs, and it timely given, helps an Emphema, or Inflammation of the Lungs, and Hysterick Diathes, cooling the heat of Luft: Does from j. to i½ ounces.

XIV. The Castile Soap. It states inflammations, and kills the Goat, and other Pains proceeding from a hot Child. It gives some also in a violent hot Malign or Head-sachs.

XV. The Balsam. It removes an Inflammation in Wounds and Ucers, cools, cleanses, and diffuses them to healing, being a good Valsam.

CHAP. XXVII.

Of the Lesser Wild ARACH.

I. There is a third, called Greek, "Atriplex anguifolii," in Latin, Atriplex anguifolii purpurea: in English, Wild Arach, the Lesser.

Chap. 28. English Herbs.

Narrow Leaved Wild Arach

III. The Description. The first Narrow Leaved Wild Arach has a long slender Root, with many strings coming from it, from whence rises up one pretty large Stalk, with many large Branches on it, all covered Moosy or Sandy, with a greene grizzled or white Sanding, as also are the Leaves: the Leaves grow fiddle and are placed irregularly up and down the Brancher, they are long and narrow, almost like the Leaves of Hydropiper, or Lodhrick, but that they are shorter and narrower, not denuded on the edges, set at the points, smooth, and pointed at the ends: The Stalks and Branches shot up into long Spiky Heads, of green yellow Flowers, not much unlike to the great broad kind in the former Chapter, and the Seed like the same also.

IV. The other Narrow Leaved Arach of the lesser kind, is not much unlike to the former, but every way lesser, and the Leaves narrower, thinly smooth on the edges, and pointed, sometimes some of them are dropt or jagged, or a little matchet, for which reason Lobel called it, Aristolochia Syveldris pinguant aut Helixines folio. The Stalks, Flowers and Seed, are also like the former.

V. The Red Berry-bearing Arach, or Wild Arach also in Spain, but with as it's Nour'd up in Gardens: It is an Elegant Plant, having a Root small and Yboum, and persifing after Seed time, advance comes slender Branches somewhat Woody, above a foot high, none or left. According as the place where it grows, and the goodness of the Ground will produce, for all the kinds of Araches, both Garden and Wild, delight to grow in a Bet, Rank Soil, as an Dunghill, etc. from these Stalks and Branches come two small corner'd Leaves, not much unlike to the Broad Leaved Wild Arach in the former Chapters, for at the points are above another, and at every of the small joint with the Leaves, which stand upon foot-stalks, even from the beastly Leaves, near the Root, besides a small Red Berry, Cluster fashion, that is like to a Bramble or Pome Berry, clear, and full of Inframescent, with many small black and white, and full of a admirable Juice, as Red as Blood, or deep Red Wine, which being brushed upon the back of the Hand, while it is fresh, will seem as if you had drawn Blood out of it, which Berry being dry fronce blacksify, and contains in it small Black Seed, out of which this very Beautiful Plant will spring up every Year of its own accord, if suffered to,ed.

VI. The Plater. The two redly grow by Walls, old Hedges, Ditch Sites, and Dunghills, in almost all places throughout the Kingdom: the Berry-bearing is Wild in Spain, from whence being brought to us, it is planted and nourished up in Gardens.

VII. The Lover. They all Flower in the Summer Months, as May, June, July, and August; the Seed continually ripening in the mean Season.

VIII. The Fires. Those Wild kinds are not fit Cold and Moist as the former, not exceeding the first Degree. They are Attitive, Aromatic, Emollient, and Alterative; dedicated, as the others, to the Womb and Joints.

IX. The Specification. They are proper against Wounds and Ulcers, the Gout, Pains and Aches, proceeding from a hot Caufe.

The Virtues.

XI. The Uses of all these Preparations are the same with those in the two afo foregoing Chapters, and therefore to them we refer you, having the same Virtues and Properties, but not full out fit Cold and Moist.

XII. The Berries of the Red Berry-bearing Arach. The Beauty of the Juice is admirable, but what Physical Virtues it may have is not to fully known: being given inwardly to a Dram, or more, in Red Wine or Alcanite, it is good against Spitting Blood, Pounding Blood, or the Blood of the urine. The Juice being infuffated and reduced to a Powder, is good to stop Blood outwardly: and inwardly given, it stops the overflouthing of the Loches, or the Terms in Women, and strengthens the Womb. Doubtless out of it there may be made several glorious Pigments, or Laminating Colours, for the use of Artists, Painters, etc. Dole of the infusible Juice is half a Dram, or more, in any proper Vehicle.

CHAP. XXVIII.

Of Stinking Arach.

I. The Name. It is called in Greek, Araphos mata: in Latin, Atriplex fatidica: and by Cordes, Garofon (because it smells like Stinking Fitch) from 466, Pikiis, whereas it comes from G. Lagmanen finis Pikiis: also, Tragum Germanicum, and by Pena and Lobel, Atriplex fatidica garum decept: it smells more fitting than the Ram, or Male Goat, and therefore, lues Gerardi, some have called it by a Figure, Vapouris: in English it is called, Stinking Arach.

II. The
Salmon's Herbal. Lib. 1.

II. The kind. There seems to be but one single kind hereof, and by reason of its growing Wild, it may be accounted one of the Wild herbs.

III. The Description. It has a Root consisting of several long Branches, filled with many Torrid Branches, from whence rises up one or more feethy Stalks, which lie flat upon the Ground, it being but a small low Plant; and from those Stalks come forth many weak and feethy Branches, upon which grow very small Leaves, almost round, yet a little pointed, without Cut or Dent, in fhoare not much unlike to Bifht, of a Greyish Colour, sprinkled over with a certain kind of Dotty Alcatale, or like to very small White Sand; among which Leaves, here and there confenfally, are the Seeds dispersed, which can be di- scerned in nothing but Dull and after. The whole Plant is of a most Leathent Sature or Smell, not much differing from that of old Rotten Vine, or something worse. It perishes in Winter, and rifes yearly again from its own Sowing.

IV. The Places. It grows naturally upon Dunghills, and other the most filthy places that may be: some times it is found in places like Brick-kills, and old Walls, and near the Emploring places of Oordre or Dang, but the cleanest of the Ground may in some measure after its Smell, which, as some fears, may be like old Rotten Cheefe, but that which grows in its natural place, smells like abomi- nable Stinking Fith, whence came the name Cut refomes, as is before declared.

V. The Times. It is an Annual springing Plant. Flowers in June and July, and the Seed is ripe pre- cedyly after, at what time it perishes, and rizes a gain of its own Seed, so that it is once gotten into a Ground, it is not safe to be destroyed, or rooted out again.

VI. The Efficacies. It is Cold and Moifht in the fift Degree; is Alteative, Cleansing and Emol-lient, and is chiefly Hyphysiac, or appropriated to the Womb.

VII. The Specification. It is a pure Aminhyrific, curing Vapors, and Fits of the Mother, arising from almost what Caufe forever.

The Virtues.

IX. The Deccion. If made in Water, and drank from three ounces to fit, it quells hot Vapors aris- ing from the Stomach to the Head: if made in Water, it cools the Stomach and Womb, being in- wardly taken, and outwardly injected with a Warm Syringe.

X. The Juice. It may be taken from 1 ounce, to 3 ounces, or more: it cleanses the Womb, if it is feld, and strengthens it exceedingly; it provokes the Terms, reprietes Vapors admirably, and cures Hyphysiac Fits; give it in a Glass of White Port, and let the Patient drink it.

XI. The Exifcence. It makes Broken Women Fruit- ful, provokes the Terms, if they be flessed, and stops them if they flow immediately; it facili- tates the Birth, and brings away the Afterbirth, or Dead Child: it is commenced as a Universal Me- dicine for the Womb, both easily, safely and speedily curing, any Disease thereof, as Vapors arising from the toulneft of the Womb, or too great abun- dance of Seed, Fits of the Mother, and the like. Dole from 1 ounce to 2 ounces, in a Glass of White Wine, &c.

XII. The Syrup. It has the Virtues of the Juice, and Exifcence, but not full out so powerful as either of them, and therefore is to be given to more quean- tified Stomaches. It is also used as a Vehicle to con- vey the Juice or Exifcence down in; you may make it with Sugar, but for cleaning the Womb, it is much better to be made with Honey. Dole 1/2 or 4, Spoonfuls.

XIII. The Salute Tincture. This is more powerful in cleaning the Womb, and reprieting Vapors, and Hyphysiac Fits, than either the Juice or Exifcence, and may be exhibited from 1 dram to 1 dram, either in the Syrup, or White Port Wine. Mift with equal parts of the Juice, it is good to fmill to, in Vapors, and Mofted Fits, for the ill Soun of the Womb, to fly from it, or precipi- tates the Vapors downwards: and being thus mix- ed with the Juice, it is good againft the falling down of the Womb, being caft in with a Womb Syringe, it also kills Worms which breed in the Sores of Utters of Horses, or other Cartel.

XIV. The Injetion. It is made of the Juice mixed- ed with equal parts of the Syrup, and Red Wine. It cleanses Utters of the Woman, is good against the Whites, strengthens the Matix, and is helpful a- gainst its falling down.

XV. The Collyrium. It is applied to the Share- Bone in Women, in a Preseniria Uterus, and gives cafe in the Gout, or other Pains arifing from a hot Caufe; applied to the Stomach, it reprieties Fits of the Mother.

XVI. The Balfam. It cures Utters in the Woman, and Privy Parts of Man or Woman, and is a fegu- lar thing to give cafe in the Gout, being applied; as also to cool and dilate Infiamations.

CHAP. XXXIX.

of Sea Arach.
III. The Description. The stilt of these has a great Root with many Shoots, which persists not every Year, and is of a fultis Toffee, tho' it is bred up in a Garden, from whence comes forth several Stalks, lying in some weares; and creeping upon the Ground, with many White, Hoary, Muddy or Sandy Branches; and with White, Broad, Muddy or Sandy Leaves, deep cut on the Edges, and pointed, set on them without any order, cut in on the Edges, near at the Bottom, and pointed at the Ends, somewhat like an to a small Goose-foot Leaf; at the top of the Branches grow divers Tender, hoary, yellowish Spikes of Seed, for chief together like Cattail's; sometimes I have seen it reddish, like the Red Garden Arach, and sometimes nothing so Mucky, but rather Green.

IV. The other kind has a Woody Root, with many small Shoots, from whence springs forth a Woody and Thiny Stalk, about a foot high, spread at the top into many small Branches, spotted with black spots, which end in long yellow spikes of Gatifering Seed, like the former. The Leaves which grow below are somewhat long and narrow, about two inches long, of a dark green Color, with some Corners about the Edges, which yet are smaller and smaller, as they grow below.

V. The Places. They grow in many parts of England, by the Sea shore, and Banks of Salt-water Rivers, and Borders of Salt Marshes, and in Marsh Grounds, particularly at Queenborough, at Kings-Lynn in Norfolk, at Margate in the Isle of Thanet, and in many other places by the Sea side. The first grows on the Sea shore near Little Hillfield in Essex, and at Kings-Lynn in Norfolk, by the Banks of the Creek, running out of the Haven by the South side of the Town, where some years since I found it in great plenty, as also in the Isle of Wight, not far from Cowes. The latter, Mr. Roy says, grows plentifully by the River, and on the Banks of the Marshes about Maldon in Essex, and doubles in many other the like places.

VI. The Times. They Flower from the beginning of June, all July and August; even to September, and the Seed successively ripens in the mean Season.

VII. The Qualities. It is Cold and Moift in the first Degree, but some Authors will have it to be Dry. It is something Catarrhick, at least in winter, and with difficulty, because it irritates and Emollient; and is appropriated to the Womb, Reins and Joints.

VIII. The Specification. It is peculiar against a Polyserus, or a too great Hystincs and Friends of the Body, and the Dropie.

The Virtues.

X. The Juice. This by reason of its Sulphic does purge the Bovels, and habit of the whole Body, of Cold and Waxy Humors, being taken from 1 ounce to 3 ounces, in the Bode of Fat Meat.

XI. The Essence. It is in property much like to the Wild Arach and being taken Morning and Evening for some time, it has been found prevalent against a Polyserus, or to great Corpulency, and Bulk of Body, and preserves the Lungs from perturbation. Dole from 1 ounce to 3 ounces.

XII. The Decoction of Wine. It has the Virtues of the Essence and Juice, but not full out its powerful: it provokes Urine, and is good against Gravel and Stone. Dole from 3 to 6 ounces, Morning and Evening.

XIII. The Syrup of the Juice. It cleanses the Lungs and Bowels, opens the Body, 'tis said, that there is not many better Medicines against the Dropie than this, to take it in 4 ounces, or more, Morning and Evening. I have proved it alfo causes Leanness in them who are too Fat, as experience has manifested.

XIV. The Spiritual Tincture. It strengthens the Womb, and is good against the Dropie than this, taken to 4 drams in Wine; mixed, half an ounce of it at a time, with vi. or vii. ounces of the Decoction in Water, it cleanses the Womb of the Whites by injection, and fluxes them.

XV. The Saline Tincture. It is a good Nephtick.
Salmon's Herbal.

Lib. I.

of ARROW-HEAD.

Arrow-head:

I. The Name. It is called in Greek, μινδας: in Latin, Sagittaria, Sagittarius, Sagittalis: And in English Arrow-head.

II. The Kinds. It is threefold, μινδας ἀνωτάτης, Magnifica, Μνιθας Μαγνητας, Bartsyllius Caballus, Sagittaria maior hastifolia, the greatest broad Leaf'd Arrow-head., 2. Μινδας μεσαίας, Sagittaria Mi-

III. The Description. The greater broad leaf'd Leaf'd Arrow-head, or Water Destiny, as some call it, has a thick Bulby Root with many fibrous or stringy, from whence comes forth several thick figures, and juicy Stalks, with green broad green Leaves on the tops of them, divided. The Stalks are two long and poin-
ted parts, so that the whole form or figure of the Leaf, is not much unlike the forked head of a Broad Arrow, or one of the points of an Anchor, that the two points at the bottom are licorice, which parts come but a little above the Waters wherein they grow, whether deeper or shallower: From among these for-
mer Stalks, rump up other thick, round, spiny Stalks two or three feet long, and higher than the Leaves, bearing drops of Stoves at the Joyce, one above another, and for the most part three in a row, each of which is composed of three large white Leaves with federal reddish Threads in the midst, after which come in their places, round rough Bars, which are green when they are ripe, much like those of Sparganium, or the Burr Reed, in which Burr's are contained the Seed.

IV. The lesser Leaf'd Leaf'd Arrow-head has also a thick and bulby or stringy Root like the former, with broad Leaves, and makes a large Foot Stool near two Feet, or more high, in hope that the former, but every way among, which rump up a fat and thick Stalk, something higher than the Leaves, bearing at the top many pretty white Flowers, declining to a light Cor-

out, but yet the former, made off of three small Leaves, and in the middle of which are several reddish Threads, which being pulled, there comes several kinder Bars greater than the former, in which in this manner are contained the Seed.

V. The Narrow Leaf'd Arrow-head has a small and thready Root, from whence rump up a tender Foot Stool about Eighteen inches high; at the top of which are Leaves shaped like the former, except in their length and narrowness, not being above half the breadth of the others, yet of their full lengths, and the two inner longer ones, are about as long as the fore right Leaf, the Flowers and Barrs are also lesser.

VI. The Places. They grow sometimes altogether, sometimes apart in Watery Ditches, and Hand-

and, in most places throughout this King-
dom, particularly in the Ditches near the Walls of Oxford, by Chelsyford in Essex, in the Ditch near St. Thomas's Waterings not far from London, and in

some Ditches in St. George's Field, and not far from Lambeth: The Narrow Leaf'd grows on the Thames Shore by Lambeth Bridge, over against the Arch-
bishop of Canterburys Palace, pleasantly before the Earl of Peterborough's house, above the Horse-Ferry on Whittington life, &c.

VII. The Times. They Flower generally in May

and June: and the Barrows or Seed are ripe in the be-
inging or middle of August.

VIII. The Qualities. They are Cold in the first

Degree, and Temperate in respect to dryness or
moisture. They are good Alternatives, Affluings, Af-

flentatives, Incunatious, Guttiatives, and Traffic-

ants or Vulneraries; and appropriated to the spleen, relans and joys.

IX. The Speciation. I have had great Experience of the Virtues and Use of this Herb, and have found it to be a particular Wound Herb, whether instantly taken or commonly applied, beloves its fi-

gurate behelpes the very same thing.

X. The Preparation. I have used it in its,

1. Decotion. 2. Juices. 3. Elixirs. 4. A Spirit-

rise or Emplastre. 10. A Cataplasme. 11. 4 Pow-
er of the Seed.
Chap. 31: English Herbs.

The Virtues.

XI. The Decoctum made in Wine, or half Wine, half Water. It is a good Gargle for Sore Mounths, and if a little Alum and Honey is diffoluted in it, it is a singular Medicine, for a Thrush in Children, and to Gargle with for sore Throats in Elder Persons; and used as an inward Mixture, it is an Injection into the Womb, it is of good use to cleane the Womb, and stop the Flux of the Whites. Inwardly taken from iiij. to viij. ounces, it is good to stop Fluxes of the Bowels and Fluxes of Blood, whether by the Mouth, Urine or Stool; and used as a Diet Drink, it is good for Wounded Persons, and such as have running Ulcers, and Fistula's about them.

XII. The Jurer. It stops Spitting of Blood, and is good against the Bloody Flux taken from it. Spooñful to vij. in a Glass of Red Wine or Clare twice or thrice a day: it contributes alfo to the healing of all sort of Wounds, whether inward or outward; and taken upon an Epsipeda ablats its heat.

XIII. The Efficence. It is a singular Traumatick taken from iij. ounces to iiij. ounces twice a day, in the Dotation, in a Glass of Wine: It not only cures Wounds suddenly to heal, but wonderfully promotes the healing of all running Sores, Caco-Thick Ulcers and Fistula's where or wherover. It is drying, binding, and Alleviating, stops Fluxes, abates Inflammations, stops Fluxes of Blood, pilling Blood, Cataracts, and Conflumtions.

XIV. The Spirituous Tincture. It has the Virtues of the former, but is left to be exhibited in a cold habit of Body for two or three days, &c.

XV. The Saline Tincture. It powerfully opens Obstructions of the Spleen, Reins, Womb, and Urinary Puffages, carries off the Excessuities in Caco-Thick habit of Body, and which supply old running Sores, purulid Ulcers, and Caco-Thick Fistula's, with the evil and malignt Matter which keeps them from Healing: it divides Gravel, and expels Sand and Tartarous Stone out of the Reins and Bladder. Dose from i. dram to ii. drams.

XVI. The Oily Tincture. It cures the Spleen, expels Wind, provokes Urine, and is good against Wounds or Ulcers of the Reins or Bladder. Outwardly poured upon Wounds of the Nerves it heals them. Dose from vi. drops to xvi. drops.

XVII. The Ointment. It allays Inflammations chiefly in Wounds, heals Green Wounds, and has an abluftive faculty in cleansing old Sores and Scurfy Ulcers.

XVIII. The Balsam. It cures Wounds by the first Intention, where they are simple. But where they are Contused, or Complex, it brings them to digestion, and afterwords by its abluftive property cleanses the ulcer, then incarzizes, and heals after an admirable manner: it also allays Inflammations in the beginning, and in time revolves them.

XIX. The Cateplasm. It is good to allay Pains proceeding from a hot Caule in what part of the Body they are: and I have often found it to give caufe in the hot Gout, and other Jointed-Aches. It is formong reproductive, more especially if it is apply'd cold, which is left to be done, when it is used to a Curant Motion upon a Bone, as the Forehead, it hinders the Rising of the Tumour, repepulates the Juxties which would flow thicker, and prevents its黑色.

XX. The Graces or Englisher. It Cures Green Wounds, cleanses, and heals Cold Sores and Ulcers, and fills up Wounds and Ulcers with Flesh. It is drying, astringent and strengthening, good to apply'd to weak Backs, or feble Joints, and places

Afflicted with Pains and Aches, from a Flux of Humors, or over-throwing of the Part through any Violence or Force put upon it.

XXI. The Powder of the Seed. Being drunk in White Wine from i. dram to a Dram, and a half, it is said to cure the Falling-off-sicknes, and help all other Difficulties of the Head and Bain: it is prevalent also against the Drope, carrying off the Membirick Matter from the Head, and is found by experience to be good against Sand, Gravel and Tartarous Stone in the Reins, and Urinary Puffages. Being crown over Wounds, Sores or Ulcers inflamed, it takes away the Inflammation, and so does the Powder of the Leaver, and Kills Worms in Children.

C H A P. XXXI.

Of Mild or Spotted ARSMARC T.

I. THE Names. It may be called in the Greek, \textit{Hypocrasia \&c} from the Peach Tree, its Leaf being like to a Peach Leaf: In Latin, \\textit{Perfarcia}, and by some Planthus; In English, Mild or Spotted Arsmart, and Peach-Root.

II. The Kinds. There are two Principal Kinds.

1. \textit{Perfarcia maculosa} Angled, in English, Spotted Arsmart, leffer and greener. 2. \textit{Perfarcia maculosa Virginiana}, The Virginian Spotted Arsmart, which is alfo two-foild, with White Colored and Fefti-Colored Flowers.

\begin{align*}
\text{Arsmart}, \quad \text{mild.}
\end{align*}

III. The Description. The first of these has a long Root with many threads and fritings therof, from whence rises up several Jointed Sticks, smooth round and hard, of a light green or reddish Color, especially at the Joints, which are manifold; from whence springs several smooth long Leaves, almost Peach fiftifumed (whence came the name Peach-root) broad towards the Root Stick, after declining Pyramidally to a Point, being even on the edges without any cut or dent, and bearing thence (for the most part) a ledden Colored or dark Spot, in form of an G 2 : half
baff Mamm, or Semincularle. The Flowers grow in high, thin, long Stems, either bicolor or unicolor, with a flat, black, blackish, brownish, or reddish Coleur d'oelets. The whole Plant has no, flat, sharp, or biting Taste either, as has the Hidropiper, or biting Arfinit, in the next Chapter, but rather almost fensitive, like Stores, coding and drying, or else almost without Taste. The Greater is like the former in all respects, but the Stalks, Leaves, Spikes, and Seed are every now and then much larger.

W. The first sort of the white flowered Virgini-

an Arfinit, has a kindly Rotten consisting of a great bulk of long black strings or threads, with Perfiv not nearly, but still, the the Stalks with the Leaves may be away, and Spring open the next Year: from this Rotten rises up several hard round green Stalks with many perfect Fruits on them, as the other two, and for large, broad, dark, black, green, fomewhile damid, and that painted Leaves, spotted oftentimes like our English or Common fries before described, and sometimes without spots, many of them for several long and brea-

ter, and three inches and a half broad, with several Casting Vents rising from the middle Kik, and others long and narrow, at the tops of the Stalks, and from the Fruits with the Leaved, Spring Branches of fliced white Flowers, like chief Grains in the other, but greater, and succeeded by black and flat flowering Seed.

V. The second sort of blufs or fible Colored Virgini-
an Arfinit, has affix like woody Rott, thick, with many Fibers in it, but greater and more Woody than the former, from whence Spring up straight round Stalks, much higher than the left, with much larger and narrower Leaves, marked, off times with Spots in the like manner, and other long and narrow, at the tops of the Stalks, and from the Fruits with the Leaves, Spring Branches of fliced white Flowers, like chief Grains in the other, but greater, and in greater plenty.

VI. The Places. The Lesser and Greater English

Arfinit are grew by the sides of Rivers and Ditches, the Latter almost every where both in Husbanding and rum-

ning Waters, and in such places as are many times wet in Winter, and dry in Summer, and in other moist Grounds, in most parts of this Kingdom, where it may many times be gotten almost in all Parts. The Larger Fort has been found in great plenty, in the Lands and Farmows of Haddington Field above six Stourbrooks, length, half a Mile from Ox-

ford. The Virginiae Kinds are only to be had with us in our Gardens, nourished up by such as are Curious.

VII. The Times. The English Arfinit: Flowers only in June and July, and their Seed is ripe in Aug-

ust: But the Virginiae Flowers with us much later, and fearely perfect their Seed here.

VIII. The Intention. They are cold and dry in the first Degree: Alternatives, Inflammatoryes, Incrifu-

tives, Retenptives, Glafrinives, Abydones, and Phaematizes or Valutinates: Also Hydriaps and Amphitrites.

IX. The Specification. Its peculiar property is in curing of Wounds, and healing old running Sores and Ulcers.

X. The Preparation. There are taken from it, 1. The Green Leaves. 2. The Diluted Water. 3. The Mixture. 4. The Juice. 5. The Exelle. 6. The Ointment. 7. Herbsalcm. 8. The Cata-

plexy to the Virtue.

XI. The Green Herb. Authors fay, that if a handful of Arfinit were in Water, and appli'd for some time to a Wound or Sores, and afterwards anointed in moist Ground, or under a Stone, as the Herb rots, fo the Sore will Miraculously heal. And being put on Horse or other Carted Sores, twill drive away Flies in Summer time.

XII. The Diluted Water. Being mixt with a half part of Agra Vina, and bath'd on any painted place for a Week, or more, if it will perfectly take away the pain.

XIII. The Mixture. Take the Diluted Water, Or Gall, Oil of Spices, of each equal parts, mix them well together by grinding them in a Glass. This annointing upon any place troubled with the Gout, and a Handi dipp in the fame, being alfo appli'd, takes away the pains thereof.

XIV. The Juice. If therewith any old running Sore, or Old Ulcers, or instantly washed, Stelles and heals it: it is alfo excellent to be put into Diet Drinks for Wounded Persons, and fuch as have old and running Sores upon them: and wailing the Sores of Beattis therewith, it keeps Flies from them.

XV. The Exelle. It is more powerful than the Juice, and is more useful to all Intentions, healing alo much more curiously, being appli'd.

XVI. The Ointment. It is excellent against all foot Swellings and Inflammations in any part of the Body, especially being appli'd in the beginning, being forming Regenerative: it also alters Infla-

mations in Wounds and Ulcers, and causes pains pro-

ceeding from a foot Canfe.

XVII. The Balsam. Being made of the Bracted Herb boiled in Oil Olive, and made into a Balsam with Tarqutine and Wax, it heals all forts of green Wounds wonderfully; it cools, dries and heals, and therefore is good for purifhed Sorex, and running Ulcers, whether in Man or Beatt, cleansing purify-

ing, incurating them, and healing them.

XVIII. The Cataplasy. The Herb beaten with Rue and Wormwood, and heat very hot in a Frying Pan, and appli'd to the Bowells, as hot as can be borne, in a Cholick, it gives preface to a Cold in a Wonder.

C H A P. XXXII.

Of Hot or Biting ARSMART.

I. T H E Names. It is called in the Greek, "Perfisarum: in Latin, Hydropiper, Piper Aquaticum, Persicaria non maculata, Persicaria Crenu, vul. Moscow: Angolar calls it Cudapeco-

num, and home call it, Zinzipher Commer: in Eng-

lish, Hot or Biting Arfinit, Water Pepper, and Peafh-Wort, or Lake-Weed.

II. The Kinds. It is the second general Species of Arfinit or Peafh-Wort, and is 1. Hydropiper, fea Persicaria acris vulgaris minor, the Common Leffer Biting Arfinit. 2. Persicaria acris Virginiana, the Virginiae Biting Arfinit, or Hidropiper.

III. The Description. The feet or English fort, has a Root somewhat long, with many Fibres theret, which as well as the root of the Plant, is of a very sharp and quick Toffe, biting the Tongue more than Peppers, from whence Springs forth a fanned Stalk, not so High nor fo Great as the former Mild Kind, but with a greater flour of Branches and Leaves some-
Chap. 32. English Herbs.

somewhat like unto Peach Leaves, but much bitter and narrower, they are also long, but somewhat narrower than those of the Mild Asfمتاز, and without any spots at all, yet sometimes they have been found with reddish Marks upon them. The Stalks are about an foot and half high, round, smooth, and jointed, with a kind of Knife at each Joint: at the greater Joints, as well towards the tops of the Stalks and Branches, as at the tops, arise four or five, heads of bluish or reddish Colored, and sometimes more red or white Flowers Mixed, clustering together, which falling away, there comes little blackish Seed, somewhat broad or flarthy and sometimes of a reddish yellow Color, of a bit and bring Toffs, (as in all the rest of the Plants) among like unto Peppers, whence came the name of Water Peppers; but the Herb it self is without any smell.

Biting Arsmart Or Hydropiper

IV. The Virginia Kind is in most things, as its Roots, Stalks, Branches, Joints, Leaves, and Flowers like unto our English before Described, and differ only in the Parts of the Flowers growing, and their Color, these growing on more slender and long Stalks, and their Color being white.

V. The Places. Hydropiper grows almost every where, throughout the Kingdom, in moor and swampy Places, and as nearly Rivers and Ditch-sides, finding methath Waters, running Brooks and such like. The latter has been brought out of Virginia, and is nourished up with us in Gardens.

VI. The Times. They Flower in June and July, to August, and the Seed is Pericled or ripe not long after; yet it is to be observed the Virginia Kind Flowers for thing longer here, and therefore its Seed is somewhat later Rip.

VII. The Qualities. Hydropiper is hot and dry in the fourth Degree. It Incites, Attenuates, opens, and expends the Stomach, and Emmenagogue, and by Appropriation is Cephalick, Neurontick, Hyphenick, and Neptunick.

VIII. The Specification. It is known by manifold and large Experience to be a peculiar Plant against Gravel and Stone, whether in Reins or Bladder.

IX. The Preparations. The Shocks keep only, 1. The Dried Herb. But you may prepare therefrom, 2. The Distilled Water. 3. The Juice.

X. The Herbs. It is hot and dry, and is chiefly used in Wounds, hard Tumors and Inflamated Ulcers. Some use it in the Transplantation of Diseases, and removing of Infirmities. The Green Herb burned in a Chamber, is said to kill all the Fleas, and a good handful put under a Horse's Saddle will make him go briskly, altho' half tyred before.

XI. The Distilled Water. It is a Specick against Stones and Gravel in both Reins and Bladder, and has cured to admiration when all other things in the World has failed, and so great things have been some hundreds of times experienced of this simple Distilled Water, which seem to be even Magicall, in performing what much required.Greater Medicaments cannot do: I write not this from my own Experience only, which in this case is very considerable, but we have also the Testimony of very Great and Learned Men, as to the same thing. And this thing I would have it be noted, That in any of my Books, whereofsoever I have mentioned Pefficery or Arsmart Water, either simply or with other Preparations against the Stone, Gravel, &c. I always in all those places, intend the Water of this present Herb, of which we now speak, viz. Hydropiper, or Biting Arsmart.

XII. The Juice. Given to 1 ounce in White Port Wine it provokes the Urine, excites the Birth, and brings away the After-Birth; and given in 1 oz. or less, or in 1 oz. of the Distilled Water, it provokes Urine, and opens obstructions of the Urinary Passages.

XIII. The Efficacy. It has the Virtues of the Juice, comforts the Head, Nerves, Stomach, Lungs, Womb, and Reins, provokes the Urine, and makes a good Diapstic, eases pains of the Gout from a cold Castle, wafts and consommates superficial Humors in any part, and is admirable against all cold and moist Diseases of the Brain, Nerves and Womb, as Fallingicknefs, Vertigo, Lethargy, Apoplexy, Pallice, Magnum, Barrenefs, &c. and made into a Syrup with Honey it is a good Pectoral. Dose is drams.

XIV. The Oil. It dissolves and dissolves all cold Swellings, Scoruphales and Scirrhous Tumors, Quinaries, Congeleed Blood, Pleuritics, &c.

XV. The Ointment. It is good against Bruises in any part, and prevails against Oedemas, and other cold Tumors of the Joints, King's Evil, Swellings, and Kernels in Neck and Throat.

XVI. The Cataplasm. It prevails against Contusions, hindering parturition, and applied to a Fellow or Whippet, it takes away the Pain almost presently, and in a short time after cures it.

XVII. The Root and Seed. Either the Root or Seed bruised and applied to an Aching Tooth, gives perfect ease, and in short time after perfectly cures it: Put into a hollow Tooth, it does also the same thing.
CHAP. XXXIII.

Of Garden ASARABACCA.

I. The Names. It is called by the Arabians, Afsaron; in Greek, *Aφαραγγα*; in Latin, *Afarum*, *Nardus* Synonymus, *Nardum Ruffii* (because of its aromatic or Sweet Smell) by Niceron, Vulgaris, as by his Verbe, *Elf Afsaron Græc*, Vulgo *della Latina*; and Vulgaris et Babylonum in Venetum reuscat: and in English, *Afarabacca*. I suppose our English Name came by a mistake, taking this Plant for Baccharis or Phemeris Spicknack; which it is not, and so out of the two names, of Afsaron and Baccharis, they made the name of Afsabacca. Others thought *Afarum* and *Baccharis* to be one Plant, and so compounded the name out of them both; and called it *Afarabacca*, as it is called in Spain at this day.

II. The Kinds. It is twofold, 1. Garden. 2. Wild. of which in the next Chapter. The Garden kind is also twofold, 1. *Afarum botanum Vulnare*, Common Garden Afsabacca. 2. *Afarum Virginianum*, Virginian Afsabacca.

Afarabacca.

III. The Descriptions. Our common Garden Afsabacca has small Roots, and whitish, spreading many ways in the Ground, and intertwisting into divers Heads, but not running or creeping under Ground, or many other creeping Herbs do; they are found in small, thence creeping, but more when they are dry, than when green, and of a sharp, but not unpleasant, colour; from these Roots rise up many Heads, from whence comes many smooth Leaves, every one upon his own root-stalk, which are smoother, rounder, and bigger than *Taste Leaves*, thicker also, and of a darker green, shining colour on the upper side, and of a pale yellow green underneath, little or nothing denoted along the edges; from among which, rise up small, round, beaten, broad, green Heads, upon Stalks of about an inch long, divided at the brims with five droppings, very like the Caps or Heads of the Henbane Seed, but that they are smaller; and these are all the Flowers it has, which being full of nectar, are somewhat sweet and aromatic; when they are ripe, are contained small covered rough Seeds, very like the Kernels or Stones of Grapes or Raisins.

IV. The Virginian Afarabacca, grows very like the former, but its Roots are somewhat greater, and fuller of substance, spreading in the same manner, and something more fragrant, and a little bit in colour, bing a little the Tongue: From this Root springs up, the Leaves as the former, but they are a pretty deal larger, stiff also, and thence somewhat emplated about the edges, of a dark green colour, and not so much shining as the former, nor yet so round, but a little pointed at the end, very much resembling the flat Hope of an Heart; some of which Leaves will be spotted or streaked. The Vines have but three droppings or points, and of a paler green colour.

V. The Places. The first grows naturally Wild under the shades of Trees, and upon stony Hills in Found, Perigee, and other places of the East: The other grows Wild in Virginia, but they are both of them Nutrid up in Gardens with us, of which the first is very common.

VI. The Times. They both keep their Leaves green all the Winter, but those first now in the Spring; and with them come forth those Hands or Flowers, which give ripe Seed about Midsummer, or in July or August, whose Seed is ripe not long after; but those Roots and Leaves are gathered in the Spring.

VII. The Qualities. They are hot and dry in the second Degree, or rather in the third. They Open, Incline, Attract, and Relieve, and are Cathartic, Embitter, and Diuretik; and are appropriated to the Head, Stomach, Liver, Splen, Reins, Womb, and Joints.

VIII. The Specification. It is a peculiar comedy for the Dropsie, Jaundice and Gout; as also for Ague of all sorts.

IX. The Preparation. In the Shops these there are,

1. The Roots in Pouder.
2. The Leaves in Wine.
3. An Infusion.
4. A Decocition.
5. An Aprell.
6. An Eleorin.
7. A Dicaryn Fernellis, an Eleorin.
8. A Salmone Timpanum.
9. An Oil by Inflammation.

The Virtues.

X. The Roots. They Vomit, working both upwards and downwards, but not so strongly as the Leaves: Dole from half a dram to 2 drams in Pouder: Being given in White Wine, a little before the Fit of an Ague, it takes away the Throat Fit, and thereby cautions the hot Fit to be more remitt, and in twice or thrice taking, it is laid to cure it, whether it is Skidward, Verion or Scian. Disurtedre faith, that 3. drams of the Root in Infusion in hoted water, being drunk, powerfully provokes the Turms: I fear the Dole is very much too large in substance, 3 or 4. drams may be infused in the Hand, and so drunk: Parkinson says, it will work like *Alkac Helte*.

XI. The Leaves. Wine being made of the Leaves, by steeping them therein, is an Embitter, and provoke Urine, as *Disurtedre* faiths, eases the Pain of the Stone, and an old Science, and is profitable against Drops. Alsevays says, it not only Vomits, but works downwards, and by Urine also, purging both.
both Choler and Phlegm, but it purges Phlegm more manifestly than Choler. It wonderfully helps the Obstructions of the Liver and Spleen, and therefore is excellent against the Dropping and Yellow Jaundice, and yellow Agues, which come from plenty of yellow bile. The Agues may then be drawn from the Leaves in Wine for one Hour, according as the Age and Strength of the Patient may be, and repeat it twice or thrice a Week.

XIII. The Decoction. Made in Meat, Mord, or Wine, of the Leaves, adding also a little Mace, Cinnamon, or Spike-nut, by Boiling, which ought not to be much, because then the Virtue will be less. It is usefully prevalent against Quotidian, Tertian and Quartan Agues, and performs all that the Wine, or Infusion can do: this may be given every other day, amounting all the Oil, Mord, and Solers of the Feet with the following Oil. Now here is to be noted, in that making this Decoction, the Liquor in which the Leaves are put, ought first to boil, that they may not remain long in the Decoction, because of losing their Virtue, as aforesaid.

XIV. The Extract. Made of the Roots, being Green, and beaten into a Malt, and the Juce Extra-acted with Wine, till the whole Virtue is drawn from them, and then evaporated to the due thickness of an Extract. Being thus made, it will keep all the Year, and is more than the simple Pouder of the Root; and may be given from xv. grains to half a dram Infusion. Made in an Aconite Extract, which is called also Coquum Affari, thus made: Take Roots and Leaves of Aconite, extract a strong Tincture with Spirit of Wine rectified, added, and other like Paolo of the leaves. This being evaporated to the due thickness of an Extract, it is very useful against Quotidian, Tertian, and Quartan Agues. It is given in the same manner as the Decoction, and proves very serviceable against these Diseases.

XV. The Essence. It is a good Medicit and Cathartic, and works not so strongly Upwards as the simple Juice, or the former Pouder, Wine, In- fusion, or Decoction; and after it has done work- ing, it commonly provokes Sweats powerfully, ex- peling the Reliefs of the Infirme that way. Dose: from 1 dram to 3, or 5, or 10 drams in Wine or Meat, as the Patient is in Age and Strength.

XVI. The Elixir. You may see the Prepara- tion of it in our London Differtentary, lib. 4. cap. 27. foll. 55. It may be given from 1 dram to 4 scruples, as a cathartic or Wine.

XVII. The Saline Tincture. It is Extracted from the green, or yet gathered Roots and Herbs. This works more by Urine and Sweat, and is gender more than the Infusion or Decoction. Dose: from 3 dram to 12 drams, it carries off the Morbid Matter of many Incurable Difaffets, as the Drop- pie, Jaundice, Gout, Sciatica, King's evil, Agues, Colds, the Puerperia, the Ruptures of the Joints, Menses, Surfeits, &c. by all the ways, as Vomit, Stool, Urine and Sweat. The Head worketh or Baf- thed thereof, comports the Brain and Nerves, which are disteche of taking Cold, and strengtheneth a week Memory.

XVIII. The Oil by Infusion. The Herb and Roots well bruited, and put into a sufficient quantity of Oil, with the addition of 6 ounces of Lodginum, to every pound of Oil, and infusor for two Months in a hot Sun, then prestil both (for want of a hot Sun, a Steam heat doth better, which will be continu- ously Night and Day the time.) This Oil warm, being anointed upon all the Body, from the Neck to the Hips, as also upon the Soles of the Feet, in a warm Bed, it provokes Sweating, and being up- on the acce of an Ague, it prevents the cold and flaking Fit, and thereby cures those who have been long afflicted with Quotidiens, Tertians or Quar- tans; it is good also against Cramps, and other dif- affections of the Sinews, and an old Cough.

XIX. The Capspills. The Leaves bruited, and applied as a Cataplasm, to the Forehead and Temples, eases the Head-ach, and cures Sleep; and ap- plied to the Eyes, it takes away their Inflammation.

XX. The Juice. The common use of this Herb is, to take the Juice of 5, 6, or 7 leaves (according to the Age and Strength of the Patient) and to mix it with a small draught of Ale, Mord, or Wine, and to drink it to cause Vomiting. It works very strongly, cures Surfeits, and has all the Virtues of the Pouder of the Root, Wine, Infusion, Decoction, Ex- tract, or Essence. Mixed with a little Tarta- sai, and dropped into the Eyes, it cures the Eye-fight, and helps the Dimples and Millets, which are often before them.

XXI. The Conserve. Made of the Flowers, with refined Sugar or Honey. This being eaten is found by Experience to strengthen very much the Auditory Nerves, and to help difficulty of Hearings, Deaf- nesses, and a bad Memory. Dose: from 1 dram to 4, dain, in the Morning Hour.

XXII. Nuts. That most of the Preparations of this Plant are not to be given to Women with Child, for that through their Violence, they cause Mifcar- rieus.

CHAP. XXXIV.

OF WILD ASARABACCA.

I. THE Name. It is called in Greek, Ἀσάραβα; in Latin, Aconitum; in German, Aconitum Syr- fize: in English, Bashard or Wild Aconit. The kind. It is the second Species mentioned in Chap. 33. Sect. 2. foregoing, and a singular Herb of the foot.

III. The Description. It has Roots long and flin- der, creeping under the upper crust of the Earth, and not showing deep down, bearing a somewhat sharp tige, a little bitter withal, from whence spring forth Leaves, rather like to our Garden Asafran, but somewhat rounder, and rougher than they, fli- ghtly and unevenly indented about the edges, growing upon long slender hairy foot-stalks, yet it is but a little Plant, and creeping, as it were, upon the Ground. The Flowers grow near unto the Ground, like unto those of Camomill, but much softer, and wholly fli- ght, as well the border of the Leaves, as the Firmum, being greenish white, but German says, they are of a Green or Daffey Colour, and not unpleasant in Smell. This Plant Cilanius thinks to be his Tutilago Alpina fo- clenda, but Parkinson says, that by reason of its sharp Tige.
Salmon's Herbal.  Lib. I.

IV. The Leaves. It is found, as Matthiolus says, on the Mountains in Bohemia: and our Lelavi found it in several places in Somersetshire, it delights in Woody and Shadowy places.

V. The Times. If Flowers in May and June: and the Seed is brought to its ripeness much about Midsummer.

VI. The Qualities. It is hot and dry in the beginning of the third Degree: It Incites, Attaneses, and is Aperitive, and Cathartic: appropriated to the Head Stomach, Liver, Wombs, and Joints.

VII. The Specification. I cannot yet find either from Authors, or my own Experience, what Disease it is peculiarly good for, but 'tis certain, 'tis a good Diuretics, or opener of Obstructions.

VIII. The Preparations. You may have it from
1. The green Herb it itself.
2. A Powder of the same
3. The Juice.
4. An Essence.
5. A Saline Tincture.
6. A Syrup of the Juice, or Herb.
7. A Decoction.

The Virtues.

IX. The Green Herb. A little of it eaten with other Herbs, as a Sailer, opens and loosens the Belly, and purges out Cold, Gross, Thick, Flegmatic Humors.

X. The Powder. It may be given to 1 dram in Mead, Canary, Sherry, Madeira, or White Florence, Wine, and to it will loosen the Belly, and purge therein Thick Phlegm, and Black or Buman Humors.

XI. The Juice. It has a Clearing, Attenuating Quality, makes thin that is thick, cuts that which is tough, and breaks that which is hard, opens the Borens which are obstrued, and purges out the Modbleck Matter of many grievous Diathesis, and is therefore prefentially given to such as are afflicted with the Falcic, Fallling-Tickles, or Yellow Jaundice: It may be given from 1 dram to 1 oz. of iv. according as the Patient is in Age and Strength, in a Glass of Mead or Wine.

XII. The Essence. It has the Virtues of the Juice, but is more grueld to the Stomach, and may be given half an ounce, or more, in a Glass of Wine.

In proceeds against the Gravel in Reins and Bladders, and gives Ease in the Gout, inwardly taken, and outwardly applied, and within it kills Worms in Children.

XIII. The Saline Tincture. It opens Obstructions of the Wombs, Reins and Bladder, provokes Urine, and expels Sand, Gravel, and Tremourous Stome: it kills Worms in old of young, and is profitable against the Droppe. Dose from 1 dram to 1 jn. in a Glass of White, or Rhumpl Wine and Sugar.

XIV. The Syrup of the Juice or Herb. It has all the Virtues of the Juice, but must be given in full the double quantity, and is much better for Queasy Stomachs, and Children, than either the Juice or Essence; but it ought to be made in a Bath, for bathing will cause much of its Virtue to be lost.

XV. The Decoction. If made in Wine, it is a good Cephalick, and excellent against most cold Dificats of the Head, Brain and Nerves: Used as an Arthrim, it purges the Head of cold and gross Humors: and taken inwardly from jn. to iv. ounces, or more, it prevails against Epilepsies, Apoplexies, Lehorrdyes, Vertigo, Megumin, Head-ach, Falties, Convulsions, 

C H A P. XXXV.

Of Common ASPHODEL.

I. THE Names. It is called in Arbick, Barbadoes; in Greek, Laspho; in Latin, Asphodelus, Holubus, Regei, Albumus, and Albocon: in English, Asphodel.

II. The Kinds. It is fourfold, 1. The Common Garden Asphodel. 2. The Onion Asphodel. 3. Marsh, or Lancashire Asphodel. 4. Kings Spear Asphodel: of this last see Chap. IV. Following: The Second and Third we shall treat of in the two following Chapters. The Common Garden Asphodel is also White or Yellow: and the White is either the Greater Single or Branches, and the Lesser Hollow, and Leafe.

III. The Description. The Common single White Asphodel bas a Root composed of many knobby Roots, growing out of one Head, like those of the Penny,fall of Juice, with a small Buttercups, and Alpringen or Tufle; from whence springs up many long narrow Leaves, like almost to those of Leeks, first painted, the Stalk is round, from, naked, and without Lecenes, two Cubits high, garnished from the middle upwards, with a number of Flowers Star-fashion, made of six Leaves apiece: the colour White, with some dark Purple flecks, drawn down the Stalk, and within the Flowers are several small Chines, which being pull, there springs up little round Heads, whereof are contained hard, black, and three corner'd Seed, like those of Backenbrandt or Straight-acere.

IV. The Common Branched White Asphodel bas a Root composed of many tuberous long Knobs, which are thickish in the unward, and smaller at both ends, foasted together at the head, of a dark green colour on the out face, and yellow within, whereby rises up many long and narrow brown triangular Leaves, sharp pointed, and lying upon the ground round about the Rod, the Stalk is fourth, round and naked without Lecenes, which rises from the midst of them, divided towards the Top, into divers Branches, (if the Plant has been of any long continuance) or else into but two or three small branches, from the sides of the main great roots, whereas stand many large Flowers, Star-fashion, made of six Leaves apiece, on the in face whereof, and finished with a Purplish line down the
the backside of every leaf, having in the midle of the flowers some small yellow threads: the seed is black, and three square like the former, and greater than the seed of Buck-Wheat, contained in roundish heads which open into three parts.

much but in the magnitude, except in the fifth of them in the roots, which are not Glandulous, but springs long and white, bearing flowers from the middle to the top Star-fashion: And in the second, in the height chiefly, it being seldom above a foot high, having Glandulous roots like the great Alphodels.

VI. The Garden yellow Alphodel, has many roots growing out of one head, made of several roots, flat and fceous yellow sprigs, or grassy springs, from the which arise up many Grassy leaves, thick and Grassy, tending to squareness, among which comes up a strong thick stalk, set with the like leaves, even to the flowers, but less: upon which do grow Star-like yellow flowers, not unlike to those of the greater white Alphodels, with much the like seed following them.

VII. The Places. They Grow naturally in Greece, Italy, Spain and France but are nurft up with us only in Gardens, where now they are become natural, and Natives of our Soil.

VIII. The Times. The Glandulous Great white Alphodel do flower in May and June: The least white One, in August and September, even till the cold hinders it: the hollow white, and the yellow, flower in June and July, and the seeds are ripe, the Month following.

IX. The Qualities. They are hot and dry almost in the third degree: They are Emetic, Incide, attenuate, open, diffus, resolve, and are Valeriana: They are also Cephalick, Neurastick, Pericnol, Hyfterick and Nephritisick.

X. The Specification. They are known by experience to be peculiar against the Kings Evil, as the Signature in the Roots demonstrate.

XI. The Preparations. The Shops keep nothing hereof, but you may prepare therefrom. 1. A Vint of the Root. 2. An Ellence of the fame. 3. A Decoction in Wine. 4. A Syrup. 5. A Salute Tincture. 6. An Oily Tincture. 7. Afters of the whole
Salmon's Herbal. Lib. I.

The Virtues

XII. The Juice of the Root. It cleanses, and takes away the white Morneth in the Face, or other parts of the Body, the place being first chased well and nshed with a coarse Linen Cloth. If it is mixed with 

Salkey Sake in which a little Myrrh has been dissolved, and a twelfth part of the Tincture of Saffron. It makes an excellent Collyrium: For the Eyes to heal inflammations, take away Mists, Cloudings, dimness of Sight, and other disaffections, being drunk into them.

XIII. The Efficacy. It may be taken from j. to ij.

ounces in Mead or Wine against the Kings Evil, Coughs, Colds, Affhios, Hoarseness of Breath, or any Venenous obstructions of the Lungs. If the Stomach is foul, it will Vomit the Patient: it evacuates evil Humors, and is contributary to the Cure of running Sores, old Ulcers, Fissula's, and the like. Bathing and Walking the Swelling and Sores with it also.

XIV. The Decotion in Wine. It is Emetic and if it meets with a foul Stomach, is opening and cleaning, good for a Cacochety Habit of Body, and prevails against the bitings of any venenous Creatures, Stone and Gravel, or any stoppages of the Urinary parts. I know it to be an excellent thing to be cuntly taken by such as are troubled with the Evil, Oedema, or other like Tumours, for it consumeth the Morbid Matter which Compotes them. It may be given to ill. iv. or vi.

ounces, or less, &c.

XV. The Syrup. It has the same Virtues with the former Preparations, but much weaker; yet plenteous to be taken by such as are greatly Stomached: It is an excellent Pellomall, and causes easy expectation in stoppages of the Lungs. Dose ij.

ounces morning, noon and night. This is fit for Children.

XVI. The Saline Tincture. It works downwards, and carries off the Caufes of Dificafes by Urine: given from j. to ij. drams in White Port Wine, it proceeds Urine and the Terms powerfully, is good against Purufes, and an old Cough, Pains and Stitches in the fide, &c.

XVII. The Oily Tincture. It is Excellent being Baited with, against Purufes and Wounds of the Nerves, bitings of Mad Dogs, Vipers, and other Venenous Creatures.

XVIII. The Afters of the whole Plant. Galen says, that if they are nixed with Docks Grace, the mixture is good against an Aloepeca, and brings Hal again where it was fallen off, by means of that Difficult.

XIX. The Oil. It is good against cold Tumours, and to anoint with in Cramps, and for any Ach or Pain in any part, proceeding from a cold Cautch; and is good to dilute Tumours and Swellings in Women's Breasts, Tetticles, and other Glandulous parts.

XX. The Ointment. It cleanses old running Sores, parad Ulcers, and rebellious Fissula's, diflopes parts to healing, and puts a stop to fretting and eating Ulcers: Diffuses Inflammations in Women's Breasts, and Tetticles, and is good against Fellous in the Fingers etc.

XXI. The Balsam. It is an Excellent thing indeed, for healing all sorts of Green Wounds, cleanses Ulcers to the bottom, incarnates and heals them, and is also profitable against the Gout from a cold Cautch.

XXII. The Powder of the Root. It may be given to j. dram in a Glass of White Port Wine, it provokes Urine and the Terms in Women, helps Pains in the Stides, Ruptures, Convulsions, and old Coughs: Used as an Erithe, it purges the Head and Brain of cold and moist Humors which cause Head-aches, Lehnagies, Vertigo's, Epilepsies, Apoplexies, &c. And j. dram taken in Broth provokes Vomit, and helps such as are bitten with Venenous Creatures.

XXIII. The Cataplasm. It is singular good to dilute Contusions, Inflammations and the like, to give ease in a cold Gout, or any Ach or Pain from a cold Cautch, strengthens the Nerves, and cures Cramps, in what part ever: and is good to be applied in Tumors of the Kings Evil, Kernels and Swellings in the Neck and Throat, &c. I have had large Experience of the Virtues of the Root of this Herb; and I write little more of it, than what is true to my own knowledge.

CHAP. XXXVI.

Of Onion ASPHODEL.
Chap. 37. English Herbs.

III. The Description. It has a yellowish round Bulbous or Onion like Root, with some Fibres hanging therefrom, from which come many whitish green Grassy Leaves, long and narrow, not much thicke in shape to Leeks, and spread upon the Ground; these come forth at the beginning of the Year, and abide till May, and then they withering, amongst those Leaves, riseth up a naked smooth Stalk, replenished towards the top with many Star like Flowers, of a whitish, or pale yellow green Colour on the outside, and whitish Green without, consisting of six little Leaves, sharp pointed, with certain Curves or Threads in the Middle, and ending on short Root Stalks, on a reasonable long Head. Sike fition; after the Flowers are past, there succeed a small Knop, or Head three square, in which lies the Seed which is roundish and black. It differs from Kings Spear, which is also a kind of Alyssum, in the Peds, which are round, but in this long and three square; from the Marsh or Lancashire Alyspod, in the Stalk, which is not wholly Naked; and the Common Alyssum in the Peds and Roots, which in those the Peds are round, and the Root multiform and knobby.

IV. The Places. It grows in the Corn-fields in the Upper Hungary: but with us, it is only nourished up in Gardens.

V. The Time. It Flowers in May, June, and July: and the Seed is ripe in Augost, not long after.

VI. The Qualities. It is hot and dry in the third Degree, having almost the same temperature with Aron. It is acufer, inclosing, attenuating, althervative, diutavative, and sometimes Emerald. And are appropriated to the Stomach, Lungs, Womb, Reins, and Joyns.

VII. The specification. The Roots which are only used, open obstructions of the Lungs, and are particular against Asthma's, causing Expectoration.

The Virtues.

IX. The Juice. Given from half an ounce more or less as the Patient is in age and strength in a Glass of White Wine, it opens obstructions of the Vessels, and is a singular good Medicinal against the Yellow Jaundice.

X. The Essence. It is good against Pains and Aches of the Bowels, Pleuridies, Stitches, and other Difficultes caused by Obstruction, whether in the Lungs or elsewhere: It prevails against Coughs, Coldis, Asthma's, Throat, of Breath, and Difficulty of Breathing, and dissolves wounds and Ulcers to a speedy healing. Dole from 1 ounce to 1 ounce and half in Wine or Mert.

XI. The Lochoth. It is made of the Juice Boiled up to a thickness with Honey, with a quarter part of the fine Powder of Elecampane Root, it is a famous Powder against the Nose, and I have known a fluxed woman cured with Plephitis, in less than two Months time: at first it Vomiteth, and continued to do so, more or less for 10 or 12 Days, after which time the Patient tooke very Pleasantly, it cleansed the Lungs, caused a great Expectoration, and in short time after healed them and performed the Cure Pleasantly. It is good for Coughs, Coldis, Asthma's, Wheezings, Throat, of Breath, of the Lungs. Dole 3 ounce in the morning Fasting, and as much as four at the afternoon.

XII. The Saline Tincture. It provokes Urine and is good against Gravel, Stone, and Tartarous Stone in the Reins and Bladder. It repelleth Vapours and Fits of the Mother, provokes the Terms, and prevails against the Gout. Dole from half a dram to 1 dr. morning and evening in a Glass of Wine.

XIII. The Oily Tincture. It is good against an Oedema in the Knees, Traumatick Tumors in the Neck and Throat, and any other cold Swelling in any part whatsoever, being moistened thereon. It prevails against a cold Gout, and other like Pains and Aches. Inwardly taken from vi. drops to xvii. in a Glass of Wine, it Comforts the Head, Brain, Nerves, and Womb.

XIV. The Ointment. It is good to anoint Carneals and Strophulous Tumors in the Throat, cleanse old Ulcers, and being put Scalding hot into Fusilts to remove the Callos and Heal them.

XV. The Balsam. It is prevalent against Oedemalous Tumors, and the Gout, heals Wounds, cleanses old Sores, running Ulcers and Fusilts, makes the Flesh grow, and heals them. It also diffuseth heat and Cursivous Tumors.

XVI. The Cataplasm. It takes away black and bluw marks of the Skin occasioned by Blows or Bruises, diftresses or resolves Inflammations, and abates pain by its Anodine Property: It is good in Tumors of the Breaths and Colds.

XVII. The Syrup. It is Peculiar, good against all diffusses of the Beet, Lungs, and Womb, causes Expectoration, and a free Breath, and provokes the Terms. You may give it from 3 ounce to 6 ounces, in a Glass of white Wine morning and evening.

XVIII. The Aloe of the whole Plant, Gutter Faith, That the Aloe of the Root mixed with Oil, or with Great Ghee, cures the falling of the Hair in an Alopecia, and restores it where it was left; and also cures a Scalp Head. It is good against Scurif, Morphew, and other like vices of the Skin.

CHAP. XXXVII.

Of Marisb or Wild ASPHODEL.

I. The Name. It is called in Greek,농고-"τίδας, in Latin, Asphodelus Mardter, Pfendos-offithorius Luteus: in English, Marsh Asphodel, Wild or Bajfield Asphodel, and Bajfield yellow Asphodel, and Lancashire Asphodel.

II. The Kinds. There are two special Kinds hereof, 1. Pfendos-offithorius major, Asphodelus Lanciftris, the greater Marsh, Wild, or Bajfield Asphodel, Lancashire Asphodel. 2. Pfendos-offithorius minor, Asphodelus Lanciftris curvus, the lesser Marsh, Wild, or Bajfield Asphodel, the true Lancashire Asphodel.

III. The Description. The first of these has a Root long and jointed, creeping at Grous depth, with many Fibres thereon. From whence rise up several long and narrow Leaves, like unto Corn Flag, but not so stiff or hard, of a beautiful green Color, and somewhat Chamerfed, narrowed or fathen down right, yet compassing one another, as the Corn Flag and Flower do ladies at the bottom, among which rises up a Stalk about a Foot and a half high, with divers short Leaves enclosing the Stalk, as it were hoised at their bottoms, and at the tops stand several yellow Flowers, as it were in a Stiffed Head, each of them made of six Leaves a piece, as of those of the other Asphodels, in the midst of which come forth several small Threads or Chives, which being soft there comes
Salmon's Herbal.

Lib. I.

Salmon. Fruit.

Afparagus, in not from green whereon green fcaly two have molt Lib. be Authors ABalfam. drams (n) narrow narrower or Afparagus of An ripe, fmall fmooth or small.

Foot England Name. thence in after in the Moorifh gon, and

theft flowers, a flower like fabin, which bing gon, there succeeds small three square reddifh Husks, or lengthifh little Cads, which, Gerard fays, are fometimes four or five Square, and in which is contained fmall reddifh brown Seed.

V. The Places. They are both found Wild in England, as well as in other places beyond Sun, in Marth and Wer Grounds; the firft near Lancalder, in the Moordl Grounds there, as also near near Mansley, and Morton, two Villages not far from thence; as also at the Foot of Bigfoot Hill in the Well of England, near to a Village of the fame Name. The fsecond grows near Liphum, not far from the River Idle there, and in many other places, in the Well of England.

VI. The Times. They Flower in May, June, and July, and the Seed is ripe, about 3 Month after the Flowers are gone: molt of their Leaves re- main green in the Winter Time, if it is not extremly cold and hard weather.

VII. The Quality. They are hot and dry in the fexy Degree. Inciting, Averting, Aperitive, Alderife, and Diuretik: Dedicated to the Lungs, Reins, Womb, and Joynts.

VIII. The Specification. There has been nothing in a confiderable Observation, to which they can be faid to be peculiar, Authors having as to their Virtues been fimple.

The Virtues.

X. Altho' Authors have faid nothing of the Vertues of thefe Plants; yet, by their Taffes, and other Signatures, they learn to have the Virtues of the Garden Afparagi, the pooffibly not so Potent and Efficacions I have made several ftrails of them, and have found the Decoffion to open obftructions of the Lungs and provoke Urine. With the Juice given to jr. comes for some days in White Wine, I once provoked the Courties in a Woman where they were obftructed: and with the Syrup and Infuffence, I have cured fome that have had cancer in Cades. The Balfam I know to be a good Vulnerary, and the Ointment is very difflusive and refolution, and good againft the Gout. The Saline Tincture provokes Uring, and clears the Reins and Urinary Flidges of Seed, Gravel, Slime and Taratuous Matter, given to jr. drams in White Wine: the other Preparations I have not much ufed, but this Iaff, (as it is the defhed made) I have oftemnes peved, and that with good Success.

CHAP. XXXVIII.

Of Garden ASPARAGUS.

I. "The Names. It is called in Arabic, Halian, & Halian, In Greek, hvoigoy; in Heroogoy, Oulanum, 'awb' r'ia, from provoking Lah in Latin, Asparagus & Coruda: In English, Asparagus, Spargarus, and Spargrge.

II. The Kinds. There are feveral Species of this Plant, 1. The Garden Kind. 2. The Wild Kinds, of which there is, 1. The Sea or Marsh. 2. The Rock Kind. 3. The Fralkly: of which threfih, in the two following Chapters. The Garden Kind is laid 1. Asparagus Sativus vel bortenas vulgation, the Minor, The Common Garden Asparagi, or Letter Kind. 2. Asparagus Sativus, vel bortenas Major, The Greater Garden Kind.

III. The Description. The fifh or Smaller Kind, has very many Roots, diverfed from a Spongie head, which are long, thick, soft and fpongie fmiring, long- ing down, and spreading themselves all about, whereby it greatly encroafe: from this Root there rife out of the Ground, drivers whites, green, fcaly Sprouts, thick, tender, very soft and Brittle, of the thicknefs of the greaft Green Shoots, or fomewhat thicker, in Taff not much unlike to Green Beans or Peas, having at top a certain fcaly soft Bud, which in time does rife up into very long and slender round green Starks, higher or lefer as the Roots are in Growth, and growing to be three or four Feet high or more (as the Ground is in goodnefs) which Starks fend forth drivers fparser Branches, whereon are set many little green Leaves, like Turner, but shorter and smaller, and growing up to the top, much finer than the Leaves of Dill; among which, at the ends thereof, come forth, fmall Yellow, yelhowifh Flowers, Which yield a Fruit or Barries, green in firft, afterwards red as Coral, of the bignefis of a White Peas, wherein are contained grofs blackifh Seed, and...
Chap. 38. English Herbs.

and exceeding hard, which is the cause it lies so long in the Ground after falling, before it Springs up.

APTARAGUS:

W. The other or Greater Kind differs nothing from the former, but in the Colour of the Shoots, their Magnitude, and Taste, they bring much whiter, vastly larger, and much more force and plesant. It is still beyond belief the relation of the vast Magnitude to which this Great Kind will grow: This present Year 1696, a present was made to a Lady of one large Bunch containing but one hundred of Sprouts or Heads, which weighed (as was reported to me) above forty Pounds weight: and the half Year I weighed a bunch or hundred, of the same Kind in Newgate Market, which they would not Sell me under eight Shillings, and warranted to weigh above twenty Pounds Weight. So that it is manifest that the larger sort is either another Kind, or else, the former Kind vastly improved by Art and Industry.

V. The Places. They grow with us only in Gardens, where they are nourished up for the daily Service of the House, being an Excellent Boiled Salter.

VI. The Times. The base tender Shoots, which are Sold in Markets in Bunches or Hundreds, come up commonly in the Spring, and may be had all March, April, and May, and sometimes in June, but the Gardner has arrived now to such a dexterity in his Art, that if the Winter or Season be warm, you may have them all January and February, as was manifest this past Year, when I could have had what quantity I pleased on New Year's Day. They ripening up after that, to a kind of diminutive Bath, and Flower in June and July, and bear their ripe Bunches in September, or late in the Yeat.

VII. The Qualities. They seem to be Temperate in respect to heat or coldness, dryness or moistur. They make, augment, open, cleanse, and are very Digestive; and seem to be chiefly Cephalick, Hypertick and Nephrotick; and, if Authors say true, Spasmagogegetic withal.

VIII. The Specification. They are peculiar against

the Strangury, or kippleage of Urine, and difficulty of making Water, to provoke Urine, and to expel Sand, Gravel, and small Stones out of the Reins, which even the figure of the hardness of the Seed, forms also to intimate.

IX. The Preparations. You may have therefore, 1. The Roots. 2. The Seed. 3. The Distilled Water of the whole Plant, distilled in September, when its Berries are Red; which things the Shoots are said to keep: But besides them, we have, 4. The tender Shoots or Heads. 5. The Decedion. 6. The Juice. 7. The Essence. 8. The Saline Tinctorie.

X. The Roots. Being reduced into Powder, and given from 2. drams to 5. drams in White Wine, or the Distilled Water of the Plant, it provokes Urine, and opens the Hoppages of the Urinary parts.

XI. The Seed. It is said to be very effectual for the purposes aforesaid, 2. drams of it being given in White Wine, to 2. drams, if it is mixed in equal quantities with the Powder of the Root, and given in like manner from 2. to 5. drams.

XII. The Distilled Waters. It is drawn from the whole Plant, and is to be refined (as Speculator directs) by putting it upon more fresh Herbs. It provokes Urine, and gives afe in the Stomach, being drunk daily three times a day, from in to 2 drams: It is useful also as a Vehicle for other things.

XIII. The tender Shoots or Heads. They are Boiled, and Eaten as a Supper, with Peppers, Vinegar and Pepper, being very Nutritive, and the crediting, as to the Reins, Bladder, and Urinary Passages, yet they comfort the Stomach, are cafe of Digestion, and relieve in Concomitances.

XIV. The Decedion of the Roots in Wine. It opens Obstructions of the Bowels, provokes Urine, being stopped, and expels that Tumultuous Matter in the Reins, Ureters and Bladder, which causes the Strangury. Dose from iv. to viij. ounces.

XV. The Juice of the Roots and young Shoots. It prevails against the Strangury, or difficulty in making Water, when it is done by Drops, it expels Sand and the Stone out of the Reins and Bladder, and helps vehement pains in the Back. Dose iij. or iv. ounces in Wine, twice a day.

XVI. The Essence made of the Juice, or bruised Plant. It has all the Virtues of the Juice before-mentioned; besides which, it is good against the Obstructions of the Lungs, Pains of the Stomach and Bowels, Falling-backs, Fits of the Mother, Yellow Jaundice, and diseases of Eyes: and taken every Morning and Evening, from it to viij. ounces in a Glass of Generous Wine, it is said to lift up Body, Lighten Seed, and remove Impotency.

XVII. The Saline Tinctorie. It has all the Virtues of the Decedion, Juice, and Essence; but more powerful in provoking Urine, and expelling Sand, Gravel, Stones and Slime Tumultuous Matter: besides it particularly Stimulates the Generative Faculty by its penetrating and quick Quickness, and effectually cures the Yellow Jaundice. Dose from j. to ij. drams in Wine.

XVIII. The Gargeriafs. The Roots bruised and boiled in White Wine Vinegar, being gargled in the Mouth warm, gives afe in the Toothache: and the Root it self is said to be profitable to be applied to an Ansestosis.

XIX. The Bath. It is made of a good quantity of the Rooses and Seeds bruised, and boiled in a great hote of Water, which is to be put into a large Vessel, in which a Man may fit up to the Breasts
at leaf; this has been found effectual against Iris of the Mother, Cholick, and Pains of the Back and Reins, and generally as good against Cramps, Convulsions, Sciatica's and other vehement Pains of the lower Parts of the Body.

CHAP. XXXIX.

Of Sea or Marth ASPARAGUS.

I. The Names. It is called in Greek, 'Arpapapos; in Latin, by Anguillara and Tubermentum, Afparagus Palustris: and Afparagus marinus, by Caius and Corruda: by Galen, Perus, and Lebed, Afparagus maritimus: in English, Sea, or Marth Afparagus.

II. The Kinds. This is the first sort of the Wild Kind, which some would have us to believe will, by Transplantation, and Minning in Gardens, become the Garden Kind, as leaf as good as the Garden Kind.

III. The Description. The Wild, or Sea, or Marth Kind of Afparagus has a Root with many Strings and Tubers, differed from a Young Head like the former, from whence rises up many, but shorter Stalks than the Garden Kind, stronger also and thicker, branching forth in the same manner, and having such like whinger Leaves, but shorter, thicker, harder, and of a blanched green Colour. The Flowers are like the other, and so are the berries or Seed which follow, but greater than they, and not so fresh a red colour.

IV. The Places. It is found to grow in the Marshes of Thame, near Oxford, and in Appleton Meadow in Gloucestershore, about two Miles from Bristol, where the Poor People do gather the young Shoots or Heads, and sell them in the Market at Bristol, much cheaper than our Garden Kind is fold in London. Mr Ray says he has found it also at the Lizard Point, and it is laid to be found about

Hornick in Essex, and divers other Marsh Grounds and Places, as in a Meadow belonging to a Mill near Thorp in Essex, and at Singleton not far from Corbe: also in the Meadows near Moulton in Lincolnshire: at a place called Badmer-leading, not far from Hornick, and at Moulton in Holland, which is also a part of Lincolnshire.

V. The Times. The Tender Shoots springing up in March and April, at what times they are gathered and Eaten; they Flower in June and July, and the Berries are ripe in September.

VI. The Qualities. It is, as to its first Qualities, temperate: Mr Ray says, that the Roots are Diuretic, and Lithontriptick, and are one of the five opening Roots: They are appropriated to the Liver, Spleen, Reins, Urin and Joints.

VII. The Specification. The Roots are peculiar against the Yellow Jaundice, Stone or Gravel in the Reins and Bladder, as also the Sciatica and Gout.

VIII. The Preparations. You may have therefrom, 1. The tender Sprouts or Heads. 2. A Decocation of the Roots in Wine. 3. A Juice from the same. 4. An Essence of the Roots. 5. A Syrup of the same. 6. A Saline Tincture.

The Virtues.

IX. The Virtues of the Roots and Seed, and even of the whole Plant, are the same in all respects with those of the Manured or Garden, so that we need not here be particular in expatiating the Virtues and Uses of the above enumerated Preparations, but wholly refer you to that which has already been laid in the last Chapter.

CHAP. XL.

Of Wild ASPARAGUS.

I. The Names. It is called in Greek, 'Arpapapos: in Latin, by Dodonius, Afparagus: in English, Wild Afparagus, or Stone Afparagus.

II. The Kinds. There are two principal Kinds, 1. Alycanthus Galenus, Afparagus Syphyllis: call it simply Afparagus Syphyllis: Corbus, Lebed, Lugdunensis, and others, Corrinus: Baumenius and Parkinson, Afparagus fustac acus, and is thought to be the Afrapagos Petraus of Galen and Dioscore. 2. Afparagus Petraus, or Corrinus aculeatus, Prickly Rock Afparagus: this is called by Caius, Corrinus aculeatus: by Dodonius, Afparagus Syphyllis,

(to that he makes little difference between this and the former, tho' indeed there is much:) and by Bau- frins, Afparagus aculeatus: an herb, that quarts quarter points of random exertion.

III. The Description. The first, Wild Afparagus with sharp Leaves, has a Head of Roots, housing many Strings and Tubers depending from it, thicker and shorter than any of the other Kinds, from whence rises up three or four Stalks, which are shorter, stronger, and tougher than the others, diversely spread and branched into many Wings, or which are set at several distances, many small, short, hard, and sharp pointed Leaves, five or six standing at a joint together: At these joints likewise, with the Leaves, come forth the Flowers, many, set upon a long stalk, which are yellow, and calling of six Leaves, being of a medium size, as well casting as sweet at a March Violet, after which come small Berries, green at the first, and of a black:
Chap. 41. English Herbs.

4s. After colour when they are ripe, wherein is contained a hard black Seed.

IV. The second Wild Kind, or Prickly Rock Asparagus, which some call Thorny Asparagus, has very thick and short Roots, with many thick Branches, all meeting together at the head of the Root, from whence rises up several branched green Stalks, having three or four sharp green Thorns (more like indeed to Thorns than Leaves, they are so hard, small, long, and sharp pointed) set together all along the Stalks and Branches, from which come forth small, mossy, yellowish green Flowers: and after them store of Berries, greater than in the former, and of a blackish green colour, when they are ripe, full of a greenish pulp, wherein usually lies but one hard black Seed, or at most two, having a White Kernel within it.

V. The Place. The first Kind grows in Stony and Rocky places, as near to Salamanca in Spain, also under Hedges, and in the very Fields in Catalonia and Granada; about Norbome and Hampstede in France, as also in Crete or Crete. This second grows in Flory and rugged or rocky places, as also by hedge sides, not only in Spain, but also in Portugal and Crete. But with us, both the Kinds are only found Nursed up in Garden of the Curious.

VI. The Times. They send for their tender Shoots early in the Spring, and Flower in June and July, having ripe Fruit in September. But with us in England, it scarcely comes to perfection, unless the Season is very warm, and they grow in a warm place, which may defend them from cold Blasts and nipping Winds.

VII. The Qualities. They are Temperate as to the first Qualities, but rather more drying than any of the former. They incite, atteinuate, and open powerfully, and are strong Diuretics and Lithontriticks: and peculiarly appertained to the Liver, Spleen, Renis, and Womb.

VIII. The Specification. I have been informed by some intelligent English Men, who have lived in Spain for some Years, that the People of the place esteem them as one of the most popular Remedies against the Stone and gravel, and much Superior to the Garden or Marsh Kinds.

The Virtues.

X. The Virtues are the same with the Garden and Marsh Kinds: and therefore the Description and Uses of each Preparations the same, to which you are referred; save, that these Wild Kinds are esteemed to be double in Force and Goodness.

CHAP. XLI.

Of Common Avenis.

I. The Name. This Herb, for all that we can learn, was unknown to the Greeks, and therefore we can furnish you with no Greek name for it: but it is called in Latin, Geum vulgatum, and Caryophyllata, (from the small of its Root) also Herba Beneidilis, Sansnaua; and Tragus would have it called Nordus agresis, (not only for the sweet scent of its Root, but for its excellent Virtues) and is supposed to be the Green Plant, in Hifl. 6. Ch. 25. Sed. 21. It is called in English, Avens, and Herb Beneis.

II. The Kinds. The General Kinds are two. 1. Caryophyllata vulgaris, the common Avens. 2. Caryophyllata Montana, the Mountain Avens; of which in the next Chapter. The Common Avenis is two-fold, 1. That, Florum minor, with the smaller Flower, (which is the most Commons) 2. That, Florum majus, ...

Herbal.

fear, with the greater Flower, as Mr. Ray has noted. Hill, Planct, pag. 60.

III. The Driftgum. The drift of the Common Kind with the smaller Flowers, has a root consisting of many thick Strings, and smaller Fibers, somewhat of a brownish yellow colour, being formed into fine filaments somewhat like hair, which, especially if it grows in the higher, hotter and drier Ground, and in a very clear and cleaner Air, but nothing so much, or not at all in many other places, especially if they be wet. From this root sprout forth many long, rough, dark, green winged Leaves, every one made of many large Leaves, set on each side of a middle Rib; the three largest colored green at the ends, and fringed or dentilated round about the edges; the other being small pieces, sometimes two, and sometimes four, standing on each side of the field middle Rib, under them: among which do rise up divers rough or bony Stalks, about a foot high, branching forth with Leaves at every joint, not so long as the above, but almost as much cut in on the edges, some into three parts, and some into more; on the top of the Branches stand small, pale, yellow Flowers, confisting of five Leaves, like Compassed Flowers, but larger, in the midst whereof, stands a small green head, which, when the Flowers are fallen, grows to be round and large, being made of many long, greenish, purple Seeds, like grains, which will stick on your Cloth.

W. The other Avers with a large Flowers, is in Fruits like differing from the former in any particular, except in the Flowers, which are greater than those of the common, and firmer: This I have sometimes seen and gathered in Woods and Co- fops in some parts of Cambridge and Huntingdon, where the whole Plant grew large and very fragrant, but the Roots not much inferior (in my opinion) in their Scent to Chives themselves.

V. The Places. They are found to grow Wild in many places of our Land, under Hedge sideles, and near By-paths in some Fields, as also in Woods and Copes, delighting to grow rather in Shallow or Sunny places. And in many places they are brought into Gardens, chiefly about London, and in some great Towns and Cities, that they may be near at hand upon occasion.

The Large Flowered Avers is found in Tedford Wood, in the Woods of Lincoln- shire.

VI. The Times. They Flower in May and June generally, and their Seed is ripe in July at fir- steth.

VII. The Qualities. Avers is hot and dry in the first Degree; and is inclining, Attenuating, Opening, Aqueous, Digestive, Revulsive, Carminative, Aph- lexiparmik, Althetting, and Venerary. Schroeder says, it is Cephalick, and Cardialk 4 and we know by Experience that it is Stomatik, Hepatik, Hy- ficall, and Arthritis.

VIII. The Specification. Schroder says, its chief use is in drying up Catarrh, and resolving Congula- ted Blood: it is a singular cure for Wounds and Ulcers.

The Virtues.

X. The Root. The Powder of the dried Roots given from half a dram to 1 dram, strengthens the Stomach, opens Obstructions, is good against Spitt-
Chap. 42. English Herbs.

57

cures simple Wounds by the first intention: It cleanses running Stares, old Herd Ulcers, and stinking and rebellious Fertil's, washing them with the Juice of this Plant, and then applying this Balm: it cleanses, incrustates, or breaks Fletch, and brings to a speedy healing.

XX. The Citapojon. It diffuseth Inflammations in their beginning, and is against Contumelions, or Bruises, cuts pains or Aches in any part, and is singular good in a cold Gout. I have applied it with great success in vehement Head-sachs, proceeding from taking cold, or any recent Candle.

XXI. The Mixture. Take Juice of the Roots iv. ounces, fine Verdgreefe 3. drams; mix them. It takes off the Callas in hollow Ulcers, and Fertil's, where it must be injected with a Syringe. But if the Callas is in an open Ulcer, the Mixture may be thus made: Take of the foregoing Ointment iv. ounces: Powder of Tobacco 3. drams: Verdgreefe 3. drams: mix them. Or thus: Take of the former Ingredients: Powder of round Birthwort Roots: 3. drams: fine Verdgreefe 3. drams: mix them. Any of these mixtures take off a Callas from any Ulcer or Fertilula, cleanses the same, and induces it to a speedy healing; and this it will do, if the affeil be in the Joints.

I. T H E Names. They are called in Latin, Caryophyllytis agriceps, Caryophyllytis montana, and in English, Wild or Mountain Avens. The Epithet Wild is put to the, to distinguish them from the former, which are never called Wild; for those they grow Wild in Fields and Woods, yet it is always near home, and beside, they are many times Nurtured up in Gardens, which these are never, except as near Rarities.

II. The Kinds. There are several Kinds of Mountain Avens, but those growing in our Country chiefly are: 1. Caryophyllytis montana purpurea, as Gerard calls it: Or Montana palustris purpurea, as Parkinson: Alto Aquaticus natans flor, and Aquatica florae rubri florio, by the Bashims; Purple Avens, or Water Avens. 2. Caryophyllytis flore amplexo purpurea, Avens with a double flower. 3. Caryophyllytis Chasmadryos folio, as Admision calls it: Cosmederia florae montanae Ciflioreis, as Parkinson: Alpina Ciflioreis, and Alpina florae frugesanae altae, the Baushims: Tenerum Alpinum Ciflioreis, as Gerard; Mountain Avens with Germander Leaves. 4. Caryophyllytis Pentaphylla, as Bashim and Parkinson: Alpina Pentaphylla, as Gerard: and Alpina quinquifolia, as Calfour Bashim. Cingefufl Avens. To which add, 5. Caryophyllytis montana Virginigetis, Virginia Mountain Avens. 6. Caryophyllytis montana florae magno laevo, Mountain Avens with a great yellow flower. 7. Caryophyllytis montana florae magno laevo, Mountain Avens with a great yellow flower.

III. Description. 1. Purple, or Water Mountain Avens. It has a Root about a Fingers thicknesse, with many Strings or Stems thereof, from whence rises upon many long and hairy Leaves, composed of divers little Leaves, with larger at the top, and thefe split or divided along the edge, like as the Common Avens: among which Leaves rise up several Stalks, a foot or more in height, on which grow Flowers, whose Heads hang down: the tops of the Stalks, and Caps of the Flowers, are commonly of a purplish Yellow, but the Flowers scarcely appear about the Stalks but contain them: these Flowers therefore are of a pretty Red Colour, and are of divers shapes, and grow divers ways (which is the reason that Common, and some others, have judged them to be several Plants, giving the Flowers here cespitifor a differing kind.) For some of these Flowers, even the greatest part of them grow with five Red, round pointed Leaves, which never lie flat open, but only round straight out, the middle part being filled with a hairy matter, and yellowish Threads: Some of these Flowers consist of Seven, Eight, Nine, or more Leaves, and some again lie wholly open, with Green Leaves, growing close under the Cap of the Flowers; and some few now and then may be found compos'd of a great many little Leaves, thick thruf the middle, making a very double Flower: after the Flowers are fallen come such hairy Heads, as you see in the Figure, and in other Plants of this Kind, among which lies the Seed.

IV. 2. Avens with a large double purple Flower. The Flowers make this to be a different Kind from the last, yet doubtfull if it be not, but is one of the sporting of Nature, wherein few are variously in one and the same Plant, and therefore the Description of the last may fully serve for this, there being in truth no variation but in the Flower, as we have in the former, above, already declared.

V. 3. Mountain Avens with Germander Leaves. It has a long, thick, hard, woody Root, with many Sprigs or Strings growing from it, and spreading under ground, of a brown blackish colour, from whence springing up several hard, woody Stalks, eight or nine Inches long, spread upon the Earth, of a brown, reddish colour, which have Leaves growing upon them without any order, like to Germander Leaves, but leffer, harder, more wrinkled, and saw-like indented on the edges, of a White Hony colour below or underneath, and of a bisthish Green colour above, having an Afrignant Taste. The Flowers are White, and each Flower stands upon a slender hairy Foot-stalk, about three or four Inches long, round as big as a Strawberry Flower, and consisting of five Leaves opposite, or more, in the circumference of which is a Thrumy Head, of a small hairy subflumus, which being fallen, there succeed little Dow-
Salmon's Herbal. Lib. I.

**The Virtues.**

XIV. The Virtues of all the Mountain Avenus, are the fame with thofe of the Common Avenus, and are applied to all the fame Difficulties, and differ in nothing, but the degree of their Strength, force, or efficacy, for that thofe Wild or Mountain Avenus, are much stronger than the Common Kinds, and operate more powerfully, expeditiously and efficaciously, than any they can possibly do; and therefore the Preparations, tinctures and Ulises of thefe severall Preparations aforesaid, are the fame with thofe of the Common Avenus before declared in Ch. 41. Sect. 10. to Sed. 26. to which you are referred.

CHAP. XLIII.

Of Common BARLEY.

I. The Name. It is called in Hebrew ערב, Segaroth, fo 31. 4. and fo 1. 11. &c. In Arabic, Barley, Stor - In Greek, Ζαθή, in Latin, Hordeum; and in English, barley.

II. The Kinds. It is either Manured or Wild, of which latter in the next Chapter. The Manured is, Hordeum Difliburnum, Common Barley, 2. Hordeum Difliburnum Zamos, Bear or Battledore Barley, 3. Hordeum Polyfibon, Square Barley, or Winter Barley, 4. Hordeum Zamos, Cesnil, Bawm, Hordeum nudaum, Zeypetan, Tritio Speltom, Naked Barley.

III. The Description. Theift has a Grassy Root, with many small fibres or Stringes, from whence rise many feveral Grassy Leaves and Stalks, sometimes more, sometimes lefs, which are shorter and feither than thofe of Wheat, and the Grassy Leaves are alfo shorter, broader and rougher, and the Stalks fife up to be 13, 16, or 18 inches high, according to the goodness of the Ground; at the Tops whereof comes forth Ear, having two rows of Corn, fed in good order, each imbedded in a Bafk, flicking close to the Grain, and bearing a long rough Anne or Beard thereof, which is many times greater and longer than Wheat, and whiter felf, or very eafily falling out of the Ear. Cortus fays, that this Kind makes a recompence for the fmalnefs of the Ear, by the number of the Stalks; that each Grain or Root produces, 

---

*Note:* The text is a section from Salmon's Herbal, Lib. I., detailing the properties and uses of certain herbs and plants, specifically focusing on the Mountain Avens and Barley. The content includes descriptions of the plants, their uses, and comparisons with other herbs. The text is written in a classical style, common in herbal literature of the time, and uses botanical names and terms from Latin and Greek. The layout and formatting suggest it is a printed page from a book.
VIII. The Times. Barley is sown with us in March, especially the two first kinds; the Square or Winter Barley is sown a little before Winter; but all sorts of Barley (even the Winter Barley) are sown with us in England in March or April, and are ripe or fit for cutting in August following, or beginning of September at farthest.

IX. The Qualities. They are cooking and drying in the first Degree. They are gently Repulsive, Abdurifive, Diuretic, and Anodyne, appropriated to the Lungs and Reins, and also Alumbredick and Gallagogesick, or breaking Milk.

X. The Specification. They are peculiar for allaying the heat of Blood in Fevers, to help Filling Blood, and sharpening of Urine, being called therjo' the Application of Vescatures, by an unskillful hand.

The Virtues.

XII. The Malt. This is called in Greek, έλαιον, by Atticus: in Latin, Biere, and Maltum; which is a made Latin Word, from the German Word Malt, or our English Word Malt, which is Barley prepared for Brewing Ale or Beer, the manner of which Preparation is thus: Take a Quantity of Barley, as much as you pleaseth, put it into a Gunner made for that purpose, which you may fill full with the Barley, then affuse so much Water thereon as may cover it, and there let the Grain soak for two or three Days,
and Nightes, till it is well fulted, then drain the Week or Paste, or five bowls; when done, the scumlet boxily is to be taken out of the Cilbert, and spread equally, or as equal thicknesses, upon the leor of a Shaking House, about half a foot thick, when it is spread, and according as the air is cold, it is covered with Cloths, or not covered, and so fye till it begins to greate, ready as it were to grow, which will be performed in two or three days, if the Weather is warm, or very cold, otherwise it may fye longer: before it greece hot, when it is up to do, it is to be turned with Shoovels for that purpose, two or three times a Day for a Week or ten Days together, to cool it, and day it: When it is thus dried, it is put upon a Malt Kiln, and there it is throughly dried by the help of Fire, made either of Straw, Burnt or Wood, to cause it to the beater Bedfith or Tafle: It is fty dried with Faggots or Wood, the Malt will take Sittersiffer from the Smock, and will easily be perceived in the Drink, which will taste Bitter: If it is dried with Faggots, or other lift fley, it will take left Bitter, but the only choie Malt is that which is dried with Straw, for that is truly Sweet, and makes the only pleasant Drink. Malt being goodley Ground is made into Beer and Ale, as we fhall in the next place shew. Ground Malt Fryed, and applied in a Bag, as hot as can be endur'd by the Sides or Belly, gives cafe it is propagated from Stitches, Colick, or Giftings called through Cold or Wind: Made into a Palefife, it is good to afflige Infammations, or other like Tumors or Scarcamens.

This is called in Greek Ψυλλος; in Latin, Cythum, Græufa Lapulate, and in English, Beer. It is made by Infuffion of Ground Malt, and a due Quantity of Hops in a sufficient Quantity of Boiling Water in a proper Pot or Vefifl, fo long till the whole Virtue and Goodnefs is Extricated out of both Malt and Hops; then the Liquor is drawn off: Now left any goodnefs should yet be left in the remaining Malt, another Quantity of Boiling Liquor is put thereon, and so furred together, and kept in Infuffion till the remaining Sweetnefs is Extricated into the Liquor: Thofe two Liquors (or more, if you think needful to make them) which are called Worts, viz. the Smaller and the Stronger Worts, are put together, and being mixed, are put into Coolers, to bring them in a better State, or rather Warmer, to make them fit for a fucceeding Fermentation: But as this only brought to a Warmth, the Liquor is put into the Working Vat, and to caufe or facilitate the Fermentation of the aforesaid aforesaid, a proprionar Quantity of Vermont or Ylif is added, and mixed with it; and the Working it continued fo long till both Watts and Smell gave a Demonftration, that the Nature of the Liquor is changed, and turned from a delight, humble, fweet Watts, in a kind of a Vifious Averofity and Vifion. I know our Common Brewers Boil their Worts, and it is their Opinion, that the Beer or Ale will not keep without much Boiling, but our Experience has long since refuted the Error or Vanity of fuch Conceptions: as only the Liquors being ftring of the Malt, which makes the Ale or Beer keep; it is weak in that, and it will boil as long as you will, it will foon grow Small, Hard, and Soure, nor can you prevent it, do what you can: and if it is very ftring of the Malt (and not too much ferment'd) then the Liquor were never Boiled at all, yet with the Drink keep several Years Good, and grow neither Soure, nor Hard, as your Drink made of Boiled Malt works, and of this I am a particular and many others bear Witness against the Boiling of Worts in my Sepulchra, or Druggift Stop. fho. 8, cap. 7, feft. 26: where you may receive abundant Satisfaction, almost next to Demonftration. 

XIV. Ale. This was called in Greek by Dioscurides Μελον, in Latin, Carnum, (from the Greek) alle, Carnes, Carnus, & Carnula, or Pulpe, or Drink net Hop, now called Ale. It is made of Malt exactly as Beer is made, without any difference, only that it is not hopp'd, which is here wanting. But of late, in the Summer Time, the Brewers put in a small Quaffy of Hops, to make the Ale keep the better, which is the property of the Hops, confirmed to us by Experience. Ale without doubt is the moft Ancient Drink of our Land: But it has left much of its Reputation since Beer came into Fashion or Use, because the Hops make it more durable without lowering, and left full and more wholesome. However, whether it is Ale or Beer that is drank, that is the heft and more wholesome which is worst or sweet, than that which is hard or flate, the former being cleansing, and keeping the Body open and more Sufficient: Yet that the Hops be allying; the Hops are Altringent, and foaping, causing Heartburnings in many, and breeding Aeid Humors, and laying the Foundation of, or may Detract it, the Hops are Altringent, and ill fent will be taken totally from it: This being done, you may either keep it in its prefent condition, of the Strength of Common Brands, for common and ordinary Uses; or you may Defperate it by reiterated Difillation per fe, either in a Copper Vat till within with its Worm, drawing off only the fine Spirit, leaving the Flffer behind, or you may Diftill it in a Glafs Body or Bolt Head in Salines Martia, or a very gentle Sand heat, which will caufe the fate Spirit only to Affend, leaving the Wary parts below, and this Work is fo often to be repeated, till the Spirit is become purely fire, and free from Flffer, strong enough to fire Gas-Former. This Work will the better be done, if a proportionar Quantity of Common Brands, or Pot-Alfes be call into the Spirit; for the Salt dissolving in the Flffer, will keep it down or make it fley behind, and caufe the Liquor to yield its Spirit with much more cafe and freedom, and to be much purer from Flffer and Empefitys. As to its Virtues and Uses, it has the same Nature, Quality, and Use with the Spirit of Wine, and performs all the fame things, in making Tonics, Cordial Water, Elixirs, Pomera, Volatile Spirits, Baths, &c. and therefore to that you are refered.

XV. The Spirit. It is drawn from Beer or Ale green, very hard, pricks, or almost fower. It may be drawn in a Copper Vatia till within with its Worm, drawing off only the fine Spirit, laying the Flffer behind, or you may Diftill it in a Glafs Body or Bolt Head in Salines Martia, or a very gentle Sand heat, which will caufe the fate Spirit only to Affend, leaving the Wary parts below, and this Work is fo often to be repeated, till the Spirit is become purely fire, and free from Flffer, strong enough to fire Gas-Former. This Work will the better be done, if a proportionar Quantity of Common Brands, or Pot-Alfes be call into the Spirit; for the Salt dissolving in the Flffer, will keep it down or make it fley behind, and caufe the Liquor to yield its Spirit with much more cafe and freedom, and to be much purer from Flffer and Empefitys. As to its Virtues and Uses, it has the same Nature, Quality, and Use with the Spirit of Wine, and performs all the same things, in making Tonics, Cordial Water, Elixirs, Pomera, Volatile Spirits, Baths, &c. and therefore to that you are refered.

Pimp. 18. 18. chap. 7, says that the Greeks made it, 'Green Barley taken out of the Ear before it was fully ripe, steeped in Water, then beaten in a Mortar, after well mixed in a pot, to free it from the Husks, so dried in the Sun, and afterwards steeped and beaten again, till it was thoroughly cleinfed, which being dried was ground fmall: of this they took 11. pounds, and added thereto, Linseed, Coriander seed, and each pound: Salt 13. ounces: these fmall things well beaten together were mixed with the Barley, and so prepared for use. 12. Other Grecians, says Pimp, added Barley mixed with the same, and washed by beating in a Mortar, after dried, and so parched or fried it the next day, and then ground it to Meal, to make Bread, Cakes, Puddings.
or Bread of. III. The Indians Made it of Porched Barly, without any methilfast, ground small to xx. pounds, with which they added Millersmeal or Ponderous meal, pounds: Coriander-seed, Lin-seed, well beaten of each j. pound, Sult. j. ounces and a half, and then mix them all together. IV. Galen Commends it to be a Make of Frey Barly out full ourse or Ponderous meal; and before the Bread was white, or quite dry, and then indifferently parched, and reduced to flour, adding nothing else to it. Many Nations used this Ponderous instead of Bread, and the Egyptians that they had Wheat growing with them, they made mostly of this. It dries and asfringes more than Barly in itself, binding the Belly and flepping Fluxes, being drunk with Almon, or Wine: Drink with Water, it quenches thirst, and allays Heat; and if taken into the Throat or Lungs, it was often eaten mixed with new Wine, or boild up with Wine, and so eaten, as every one liked it.

XVII. Alasa. This is only Potones, or the Flower of Porched Barly, mofthold with some Kind of Liquor, as every one liked best: some with Water, some with Water and Wod Gner, some with a frame of Pine, some with Wine and Wod, and some mixed it with Honey, as Hysphcru, Hippocrates and Galen declare: but Galen says that Alasa, is hard of Digestion, and generates Wind: if it is well mofthold with Water, fower Wine, or Oil, and Honey also is added to it, it is the fooner paffes off.

XVIII. Psifana. The Ancients made it of several sorts of Grain, not of Barly only, but of Wheat, Rice, Orzo, Peas, Lentils. But Psifana, fimpfly confidered, is always underfoot to be made of Husked Barly only. Hippocrates his way of making it is thus: Take the Barly and boil Barly; keep it in Water fivr Hours or more, then put it into a coarse bag, and beat it with a Mefle or wooden Poffle till the Husks come off which take away with washing, dry it in the Sun, and keep it for fome time. Take of this boiled Barly what you please, and boil it in a fufficient Quantity of Water till it breaks, and that the liquor is thick like Cream: this liquor is the Psifana, which ought to be moderately liquifed. This has no Affedtion, nor troubles the Stomach or Bowels, nor fwell or fills them with Wind, for the Windy part is vanifhed by boiling: it clots not the Blood or Stomach, but by its Liquidity easily difpafs itself, and quenches Thirft by its mollifing quality; and for thefe Properties fike, it is probable both for fick and well: Thus Hippocrates and Galen. But Dijpofitors further adds, that this Psifana by reason of its being boiled, yields more nourifhment than Potones, is good againft Exacerbations, and to help the Hearties and Roughness of the Throat: This was the Psifana of the Anciens: but the Philofofhs in our Times makes it thus, Take boiled Barly, commonly called French Barly, boil it in Water till it be fift or broken, then heat it in a Mortar, and strain it, to which add fweet Almonds, Melen and Circular Seeds, beft to a Pafh, and then mix together. This is their usual Psifana, or Barly Milk. Psifana Drink is thus made, Take boiled Barly, boil it in a fift Water, and then a second Water, but something lefs than in the former Recife, strain the Water from the Barly, and to fift quarts of this Water, add Rallyns of the Sun flooned in, curtes, Blew Curranes j. ounces, Linjurks, Bay leaved j. ounces, fweet Fenel, brooks of Almonds, j. ounces, Cardamon, j. ounce, and Madaen. Hair a handful, boil again quarter of an Hour, or better, then strain out for ordinary Drink. It is good against Coughs, Colds, Headaches, tertunes of Barly, difcomfort of Heart, old affection of the Lungs, coughs of the Bowells, and all for weak and Conipitive Bodies.

XIX. The Yeaf. It is the Supernatural Excellency of the Drink, raised therefrom in Working, and Yeaf Ufes apply, bating on and more specially perfections the Fermentation of the Liquor, which is a separating of the Vomery or Mealy Parched Particles, which fall from the Wort, and the ftripping up an innate and latent Acid into act, to give the Drink a pleasant which all briskfants or Quickfants, efpecially is with a Subtle and kind of Vomity Spirit. This Yeaf is by Distillation yields a Vomitory Spirit, of equal Virtures with the Spirit of Wines, and Bakers make Yeaf leafl inlep of Yeaf, to make their Bread light, which would otherwise be bad; but this Spirit is chiefly of External use. Being immediately applied in Bains and Scalds, it readily takes out the Fire, and eafes the burning Pain, making the afeet more easy and yielding to other Medicaments. Applied to Phelegmons, and other like Tumors, it helps to lufes and resolves them, unless they be Applanated, and then it inwardly with the Quaption of the Apptation or Tumor, and alleviates the pain: Being boiled to a Salve or Emplifhick body, and applied, it strengthens a weak Back, and weak Joints, cafes Pain in those or other parts, and is diftillative and refolutive.

XX. The Exces or bottoms of the Barrels, called by some, Emptifying. They yield a Spirit by distillation like the Yeaf, which may be rectified to the like degree of Sadbility and purity, and may serve for all the fame Intention or Purposes, and to all the fame Difices for which we have prefcribed the Yeaf in the former Section to be applied. But this is not fo good for the Fermentation of Wores, as Yeaf is, because it will increafely work at all, and if it does it is fo meanly and weakly, that it makes rather a Slafe and Inflapid or dead Kind of Liquor, than any thing which has briskfants and Life: But it may be renewed, by adding a little fower Leaven wafen, difpated, in a little of frong or fwalk Wore, mixing them well together, ad digefiting them in a warm place, for that little time.

XXI. The Balfam. It is made of strong Ale, by gently boiling it, so long till it be reduced thick like Chlo Tarapente, and will fpread on Leather like a Słabore, or felf Cretce. This being apply'd warm to a Neck or Throat troubled with the King's Evil, or Venereal, or other hard Swellings, gives much eafe and other difficulties or refolves them: it is good to refolve conftaint Shews and Tendons, comfort and strengthen weak Nerves and Joints, and is an excellent thing for weaknefs and pain in the Back, and to apply it to any part or Member which is hurt by Sprainings, falls, breews, or other like Accidents.

XXII. The Meal or Flour. The Ancients make it of old, made of it Bread, 13. Kings 4. 42. John 6. 9, and 13. They made also Cakes of it, Judges 7. 13. Ezek. 4. 12. And to fo they have done almost in all Nation, and in most parts of this Kingdom, within thefe three or foureire yeares that paffed, they made alfo of it a kind of Baked Bread or Puddings, and fried Bread or Pancake, but now in our days Wheat being fo plentiful with us, Barly is wholly difcarded, unless amongst the pooreft of the People: The Turks at this day make a kind of Drink of the Meal or flour which they add, they call Copect: Thus, they take the Meal or Flour which they make into Pufle, and boil it in a great Caldron after which it is made into small balls, and then boil the balls being well into the Water, it will presently boile them a little, and grow hot, without the help of any fire, and because working by a kind of Drink. It is of a wholesome Color, thick, of a good nourishment,
tures into the Head, and enure Drunkenness if it is too largely taken, and this kind of Drink, says
Sertorius, is usually40 fixed in all the Cities of Africa, in the Tap Hoops against all foes, and generally with chem called Gout. In the Leucum, and
other the Euxyn parts of the World Barly is yet more eaten, and made more into Broth than Water. I suppose because it is more cooling, and preventive
of Fever. It is also cheaper for the poor and ordinary Fort of People: it nourishes much less than Wheat, but the Grain being Mashed, makes a more excellent
Drink, cleaner, thinner, purer, more Homeric and Dudistic.

XXIII. The Bread. It is made of the Flower
with a proportionate quantity of Water and Salt, to every hiff of which Water, a few Leucum, as big as a Mens fist doubled, or a Pint of Ale Yeaf, is added, being disfused in the warm Water, wherein the Palle or Dough is made: this being mixed with one
part of the Flower, is covered with the other, and left in digesting as an hour or two, that the whole may be Levecname, then the Palle or Dough is made by mixing all well together, and handleing it with the hands, till it becomes a stiff Palle, which then is suffered to ly again about half an hour, and then made up into Leucum, which are after baked in an Oven. This Bread is proper to be eaten willfed now, appealing
that the name of Corn, and nourishing bift.

Apply'd to the place where the Pain is, in a Vege-
Head-set, as soon as it comes out of the Oven, or
as hot as the Patient can endure it, it gives prompt
cure, and by the four times Application, cures it.

XXIV. The Cream. It is made of boughBarley,
bulled in a first Water and cool away, then boiled in
a second Water, till the Grain burns, and is perfe-
cally soft: this is then beaten well in a Mortar, and
mixed in the Water in which it is boiled, and
streamed through a Chefe Cloth: then Melon seeds
blanched are beaten to a Pulp, and mixed with Milk,
and strained till all the Myth and most part of the seeds are taken forth: This Milk is seasoned with double Refixed Sugar, and mixed with the for-
mer framings of the Barley, so you have Barley Cream. Some at Eating mix with it a little Damask Rofe Water and Juice of Limons. This ordinarily
taken is good against hot burning Fevers, and such as are weak, pain and feble, labouring under Hecticks, and Confumptions, for it cools pretura-
tural heats, and refreces much. Without the Juice of Limons, it is good against filamentous of Urine, and such as make a Bloody Water.

XXV. Botley Water. It is made of boughBot-
ley, boiled in a fift Water, and that cool away, and
then boiled in a second Water, half a pound of Bot-
ley is a Gallon of Water, adding after an ounce and half of burnt Hawthorn, boiling them so long till the Botley is breaking: then the Water is strained from the other things, and made poffitient with the Juice of Limons, and double Refixed Sugar. This is used as ordinary Drink for such as are in Burning or Malgin Fevers, Hectick Fevers, Confumptions, or good with it, it cools, admifibly quesses Thif, and prevails against Diffacles of the Lung.

XXVI. The Cough. 1. Take Barley Flower
six ounces, Acorus or Water, a fuffifient quantity, mix and boil in the confidence of a Pul-
licate. This apply'd warm cures Coughs under the Ears, in the Neck and Throat, and other like places.
2. Take Barley Meflor Flower, six ounces, Peppers of Pomeracq-feel, Linseed and Rye, of each six ounces, Persons of Mallot and Camomile Chops half a Bound, and half a Bound in a Butterfick. This apply'd warm, diffufes Infu-
mations, expels Wind out of the Bowels, and cures Pains of the Iides, Stomach, and Spheen.
3. Take Barley Flower six ounces, Powder of Pomegranate seeds and Myrrhe Berries, of each an ounce, a fuffifient quantity, mix, and boil to a Confidence: apply'd to the Belly, it is said to ftop the Loofness, or other Fluxes of the Belly. 4. Take Barley Flower six ounces, sharp Wine Vinger, a fuffifient quantity, mix and boil to the thicknes of a Giov-
fraen. It is good against Scurf, Dimdrift, or Mor-
phew in the Head or any other part, being laid on hot, and as Ants help to the Leucum. 5. Take Barley Flower water, white Salt and Hony, of each six ounces, white Wine Vinger, a fuffifient quantity, mix and boil to a Giovfrah. Apply'd it is said certy to cure the Itoh.

XXVII. The Mixture. Take Barley Water six
ounces, Scarp of Curn Poppleby six ounces, Tintrure of the same flowers made with Spirit of Wine six
ounces, mix them. Dole six ounces twice or thrice a day, with this I have cured fveal Fluxes. But the Barly Water six ounces, Boats, Germ, Ephemer. An. 2. 2 Pro-
ceed to cure other Calentom Pufhies with Barley Water alone.

XXVIII. The Julep. Take bough Barley six
ounces, hot it in a fift Water, which cool away, boil it in six pints, then mix it with six ounces of
Strap of Vickers: It provokes Urine, and is very
good in Choleric Fevers. 2. Take bough Barley six
ounces, boil it in Water, which cool away, and boil it again in six pints more of Water, adding
strawberry Leaves, Violet Leaves, of each half
faufs, boil till a quart or three pints is consumed,
then strain out, and distil it with six ounces of
Milk, and twice as much of Sugar Candy. It
breads Milk in Neries plentifully, cools the heat
and furfames of Urine, and helps Pilling Blood,
effectually if it is caufed by the Application of Vencesocytes, or Oiling Blatterfuls. It is good against Coughs, Colds, Wheezings, Hoariffs
Alrirm's, &c.

XXIX. The Bath. Take Leaves of Mallow,
Violets, Beers, Fumitory, Black Hellebor, of each
halffaufs, Barley in pount, but the fufficient
quantity of Water for a Bath, till the Barley breaks, the Grain is to be boiled a confiderable time
first, and then the Barley is to be put in to come to the end of the boiling. It is a very efual efficace thing against Scurf, Moprophew, Legedias, Scabs, Itoh, and other break-
outs, being often ufed.

XXX. The Empflaffer. Take Barley Water six
ounces, or Water, six ounces, Giuffit, a fufficient quantity, mix and boil to the confidence of a Conicere, or fift Empflaffer. It is said to cure hard
Swellings of the Throat and other places called the Kings Evil. Apply'd afar, it is an admirable thing to cure the Gout.

XXXI. The Diffilled Water from the green Barly, and the whole Plante. It is Diffilled in the end of May, and is good to cool Inflamed Eyes, and for such as have Deftutions upon them, to fay the Hu-
Iours, and to cale the Pain, being often dropped into them, white Bread being also dippt therein, and apply'd upon them, does the fame.

XXXII. The Grains, which are left after Brew-
ing. Tho' they are generally ufed as Food or Meat for Horse, Cows, Sheep, Hogs, and Poultry, yet they have the Fire of Barley in them, which is benefial in curing Lamefits in the Hands, Arms, Legs or Feet, caused through Cold, or civil Humors, being fallen into them, as also thinkings of the Water and Swarms, made all in a Bittin Tub or Barrel be filled with them whilet
whilest they are hot, or, if cold, heated again as hot as may possibly be suffered, and the Patient fit therein, so as to cover those parts, that they may gain strength, so long as he can well endure it without Fainting: this I say, if it is done three or four times, or more if need requires it, will both abate the Swelling and ease the Pain, also remove the Nerves, Joints, and Limbs, to their natural health and strength.

CHAP. XLIV. of Wild B. ARLEY.

1. The Name. It is called in Greek, ᾶρτος, in Latin, Hordeum gramine. In English, Wild Barley.

II. The Kinds. There are several Kinds thereof,

III. The Descriptions. *Zea*, or *Bryza*, has a small Fibrous or Stringy Root, from whence rises up slender and short Stalks, but from, bearing a small, thin Spiked Ear, with small or weak or slender Ear, and the Corn in two rows, one Corn in each side opposite to the other, from the bottom of the Ear to the top, whereby the Ear is flat, like unto Barley, with many small and slender Grains, or a Beard, as Barley also has, every Grain is contained singly in a husk, which sticks to it, so as not easily to be gotten off, the Ear, though remarkably Barley, and the Colour of the Grain, is a dark Red, as also slight blackish or dark brown Bread, and not altogether so pleasant as our Common Barley.

IV. *Aegilops*, (which in my opinion ought rather to be called *Monococcus*) has a Root which from a small, thin Stalks, from many Grains or Strings, from whence springs forth Stalks 2. or 3. handful high, resembling Wheat or Barley, *joined in three or five places, from whence comes forth divers Granes of a pale green colour, and at the top of the Stalks two or three Heads, set one above another, which are round and somewhat long, hard and stiff, having also many Beards at the end of each, wherein, when they are ripe and scalp whiteish, one or 3. small Grains or Seeds a little smaller, (says Gerard) than Barley; these Seeds are wrapped or infolded in a creased Skin or Skin, out of which the Awns come forth, Matthioli says, that as Loliun, or Common Darnel is known to be a Seed degenerate from Wheat, being found for the most part among Wheat: So by his own experimental knowledge, he had found that this Aegilops or Petruca, was a Seed or Grain, degenerating from Barley, and is found among Barley, or where Barley has grown.

V. The greater Way Barley, or Wall Barley, has a Fibrous or Thready Root, containing many Heads, from whence springs up many Grassy Leaves, and among these several Bent Stalks about 6. or 8. Inches high, at the top of which grows several whitish yellowish Ears, with somewhat rough Beards, but much shorter than those of Barley, and some have but one or two Beards at all. The Ear is much more like that of Rye than Barley, and the Corn, or Grains which come out of it, are brown Coloured, small and small, in Color and shape resembling Rye, so that it might more properly be called Wild-Rye, Way-Rye, or Rye-Grass, rather than by any Appellation of Barley, to which in my opinion it has no resemblance.

VI. The leffer Way or Wall Barley, is like the other in its Roots, Leaves, Stalks, Ears and Grains, so that many have taken it to be the same with the former, but in this it differs, that it is much larger, so that it scarcely attains to be a Foot high; and instead it comes to near to the former another, or rather Rye-Grass, that many have taken it to be one and the same, even as I myself also do.

VII. The Places. The first was anciently grown in Greece, and the Eastern Countries, now it is Sown in some parts of Germany and Sweden, but with the
Salmon's Herbal.

Lib. I.

The Virtues.

XII. The Infusion in Ale, Beer, or Wine. The Seal infused, or Drink in Poudret in any of these Liquors, affects the Head and Brain much, and cures Drunkenness.

XIII. The Decoction in Wine. If it is made with the Addition of dried Damask Rose, and drunk from 5 to 10 ounces, as also the Mouth and Throat, Ganglial then, it is good against a thinking Brain, I suppose caused by some thirty Ulcers or Ulcers in those parts, for that it has a property to heal Ulcers.

XIV. The Syrup. If the whole Herb, Roots, and Seed be bruised, boiled in Water, strained, and made into Syrup with Honey, to viii. ounces, of which it is of Aloe Socotrinium in five Ponder be added, you have an excellent Medicine against foul Ulcers of the Nostrils, by wetting Tents therein, and putting them up the same, holding them a pretty while therein, and often repeating it.

XV. The Powder. Mixed with Water in which a little Rock Alum, or Seltzshammar Savarys has been dissolved, and laid upon the Aegilops or Fistula in the Corner of the Eye, it cures it; it also cleanses, dries up and heals Ulcers in other parts of the body, being to used, or fried on dry.

XVI. The Juice. It is mixed with Barley Meal and to dried; and then upon occasion mixed with Rose Water, and applied. Another wise, it heals (as Gerard says) the Aegilops, or Fistula in the Eyes; it also softens and allivages hard Tumors, and swellings in the Joints. Label says, this has been often tried to be efficacious against the Aegilops, for that it has a drying quality without sharpness.

XVII. The Flowers of the Stalks or Straw. Made into a Linement with Water, it is good against the Gout from a Rheumatic cause, by often burning there with, and to dissolve hard Tumors or Swellings in the Head, and diffuses Tumors of the Joints.

XVIII. The Cataplasm of Wey Barle or Eye Grafs. Being made of the Green Bars and Grafs by bearing it in a Mortar, and then apply'd to places bald, or where the Huit is wanting; Gerard says, it caules it to come forth and grow again.

CHAP. XLV.

OF BARREN-WORT.

I. THE NAME. It is called in the Greek, Ἐρεμών: in Latin, Epimenium, Epipertum, Epimenium: in English, Barren-wort.

II. The KIND. It seems to be a Sanguineous Plant of the Kind, without any Species, the Parthenium talks of an Alterum fructificum, &c.

III. The Description. It has a Root small and reddish, spreading much under ground, in fodder than any place, from whence springs up several hard round Stalks, twenty or twenty four inches high, each Stalk divided for the most part into three Branches, and each of them bearing three Leaves opposite, which are several, somewhat broad and round, set pointed at the ends, hard or dry in feeling, and a little sharply dent'd about the edges, of a light green Colour, on the upper side, and darker underneath: from the middle ofborne of the Stalks of Leaves, shoots forth unto them, from the first rising up of them, a small long Foot of Flowers, not much higher than the Stalks of Leaves, divided into Branches, containing on each of them, three Flowers: and
Chap. 45: English Herbs.

Barren Wort.

IV. The Places. It grows on the Mountains of Liguria, and in most Meadows in Italy, about Rome and Vincent; also in Romanies, and on the Eugenian Hills. It grows with us in Gardens only, in moist and shady places, where it brings forth its Seed to perfection, tho' Drucides and Flora say, that it is without either Flower or Seed.

V. The Times. It flowers at its first coming forth, or first year of its growth from June till the middle of August; but after it has taken full hold, and well rooted it fell in the Earth, a Year before, and then Flowers in April and May.

VI. The Qualities. Galen allows it to be moderately cold and moist; I judge it to be cold and moist in the first degree: it is Repellent and Diffluvent, and appropriated to the Joints.

VII. The Specification. Parkin says, it is without any specific property, more than to keep Women's Breasts from growing over great.

VIII. The Preparations. By reason much of the Virtue of this Plant is not known, there are not many Preparations from the same; the chief being, 1. A Juice, 2. A Powder of the Roots and Leaves, 3. A Caustic.

The Virtue.

IX. The Juice. Whether it is taken out of the Roots or Leaves, it is good to cool Inflammations, and is profitable to bath with in an Erythraean.

X. The Powder. It may be made of the Roots or Leaves, for of either the Virtue is the same, tho' if made of the Root it is thought to be stronger:

Parkin says it is reported, that being taken inwardly for some time, it makes Woman Barren from whence possibly the Name might come.

XI. The Grasping. The Leaves made into a Pulsife, by beating them up with Oil, and applied to Women's Breasts, keeps them from growing great, and is good to Dificut a flight Cornition.

CHAP. XLVI.

Of Common BASIL.

III. The Descriptions. The Common Great *Ocimum Vulgatum* has a Threadly and Fibrous Root which perishes;
Salmon's Herbal. Lib. I

at the first approach of Winter, and therefore is to
be flown a new every Year, if you will have it, from
where rises up faintly but our upright. Stalk nearly
a foot high, variously branching forth it falls on all
sides, wherein, at every Joint, are fat two Leaves,
broad, thick, and fat; a little pointed, of a pleasant
sweet scent, facili, of a fresh green Colour, and a little
japet about the edges of which some are here and
there, are of a black reddish hue: towards the up-
per part of the Stalk and Branches come forth a num-
er of small white Flowers, which many times tend
to a black purple, with two small Leaves at the Joint,
in some places green, in others brown, after the
flowers come small black Seed.

IV. The Small Bulb Basil, has a fragrant pervading
Root much like the former, from whence rises a
small tender Stalk, which grows no so high as the
former, but is thicker spent with Branches, and
smaller leavews there; and for slender together; these
Leaves are little, less than those of Pennyroyal, and
the whole Plantation, and finger small growing into
a kind of diminutive Bulb, wherein the Name of Bulb
Basil, and of a more pleasing Root then than the
former by which: the flowers are small and white,
and the Seed black like the other, when it yields Seed
with us, which is more seldom, is not often snatching
vapor Seed here, because it another Springs, but Her-
nor Seeds so early as the others. Parkinson adds
another middle kind something larger than this
both in the height of the Bulb, and magnitude of the
Leaves, but not altogether differing, which to some
seems to be one and the same Herb, but differing ac-
cording to the goodness of the Soil.
V. The Anointed Basil, is truly of the self same
Kind with our ordinary Garden Basil but of a middle
size between the Common Great or I Bulb Basil, and
differs nothing in it Roots, Stalks, Leaves, Flowers,
nor Seed; but a little in the magnitude, and som-
ething in the scents, which is like the scents of Ani-
feeds.

Common Basil. Easifayd.

VI. The Places. Whence these Herbs first come
is unknown to us, but in Italy, France, Spain, and
England, they are only nourished up in Gardens.

VII. The Times. They Flower in the heat of
Summer as in June and July, by little and little,
whereby they are long in flowering, beginning at
the top, first, and its Flowering as twere down-
ward.

VIII. The Qualities. They are hot and moist in
the second Degree. They inside, ateum, open, excel-
difcou, resolve, concoct, digest, and are carminati-
and and sudorific, being Caphalic, Neuatric, Stom-
astic, Pectoral, Cardiact, Nrophitick, and Ultra-
tic, also Emimenogic, and Alexipharmac.
IX. The Specification. Schroder says, It is a pe-
culiar thing to cleanse the Lungs, and provoke the
Courses in Women.
X. The Preparations. The Ships make use of,
1. The Leaves. 2. The Seed. 3. And Distilled
from a Water. But you may further prepare, 4. A
Juice. 5. An Essence. 6. A Spirituous Tincture.
7. A Salter Tincture. 8. An Only Tincture. 9. A
Decotion, in Wine. 10. A Syrup. 11. An Oil.

The Virtues.

XI. The Leaves. Their small comforts the Brain
(whatever some Authors say) to the contrary and were
eaten into Olives the thing (I suppose as a Soli)
being corrected with Oil and Vinegar. Some Authors will
have it that, they dry up Milk in Womens Breasts,
which for my opinion is against their proper Nature,
being hot and moist, and therefore more apt to
seal Milk.

XII. The Seed. Being made into a fine Powder,
it may be given from half a dram to 3 drams, in
Wine, against the Pulmonary or Tumbling of the
Heart, to cheer and comfort the same, and expel
Melancholy, or fits of Mind; It is good also against Poison and the Stinging of Scorpions.

XIII. The Distilled Water from the whole Plant. It
is good to clear the Eye-light, and to be used as a
Vehicle for the other Preparations.

XIV. The Juice. If it is pin into the Eyes, it
takes away their Dimness, and light up Humors which
fall into them; first up the Noffills it causeth
Snorting, and doth Purges the Brain; given to j.
ounce in a Glass of common Creamy morning and evening,
it provokes Vesey in Lungs, and is good for such as
are troubled with Heart Qualms, or Swooning Fits,
or Troubling of their Terms.

XV. The Essence. It much exceeds the Juice for
 inward uses, being corrected, and made more Pure
or fine, as being freed from its gros and exulant
parts. It has the Virtues of the Juice, besides which
it is an excellent Stomastic, Cardiact, and Pecto-
ralt, freeing the Lungs from the Tarurous Matter
which obstructs them, and causing thereby a free
respiration, and therefore is profitable against Coughs,
Colds, Asthma's, and other like Distempers of the
Lungs.

XVI. The Spirituous Tincture. It is Stomastic
and Cardiac, refils Poison, and is good against the
stinging of Scorpions, or bitings of other Venemous
beasts; prevents against Painting and Swooning Fits,
Rickets, Heart, and is good for both as are trou-
bled with Lethargies, Carts and Apoplexies, and
other Cold Distempers of the Head, Brain and Nerves.

XVII. The Distilled Water. It is powerful against
Diseases of the Reins, opening their obstructions,
and removing the Tarurous and Viscous Matter which
attends them. It provokes Urine, expels Sand, Gras-
s, Slime and Stones out of the Reins and Urinary
Pulaiges. It provokes the Terms in Women and fa-
cilitates
Chap. XLVII.  English Herbs.

Of Citron and Clove B A S I L.

The Name. The first of these is called in Greek, "Cnncron bubehia; in Latin, Ocimum, vel Balsamus aliarum, Ocimum citrus; in English, Citron Basil.

II. The second of these is called, "Ocimum & Bomaliops lucubri vorum: in Latin, Ocimum vel Balsamus Caryophyllatum: and in English, Clove Basil, or Basil Gentile.

III. The Kinds. The first or Citron Basil, is the Greatest Basil, and is singular. The Clove Basil is,

1. Ocimum Caryophyllatum major, the Greatest Clove Basil.
2. Ocimum vel Balsamus Caryophyllatum minus, the Lesser Clove Basil.

IV. The Descriptions. Citron Basil: It has a pretty thick Root, with many Strings, which perish after setting time, or upon the approach of Winter; from whence grows up one upright stalk, spreading itself into many Branches, not much unlike the Common Garden Kind, with Leaves set by couples at the Joints, but much larger, and of a reddish Colour in the better Countries, but not so in our colder, a little dented about the edges, of a very pleasing Smell, much resembling that of a Citron Peel, and therefore called Citrum; the Flowers are White, like those of the ordinary Common Basil, and the Seed black, like those of the former.
VI. The Lesser Close Basil: It has a pretty long, ready flat with many little leaves, from whence rises our Upshur Stalk, which admirably spreads it self forth in Arms and Branches, looking very much like two bushes, and not very much unlike Mother of Tyme, but in the form of its branches, and the shape and magnitude of its Leaves, which grow more differently upon the Branches: the flowers grow at the Top of the Branches, after the manner of those of Basil, of a white Colour, but bending somewhat more backwards. The scent is the strongest and most fragrant of all the Basils, and smells perfectly like Clove, from whence it is also called Caryophyllatum, and this is the true Basil Gentle. An beall Figure hereof you have in Delapchamps Hist. Plantarum, lib. 5. cap. 51. fig. 5. pag. 681.

The Virtues.

VII. The Places. They grow in the Eastern Regions, and hot Countries, where they are more odoriferous, than in our Northern Climates; but now they grow in all the Northern Nations in Gardens, where they flourish well, and yield their Seed in perfection, but their fragrant Scent is not altogether so strong.

VIII. The Times. They flower gradually during the hottest Summer Months, as all June, July, and some part of August, flowering at the Top first; and then it gradually Ripens not long after.

IX. The Sorts. There are four in the second Degree, and most in the first Degree: including, Attenuating, Opeining, Digestive, Redulitive, Carminative and Aromatic. And appropriated to the Head, Nerves, Stomach, Bile, Lungs, Heart, Kidneys and Wombs: they are also medicinal and relish Palates.

X. The Species. They consist of the Nerves, prevalent against Palates, clean the Lungs of Tartarous Matter, and provoke the Term.

XII. All these Plants have the same Virtues with those in the former Chapters, and therefore the Preparations have the same, for which, and their particular Uses we shall refer you thicker.

CHAP. XLVIII.

Of American Basil.

I. The Names. This was wholly unknown to the Greeks, and therefore can have no Original Greek Name, but considering it is an Indian Plant, may well enough be called, "Basilicium Indicum"; in Latin, "Ocimum Americanum"; and by Connerus, "Basilicum Hispanicum": in English, "American Basil".

II. The Kind. It is twofold, 1. Ocimum Americanum multatum, smooth, spotted American Basil. 2. Ocimum Americanum crispum non multatum, crisped American Basil, not spotted.

III. The Description. The smooth spotted American Basil, has a leaf like those in the former Chapters, which perishes after Ripening, from whence rises up a four square, reddish green Stalk, a foot high, or better, from the Stalk whereof spreads out many Branches, each broad flat Leaves set thereon, two always at a joint, one opposite another, as the Basils have, but somewhat deeply cut in on the edges; and sometimes a little crumpled, sprawling upon long reddish foot-stalks, of a dark purple colour, spotted with deeper purple spots, in some greater, in others less, the Flowers stand at the Top of the Stalks, Spike-like, of a White Colour, with Reddish Stripes and Veins running through them, set or placed in dark
dark purple coloured Huds: The Seed is greater and rounder than any of the former Kinds, and somewhat long ovalish: the whole Plant flowers freely like to the common or ordinary Basil and Completer Pat together.

IV. The Crispated or Curled American Basil, not spotted: It has a Root like the foregoing, being a degenerate of the other kind, rifer (as Parkefick supposes) from the Seed of the former Plant, gathered in those colder Countries, and is indeed of the Kind of the American spotted Basil, having like Stalks, and such like large Leaves, cut somewhat deeply on the edges, and curled or crumpled; as they also sometimes are, together with foulling branches like Bladders in them, but wholly of a green colour, and without any spots, or spot upon them: The Flowers before are all white, and without any spots as the other has: the small breaft is very strong, and perfectly resembling the former.

V. The Alps. They Originally grew in America, from whence they were brought into Spain, and from thence to us, being nourished up in our Garden, the latter of which seems now to be a Native of our own Country.

VI. The Tones. They Flower gradually in June and July, as the others do, and their Seed is ripe in August.

VII. The Qualities. They are hot in the second Degree, and moist in the Fifth, highly Cephalick, Nervous, Cardialick, and Hypericick; they Attenuate, Open, Resolve, Diffuse, are Carminative, Aperient, Alepharmacick, and Emmuencagogick.

VIII. The Specification. I have found them peculiar against Palfies, and Pains and Aches proceeding from a cold Carle.

The Virtues.

X. The Distilled Oil. It cures Head-aches, Migrains, Lachrymace, Apoplexies, Epilepsies, Palfies, Convulsions, Tremblings, and weakness of the Nerves, Obstructions of the Womb, Rubs and Bladders, Punctures and Wounds of the Nerves, and all sorts of Pains, Aches, Sciatica, and Lamenets from a cold Carle, being taken inwardly from iv. to v. drops to xii in some proper Vehicle, and outwardly anointing the part affected therewith. It expels Wind, and cures the Colick.

XI. The Pourex or Pourex. They have all the former Virtues, but penetrate more, as being more Subtil or Volatile: They provoke the Terms in Women, ease Pains and Stitches in the Side, are good against Fits of the Mother, and Vapors, either in the Heart, or the Spleen, redit Hysteres, remove Melancholly, strengthening the Stomach, and all the Viscera. Dose from j. dram to ij. dram, in a Glass of Wine, or some other proper Vehicle.

CHAP. XLIX.

Of Stone BASIL

I. THE Names. It is called in Greek, Αίξινα; in Latin, Actinum and Actina by Lobel and Deechamps: Clinopodium Vulgarre, by Martinus; Clinopodium major, by Cuvierius; Botanica Paulin, by Guilemar; Palaenium montanum, by Lemercur, Polycenmone, by Gesner, and Clinopodium Origine foauto, by Bladin: in English, Stone Basil, and Great Wild Basil.

II. The Kinds. This is properly the first and chiefest of the Wild Basils, and is twofold. 1. Actinium major, the greater Stone Basil. 2. Actinum minor, the lesser Stone Basil.

Stone Basil Greater.

III. The Descriptions. The Greater Stone Basil has a bulky Root, of many Sprints set together at, and depending from one Head, which root forth jacta round about: from this root spring forth several hard, four square, hairy or Barby Stalks, a foot, or foot and half high, or more, jet with two barby green Leaves at each joint, being covered also as the Stalks are with a barby Devin, somewhat larger than any of the other Wild Basils, coming near unto the bigger and fission of the Leaves of Origemum: the flowers grow in Randleys, or round the Stalk, in greater plenty than in the Wild Basils of the following Chapters, and of a parglous colour, but sometimes white, the blatchs of which are some what larger and rougher.

IV. The Lesser Stone Basil, has like Roots, Stalks, Leaves, Flowers and Haks, and differs not any thing from the former, save that the Stalks be lower, the Leaves closer, and the Hooks of the Flowers smaller; in a word, it is of the same Kind, but the whole Plant is every way lower.

V. The
Salmon's Herbal. Lib. I.

V. The Flowers. Gerard says they grow plentifully in Armenia, almost by every Hedge; Parkinson says, they are found sometimes in Corn Fields in England, but more often in open Woods and Copes which have been filled, and that almost throughout that Country, more especially if they are not plowed.

VI. The Tymber. They flower in the latter end of May, all June and July, and the Seed is gradually ripe in July and August.

VII. The Herbs. They are hot and dry in the first Degree: Digestive, Affrighted, and瓦luerous, and dedicated to the Nervous.

VIII. The Specification. They are peculiar for stopping Fluxes, and the Terms in Women, more especially for Fluxes of Blood.

The Virtues.

X. The Juice. Given from 1 ounce to 2 ounces, it strengthens the Stomach and Bowels, and hasting an inflammation it allivates it.

XI. The Essence. This is more Stomackish than the former, and gives inwardly, I. flows all sorts of Fluxes, whether of Humours or Blood, and also the Terms in Women. Doth from j. to 2j. ounces, in some proper Vehicles.

XII. The Spirituous Tincture. This has all the Virtues of the former, and is good to take inwardly, to heal Wounds and Ulcers, from a dram to half an ounce, in a Decoction of the same Herb, it is an excellent Valuerous.

XIII. The Oily Tincture. It is good against Pains and Aches from a cold and moist Caufe, gives relief to the Gout, and heals Wounds, Punctures, or other hurts of these, by assuaging therewith Morning and Evening.

XIV. The Decoction in Wine. By fermenting thereof, it Diffuses hot Tubors and inflammations, used as an Infection into Eul, Salis, and hollow Ulcers, it cleans them, and daily drunk from iva to 2j. ounces, it stops the overflowing of the Terms in Women, the Bloody Flux, and other Fluxes of the Belly.

XV. The Balsam. It is an excellent Valuerous, cures Wounds by the first intention, and digests and cleanses, old, foul, rotten, and split Ulcers with great speed and ease, which it insinuates, or fills the Ulcer with Herb, and presently heals it up.

XVI. The Carpfloea. It is made of the Herb chopped small, beaten with an Moour, and boiled in Milk, and brought to the thickness of a Pulpire, with Yecks of Eggs, and Crumbs of Bread. It is Diffusive, Restorative, and Apotrope, and of singular good use to be applied to a recent Contusion, or a Gout from a cold Caufe.

CHAP. L.
Of Wild Basil.

1. The Names. It is called in Greek Καστελλίων, (Καστελίων, Bedsted Flower, because they resemble the Beds feet;) in Latin, Καστελλίων, Σύκμενη, Σύκαλομ, Βιβλία, Αγριομ, Καστελλίων; and in English, Wild, or Field Basil, Bedsted Flower.

II. The Kinds. There are three several Kinds hereof, 1. Καστελλίων, Βιβλία, Βιβλία; because left the Stone Basil; 2. Σύκαλομ, Σύκαλομ; because leaves

FRS, by Label and Clafim, Αικμος and Ευχεαθαρα, by Euyctes and Daceto, Iapomum, by Septo, Σύκμενη, Ευχεαθαρα, Σύκαλομ, and in English, Wild, or Field Basil; Bedsted Flower.

III. The Descriptions. The first is a Woody Herbous Root, full of hoary Threads, creeping along the Ground, and springing up Yearly if it be not without Sowing from colleague rises up, several slender Stalks, about six or eight Inches high, with two small Leaves at each joint, being somewhat like Wild Marjoram, or the same but Basil, a little denser about the edges, but not much, and some Leaves not at all denser, and in some Plants and Places a little rough and hairy, and in others, lea, or not at all; the Flowers grow at spaces with the Leaves, like as Herebound does, standing in green rough Caps, which are of a purplish Colour, and parted, as it were, into four equal flat pieces at the end, like to the four square feet of a Bedstead, and open with several Leaves like other Handle flowers; the Caps of the Flowers have not every one of them a single Perity, but many flanked together upon the same Pedicel or Stem, after which comes small round reddish Seed, growing three or four together in small reddish Hucks. The whole Plant, has some small beat, but more dryness in the Tafle thereof, and sweet or odoriferous in Smell between Basil and Calembine.

IV. The second Kind has also a Ruffy, Vobrous Root, which perishes every Year, from violence rises up, several slender four square Branches or Stalks, seven or eight Inches high, lying on the Ground, or which
V. The third Kind has a bawdy Root with many yellow Strings like the former, from whence rises up four, five, or more, four square hard Woody Stalks, divided into many Branches, covered with a soft white hairy down, two feet long, or longer, not growing upright, but trailing in some measure upon the Ground: the Leaves grow upon short foot-stalks, by clusters, of a light green colour, somewhat like the Leaves of Bafil, or rather Balm, about three quarters of an Inch broad, and not fully an Inch long, a little sharp pointed, and slightly notched about the edges, covered also with a soft foot haires, of a very fucculent, but not much inferior to Garden Marjoram, of a hot brimming taste; out of their Bafms grow other smaller Leaves; or else Branches: the flowers also grow out of the Bafms of the Leaves, towards the Tops of the Stalks and Branches, not in Whorls or Rings, like the Henon, or Stone Bafil, but having one little foot foot-stalk, on which is placed three, four, or more, small Flowers, opening open, and divided into four unequal parts at the top, like the Flowers of Basil, and very near of the Henon's and Byns of the Flowers of Garden Marjoram, but of a pale yellowish colour, tending towards a purple, after which come the Seed Vessels, which contain small roundish blackish Seed.

VI. The Places. The first grows commonly in the borders of Fields, and among Corn in fall, as at Sutton in Kent, not far from Dartsmouth, at Thoford in Norfolk, and in divers other Dry, Sandy, and Untilled Grounds. The second grows wild in Kent in divers places, where Clafier says he found it; also in several other parts of England; Gerard says he found it a little on this side Pontefrick in Yorkfor, and since by Thoford in Kent, and in the Isle of Thanet; he says it is brought to our London Markes, and is called by the Hef Women Poly- mountain. The third grows wild in hot Countrys, but with us in Gardens, and is often found amongst Sweet Marjoram.

VII. The Times. The two fiff Flowers in May and July gradually, and their Seed is ripe in July and August: The third Flowers in July and August, and its Seed is ripe in August and September.

VIII. The Qualitites. They are all of a nature, hot and dry in the end of the second, or beginning of the third Degree: they are also, Astringent, Incubing, Opening, Camomantine, Difcorre, Refrigerant, Ulcer- rative and Anodyne; Gepallic, Neurotick, Stimulick, Cardiack, Phytoick, and Arthricket, and powerful Alexipharmicks and Emmenagogicks.

IX. The Specification. The Field Bafil has been experimented against Convulsions, Cramps, and Neurotick Distempers. Acinos or English Wild Bafil is approved for Stopping Fluxes: and the Broad Leaf's sweet Scented Wild Bafil is good to facilitate the delivery.

X. The Preparations. The Shops keep nothing of them, but you may prepare, 1. An Infusiate Juice of the Acinos. 2. A Spirit from the first and third. 3. A Spirituous Tincture. 4. An Oily Tincture. 5. A Saline Tincture. 6. A Balsam or Oil of the fift.

The Virtues.

XI. An Infusiate Juice of the Acinos. Being given to a drum in Red Wine, it stops all sorts of Fluxes of the Belly, and Fluxes of the Terms, and dissolves,
disolved, and mixed with Lard into an Ointment it dextes hot Tumors.

XI. The Infusible Fleece. Diffusel in a mixture of Red Wine and Water, it is a singular thing to heal internal wounds, and hamp inward bleedings, and to repel the Fits of the Mother. Injected up the Womb two or three times a day, it stops the overflowing of the Terms, and the Witnes in Women. It be reduced to powder, and drank as one dram in Red Wine it heals inward Wounds, and outwardly being freezed upon any fresh wound, it heals it.

XII. The Spirituous Tincture. It heals inward Wounds, and gives c:afe to the Colic, and is found to be of excellent use in fainting and swooning Fits. Dole from 3 dram to 6 dram in any proper Vehicle twice a day.

XIII. The Oleaginous Tincture. Given to 1 dram, it opens old redructions of the Womb, and is good against Fits of the Mother. It also cures vehement pains in the Back and Ribs, being given in a proper Vehicle twice a day.

XIV. The Oil by Infusion in Olive Oil. It is a most singular Vulnerary, not only for all sorts of external Wounds, but for inward Wounds also, being drunk (in some proper Vehicle) from 1 dram to 4 dram twice a day. And as for all sorts of outward Wounds which are green or fresh, it drys them, consolidates their Laps, and heals them. It also drys up the mothe of inverted or old Ulcers, which hinder them from healing, and diffuses them to a speedy cure. Being applied with Lin, it is good against the Piles or Hemorrhoids; and being applied hot, it is efficacious against Fumures of the Nerves. Some Authors say, that anointed on the Belly of Women which are Baret, it causes them to be fruitful. It also cures bursings with Fires, and scorchings with Water, and eases the Bubbling of Bees, Wasps, Hinges, &c. and being anointed on the Mark, Scars, or blennishes of Wounds, it takes them away, or much abates them.

XV. The Balm. If it is made of the former Oil, by addition of Venice Turpentine, or Balsam Capri, and Bees Wax, it becomes a most singular Vulnerary, and in many respects more excellent than the former; and indeed is much more profitable for the healing of running Noon Scours, and old purrid Ulcers, applied to Cramps or Convolutions for some time, it helps the same, and is a singular thing to heal Ulcers in Women Brees, and such as happen in the Secret Parts of Man or Woman.

CHAP. III.

BALSAM-APPLE Female and Yellow.

I. THE NAME. It is also known to the Greeks, but is called in Latin by Marthutus, Argentea, Buchfania, Geisser and Tragan, Balsamino altares: by Doformace, Balsaminum: by Lugeum, Balsamino: by Cordis, Balsamelle: by Geisser ad Cordum, Balsamum angulolideus: by Commeratium, Laporontanum, and Gerard, Balsamino Eximia: by Lobel, Balsamino safari pericohidale: and by Gelflina, Catanans: and in English Balm Apple female.

II. THE KIND. It is the second kind of the Balm Apple, viz. the Female, differing very much from the former, both in the form and manner of growing. The Yellow Balsamino is the third kind, and by Gerard, Commeratius, Gerard, and others, is called Persicaria Stipifuga, in English, Caddet Arsmart;

III. The Description. The Female Balm Apple does much differ from the former: It has a Root intersecte into manifold Arms, from whence proceed many small springs spreading under the Earth: The Stalks arise from the main fork of the Root, which are thick, fir, full of Juice, in substance like the stalks of Parplane, of a reddish colour, and somewhat shining. The Leaves are long and narrow, much like the stoke of the Willow or Peach tree, a little toothed about the edges: among which come forth the Flowers, of an incarnate colour, tending to blossom, with a little tai or spur annexed thereto, like to Lords heels, of a faint, light crimson colour. These being gone, there comes up in their places the Fruit, or Apples, rough and biny, round, and sharp at the point, and thicker than stoke of the Male, at first green, but afterwards yellowish when ripe, the which open of themselves when ripe, and fall abroad their Seed, much like unto a Birch, a little Dailise, or like to Lentils, as other Authors say. But that which Gerard had in his Garden call forth the Seed like Cole-flower, or Muffard-seed, which made him to think that either the Chine had altered its shape, or that there were two kinds thereof.

IV. The yellow Balsamino (which Gerard places with the Arspars, and Partaking with the Mercuries) has a thick and thready Root, which pervades every year from which spring forth Stalks about two foot high, tender, green, and somewhat parasitical, below, smooth, juicy and transparent, but large and eminent fronts: From whence proceed Leaves or stoke of French Mercury, a little larger and broader towards their Stalks, and whatsoever also cut in with deeper Teeth or Notches. From the bosom of each of these Leaves, comes forth long Stalks hanging downwards, which are divided into three or four branches, upon which hang yellow flowers, much going, with crooked Spars or Heels, and pointed also with red or crimson Spots. The leaves being gone, there succeeds Cods containing the Seed, which are about two Inches long, tender, knotted, and of a whitish
Salmon's Herbal. Lib. I.

The fruit, when gathered with greenish lines, which are soon after they begin to be ripe, are so impatient, that they will by no means be touched, but presently the Seed will fly out of them into your face: from whence comes the name herbal impatient. and for which reason cabin'd, and where have called it, Nois me tangere.

V. The Places. The first of these is only Nut's up with us in Gardens. The latter grows in thisty Woods in France, Germany, and Italy. It has also been found in thisty Woods, in France, Germany, and Italy. It is the outer bark when green, and thisty thistles of Mounts, and their Vailils in Wales, Stow distract at Hampton, on the Banks of the River Kennett, and on the Plain in the Parish of Sherfield, half a mile from the field River, in the Highway among great Alder-trees: but it will grow and abide in our Gardens very well, and every year you sow it, being let in a thisty place.

VI. The Times. The first of these (as also the former Male kind) must be sown in the beginning of April, and in a hot bed of Horse-dung, as you do Ask-Melons, Cournouses, and such like Cold Fruits: then they must be replanted abroad from the bed, into a hot, mild, and fertile place, at such time as they have gotten three Leaves a piece. They flower in July and August, and their fruit comes to the greatest perfection our Country will get it in September following. The Noli me tangere flowers in its natural place, about the middle or end of August, and presently after Soeds: but that which grows with us in Gardens, flowers in June or July.

VII. The Qualities. The first of these is in 1st and dry in 2nd Cephalick, Neurick, Vulnerary, and Alterative. The Noli me tangere, is hot and dry in the third degree, Nephreticks, Diureticky, and Alterative.

VIII. The Specification. The latter Specifically provokes Urine, even unto a wonder, as Geyser tellis.

IX. The Preparations. They may be the same with those of the Male kind, as, 1. Powder. 2. Decoction. 3. Infusorial Juice. 4. Spiritious Tincture. 5. Olieous Tincture. 6. Oil by Infusion. 7. A Balsam. From the Noli me tangere, there is 1. A Powder of the Herb. 2. An Infusorial Juice. 3. A Distilled Water.

The Virtues.

X. The Powder. It dries up green Wounds, coals, and heals them.

XI. The Decoction. It cleanses old Ulcers, and rotten Sores, and helps Fizal's (being inhaled into them) to a healing.

XII. The Infusorial Juice. Being reduced into a powder, and dressed upon a green wound, it presently conglutinates it, and heals it.

XIII. The Spiritious Tincture. It is helpful to a Gastricke in beginning, and by its gentle Hyperick quality, refines and strengthens the heat of the Part.

XIV. The Olieous Tincture. It has the same Virtues with the Spiritious Tincture, but much more powerful, bathed upon the Sore, it conglutinates and strengthens them, helps Cramps, and cures Aches and Pains, and is good against punctures of the Skin.

XV. The Oil by Infusion, heals Wounds, abates Inflammations, and cures fiery Pustules of the skin.

XVI. The Balsam. It cleanses and heals Ulcers, and gives strength and Punctures of the Nerves; being applied, it cures old rotten Ulcers, running Sores, and lided Heels.

XVII. The Powder of Noli me tangere. It is

Emerick, and sometimes Catharick, working (as some Authors say) strongly; for which reason Designus says, it has a percutious Faculty, and is deleterious; yet it may be given from a learepe to half a dram in some convenient Vehicle, in strong Bodies.

XVIII. The Infusorial Juice. It is Emerick like Camphora, and sometimes it works downwards like Scammony, but its operations are not altogether for certain. It may be given from ten grains to a mereple, made up into a Bulis, and so swallowed.

XIX. The Distilled Water. It is of mighty power to provoke Urine, and if largely drank, it is said to induce a Diabetes: and some make it, as to expel the Stone in the Reins: but without doubt it powerfully cleanses the Reins and Urinary Paffages, expelling Sand, Gravel, Stones, and other things which disturb the Paffages of the Urine.

C H A P. LIII.

B A W M Garden and Baffard.

I. T H E Names. It is called in Arabick, Bede-ronge, Bederongi, Bederorgee, Vararrongi, Harmerone: in Greek, 

MELI/JO, 

and in English, a Baffard, A Baffon, A Baffance, A Yogurt, 

MEL/JO, 

Speculative, Differ, lib. 2, cap. 18. Plebe lib. 21, cap. 

Melisphonius et Melisior, Jn Latin, Melisilja, as Apeth que etiam vnam esse dicuntur: and in English, Bawm.

Bawm.
Chap. 53. English Herbs.

57.

XXI. The Spiritus Tinctorius. It has the former Virtues, and more powerful to all the fist Intentions, but not so pleasant. It is indeed a declared thing against all Pains of the Heart, the Colick, and Gripping Pains of the Bowels. Dose j or ij. drams, sweetened with the Syrup of the Worms.

XXVI. The Saline Tinctorius. Being given from one Dram to two, or more, in some proper Liquors, is good against Poifon, and the blistings of Mad-Dogs, eases the pains of the Stomach, and the gripings of the Bowels, proceeding from sharp Humors, it opens the obstructions of the Lungs, and causes fuch as to breathe freely, who before could not breathe; they break their Breath: it may be made pleasant with the Syrup, of which we shall speak anon.

XXVII. The Essense. It causes speedy and easy delivery to Women in Travail, and is more effectual manner is recommended against Hypochondriack Melancholy, being effectually taken for some time. It has all the Virtues of the Spirit and Tincture, but might be given in a larger Dose, by reason of the gross Particles which are mixt with it: mixed and made pleasant with Rose-water and Sugar, or its own Syrup, it may be profitably given to Women in Child-bed, to bring away the Birth, or to be taken by a Woman in a perfect cleaning. Galen lib. de Simplic. says, that Bawm is like unto Horshound in Qualities, but much weaker. I will not gainsay Galen totally, but that it may be so in some Cases, as in Hypochondriack Diletance: but where a Cordial is intended, I am sure Bawm is much the fuperior, and is much better for Women in their Lying in, when they are fainting, from their own Travail or hard Labour: Dose from half an ounce to two ounces. It is good against Poifon, and the blistings of Venemous Beasts, and such as have been long troubled with the Bloody Flux.

XXVIII. The Syrup. It is Cordial, but is chiefly used as a Vehicle to other Cordial Medicines, and to make them palatable: however it is of it felt a singular pheasant, and good against Congis, Colds, Ahuma's, Spitting of Blood, Obstructions of the Lungs, and other like Diletane of the Breast, and parts adjacent.

XXIX. The fixed Salt. It strengthens the Sto- mach and Spleen, refis Vomitting, and carries off much of the Morrisht Caufe by Urine. To stop Vomitting you may give it thus: Take of this Salt a quadruple Spirit of Salphuir viij. or x. drops; mix them till the efferveffence is over: then diffi- fuse it in a Glass of Canary, or some other Spirituall Vehicle, and do give it the Patient to drink.

XX. The Balfum or Or. They are most allingular Visionaries, and many times cause the Story of Dreefing: and it is my opinion (grounded upon the Experience I have had of the Plant, in Chirurgoy) that it is not inferior for curing Wounds and Ulcers, to any of the Allheals: and adding the valiant and healing Properties it was, that our Ancients called it Balun, as being of the nature of Balfum. Out- wardly applied it is good against the Hanging of frit-
I. THE Names. The first is called in Latin, *Melisca Turkey*, or Meliscophium, or Meliscophium Turcicum: by Geyer in Hort. Cordonia, and Gérard Turcica, and in English, Turkey Bawm.

III. The Kinds. The Turkey Bawm, is the Third Species, in our Order: The Syrian, or Melisca confutes the Fourth Species, which are all that are necessary for us to consider in this Work. This Syrian Bawm, Authors will have to be twofold, viz. *Leaves and Affers, or Affers*: or Ubrana, and Indorato.

IV. The Description. The Turkey Bawm has a Root small and thready, which perishes every Year at the first approach of Winter, and therefore must be scoured again, every Spring. From this Root rises up one square broad green Stalk, two Feet high and sometimes more, if it grows in good Ground, spreading is left with two Branches from every Joint, where the Leaves are set, and this Course is continued up almost to the Top. The Leaves are narrower and longer than those of Common Garden Bawm, and more pointed in about the edges, of a fower Luminous green, rather exceeding that of Common Bawm: they are rough alia, and of a Light Green Colour. The Flowers are gaping or bound, growing at the Top of the Branches, in certain Fidances, standing in sharp, rough, pointed Hats, and they are of a blue or purplish blue Colour, but in some the Colour is perfectly white, whence several Authors would make several Kinds thereof, as the same time they differ in nothing but the Colour of the Flowers, but some say the Leaves are of a frether green Colour, which I have not yet observed. After the Flowers are poll, then comes the Seed, which is black and roundish, with a white Spot in each Seed, whitt it is fresh, which afterwards in a manner Vansifies, not being so durable when dry.

V. The Syrian Bawm, has a Woody thick Root, and full of Strings, which perishes every Year. From whence rises up, a round hollow Stalk, thick, and of a reddish Colour, about Two Feet high, branching forth variously on all sides up to the Top, on which are far shorter and rounder Leaves, at the end of longer Stalks. The other Leaves stand still upon long Stalks, and much rufaceous than the of Common Bawm (for which reason, some Authors have taken this to be one of the Kinds thereof) somewhat less demed about the edges, than the Canton Kind. At the Joints of the Stalk, from the middle upwards, come forth round about it, certain hard, whitt Skins, small and round at the bottom, and wide open at the brims, a little prickly at the corners, and much like unto a Bell, being for the most part Flattened. From the bottom of each of these comes forth one Flower, somewhat small, and like to those of the Common Bawm, almost white in Colour, or with a small blush of Red therein. After they are poll, in the bottom of the same skinny Bell, the Seed grows (but it very rarely comes to be ripe withal,) which is whitish and Corned. The Plant has nothing of the swell of Bawm in it, but it is strong, and the Lidge is bitter.

VI. The other Syrian Kinds, which is called Affers, differs not much from the former, as this form, yet it rizes elister bigger, and grows somewhat greater, but after the same Eftion: the Stalk of this is Four Square, and lightly hollowed or furnished. The Leaves are somewhat larger and sharper on the edges. The Cops or Bells in which the Flowers grow, are more prickly than the former, and much sharper at the corners of them, longer, more in number, and of a paler white Colour. The Stalks of the Flowers are brownish, and not so white as the other: and the Seed is three cornered, and sharp upwards like a Wedge.

VII. The
CHAP. LV.

BEANS Garden and Baftard.

I. T H E Names. The Bean is called in Arabick, Bachale, Bachele,Bahilla, and Hacbiile in Greek, Ἀραβίτζα : and in Latin, Fava. The Cod is called in Greek by Aρριθιλαντας by Nicander, and by Ἁρριθιλαντας by Apollonius K'ihvtp©-I, and in Latin, Theca.

II. The Kinds. There are many Kinds of Beans, but those which we shall chiefly take notice of, are 1. The Garden, 2. Kidney or French, 3. The Field or Horse Bean. Of the Garden Kind there are said to be two sorts, 1. The True. 2. The Baftard.

Ordinaries Garden Beane

III. The Description. The True, Large, Sweet Garden Bean, has a Root thick, with many Fibres or Strings annexed to it, from which rises one, Two, or Three Stalks (according to the goodness of the Ground) smooth and square, and sometimes Four or Five Feet high or more. Upon these Stalks are set the Leaves at certain distances upon a small Foot-Stalk, from the very bottom almost to the top, by Two and Three, which are lofty, thick, of a light green, and long, a little pointed at the ends. Between these Leaves and Stalk come forth divers Flowers, all of them looking one way for the most part, which are close, a little turned up at the ends, White, and spotted with a blackish Spot in the middle, and sometimes purplish at the face or bottom, of the form almost of Bloom, or Pea Flowers, many of which, that grow upwards to the top, do seldom bear Seed, and therefore are gathered by many to be Distilled, and the tops also being cut off, it makes the root of the Plant to thrive the better. The Flowers being gone, there grows forth long, great, fine, smooth, green Coals, greater than in the other Kinds of Beans, which grow...
Salmon's Herbal. Lib. I.

XIV. The Cataplasm of Bean Flour or Meal. If it is made with Vinegar and Oil, and applied to Woman's Breasts, filled with abundance of Milk, so that they can feantly hold, it will not only expel the Milk, but also so much the better occasioned by Custom thereof. If the Cataplasm be made with Henneck and Honey, and applied to Felons, Biles, Blisters, Apotomes, as also Kernels about the Ears, and Ringlet-Swellings, it helps them all. If the Cataplasm is made with Wine, and applied to Watering Eyes, or Eyes having a Concretion by Brows, it gives ease and does them good. If made with White Eggs, Egg Leaves and Brandon-cage, and applied, it helps Eyes which Swell or grow out. If it is made with White Wine, and with Vineger and Oil, and applied to the Cods, it takes away their Pain and Swelling. If it is made with Wine only, and a little Oil, and Eaten, it is good against Impotency, and ris up Luk in such as cannot use. All of Generation, by reason of the coldness, fangglings, and weakness of their Members. If Fries in Oil with Garlick to the thickheads of a Holly Padding, and Eaten as daily Food, it helps inveterate Coughs, almost pure cure, and the bounties of the Voice: and being for some time Eaten, it breaks Apotomes of the Breast and Lungs.

XV. The After from the Cods and Starks, Being infilfed in Ale or Wine, and the Liquor Drums, they are very Diureticke, and open all Obfuscations of the Reins and Bladder, and therefore are very good against Sand, Gravel, Stone, Dropsey, Jaundice and Urine. The Faces made into a Cataplasm with Horse Lard, and applied, are good against old Pains, Confections, Wounds of the Nerves, Distinctions upon the Joints, the Scarcia, and Gout, whether in Hands, Arms, Knees or Feet.

XVI. The Volatile Salt, Spirit and Oil of the Beans. Beans and Pease yield a very quainty of Volatile Sulf, and in much larger Proportion than any other Vegetable Production. It is thus made: Beans or Pease, whole and dry, put them into a large Earthen Retort, or into a large Glass one well Luted, so large as that about a third part may remain empty: put it into the furnace of Reverberation, letting to it a large Receiver or great Glass Bell, with the Reft of the Furnace of the Vaturnins, and make a small Fire in the Cider or Air place at first, only to warm the Receiver, and that when the Salt is melted, which keep so for an Hour, then kindle a Fire in the Grate Place, gentle at first for an Hour more, after which increase it gradually from Hour to Hour, but not so much as to be in the mean time, the air and waters part will come over in large quantity, then give a little Air to the Receiver of the furnace of the Receivers side, continually enquiring the Fire, till you see the Receiver to be filled with volatile Clouds, which will by degrees condense into Liquors, the Luscious and Salt parts sticking to the bottom of the Vejiles, deep appear on the Vejiel, for about two Hours, giving a little Air to the Receiver, after which open it for another, giving a more violent heat, and at length a flaming Fire, which continuall the Vapors envelope, and the Receiver is shut: then the fire is out, and the Vejiel cool. In the Receptacle we shall have much Venin mixt with Oil, and Spirit, and Volatile Salt, so penetrating that you will not be able to hold your nouse over the Mouths of the Vejiels. But all these Substances immediately into a Bath Head with a long Neck, covered, with its Head well Luted, and filled with a Beak and Receiver: place it in a dear Air, in a cool Daisy place. So may you see the volatile Salt afford by little and little cool and condense itself in the Head (which you must often cool by double Cloth dipp'd in cold Water, to bind the Effusion of the Salt): this Salt with what
CHAP. LVI.

BEANS Kidney and Scarlet.

I. The Names. This Plant is called by Hippocrates, Theophrastus, &c., and most of the Ancient Writers under the name of a bean from the Seed call it 

II. The other is called in Greek Κάκτος, σάκριος, and in Latin, Raphanus, &c., by others as a diminutive from μέλας, διάφορος, collect it Säckel, somach, אס

III. The Kind. The Species of the Kidney Bean are many: whose chief differences consist in the Colour of the Beans, which every Child is able to distinguish at Sight, as the White, the Black, the Red, the Purple, the various Coloured, the Great, the Small, and, as for other Differences, as they would be superfluous and needless, for they would be almost endles.

IV. The Scarlet Bean is said to be of two Kinds:

V. The Description. It has a long Root with many Fibres springing from it, which produces every Year, from which rises up first but one Saff, which afterwards divides itself into many Arms or Branches, every one of them being so small, that they cannot distinguish themselves, but are upheld by Species or Poles, or other adjacent things, taking hold with its clasping tendrels thereupon, in like manner as does Bryony, Hops, and the Vine, otherwise they would be sprawled upon the Ground. From these Branches arised great faults of several Places long Years Stalks, every one of which has three broad, round, pointed Leaves, of a green Colour, growing together by three's as in the Common Trellis: Towards the Tops of the Branches come forth divers Flowers in form like to Pea Blossoms, which vary and differ in their Colours according to the Soil in which they Grow, sometimes White, Black, Red, Yellow, Purple, Pale and various Coloured, for the most part of the same Colour the Beans will be of. After which some forth long and tender, flat, light green Pods, mostly crooked a little, and some thist, in which are contain'd the Beans, made about in form of a Kidney, five and much about the Magnitude of Horse Beans.

VI. The Scarlet Bean is a large Plant, but differs not much in its manner of growing from the former Kidney.
Kidney Bean: but the Flowers are large and many, and of an elegant Scarlet Colour: for which reason it is commonly called by our Morists, The Scarlet Bean.

**The Plants.** They Grow both of them, not only in England, but also in most parts of Europe, and with us they are nourishing up in Gardens. The first or Common Garden Kidney Bean (which some call the French Bean) extend their Branches to a very great length, having Poles or other like things to support and fall on themselves upon. The Scarlet Bean was first brought to us by John Tradescant, and made to Grow in our Gardens, where it now very naturally Breastheth.

**The Planter.** They are sown in the Spring, chiefly about the middle of April, and not before, and the Beans themselves are ripe, about the latter end of the Year.

**The Qualities.** The former are Hot and Mofit in the first Degree: (as for the latter they are more for the Show and Beauty of the Flowers than for any Physical use:) They are also Suppurative, Astringent to the Bowels, Nephritick, Spermatozogick, and Alterative.

X. The Specification. There is nothing Observable in this, saving that they have been found to provoke Urine.

XI. The Preparations. The Shops keep nothing of them, but you may make themthrom, 1. A Distilled Water from the green Cods, and whole Plant. 2. A Decolation of the green Cods, or whole Plant in Water or Wine. 3 An Essence of the Leaves and Cods. 4. A Volatile Spirit, Oil, and Salt, from the dried Beans. 5. The Athers of the Straw and Cods. 6. The green Cods to be eaten as a Salter.

The Virtues.

XII. The Distilled Water. May be used as a Vehicle to convey Nephritick, Diuretick, and Lyshen-triptick Medicines in.

XIII. The Decollion in Wine or Water is very Diuretick, and as its Signature shows, powerfully opens Obliteration of the Reins, Ureters and Bladder. It may be Drink a Pint at a time morning, noon, and night a little sweetened with Honey, and be continued for some days.

XIV. The Essence. It has the Virtues of the Decollion, but much more powerful, and is a singular sweeter of the Blood.

XV. The Volatile Spirit, Oil, and Salt. They are made from the dried Beans, exactly as we have Taught in the former Chapters, Sect. 16. and their several Virtues, Ufes, and Dofes are the fame, to that we need say no more of them in this place.

XVI. The Athers of the Straw and Cods, being Infus’d a Night or two in a Bottle of Ale or Wine close stop’d up, and that Liquor Drink Morning, Noon and Night, half a Pint at a time, or more, it powerfully provokes Urine, opens obliterations of the Reins and Ureters, and pleasantly brings away Sand, Gravel, Slime, or other Tartarous Matter offending those Parts. You may put two ounces of the Athers to a Gallon of Ale or Wine.

XVII. The Green Cods. They have the Virtues of the other Beans, provoke Luft and breed Seed; boiled and eaten with sweet Butter and a little Salt, and Juice of Oranges, they foment the Belly, provoke Urine, strengthen and pleaseth the Stomach, and make good Blood, but they ought to be eaten withleft they are green and tender (otherwise they will not be fo Teethform) and the Rif for String, which runs along the Cod, being taken away, then to be boiled close Covered, till they are footh, and do frett up with Salt, melted futh Butter and Juice of Sead Oranges, is confidered, in which manner they are very wholesome, nourishing, reftorative, and of a pleafant and grateful Taffe, and not in the leaf inferior to the other large Garden Beans.

**C H A P. L V I I .**

BEANS Field or Horfe.

I. The Name. It is called in Greek, Κόλλων: in Latin, Faba Equina, Faba Minor: and by the Greeks, Phalèus Minor, Faba egrica, vel Ratipia: and in English, Field Bean, and Horfe Bean. N.B. This Gracie both crediturque quin quatuor in nationibus. ia Codum, in Codum, Ray.

II. The Kind. We shall take notice but of three sorts of these Beans. The Horfe Kind, is our common Field Bean, which is usually found with us for Horses and Hogs, and is Named as above declared. The Second Kind, is that which the Greeks call Κόλλων, and by some Κόλλων: in Latin, Faba Syphoformans, Faba Gregaria, and in English, The Wild Bean. The Third Kind, is the Old Greek Bean, called Κόλλων: in Latin, Faba Vetricum Greacorum, Faba Syphoformans Greacorum antiquorum: in English, The Greek Bean of the Ancients.

III. The Description. The Field or Horfe Bean has a faint Root, going down right, with many small Springs springing from it, which perishes every Year, from absence Springs forth one, two, or more Stocks, which grow upright like the Garden Bean, not branching down, the Leaves are like unto the Garden Bean, without any dents on the edges, but they are smaller, more or a Joint, and growing others. The Flowers hand also more or a Joint, leifer, and of a more Purpufhe Colour: the Cods succeeding them
Chap. 57. English Herbs.

them are long and round, smaller than the Garden Kind, and planted upright: within which are small length round Beans, which when they are Ripe, are some blackish, some brownish, and some of a dirty yellow.

VIII. The Guelder. Our Field Beans are hot and moist in the first Degree, suppurative, strengthening and pharmacogenetic: nephrick, diuretick, and altative: and used externally, as in Wounds, they are of an ablutive faculty. The Wild Bean, and John Vintage, or Greek Bean, which Desforider, Gabin, and other Greek Authors intend, when they give us their Viruses, are used to all the same purposes and Intentions attributed to the Our Field Beans.

IX. The Specification. They have a peculiar Facility to remove Obstructions of Urine, and to make a clear Passage for the Waters.

X. The Preparations. They are exactly the same with the former, as 1. A Distilled Water from the Flowers and green Cols. 2. A Decotion of the same. 3. An Infusion. 4. A Volatile Spirit, Oil, and Salt. 5. The Athes and Fixed Salt. 6. A Broth of the Beans. 7. A Cataplasm of the Meal.

The Virtues.

XI. The Distilled Water. It is used as a Vehicle for other Preparations, and as a coluretick for the Face and Skin, to take away Pimples, Murphys, Thurnings, Sunburnings and other like Deformities, by often washing therewith, and letting it dry on.

XII. The Decotion of Cols and Plants, opens Obstructions of the Vesica, but chiefly of the Reins, Ureters and Bladder, and provokes Urine.

XIII. The Infusion, is said to dissolve the Stone in Reins or Bladder, but then I conceive it must be a soft and gritty Stone, not of a Film like Substance: it increases Seed, and provokes Luff.

XIV. The Volatile Spirit, Oil, and Salt of the dry'd Beans, They are made as those of Garden Beans chap. 55. Sect. 15: and have all the same Virtues, Utes and Doles.

XV. The Athes and Fix'd Salt. They are Diuretic, and powerfully provoke Urine, and therefore are highly good against the Urinary Stones, Gout, Stone, Gravel, and Jaundice. Dole a scruple in White Wine, morning and night.

XVI. The Broth of the Beans. It has the same Viruses, but not all out so Powerful.

XVII. The Cataplasm. Made with Wine, it is good against fulminations and Blows of the Eyes, and is probably applied to ease the Pains of the Gout. Made with Wine, Sugar, and, if applied, it takes away the Inflammation of the Taffi- cles, and Woman's Breast, and apply'd where Hair are fretted and immediately plucked forth, it costumes their Nutrimen, and in some measure hinders their growing again. And if beaten up with Whites of Eggs, it is good against the Pin and Web, and helps the Watering of the Eyes. If made with Vinegar and equal parts of Barkey Meal, it is said to wash away the Swellings of the Kings Evil. If made up with equal parts of Meal of Venerger, it takes black and blow Paps, occasion'd through Blows, and Diffusifys hard Swellings under the Ear. If the Cataplasm is made with Oxynt, it is good against the Stinging of Scorpions, and Injures of Venomous Beasts, Diffusifies Tumors cau'd by Blows and Bruises, abates the Milk in Woman's Breasts, and eases Wound'd Nerves, if apply'd upon the Wound.
Bears Breech.

III. The Description. Garden Bears Breech has a Root thick and long, with many long flings spreading far and deep in the ground, of a blackish or dark colour on the outside, and white within, full of a very chimney juice, more mucilaginous than the Leaves, so full of life, that if a small piece be cut left in the ground, it will spring up again, and bring forth the whole Plant, but requires a shelter or defence from the extremity of the Winter. From this Root there flows forth many large, thick, smooth, flat green Leaves upon the ground, with a thick middle rib, divided into many parts with great and deep gashes on the edges, from among which (after it has stood long in a convenient place) rise up a reasonable great Stalk, three or four foot high, without either joint or branch therein, set with few Leaves, and from the middle upwards, set with a Flies, as it were, of white hooded or gaping Flowers, standing in brownish Marks, somewhat sharp at the points, and a small long undivided Leaf under each Flower; of
ter which come (in more but Countries, but not in ours that I know of) broad, fat, round, thick, brownish yellow Seed. Dodoens says, that the Leaves are great, large, of a flat green colour, thick, gross, smooth, and deeply cut in by the fides, like the leaves of Rocket.

IV. Wild Bears Breech has a Root not spreading so deep, or so far as the former, nor so great in magnitude, but more tender, as lies able to endure the Winters cold. From this Root rises up several long Leaves lying upon the ground, but much narrower, and more divided on the edges into smaller parts, and each part with small incisions, set with very sharp white prickles, from among which a leafless and lower Stalk rises, with the like spik'd heads of Flowers, and a few prickly Leaves thereon, in their way coming up, standing in more sharp and prickly banks than the former, after which comes Seed, small as a little Pea, hard, black, and round. Gerard faith, that this Thistle is in Sthals, colour of Leaves, Flowers, and Seed much like the first kind, but the Plant is shorter and lower, and the Leaves pretty large, dented or jagged with many cuts and rents, not only in some few parts of the Leaves, but some other Thistles, but very thickly dented or clumsy, and having many sharp, large, and broad prickles, about the sides of the divisions and not, very easy to be handled or touched, without danger to the hands and fingers.

V. The Places. They naturally grow in great numbers in Italy, Spain, and France, but with us, and in Holland, Germany, and other cold Countries, it is only to be found nourished up in Gardens. Dodoens says it grows only in moist and flinty places. The Wild grows in many places of Italy near the Sea, and Pens Isles, he found it in moist and gravelly places near to the Walls of Montpelier; but with us it is only in Gardens.

VI. The Times. The Root keeps alive in Winter in hot Countries, and so with us, but sometimes it dies, if the weather is too cold: but in England that is rare in the Garden kind. The former flowers in June and sometimes in July, but yields prickly Seed with us: the latter flowers later; seldom or never giving us any ripe Seed: but in those Countries where the Seed comes to perfection, it is always in Autumn, or latter end of Summer.

VII. The Qualities. They seem to be Temperate in respect of heat, and drying in the first degree. They are Arthritic, and whiffet green, Digestive, afterwards Affluent, Drying, Referative and Alterative.

VIII. The Specification. They are peculiar against Contumacies and Spitting of Blood.

The Vertues.

X. The Liquid or Infusior juice, prevals against Spitting of Blood, pitting of Blood, and the Phthisick, being laid to cure Contumacies, melting those of the Lungs. 2. Dose of the Liquid, one or two Spoonfulls of the Infusior one or two drams, diluided in Red Wine, or Tinct, and so either of them to be taken.

XI. The Infusion. It has the Virtues of the former, besides which it stops Fluxes, and the Coughs, and is great, large, of a Flies in Women, and is prevalent against Ruptures in Children, and vehement Coughs. Dose one spoonful in Red Wine, boiled, Morning and Evening. Applied it is good against Blisternes.
Chap. 59. English Herbs.

XII. The Decoction in White Wine. It provokes Urine, and binds the Belly.

XIII. The Syrup. It is good against Coughs, Colds, Asthma's, Phthisicks, spitting and pilling of Blood, Bloody Fluxes, &c. Dose two spoonsfuls in Wine.

XIV. The Glyster. By reason the whole Plant is of a Glutinous, Clamy, and Slimy Mucilaginous Nature, it is given Chylick-wife to procure Stools, and heal the Excoriation of the Bowels.

XV. The Cataplasm. From its Glutinous and Mucilaginous property, it is (like Comfrey) applied to weak parts to strengthen them: and applied to the Gout in the Joints, it eases the Pain, diffuses the Humor, and eases the Disaffection: It also is profitable against Cysts and Ulcers, and Ruptures in Children, when applied to the Part made into form of an Emplastrer, and applied to the Back, it eases Pains there, and strengthens a weak Back.

XVI. The Saline Tincture. It opens obstructions of the Urinary Paffages, and powerfully provokes Urine. Dose, one or two dram in a draught of White Wine: and Clothis dipp'd in it, and applied to parts burned (where the skin is not broken) it presently draws forth the fire.

XVII. The Wild Bear Breech has the same Preparations, Virtues and Uses.

CHAP. LIX.

BEARS-EARS.

I. The Names. They know no Greek Name, but have obtained several Latin ones, according to the variety of Authors, who have treated of them: but they may well enough be called

Greek, in our Signes: They are called variably by several Authors, as Lanarius Arbovitis, also Lanarius Paradisicae, Alpina, and Santicula Alpina, by Goyers: Prinula veris Pachyphyllos; by Lidgian: Arunculus Urfs; by Matthiolus, Businier, and others: and at this day they are so generally called by Mr. Ray, and other Authors. Some Authors, as Edens Colonna, will have them to be the Alpina, or De- 

massonianum, of Dioscorides, but are, in my opinion, mistaken, because the form of the Flowers plainly demonstrates the contrary: in English they are generally called Bears-Ears, and Ariocula by the Florists. They are certainly of the Family of the Cynips, and therefore are also called Alpine Cynips, and Mountain Cynips, from the places whence they first came: Santicula Alpina, or Montan
c Cynips, a janandis vulneribus, and Ariocula from the form of the Leaf.

II. The Kinds. There are three principal Kinds.

1. That with long dent'd Leaves. 2. That with

long Leaves not dent'd. 3. That with round

Leaves, and of each of these there are many varie-
ties, as, the Yellow + the Purple: the Red: the

Scarlet: the Bright Red: the Bluish-grey: the 

Various-colored: the Blew: the White: the Hair

coloured: the Straw-coloured: and the Variable 

Green.

III. The Description. Those with long dent'd

Leaves (of which the Yellow kind is principal,) which is a beautiful fine Plant, has a thready Root, very like to the Oxlip; which sends forth green, thick, and flat Leaves. The Variety being freely offered, that these are Edges, much like those of Cynips, but greener, smoother, and moving so cramped: among which rises up a slender, round Stem, as beautiful high, bearing a head of Flowers at the Top, from four to twelve in number. Sometimes of a Yellow, sometimes of a Purple, or Red, and sometimes of a White, or various-coloured, not much unlike to the Flowers of Ox-lip, but more open, and confiding of one leaf like Crotalaria, or Pennyswort: which come small heads with a point at the Top of them, not rising to the height of the Cup, containing small blackish Seeds.

IV. Those with round Leaves not dent'd, have a Root greater and thicker than the former, with long fringes or fibres like unto the other sorts, but greater; from whence springs up many fair, large, thick Leaves, somewhat mealy or hairy upon the green-

nefs, smooth upon the Edges, and without any indenting at all. The Stalk is great, round, and not higher than in the former, but bearing many more flowers thereon, more in number than any other kind, amounting sometimes to twenty or more, yes sometimes to thirty, standing so round and close together, that they seem to be a Nosegay alone: their form is like same others, but that the Leaves are shorter, and rounder, yet with a notch in the middle, like the 

riff, of a fair Yellow, &c. colour, neither very pale nor deep, with a White Eye or Circle in the bottom, about the middle of every flower, giving them an extraordinary grace: after which comes round heads greater than the former, with a small point striking in the middle, in which is contained Seed of a blackish brown colour.

V. The round Leaf'd, which Telemonianus, and Gerards, call Santicula alpina, and Matthiolus, Cor

ta, and the Bear-Ear Tumule, has a Root confiding of a thick Tuft of small whishy Threads, rather than Roots, much interlaced one among another: from whence springing Leaves, six, such as are much cramped, and as they were folded together, which afterwards open themselves into fair, broad and roundish Leaves, somewhat rough or hairy, not only cut into fine divisions, but somewhat notched also about the edges, of a dark green colour on the upper side, and more wither green underneath. The Leaves of this Plant die down every Year, and rise up anew every Spring, whereas all other Bears-Ears keep their Leaves green all the Winter, especially the middlemost, which stand like a close head, the outsides ones for the most part perish after Seed-

ime
Salmon's Herbal.  Lib. I

Chapter LX.

Beets Common and White.

Green beet common

The Virtues.

XIV. The Decoction in Wine. It is Vulnery taken inwardly, opens Obstructures of the Lungs, and cuts free breathing, gives afe in Grippings of the Belly, and the Bloody Flux, for which Delph, and in a Diarrhosa, and Lumbria, the Liquid, Inflamatory, and Ease are all profitable.

XV. The Oil. It is made with Salter Oil by boiling, it serves as an Ointment, as a Medicine flux, cure the bitings of the Nerves; stings, and cuts free breathing, gives afe in Grippings of the Belly, and the Bloody Flux, for which Delph, and in a Diarrhosa, and Lumbria, the Liquid, Inflamatory, and Ease are all profitable.

The Names. This Plant is called by the Arabicans, Decks, and Caldon: by the Greeks, Terebinthes, and Scorbut. It is a useful good service, because it comes up in few days after the Sowing, and then grows very tall till it comes to its large-

IV. The Ointment or Balsam. 1. An Infusificat Tincture. 2. An Ointment or Balsam. 3. A Soothing Tincture.

The Virtues.

XII. The Infusificat Tincture. Diluted in Red Wine, and used as the former, it is prevalent to all the same Injuries, and against all the same Difficulties; besides it strengthens the Stomach to a Miracle.

XIII. The Essence. It has all the Virtues of the Expressed Liquid and Inflamatory Tinctures; besides which taken every day from 1 to 6 Spoonfuls in any proper Wine or other fit Vehicle, it prevails as a Vulnery potion for the Cutting of all sorts of new Wounds and old Ulcers, and is found to be a regular thing, against the Skins, dimes of Sight, and many other Difficulties of the Head, Brain, and Nerves.

The Virtues.

X. The Expressed Liquid Juice. Taken inwardly or outwardly, it serves as the cause of a good and heal-

XV. The Balsam. It has the Virtues of the Oil, but more excellent for the Cures of Wounds and lacerated Nerves, good against the bitings of the Sea Hare, and of the Tom, and refolves Diftempers.

XVII. The Spiritual Tincture. It cures Grippings of the Belly, the Dysentery, Convulsions, Fits of the Mother, and other Diftempers of the Woman. Take 1 Spoonful Morning and Evening.

XVIII. Parkinson says the Leaves of Cortusa silt a little hog, and if one of them be laid whole, without bruising, on the Cheeks of any tender Skinned Woman, it will take an Oxygen Red Colour as if some Fire had been laid on, which will pass away without any manner of hurt, or mark where it lay.

The Virtues.

XII. The Infusificat Tincture. Diluted in Red Wine, and used as the former, it is prevalent to all the same Injuries, and against all the same Difficulties; besides it strengthens the Stomach to a Miracle.

XIII. The Essence. It has all the Virtues of the Expressed Liquid and Inflamatory Tinctures; besides which taken every day from 1 to 6 Spoonfuls in any proper Wine or other fit Vehicle, it prevails as a Vulnery potion for the Cutting of all sorts of new Wounds and old Ulcers, and is found to be a regular thing, against the Skins, dimes of Sight, and many other Difficulties of the Head, Brain, and Nerves.

XIV. The Decoction in Wine. It is Vulnery taken inwardly, opens Obstructures of the Lungs, and cuts free breathing, gives afe in Grippings of the Belly, and the Bloody Flux, for which Delph, and in a Diarrhosa, and Lumbria, the Liquid, Inflamatory, and Ease are all profitable.

XV. The Oil. It is made with Salter Oil by boiling, it serves as an Ointment, as a Medicine flux, cure the bitings of the Nerves; stings, and cuts free breathing, gives afe in Grippings of the Belly, and the Bloody Flux, for which Delph, and in a Diarrhosa, and Lumbria, the Liquid, Inflamatory, and Ease are all profitable.
almost of the opinion that the Black Beet of the
Ancients was that we now call Our Red Beets; but
Modern Authors have found out several other Kinds.
As, 1. Beta virdis: Common, the Common Green Beet.
  2. Beta alba, called also Candia & Pathific-
    cers, The White Beet.
  3. Beta rubra minuta, cal-
    led also nigra, & rubra vulgaris, The Red Beet.
  4. Beta rubra, called albo, Beta Roman, Beta rubra
    Ripe Russet, Rapum Rubrum, Rapum sativum Rub-
    brum, Beta nigra Romans, Beta erythrobrasia, by
    Lucandencia, The Roman Red Beet. 5. Beta Creti-
    con, the fairest, Frickey Beets. 6. Beta Syl-
    vestris moravica, Sea Beets. 7. Beta Lactis Syracus.
    Yellow Beets. 8. Beta platycodon, Beta Dahlata, alba
    Lacte, aurea, rubraria, helix, salt, The
    yellow or flat Stalk'd Beet. Of all which Kinds we
    shall only Treat of the first Four in this Book, as
    being only proper for this Purpoze. And of them, we
    shall Discourse of the two first Kinds in this Chap-
    ter.

III. The Description. Our Common Green Beet is
  almost like unto the White Beet, being a great
  long hard Beet of no size after Seed time, from
  whence springs up many Large Leaves lying upon the
  Ground of a green Colour, and which rises up a
  large green Stalk crested, with some Branches and
  many Leaves thereon, almost up to the Top. The
  Flowers grow in long Tiffs or Spires, and at the
  ends and turning down their Heads, and yielding
  cornered Seed.

White Beets.

IV. Our Common White Beet has a long thick,
  great Root, and hard after bearing Seed, which
  endures the Winter, and with the Leaves upon it;
  but persisting commonly the second Winter, the
  leaves come forth great broad Leaves, smooth and
  Plain, lying next the Ground; these first Parkinson,
  grew in hot Countries to be three feet long and very
  broad, and in our Country they are very large but
  nothing near that Proportion, and they are of a
  whitish green Colour. From this Root rises up a Stalk
  great, strong, and ribbed or creased, bearing great
  flower of Leaves upon it, almost up to the very top;
  the Flowers grow along the Stalks in long Spires.
  Spikes, small at their extremities, and bending down
  their Heads, and they cluster together in shapes like
  little Stars, which being soft, there are small pale
  greenish yellow Barrs, yielding cornered, and uneven
  prickly Seed.

V. The Places. The Green Beet Parkinson says
  has been found near the Salt Marshes by Rochester,
  in the Foot way going from the then Lady Lewis's
  House thither. The White Beet is said to grow
  wild upon the Sea Coast of Tener, and divers other
  places by the Sea. They delight to grow in flat and
  moift Ground, but are chiefly nourished up with us
  in Gardens.

VI. The Times. They ought to be sown in the
  Spring; they flourish and green all the Summer
  long, as also in Winter, and they Flower in the
  beginning of July, and the Seed is ripe in Au-
  gust.

VII. The Qualities. They are Temperate in re-
  spect to heat and moifure; and of a Nitrous Quali-
  ty, Ablative, a little Diuretic, Opening, Cepha-
  lic, and Hepatic, Parmick, Alternate, and Alexi-
  pharmac.

VIII. The Specification. They are found to be
  Speciffick against Difficulties of the Head and Brain.

IX. The Preparations. The Shops keep nothing
  thereof; but you may prepare them from. 1. A
  Liquid Juice. 2. An Influffate Juice. 3. An Effe-
  cence. 4. A Decotion. 5. An Erfwine. 6. A Ce-
  phaloplas.

The Virtues.

X. The Liquid Juice. It is Nitrous and efflefting;
  being taken y, or vili. Spoonfuls at a time, at going
  to Bed. For some Nights, it opens the Obftuclions
  of the Liver and Spleen, and is good against the Head
  Ache.

XI. The Influffate Juice, made with Vinegar in-
  to the thicknefs of a Batlin, and applied to the
  Temples, prevails against the Infammations of the
  Eyes, and mixed with Oli Olive, is good against
  Bumings and Scablings.

XII. The efficence. It is good against the Yellow
  Jaundice, opens Obftuclions both of Liver and
  Spleen, is good against the Vertigo, and the Biftings
  of any Venomous Creature. It is good against the
  Fitch, the parts affected being bathed therewith, and
  drenches the Head of Duck, dry Scurf, Scabs,
  and heals fretting and running Sores, Ulcers and Her-
  pes in the Head, Legs, or other Parts; it is also
  faid to cure Baldness, and hinders the falling of the
  Hair. Dofe 2, or 4. Spoonfuls of more.

XIII. The Decotion. If it is made with Equal
  parts of Water and Vinegar, it has all the Virtues
  of the Efficence besides it prevails against St. An-
  thanious Fire, and all other Infammations in any
  Part.

XIV. The Erfwine. It is made of the Liquid
  Juice y. ounces, Niter half an ounce mixed and
  diffolved. Being finift up the Nodrifts it power-
  fully empties and drenches the Head and Brain of
  supernumerous Humors which caufe the Apoplexy,
  Epilepsy, Vertigo, Migrain, Cephalalgia, Cephalic,
  Lethargy, Curb, and other like Diffemper of thole
  Parts; it also e-fives the Tooth Ache, and pains in
  the Ears, and being outwardly applie'd, has all the
  Virtues of the Efficence and Decotion.

XV. The Cephaloplas. Made of the boiled Herbs
  with or without the Addifion of a little Niter and
  Alum, and apply'd, it is good againft all fora of
  Wheels, Pathes, Bolts, Blains, and other eruptions
  of the Skin, as also for Chilblains or Kibbs whether
  on Hands or Feet, presently Curing them.

C H A P.
CHAP. LXI.

BEETS Red.

I. The Name. This Plant is called by the Greeks, Tetra rhaphis; by the Latins, Beta rubra, and Beta nigra; and by us in English, The Red Beet.

II. The Kinds. It is the third Species of the Genereick Kind, as is before declared.

The Virtues.

IX. All these Preparations have the same Virtues with the former, and may be given in the same manner and Dose. But this difference is observed, that there are more Astringent or Binding, and therefore, both the Liquid and Solid Extracts, the Essence and Decotion, all very effectually flop the overflowing of the Terms in Women, and flop other Fluxes of Blood, and are more effectual for curing any Ulcer, or running Sores, and to dry up and remove molit and running Scabs, and other like defacements of the Skin. They are good against the Bloody Flux, and other Fluxes of the Bowels, flop the Whites in Women, and help the Yellow Jaundice, and this more especially if daily given for some time mixed with a small quantity of the Tincture of Murr.

CHAP. LXII.

BEETS Roman.

I. The Name. This Plant is called in Greek, trimis rhaphis; in Latin, Beta Roman, Roman rubra, Rapafa, Beta rubra, Rubra, Rubra, Rubra, and in English, Roman Beet, Red Beet, and Carrot Beet.

II. The Kind. It is our Fourth Species of Beets, and a singular Kind.

The Virtues.

IX. All these Preparations have the same Virtues with the former, and may be given in the same manner and Dose. But this difference is observed, that there are more Astringent or Binding, and therefore, both the Liquid and Solid Extracts, the Essence and Decotion, all very effectually flop the overflowing of the Terms in Women, and flop other Fluxes of Blood, and are more effectual for curing any Ulcer, or running Sores, and to dry up and remove molit and running Scabs, and other like defacements of the Skin. They are good against the Bloody Flux, and other Fluxes of the Bowels, flop the Whites in Women, and help the Yellow Jaundice, and this more especially if daily given for some time mixed with a small quantity of the Tincture of Murr.

III. The Description. This Kind differs nothing from the former White Beet, but only that it is not so great, and that both the Roots and Leaves are somewhat red: the Root is red, spunge, and not at all to be eaten. The Leaves are in some more red than in others, which have but red Veins or Streaks in them, in some of a fresh red, in others of a very dark red, freckled here and there confusely. The Flowers and Seed differ little or nothing from the former.

IV. The Places. It grows where the former grows, and with us are only brought up in Gardens.

V. The Times. They are Sowed in the Spring, endure all Summer, and sometimes all Winter, Flower in July, and the Root is Ripe in August.

VI. The Qualities. It is temperate as to heat and cold; and dry in the first, some think in the second Degree. It is Alkalick, Astringent, and Vulnery: Cephalick, Spleenick, Nephritick, Hydrick and Arthritick, Alterative, and Analeptic.

VII. The Specification. It is a peculiar thing for stopping the Blood in any kind of Hemorrhages.

VIII. The Preparations. They are the same with the former, as 1. A Liquid Juice. 2. An Injunctive Juice. 3. A Tonic. 4. A Decotion. 5. An Elixir. 6. A Confit邀.
are of a better taste, and of a red Colour like the former Beet. Gerard says, they are of a very red Colour, and that they, as well as the Root, Stalk, and Flowers, are perfect with a perfect purple Juice, tending to Redness: the middle Rib of the Leaves is for the most part very broad and thick, like the middle part of the Cabbage Leaf, which is equal in goodness with the Cabbage itself: the Flowers (excepting the height of the Colour) and the Seed are all one with the former Common Red Kind. Gerard says that in 1556, it grew with him to the height of a Violet-Leaf, which is xill Foor, and did bring forth its rough and unpleasing Seed very plentifully. With this Plant (says he) Nature seems to Play and Sport her Self: for the Seeds taken from that Plant, which was altogether of one Colour, being Sown, do bring forth Plants of many and varied Colours, very beautiful. Now if I may be admitted to render a Reason of this Variety, I am of opinion it is from the differing Seeds in which they are Sown, which things I have observed in several other Plants, every thing being of a larger or smaller Part.

IV. The Places. It is Originally a Foreign Plant, and brought to us out of Italy, but now is become a native in some of our Countries, in which it thrives as well as in any part of the World. It is nourished with us only in Gardens where it propagates very well.

V. The Times. If Flowers in the latter end of June if the Season is warm, or beginning of July, and yields its ripe Seed in August.

VI. The Qualities. It is temperate as to heat and cold, and dry in the end of the first Degree. Traumatick, very Astringent, and something Stryphick withal, Spleenick, and Hyperick, Alternative, and Analapick.

VII. The Specification. It is a peculiar thing for stopping Hemorrhages.

The Virtues.

IX. The Liquid Juice. Given to sick or leis, courses in White Wine, it is good against the Yellow Jaundice: it also stops all Fluxes of Blood in the Internal parts causing Spitting, Vomiting, or pilling of Blood, but when it is admirable for the cure of a Dysentery, and other Fluxes of the Bowels, very much strengthening them.

X. The Infallible Juice. Being reduced to Pouder, and thrown upon any bleeding Wound, very readily stops the bleeding. So also being dissolved, in Vinegar or Oyster, and then Supposes to be dried in and applied. This Juice dissolved in Syrup of Linseed, and made into a Lochock, is excellent to strengthen a Weak Stomach, being sometimes taken with a Liquorice Stick.

XI. The Efficacious. Being taken daily with Timifera Murina, it powerfully opens Obstructions of the Stomach, and being taken with Orient Amris Africains, it powerfully stops the overowing of the Couries.

XII. The Decotion. It has the Virtues of the Juice and Efficacious, but is somewhat weaker, and therefore ought to be taken longer. It will be better if it be made with Red Stiplick Wine, or with the Roughed Red Florence.

XIII. The Cures. If it is made of the raw Leaves and applied, it removes Dandruff or the white Scurf, the place being first well rubbed with Sal Nitri; it also stops the spreading of running Sores, and helps Scald-Heads, (if mixed with a little Nitri) as also the Tiney, Alopexia, and other ill-natured breakings out of these parts, which cause the Hair to fall. It is made of the boiled Leaves, it is good against Burning and Scaldings, Inflammations, and other hot Tumors, Tubercles, Wounds and ulcers like, proceeding from Intemperate Blood and Choler.

XIV. The Saline Tincture. It is good against Scabs, Itch, Scurf, Dandruff, Scales, Scabies, Blackheads, Nits, &c. Childblains, Kiled Heads, the parts affected being often washed, and sometimes well soaked in the same.

XV. It is used (I mean the Root) at a Sallet, and to adore and furnish out Dishes of Meat withal, being as sweet and good as any Carrot: and if boll'd as Carrots, and eaten with Butter, Vinegar, Salt and Pepper, it makes a most admirable Dib, and very agreeable with the Stomach.
BELL-FLOWER Great.

I. The Name. It has no known Greek Name; the Latins call it Campanula, and Campanula wagneri: in English, Great Bell-flower.

Salmon's Herbal. Lib. I.

Flowers. Of the Bell-flower of which we shall take notice, there are two Principal Kinds, viz. 1. The Small Bell-flower, of which we Treat in this Chapter. 2. The Great Bell-flower, of which in the next Chapter.

II. The Kinds. This is the second Species of our Generick Kinds, and is three-fold. 1. Campanula persicifolia, the Peach-leaved Bell-flower. 2. Campanula latifolia, the Common Bell-flower. 3. Campanula major, the Pyramid Bell-flower.

III. The Description. The Peach-leaved Bell-flower has a Root very small, white, and thready, creeping under the upper crust of the ground, so that oft times the heat and drought of the Summer dries up the earth, and causal it to wither away; from whence springs many Tuffs or Branches of Leaves lying upon the ground, which are long and narrow, much like to an Almond or Peach leaf, being finely nick'd about the edges, and of a sad green colour. From among these rise up driers Stalks two foot high, or more, with Leaves to the middle, and from thence upwards, with many flowers standing on small Foot-flats, one above another, with a small Leaf at the foot of every one. The flowers stand in small green Baskets, small and round at bottom, but wider open at the brim, and ending in fine corners, with a three forked Clapper in the middle, set with some small threads rapt with yellow, which flowers in some Plants are pure White, but in others of a pale Blue, or Water colour, having little or no scent at all: the Seed is small, and contained in round flat Heads, or Seed-leaves.

IV. The Lathesium Pyramidalis is a great Bell-flower, whose Root is thick and white, yielding more flour of Milk, being broken, (as the Leaves and Stalks also do,) than any other of the Bell-flowers, every one of which do yield Milk, some more, some less: from this Root rises divers Stalks, a yard high, or better, on which grow divers smooth, dark, green Leaves, broad at the bottom, and small at the point, somewhat unevenly nick'd about the edges, and standing upon longer Foot-flats below, than those above. The Flowers are Blue, and in some White, not so great or large as the former, but in the same Fashion, growing thicker, and more plentifully together.
but the next year when it runs up to Seed, it grows hard and perferv; from hence sowing up Leaves of a pale or fresh green colour, long and narrow, to the bottom, and broader from the middle to the end, somewhat round pointed, a little furry all over, and denser about the edges. The next year after the Sowing, rise up Stocks, somewhat hairy also, and branching forth from the Root into divers Arms, upon which grow several Leaves, smaller than the former, and of a darker green colour. At the end of every Branch stand the Flowers in green buds, from whence come large, round, bell-shaped Bells, growing out in the middle, and rising somewhat white at, like the neck of a Pot, and then ending in five Corners, which are either of a fair or faint White, or of a pale blew Purplish colour, and sometimes of a deeper Purple or Violet. The Flowers being put, there grow up great, square, or coronet Seed-vejes, in which are contained in five several Cells, or Diaphragms, small, hard, brown, fluting Red Seed.

VI. The Places. All these grow with us in Gardens, where they are brought up for the beauty of their Flowers. The Coventry Bells, Roy Eyes, grow in Woody and Mountainous places; and Gerard says, in dark Valleys, under Hedges, among Bulbs, more especially about Coventry, whence the name, and where they grow very plentifully abroad in the fields, but are also with them Planted up in Gardens, as they are with us in London, which pleasant Bell-flower, is kept chiefly for its beauty like, though its Root is also eaten as Rampion are. The root of them also requires to be planted in thiny places.

VII. The Times. These plants are to be continued by Sowing them every other year. They flower generally all the Summer, and the Trench-End Flower for the most part earlier than the others: The Coventry Bells begin in June, July, and August, and the Seed ripens in the mean Station, in regard they bring not forth their flowers all at once, but as some flower, others feed.

VIII. The Qualities. They are cold and dry in the first degree, Alterning, Traumatick, Vulnerary, Stomachick, and Alterative.

IX. The Preparations. You may make thereof,

The Virtues.

X. The Expressed liquid Juice. Being bathed upon any Inflamed Part, it abates the Inflammation, and haps the Fissure. And if a little Alum and Honey is dissolvd therein, it makes a good Lotion for old Sores, running Ulcers, and a virulent Gonorrhoea in Man or Woman.

XI. The Decoction in Wine. It makes an extraordinary Gauple for a sore Mouth and Throat, inflammation of the Uvula and Almonds, more especially if a little Alum and Honey be also dissolved therein.

XII. The Cataplasm. It allays inflammations, eases Pain, and regulates the Flux of Humors.

CHAP. LXV.

B E T O N Y Wood.

I. T H E Name. It is called by the Arabians, Chafra: by the Greeks, Biron, & Ptolemaus: by the Latins, Betoxy: and by us English, Betony.
II. The Kinds. There are two principal kinds thereof: 1. Rhen. Betonica, Letyon, which is that set forth in the first book, which is also called Purple flower, which is most common, or with White: which two kinds differ nothing one from another, but only in the colour of the flowers. 2. Betonica Aquatica, Water Letyon, of which in the next Chapter.

Betony.

III. The Description. Wood Betony has a Root consisting of many white, Wendy streets like some tho' of Plumage, which generally endures all the Winter; from whence rises many Leaves, the lowermost whereby are somewhat broad, and roundish at the ends, highly indicated about the edges, and stand upon very long footstalks: but those which grow by two and two at the joints upon small slender four square and somewhat hairy Stalks, are much biffer. The Leaf is for the most part near a foot high, and some times higher, and persists every year, upon which grow some Leaves, and whereby are set severall fished heads of Flowers, of a Reddish or Purple colour, fronded with white spots all over. The Seeds are longish and narrow, and of a blackish colour.

IV. That with White Flowers is wholly like to the former, save that the fished heads of Flowers are somewhat slender, the flowers without any spots in them, and the Leaves somewhat greener. There is also a Mountain Betony, which differs nothing from the first, but that the Leaves, Stalks and Flowers are smaller. There is a Broad Leaf'd Betony, which differs not from the first, but in the Leaves, being two or three times as big, a larger and higher Stalk, and the Flowers being larger, 1 is called Betonica Divisa. Also Betonica Alopecuros, Fox-tail Betony, so called from the form of the fished head of flowers, but is every way felf, as also are the Stalks and Leaves.

V. The Places. The common sort is usually found in Woods and Coppies, and other shady places throughout the Kingdom, and is many times marked up in Gardens; but that with the White flower is more usually found in that Clay Ground, and in the Woods by Bromy in Kent. The first I have ferved times found in, and by the Borders of Horsey Wood, not far off the Anew River. That with the other is very plentiful.

VI. The Times. They flower for the most part in the Months of June and July, and the Seed is ripe not long after.

VII. The Qualities. They are hot and dry in the second degree; Alte rise, Digestive, Diffusive, Incurative, and Vacular; Cephalick, Neurotic, Smoratic, Cordick, Hydrick, Arthritic, Alterative, and Anaplectic.

VIII. The Specification. They are peculiar against Difeases of the Head and Nerves, as Falling-ficknes, Apoplectic, Pallys, Gouts, Madnese, &c.

IX. The Preparations. You may make therefrom,

The Virtues.

X. The liquid Juice by expresson, being drank to fix or eight founfeful it is good against Frie, chiefly the Falling-ficknes, Convulsion, and the like; and being mixed with a little ponder of Sena, it prevails against Madnese; being fnuffed up the Nostrils, it purges the Head of Flegm, and Cold Humors, and gives relief in the Apoply, Pelie, Lathargy, and other like Difeases.

XI. The Dcow. It made with Wine, it is Stomachick and Caphalick, comforts the Nerves and Brain, cures the Spirits, opens Obstructions of Liver and Spleen, and is said to kill Worms, eafe the Gripings of the Bowels, and the Colick. Dofe half a pun.

XII. The Vinegar. It is Stomachick, and being drank to half a pint, or three quarters of a pint, it is said to cure Quarant Agues, and all the Hu- mors which fall into the Eyes, and cause Blindnefs.

XIII. The Syrup. It is Pecoral, and cures all Expectoratration of Flegm, and other tough Vicious Humors out of the Lungs, and other places adjacent. It may be taken with a Liquorice Rilk.

XIV. The Spirituous Tincture. It is a noable Medicine, to give all cold and molt Difeases, against Head, Brain, Nerves and Joints, is good against Epileptick, Apoplectic, Convulsion, Pallies, Pain and Aches of those parts, Gouts, and Wakhiefs of the Joints; Dofe from half an ounce to fix drams, in forme fift Vehicle.

XV. The Oily Tincture. This is of chief ufe for external Applications, and is profitable to be anoint upon any pained place, proceeding from Cold, Blows, Bruifes, or other weaknefses of the Limbs and Joints: being bathed upon the Head, it eafe the Head-ach, Megain, and other like Difeases.

XVI. The Salve Tincture. Outwardly bathed upon the Joints, it prevails against the Gout, and other pains of the Limbs, Pallies, Convulsion, or thinking of the Sinews: drunk in White Wine from one dram to two drams, it is good against the Jaunt- dice and Dropsie, and opens Obstructions of the Reins; and given to Children from a Kruple to 2 drams, it kills Worms, and is good against the Ric- kets, and expels Sand and Gravel in Reins, Lithes, and Bladder.

XVII. The Acid Tincture. This poffibly is one of the greatest Somaticks in the World, and is an excellent thing to strengthen the Head, Stomach, and Womb, to help Digestion, cause a good Appetite.
Water BETONY.

I. THE Name. It knows no Greek Name: but it is called in Latin by Dodonaeus, Gerard, Label, Loddigeschi, Parkinson, Tabermeuntius, and Turner, Betonica Aquatica, and Aquatica. Tragus makes it his greater Osimilaeus. The former calls it Scrophularia major aquatica; but also Basinsius: We in English call it Water Betony, and some Brown-root; but this Name is more proper for the Scrophularia major.

II. The Kinds. It is the second Species of the Genusbet, and is also either the Greater, or the Lesser: the Greater is called in Latin, and English, as alreadied; the Lesser is called by Label, Betonica aquatica minor: Camarian, in his Epitome of Medicinal, calls it Scrophularia jarnia; and in English, Water Betony the lesser, Brook-Betony, and Bishoys-Betony.

III. The Description. The Greater has a Root consisting of a thick batch of sinewes and threads proceeding from a head; or of a great number of Fibrous sinewes, which being sloped to the bottom of the stalk, feeds it with nourishment in Summer, at the end of which time it dries off. From this Root the Stalks rise up, somewhat like Big-root, but generally higher; finer, hard, and green, sometimes brown, set with dark, broad, green Leaves, so very like one those of Big-root, that they have been often mistaken for one, being also dentad about the edges, but with rounder Notches; by the careful observing absolved, they may be distinguished, and in that respect something resembling Wood Betony Leaves, but of a longer size, and two for the most part set in a point. At the top of the Branch, at last of the Faints, where the Leaves come out from the middle of the Stalk upwards, come forth many round belted Flowers, which being perfectly blown, are open on the brim, but divided into two parts, the uppermost like a hood, the Innermost like a lip hanging down, of a dark red color: which being past away, there comes round Heads with small points in the ends, containing small and brownish Seed.

IV. The Lesser kind has threads Roots almost like the former, differing only in smallnes: the Stalks are square and green; the Leaves round, almost, but yet pointed, and of the same dark green color, and the Flowers are of a full red or purple. In a word, this is in all things like the former, save only in the magnitude; this being lower and lesser by three parts in four.

V. The Place. The first grows in England as frequently as any Herb whatever, by Brooks, Banks of Rivers, and other Water-courts, but is seldom found far from the Water-side, unless it has been planted in a Garden. The other is found in like places in Germany near Bolf, and grows alike with us, if planted in Gardens.

VI. The Time. They flower in July and August, and their Seed is ripe in a little time after.

VII. The Qualities. They are hot and dry in the end of the first degree; or beginning of the second: they are Astringent, Alleviative, Digestive, Traumatic, and Vulnary: Pedicular, Hesperic, Splenetic, Hypertonic, and Articular, and Anoscent.
The Virtues.

X. The Liquid Juice of the whole Plant. Mixed with Vinegar, and applied Morning and Night, it softens and diverts any hardiness or swelling: The Juice drunk five or six spoonfuls at a time, causes the fasting of Blood, bleeding at Nose, bloody Flux, overworking of the Terms, &c. repels the afflux of Blood to the Tumor in the Throat, called a Quenches.

XI. The Powder of the whole Plant. Being drunk half an Hour and Evening to one dram, in any convenient Vehicle, it is much commended against the Piles or Hemorrhoids.

XII. The Effusion. It has all the Virtues of the Juice, &c. which, being taken inwardly every day for some time, Morning, Noon and Night, to three or four ounces, it wonderfully prevails against the Kings-Evil, and induces Running Sores, Old Ulcers, and Fissions in what part of the Body ever to a speedy healing: It is also good against Scabs, Itch, Boils, Wheels, Pustules, Leprosy, being daily drank, as a cordial, and outwardly bathed, and applied upon the Parts affected.

XIII. The Decoction in Water. It allays the heat of Fevers, quenches Thirst, and is good to Bath in Leprosies, Scabs, Breakings out, or any other defilements of the Skin: It also greatly diverts Inflammations, and other hot Tumors.

XIV. The Wine. Drunk daily as a Diet Drink, wondrously prevails against the Scrophula, or Kings-Evil, and strikes at the Root of the Disease, whether in Old or Young; refifts Vapors in Women, and helps Fins of the Mother.

XV. The Spirituose Tincture. Being taken for some time, it warms and strengthens a cold and moist habit of Body, comforts a cold and moist Brain, gives relief to the Nerves, strengthens the Liver and Spleen; and, as I have been told by a very understanding Midwife, it copulates and warms the Worms, as to cure Barrenness in Women, the which it has done in several. Dole, half a Spoonful Morning and Evening, in a Glass of Generous Wine.

XVI. The Only Tincture. It cures wounds of the Nerves, takes away Pains and Aches of the Joints, proceeding from a cold Caust, gives relief in Rheumati
cums, and softens cold indurated Tumors. Taken daily inwardly from ten drops to twenty, in any proper Vehicle, Morning and Night, it cleanses the Reins and Wombs of cold illiny Humors, and other Terraneous Maculations.

XVII. The Saline Tincture. It is a famous thing to clear the Skin of Tainting, Sun-burning, Freckles, Lentils, Scurfy, Itch, Scars, Ulcers, Boils, Wheels, Scabs, Leprosy, and other like Defections, being bathed therewith Morning and Evening for 3 or 4 days, more or less, as occasion requires: 'tis possible it is capable to take away old Scars, under which a new one will come before. It ought to be used limple of it left at first; afterwards it is to be weathered, and to be used, mixed with Rose-water.

XVIII. The Acid Tincture. Being taken for some considerable time Morning, Noon and Night, from thirty to fifty drops in any convenient Vehicle, it cures the Scroty radically with all its Symptoms, and destroys that humor which is the cause of the Kings-Evil: it also kills Worms in Children, and by correcting the matter which breeds them, prevents their future increase.

XIX. The Spirit. It is Cordial, Hysterick, Antirhe
tic, and Anticebratics, and has the Virtues of the Spiritious Tincture. Dole one or two Spoonfuls.

XX. The Salt. It opens obstructions of the Womb, Reins, Urethra, and Bladder, carries off Wat
y and Hydroptic Humors; it is good against the Rickets in Children, and the Cachexia in Vinpuls, and other young Women: and dispersed in Water, is good to wash the face withal, to clear it of Sun burnings, Tanning, Roughness, and other like deformities of the Skin.

XXI. The Wash. It is made of the clarified Juice mixed with the fixed Salt: to a quart of the Juice, one ounce of Salt. It is an admirable thing indeed for the Face and Skin, cleansing it, as it were, of all deformities: and if to the former composition, an ounce of pure Nitre is added, it abates all manner of scurf, redness of the Skin, Inflammations, and other like deformities. But if you yet add thereeto Licor Salutarius, or if but flowers of Sulphur, you will find it effectual against the Itch, Pimply, Scabs, Scours, Dandriff, Leprosy, and all other Breakings out of the Skin whatsoever.

XXII. The Oil by Infusion or Infusion. It eases Pains, diverts Tumors, and is good against Contusions or Bruises in what part of the Bodysoever.

XXIII. The Balsam. It has all the Virtues of the Saline Tincture, and, being applied, is a singular thing against Wounds new or old, running Sores, old Ulcers, maligina Fissulae, and it cures Scrofula, or Kings-Evil Sores almost to a miracle, for which reason it is called by some Authors Scrophulare. It is also applied to the Gout, and other Aches and Pains of the Limbs, it gives ease to them, by expelling the Humor through the Pores of the Skin.

XXIV. The Cataplasm. It is Difficultive, wafts and diverts swellings, and is profitable, being applied in Strumatics, or Kings-Evil Tumors. If the Cataplasm is only made of the green leaves beaten, and mixed with a little Vinegar, and applied Morning, Noon and Night, it does not only divulse hard Tumors, but boils old, sore corrupted, spreading and fretting Sores and Ulcers, corrects the virulence of Pockey Sores, and stops the malignity of Cancers, and this more effectually, if a proportional quantity of Burga, or Serphaurum Saturni be added thereto.

XXV. The Distilled Water. It is Cosmetick, and is of the nature of the Saline Tincture, and the Wash, having the same Virtues, but it is taking near to the powerful. However, where water is necessary to be mixed with them, this, as being more homogeneus, may be used in its place.

XXVI. The Syrup: if it is made with Honey and Juice of Lime, or pure Wine Vinegar. It is an excellent thing to open Obstructions of the Breast and Lunges, help Thrombosis of Death, cast out Expectoration, and to expel those galls and obnoxious Humors which cause the Scoury, Gout, Rheumatisms, Kings-Evil, and are the Ground and Foundation of all Sorts of Fevers happening to the Bodies of Human Kind.
Chap. 67. English Herbs

CHAP. LXVII.

BIFOIL, or TWA-BLADE.

I. The Names. It was not known to the Greeks, unless the Ophris of Pliny be it, which some Herborists believe, and therefore call this Plant by that name; in Latin it is also called Opbysis and Bifolium: and in English, Bifol or Twablade.

II. The Kinds. There are two Kinds thereof, viz.
1. Ophrys seu Bifolium, fylvestre vulgare, Common Bifol or Twablade.
2. Bifolium Palusfirc, Marsh Bifol.

III. The Description. It has a Root somewhat suret, with a head or top somewhat thick (which some call a Bulb.) shooting many long Fibres downwards, from which Root rises up a round green Stalk, bore or naked next to the ground, for an Inch, two, or three, to the middle thereof, as the Plant is in age and growth, as also from the middle upward unto the Flowers, having only two broad and soft ribbed pale green or hoary Leaves, very like unto Plantain leaves, but whiter, and yet fit in the middle of the Stalk, one on each side, and encompassing it at bottom; sometimes it will have three leaves, but is more rare; and this same account to be a different sort, but is rather to be looked upon to be the true Nature, in ground which abounds with too much nourishment, the which happens also to many other Plants, (as in Herb Paris, which has sometimes six, six or seven leaves, and sometimes it wants a leaf of its ordinary number being but four, and in common Trefoil, which usually has but three leaves, yet oftentimes four or five are found upon several Stalks, &c.) the Stalks at top of the Stalks, are in a fished head, and they are many, small, long, with whitish green, and almost flopedefl doubtless, somewhat like unto some of the Orach or Vulgar Saturions: these falling away, there remains small heads, with a kind of dust in them, which is accounted to be the Seed.

IV. The Marsh Bifol has a Root which runs or except in the Earth, and the whole plant is so little differing from the former, that the differences have scarcely been observed, whereas several have been deceived in their judgments; but in these following particulars it is distinguished.
1. In its Site, or place of growing. 2. In the end of the Plant, this being much lefer, and having sometimes three leaves also. 3. In the Greenness, the other being of a more hoary White.

V. The Places. The first usually grows in Woods or Coptes, and such like shady places, as between Hedges and Hamstead, also at Southfield in Kent, in a Wood by Longfield Down; in the Woods by Overy down near to Clare in Essex; also in the Woods by Dunmow in Essex. The other grows not only in the low wet grounds between Harfleid and St. Albans, but also in divers places in Romney Marsh.

VI. The Uses. They flower for the most part in May, and so continue to the middle or end of June, and then wholly wither away, and are gone in July.

VII. The Qualities. They are Temperate in their first qualities, Guttinative and Vulnerary, Neurotic, Articulck, and Altemative.

VIII. The Specification. They are Adapled for the Cure of Green Wounds.

The Virtues.

X. The liquid Juice. If mixt with Nitre, it always inflames, and gives cause in the Gout, to alio if mixed with Vinegar.

XI. The Effece. It is Guttinious, and heals Wounds (if simple,) by wafting them thereby, more especially if at time of flowering, it is mixed with a third part of Wine, or Spirit of Wine: it prevails also against Ruptures.

XII. The Decoction. It is admirable use in dilacerated Contusions, for it draws forth the stabbered and bruised Blood, cleanseth the Wound, and disperseth it to healing.

XIII. The Powder of the Leaves. It disperseth green wounds to healing, days and heals.

XIV. The Ointment. It softens, gives ease in pain, and heals Wounds without any sharps or peels, which now or old: and is of good use in Ruptures.

XV. The Balfam. It curset all simple wounds commonsly at one drefsing, and if they be contrived and dilacerated, it digests them, cleanseth them, and after an admirable manner speedly heals them.

XVI. The Cataplasm. It disperseth hot Tumors, and Contusions, where the skin is not broken, and applied upon an old open Ulcer, causes a separation of the Scab from the quick flesh, and disperseth it for healing, to be accomplished by other proper Medicines.

CHAP. LXVIII.

BIND-WEED Common.

I. The Names. It is called in Greek, by Gno-les, and Panthe Agniste, 29: as also in Lat. Sinales levis: In Latin, Silene levis: It is called Herb Leves and Swiss, because the Stalks and Branches have no prickles at all.

Pliny lib. 21. cap. 5. calls it Cercopatia, and Compa-
Companidula, Corviscola alba: also Frutsichus ario: and in English, Bindweed, White Bindweed, and the Greater Bindweed.

**Greater Bindweed**

III. The Description. The Root is whitish and small, of the largeness of Quitch-grass, or something bigger, running much under ground, and flowering forth again in several places: it lives under ground all Winter, and flowers forth a fresh every Spring, and yields Milk, being broken. From this Root springs up slender winding Suckts, which run up, and wind themselves upon hedges, bushes, or what is next it to catch hold of: and if there is nothing for it to climb upon, it runs it self along upon the ground, especially on the banks of dry ditches. The Leaves are divers and large, growing severally on the Stalks, somewhat long, and pointed at the further end, and parted into two parts or points at the broad part next to the Stalk, making it seem almost three square, being smooth, and of a pale green colour, yielding a milk, being broken, but not so plentifully as Scammony. At the joints with the Leaves towards the tops of the Branchers come forth large White Flowers, in fashion of a Bell, without any cut or division in them; which being pulled off, there come forth round shining Buds, or Heads, containing within them many small blackish Seeds, and almost three covered. This Great Bindweed is so like unto Scammony, that excepting the largeness of the Roots, and the greater force in purging, which may both of them proved in part from the Climate, one would think it to be one of the kinds of Scammony, whose many slender winding Suckts run up, and wind themselves upon whatever stands next, or near to them.

**BINDWEED COMMON SNAH**

IV. The Leaves are like the Greater in most respects, except the Magnitude.

V. The Flowers. It grows throughout this Kingdom, near hedges and dry ditches, and other like places.

VI. The Time. It Flowers with us in June, July and August; and the Seed is ripe in some small time afterwards.

VII. The Qualities. It is hot and dry in the first degree: Vurinary, Arthrctic, and a little Cathartick.

VIII. The Specification. It is peculiar for wafting and diffusing Tumors.

IX. The Preparations. You may make therefrom, 1. The Infusitae Juice. 2. The Liquid Juice. 3. The powder of the Leaves, Flowers, and Roots, or of the Infusitae Juice. 4. The Balsam. 5. The Cataplasm. 6. The Distilled Water.

---

**Gr. BINDWED common.**

II. The Kinds. Of the Bind-weeds we have to treat of in this Work, there are chiefly three. 1. The Common Great Bindweed, as also the Last aforementioned, of which in this Chap. 2. The Lesser Bindweed. 3. The Black Bindweed. Of which in the two next.

---

*Salmon's Herbal*
The Virtues.

X. The infipid Juice. Being dissolved in Wine, it makes an excellent Wash to cleanse old Scars, filth, purifies, and washing Ulcers, and hollow Fissures, inducing them to a speedy cure.

XI. The liquid Juice. Mixt with Red Wine, it is a very good thing for a sore Mouth, and is of use to heal Canker in the Mouths of little Children: and if Children's Feet, who are usually troubled with Chilblains or Kibes, be washed therewith, it perfectly cures.

XII. The Powder of the Roots, Leaves, Flowers, or infipid Juice. It admirably cleanses and heals old, rotten, and flinking Ulcers and where the Bone has been putrid, it has perfectly cleansed the Ulcer, dried the Bone, and in a little time healed it, and afterwards by the continual application, it has covered it with Flesh, incrusted the Ulcer, and in a little time healed it: I speak this by great experience: one time it happened that a Youth who had Kibes in his Feet, and so much corrupted, that the Bone it self was putrid, by the sole application of this powder, dry, upon the Ulcer, I cleansed it, healed the Bone which was black, and afterwards incrusted and healed the Ulcer, beyond the expectation of any one that saw it.

XIII. The Balsam. It is singular good for the curing of Wounds, but chiefly of old and putrid Ulcers, and especially of those Ulcers which arise from Efts in Children's Feet, or from Ulcers in the Kings-Evil.

XIV. The Cataplasm. Being made of the green Herb, and applied to the griev'd place, it warres, kills Ulcers, and cures Ulcers or Swellings, as Galls: I know it to be excellent to cure Chilblains in Children's Feet.

XV. The Distilled Water. It is a good Confection, and as one say, good against Freckles, Pimples, Scarfs, and other blemishes of the Skin: it takes away Tumors, Sunburning, and redness of the Face and Hands: and this it does more especially, if it is mixed with a small quantity (some say, equal parts) of Vinegar, or Juice of Limes.

C H A P. LXIX.

The Lesser BLEW BINDWEED.

I. The Names. It is called in Latin, Convolvulus minor, and Valdivia minor, to which they add Purpuraceae, because of the Purple color of the Flower. And in English, Bindweed the lesser, and Blew or Purple Bindweed.

II. The Kinds. There are several Species of it, as 1. Convolvulus minor vulgaris, The Common Small Bindweed. 2. Atropa solida, Mallow leaved. 3. Purpuraceae, Purple Bindweed. 4. Corethum Hifpanicum, Blew Spainish Bindweed. 5. Convolvulus Sppes solis, Lavender leaved Bindweed: of all which in order.

III. The Description. It has a Root small and slender, running both deep into the ground, and spreading also far and wide. The ground is loamy and mellow: from this Root comes Stalks, which rise up and wound themselves upon any thing which is near it, but otherwise usually spreads every way on the Earth, with long trailing and winding Branches, one within another, having Leaves thereon, somewhat like unto the greater White Bindweed, but much shorter: the Blossom is for form, like the former White Bell-flower, and is sometimes wholly

Chap. 69. English Herbs.

White, or has Plates purplish, but leaf, made of one fold, pleated as it were into five folds, and opening wide at the Base: after which come small blackish Seed, contained in small, long and round heads.

Small Bindweed Blow.

The Lesser BLEW BINDWEED.

Small Bindweed Blow.

W. The Mallow leaved, has a small and brownish Root, creeping under ground, and shooting up branches in distant places: from this Root springing branches, which grow not high, nor climb much upon any thing, but for the most part lies with its small, flin-

very
very thirsty, or pressing for them, something broad and long, like unto the leaves of Arblm-mulb., smaller, compact, and cut sin on both sides, at the lower ends, dashed about the edges, and of a heavy or dally growing green color, when which they are cleared, are clumsy, or flissing like Gram to the Touch, somewhat bitter in taste. The Viners come forth one by one at the Touchs, along the Stalks, up to the top, every one upon a long Stalk, which are very like the former, but before defleshed, they confess of one whole leaf, yet placed as it were before the opening into five, or six, and being open, have five corners, as if it had five leaves, broad like a Cup or Bell at the brims, and small at the bottom, of a fine pale Purple color, and sometimes deeper, after which come forth heads of small Seed.

V. The Small Purple Bindweed, is in all things like unto the bell of these described in this Chapter, saving that the flowers are of a pale purplish, or blenched color, the folioes being White, or of a deeper Purple varnish, and White within, the bottom being of a flat comfortable smoothness, which is of much beauty.

VI. The Spanish Blew Bindweed has a small thready Root, which dies every Year, from which shoots forth several small Branches a yard long, or more, having several Leaves having very strong Petiole, and long as the bottom, and broader, and almost round at the end, a little hairy in it were, all over. At every leaf in the same part, from the middle of the stalks upwards, comes forth a flower, like unto the common sort, folded into five plates, which open into so many corners, of a most admirable sky colored Blue (so pleasant to behold, that it amazes the spectators) with very White bottom, pointed upwards, and Yellow in the middle, which passing away, there comes small, round white beads, containing within them, small blackish covered Seed, which is to be new form every Year.

VII. The Lavender leaved, This is like the first in all things, except the Leaves, which are long and narrow, resembling those of Lavender, or Linnarum: But it has a finer Vener, piloted or folded in the compass of its Bell very orderly, especially before the Sun rise, or else after, when it opens its self, the folioes are not so much inserted, and it is of a deep Purple color; the Seed is not unlike the rest, corner'd and flat, growing out of slender Branches, which hang upright and thick together, proceeding from a White woolly Rete.

VIII. The Places. The first of these is common, and grows almost every where in Fields, By-ways, dry Ditches, Ditch banks, and Hedge sides, through England. The second and Fourth grow in Spain, and are moulded up with us in Gardens. The Third and Fifth are common with us in England: This Fifth or last, Gerard says he found it growing in the Corn Fields about Great Dunmow in Essex, in such abundance, that it does much hurt to the Corn, and Park for, says it, is as great a plague to the Fields where it grows, as the Thistle is.

IX. The Times. They all flower from May to the end of August, and the Seed ripens gradually in the mean Season.

X. The Qualies. They are all much of a Nature, being box and dryness of the first Degree, a little aromatic, Valerianary, Antirick, and Alterative.

The Virtues.

XII. The Balm. Being oftenDistilled it comes out again at the Mouth, it cleanses and heals Running Sores or Ulcers in those parts: And if a little Nitre is dissolved in it, it names the Head and Brain.

XIII. The Essence. It has the same Virtues, but is more Diffusive, and prevalent for the cleansing of Ulcers, and healing of Wounds.

XIV. The Powder. Strewn upon a foul Ulcer, it cleanses it (if also wafted with the Essence) and afterwards it incains and heals.

XVI. The Cataplasm. Made of the Green Herb, it diffuses Tumors, and applied upon Contusions Eblates the Humors gathered together.

XVII. The Distilled Water. If you dislodge a little Salt Pusella, or Nitre in it, it is good against Heats and Breakings out in the Face, Tanings, Sun-burnings, Pimples, Scars, and other like Deformities.
III. The Description. It has a Root small and tender, piercing every Year, and rising again from the Seed every Spring, unless it is weeded out of the Garden. From this Root rises Branches, which if they meet not with April, till Herbs, or other things whereon it may climb, it rises up but a little being Mrsled down upon the Ground, but otherwise if it meets with such things, on which it may cling, it will wind itself with its long, tender, reddish, thread Branches about them, to the height of three or four Foot, or more, shooting forth its Leaves finely at the joints at the other's do, either somewhat like to an Arrach leaf, or almost like the first small field Bindweed, or like the leaf of Black Briery, far of these kinds there are, but much smaller. The Flowers, Gerand Jar, are small, like those of the Arrach, and Parkinson says, they are very small, and many, standing together upon a small long Stalk, which comes from the joint where the leaf stands, and are of a reddish green color, but so small, that they are sometimes not taken notice of, and they are quickly fade, that they are scarcely regarded: The Flowers being gone, then comes the Seed, which is small, blackish, and three cornered, like, but less than that of Buck Wheat.

IV. The smallest kind of Black Bindweed, differs from the former only in the Magnitude, this rising not above a hand breadth high.

V. The Places. They grow in many places of this Kingdom, both in Fields and Gardens, where they grow as a Weed. The larger of them is not only a hurtful Weed, but of an ill smell, and too often found amongst Corn.

VI. The Timer. They flower in May, June, July and August, and the Seed ripens in the mean Season, in a little time after the Flower is gone.

VII. The Qualities. They are hot and dry in the fifth Degree, Diffusive, Vulnerary, Anthricick and Solutive.

VIII. The Preparations. You may make thereof,

The Virtues.

IX. The liquid Juice. It is made of the Leaves only, and if it is taken inwardly 2 or 4 ounces at a time, it loosens and opens the Belly very much.

X. The Effusion. It has the same Virtues as the Balsam by heating the Belly, before I have heard it confirmed from Experience, that it is prevalent against the King's Evil.

XI. The Balsam. It is very good for healing green Wounds, and to cleanse Old Ulcers, and Running Sores, and to cure Kids in Childrens cheeks.

XII. The Cataplasm, made of the Green Leaves. It dissolves and dissuces Tumours or Swellings, and hard Lumps in the Flesh, as Gunews Bays: and if mixed with a little Nitre, it allays inflammations.

XIII. The Diffusel Water. It is good against Pimples, Scars, Freckles, Tumours, Sun-burnings, and other deformities of the Skin; more especially in a little Vinegar, or Juice of Lemons is mixed with it.

CHR. LXXI. BINEWWED Sea. Sea Bells, or Bell-Flower. I know that Aristoleus, Cardon, Gefner, Cavarnarius, Sendommes, and others, call this Sea Marigold. But there is no such thing, for that is clearly another Plant.

II. The Kinds. There are three Kinds thereof,

1. Soldanella, Sea Bindweed, properly so called.
2. Soldanella Marinorum, the Greater Sea Bindweed. 3. Soldanella Alpina, Mountain Soldanella.

III. The Description. The first of these has a Root small and long, spreading a little in the ground, and shooting up divers heads in several places, and if any part of it is broken, there comes forth from it (as well from the Leaves) a yellowish water, which is bitter, flat, and unpleasing. From this Root rises many Week, slender, brownish green branches, trailing or lying upon the ground, rather than rising itself up, or climbing upon other things. Upon these Stakes are set divers Leaves, not always two together at a Joint, nor yet always single, one at a Joint, which are always round like the Leaves of Alfacaces, but a little unevenly dented about the edges, and thicker, every one standing on a long footstalk, and of a greenish green color: among which come forth the Flowers towards the ends, each flower by itself, springing forth at the Joint, much like in shape or form to the Common Small Bindweed, which grows upon the ground. The Flowers in very few every where, but they are a little larger, and of a reddish purple color: Those being past away, there comes round heads, containing within them 2 or 3 round black seeds.

IV. The Greater Sea Bindweed, has a Root a little creeping in the Earth, from whence rises up several long slender Branches, on which are set larger Leaves then on the former, many of them having a division on both sides the Leaf next to the bottom, and many of them but on one side, and several of them which are smaller, having none at all; yet all of them for the most part a little flattened on the edge, opposite to each other, and about the middle, making the point seem double forked, with many Veins running therein. The Flowers are of a red purple color, and are not Bell or Cup fashion like. 0
The Virtues.

XI. The Decoction. It ought to be made in Fat Mutton or Beef Broth, (because of its strength, and capable to trouble the Stomach) open the Belly powerfully, and purges violently in Droples; and Tumpeons, and therefore is not to be given, but to such as are of a strong Constitution; it opens Obstructions of the Liver, and strengtheneth the Spleen.

XII. The Infusiate Juice. This is not to be procured; but sufficed to issue out of its own Accord when the Herb or Stalk is broken; this being dried, and afterwards formed with the Efficace, or Wine, or other like Liquid, so as to be used Plasterwise, being applied to the bottom of the Belly, admirably draws forth the Watry Humor in Droples.

XIV. The Balsam of the Mountain Soldanella. It is admirable Valesare, curing not only green Wounds with much speed and force, but also cleanses old and rotten Ulcers, and purges Spleen, and drives out the Putrid Humor. It wonderfully leucrates or breaks Flesh in Wounds, and heals them.

XVII. The Balsam of the Mountain Soldanella. It is admirable Valesare, curing not only green Wounds with much speed and force, but also cleanses old and rotten Ulcers, and purges Spleen, and drives out the Putrid Humor. It wonderfully leucrates or breaks Flesh in Wounds, and heals them.

XV. The Poudre. It is made of the Leaves dried, and ought to be concerned with Annicafea, Caraway, Cinnamon, Cardamom, Ginger, Zedeloy and Sugar: So prepared and given, it kills Worms in Children, and purges the Belly: The simple pouder is good also to cleanse Sores and Ulcers, to incaricate or break Flesh in deep and hollow Ulcers, and also to heal them.

XVI. The Cataplasm. Made of the Green Leaves, and applied to the Belly, it is said to purge the Bowels by Stool, and drive forth the Watry Humor which causes the Droples: but it must be often applied, and renewed with fresh Herbs; and so it is probable against the Sciatica and Gout.

XVII. The Balsam of the Mountain Soldanella. It is an admirable Valesare, curing not only green Wounds with much speed and force, but also cleanses old and rotten Ulcers, and purges Spleen, and drives out the Putrid Humor. It wonderfully leucrates or breaks Flesh in Wounds, and heals them.

XVIII. Gerard Eys, That the German Physicians do much boast of the Wonders they have done with Soldanella Alpina: That the Leaves applied as a Cataplasm to the Navel, and Somewhat lower, draws forth Water from the Bellies of fish as are Hydrophiles and this effect (says he) it works in other Parts without hurting.

B I R D S - E Y E.

I. The Name. I find no Greek Name that this Plant has; but it is called in Latin, Parus, Astra, Phœnix minor; by some Samnites Eugenofides: in English, Bird-Eye, and Birds-eye, and Birds-eye.
II. The Kinds. This Plant doth also belong to the tribe of the Goosefips, of which it is a special Kind, as being a larger sort. There are also two Species of Birds-Eye, viz. 1. Paralyfis minor flore rubro, the lefter Cooflip, which is also the lefier Birds-Eye with Red Flowers. 2. Paralyfis minor floribus albis, the lefier Cooflip, which is the greater Birds-Eye with White Flowers.

III. The Description. Red Birds-Eye, which is the smaller Plant, hath Roots small, white and thread-like, from which arise a head of Leaves so closed together, that it seems a small white head; this afterwards opening it spreds round upon the ground, and hath small long and narrow Leaves, snip about the edge, of a pale green colour, on the upper side, but very white or mealy underneath; among these Leaves rise up one or two Stalks, small and hoary, half a foot high, bearing at top a bunch or tuft of much smaller flowers, spreading upon short Foot-sticks, something like to Cowslips, but more like unto Bears-Ears, of a fine reddish purple colour, in some deeper, in others paler, with a yellowish Circle in the bottoms of the Flowers, like unto many of the Bears-Ears, of a joint, but little seem; after which comes a Seed, smaller then that of Cowslips.

IV. White Birds-Eye, which is the greater of the two, differs little from the former, ftre that it is a little larger both in its Leaf and Flower, and that the Flowers hereof are wholly white, without any great appearance of a Circle in the bottom of them, unless it is well observed, at leaft it is not so conspicuous as the former; both these Kinds of Cowslips have sometimes, though but seldom, from the midf of the Flower on the Stalk, sent forth another small Stalk, bearing Flowers therein likewise.

V. The Place. This Plant is growing wild in Goffe and Paffure Grounds in many places of England, from whence they have been transplanted into Gardens for the pleasantnes of their Flowers.

VI. The Times. The Red Birds-Eye, for all the care and industry we can use to keep it, will scarce endure in our Gardens, but all the Winter long, till the Spring begins, its Leaves are so closed together, that it seems a white head of Leaves. They both flower in the Spring of the Year, some earlier, and some later, according to the mildness of the Season.

VII. The Qualities, Speciation, Preparations and Virtues are the same with those of Gooseflips, and therefore referring you thither, we shall say no more concerning the same in this place.

CHAP. LXXIII.

BIRDS-NEST.

I. The Name. It is called in Greek by Dodos: in Latin, Neftus; in English, Birds-Neft. It has many Names; by Gesner, it is called, Orbanche; by Label, Satyrion abortivum, and Orchis abortivus; but we in English call it Birds-Neft, or Goose-Neft, from the Plunting of the Roots, like the Flicks and Straws of a Crown or Birds-Neft.

II. The Kinds. Authors make two sorts thereof, the one not much differing from another, save in the color: the first and longest known is of a yellowish colour; the other of a purplish Violet, and is called by Chaffus, Limodorum, and Pseudolimodore.
very short than thin, at least, of a brownish deep yellow color. The flowers are of a deep yellow or tawny color, and stand upon a filiform head, like unto that of the Orchis, and of the same fashion; after which fashion Weeks of daily Seed.

IV. The Purple Bullwort has a Root exactly like the former, from whence rise up a stalk or stalks about eight or nine inches high, the lower part of which within the ground is not round like the former, but fluted, and of a whitish yellow color; the stalks are set with a few small, narrow, short, skinny, sharp-pointed Leaves, set without any order, very little, or without nothing at all covering or encasing the Stalks, which has a spike of flowers very like the former, without tails or leaves growing amongst them. The whole Plant, as it appears above ground, Stalks, Leaves, and flowers, is of a Violet, or deep Purple color: After the flowers are fallen, there succeed little fleshy dark Seed, like the former.

V. The Place. They are both found in many places of England, in Woods, and low Copes: but they are not so much found in the Southern parts of the Kingdom, as in the Northern: As is said, that they grow near to a village called Kassenbruch in Twente. Gerard found it growing in the middle of a Wood in Kent, two miles from Gravesend, near to the then Mr. William Steel, husband of Hooch-Green; the Wood then belonging to one Mr. John Sibuly; the ground in the same place (says he) is covered all over with the Herb Saturne, and with that kind of Orchis, called Her-maphrodite, or Butterfly-Satyrion.

VI. The Time. The flowers and flowers in June, July, and August, and its Seed (if it may be called Seed) which is mealy or dusty, falls in the end of August: But Gerard will not allow it to be any Seed at all.

VII. The Virtues. No Author that have ever wrote of it, have alligned it any Virtues: however it is certain, that it is of the Nature of the Oreges, and possibly may have their Qualities, Properties, and Effects, being in like manner applied.

CHAP. LXXIV.

BISHOPS-WEED Common.

I. If it be asked, Where is it found?—It is called in Greek Αμηνιαν Σελιδων, and in Latin, Ammi Salicaria. It is called, Ammi, Salicaria, in the American Commonwealth, Ammi Salicaria, in the American Colonies. (from the ancient name of the place where it is found)

II. The Kinds. They are of two principal Kinds, 1. Dovileck, called in Latin, Ammi Vulgaris, and Vulgaria: It is called by Tuberingeniana, Am- mi vulgaria, which is our English Bishop's-Weed.

III. The Description. Our Common Bishop's-Weed has a Root White and Fibrous, pervading every part, after it has seeded, and commonly rising again of its own power; from this Root rise up a round or Globe-like Stalk, sometimes as tall as a Man, but commonly 3 or 4 feet high, set with several leaves, bent, and somewhat broad Leaves, cut in, in some places, and sharp or divided about the edges, growing in both places of a long footstalk one against another, of a dark green color, somewhat like unto Shrub Leaves, bearing several Branches on them, and as the ripe small Umbles of white Flowers, which turn into small, round, and brown Seed, little bigger than Parry or Seed, and not so large as Ammi Seed, of a brick, quick, round, and but little.

IV. The Place. It is found growing Wild in many places of England and Wales, by a hedge field next field beyond Green Hill, on the way as you go to Greenfield, and with us it is also nourished up in Gardens.

V. The Times. It flowers in June and July, and the Seed is ripe towards the latter end of August.

VI. The Qualities. It is hot and dry in the third Degree, the Seed more especially. It is alternating, Difuse, Squint, and Nephritic, Hysterical, and Arthritic, Alternative, and Alacrimatic. It is situated in nature, of thin parts, and sharp withal.

VII. The Specification. It is approved against the Cholic, and mightily provokes Luf, which I believe is from its Sperragmatogenic faculty.

Chap. 75. English Herbs.

The Virtues.

IX. The liquid Juice. It is very thin and light, digests Humors, expels Wind, and gives ease in the Glutings of the Guts. Dose from 2 to 2½ Spoonsfulls in a glass of Canary, Sherry, or other generous Wine, two or three times a day.

X. The Effume. It has the Virtues of the Juice, but more powerful to the purpose designed, it provokes Urine, and the Confinings in Women when Incontinent, helps the Cholick, and is very powerful against the biting of Mad Dogs, Serpents, as the Viper, Rattlesnake, etc. on the bite of, or flinging of any other Venemous Creature whatsoever, being given Morning, Noon and Night, from ij. ounces to vii. in a glass of any generous Wine.

XI. The Distilled Water. It is Romatick, and has the Virtues of the Effume, but very much Weakner, and therefore may serve as a Vehicle, to convey any Medicines in, good against those kinds of Distemers.

XII. The Powder of the Seed. It expels Wind, converses the Stomach, and other Vifcera, gives ease in the Cholick, and has been found, by experience, to be profitable against the Stone, Sand, Gravel, or any Tumorous or Slimy Matter in the Reins, Ures, and Bladder. It may be given mixed with Sugar in a glass of White or Rhumflh Wine.

XIII. The Spiritus Tinctura from the Seed. It is Cordial and Stimatck, good against Vapors, Wind, Fainting and Swooning Fits, Cardiacs, Palliation of the heart, Poyson of Vipers, Rattlesnakes, Mad Dogs, and the biting or flinging of any other Venemous Creature. Dose from one Dram to two, in a glass of excellent Wine.

XIV. The Only Tincture. It is good against Paf-
fies, Convolvions, Rheumatifs, Pains, Aches, Weak-
neces, and Pains of the Nerves in any part of the Body: It eafes the pain of the Gout, proceeding from a cold Cough, Colds, Difflibles, and cold Tumors, and is of admirable use, being taken inwardly, for the mollii of a Ficcd Pain of the Back, or any Other Diforders of the Reins, Ures, or Bladder. Dose from half a dram to one or two dram Morning and Evening in a glass of White Wine.

XV. The Saline Tincture. This may be made either of the Seed, or of the whole green Plant. It is good to take away Black and Blew Marks, Scars, Tanning, Sunburning, and other deformities of the Skin: being often washed therewith, it is also good to add to an high color, and a Spong being diped therein, and applied upon the biting of any Venemous Beast, especially that of a Mad Dog, it effectually attends and draws out the Poyson; It also diffuses the afflux of humors in Contusions, and being drank to one dram in Brown Wine, it is prevalent against Fics of the Mother in Women, and is good against the evil Effects of Cantharides, if timely taken in some proper Emulsion.

XVI. The Spirit. It is an excellent Cordial, good against Painting and Swooning Fits, eases the Pains of the Heart, cheerst the Spirits, comforts Nature, provokes Lust, strengthens the Worm, and all the utensils of Generation in both Sexes; and has indeed all the Virtues of the Spiritus Tincture, but not altogether so powerful. Dose from two dram to four, alone by it self, if prolonged, otherwise to be taken in a small glass of Wine.

XVII. The Chymical Oyl of the Seed, is giving it to correct the Vitiology of Cantharides, that it be digested in it for some time, they may be given inwardly without any danger: this may be true, but the true Cantharides in a Spanish Liqueur of Spirit of Wine, it is fliwer in their place proper. This Chymical Oil is an admirable Carminative, and gives present ease in the Cholick, by giving it inwardly by the Mouth, if the Difficult lies in the Stomach, Vesicamentum, and upper Bowels, or giving it Clysterwise, if it lies in the Colon, or other lower parts. It also provokes Urine, and the Terms, is good against Poyson, and the bitings or flings of Venemous Creatures. It opens Obstructions of the Stomach, and has been found very helpful against Hypochondriack Malignancy.

Dose from six drops to twenty in a glass of Wine, or Wine and Water; drop the Oil into Sugar, and mix them well together, then mix it with the Wine, and to drink it.

XVIII. The Fixed Salt of the whole Plant. It is a powerful Disstirick, and being taken in all the Liquor the Patient drinks, as Ale, Beer, Wine, it has been found profitable against the Droplue and Jaundice: It also cleanses the Worm, Reins and Bladder, of any Tumorous Matter obturating them. I once knew a Gouty Person, by the constant use of this Salt, and drinking Milk and Water, to become perfectly freed from his Gout, and had not so much as one Fit of it in above 18 Years time, which was contrasted to me at the writing hereof. Dose from xvi. grains to xvi. in Water, or Wine, Milk, and Water, if for the Gout; but in Ale, Beer, Cider, Mead, or Wine, if against the Droplue, or other Distemers.

XIX. Pottelles or Pouces. They have all the Virtues of the Effume, Spirit, Spirituous Tincture, Chymical Oil and Salt, and may be given from one dram to two, Morning, Noon, and Night, in Wine, Mead, Hypocras or any other its Vehicle.

XX. The Balfam. If it is made of the Chymical Oil, with Turpentine and Wax, it is of excellent Use in all Wounds and Pustules of the Nerves; and applied, gives ease in the Gout, proceeding from a cold Cattle, as also in the Sciatica, and other Pains and Aches of the Nerves and Joints. If it is made of the green Herb, it is good against Pains and Aches also, but is a peculiar Valuntary, for healing wounds made in Sandhills, Cold, Snow, or other habited Bodies, and in depending places, because besides its admirable healing property, it dries powerfully, and strengthens the part afflicted.

XXI. The Camphrum. It is not only good to be applied to Contusions, for it prevents the further ad-
flux of Humors, and diffuseth thicke which are pre-
vent, diffuses and covers congealed Blood, and this more especially if it is mingled with Honey: it also takes away Black and Blew marks, which come by blows or falls, or other discolurings of the Skin.

XXII. The Seed. It is one of the four leafer hot Seeds, always commended as a Carminative: and it is said the Egyptians make use of the Seed, to pro-
voke Lust or Vomity, for which it is very power-
ful.

CHAP. LXXV.

BISHOPS-WEEDE Forcin.

I. The Name. It is called in Greek AAmAm, which is the Name, given by Dioscorides and in Latin, Ammi, Commum Regiam, and Athie-
picum; and in English, Forcin or Oftonhook Bishopof.

II. The Nature. It is twofold, 1. Orist, or that of Candy, called AmmiCristicum, and by Label, Am-
i Commun Amaretum, Bishopifeed of Candy.
2. Egyptian, called by Oystir, Ammi mafcinum, or Dodecan, Ammi alterum parum : Ammi perpophye,
Salmon's Herbal.

Chap. LXXVI.

Bistort. English.

I. The Name. This is a Plant that I cannot perceive the Greeks knew any thing of, no Greek name being yet assigned to it: it is called in Latin, Biflorta, (by most Authors) a compositio & interrete radicibus (Lays Roy.) by Tragus, Lomeras, and others, Celahuma, and the Root Radix Colubrina, Dracunculus, Bulgarum, as well as Biflora, and we in English call it Biflort and Smoke-weed. Some will have it to be Petran Rubrum; others Alypsa no Petri; others again Dracuncula Plant; some again, as Gesner, Leonurus: Label and Chaffes say, that it is the bristleness of Discolorides and Plant, but in all these they are mistaken, as those who please to examine those several Plants in their proper Chapters, and compare them with the Definitions here, may easily perceive.

II. The Kinds. What we shall discours of here, are principally two. 1. Biflota major, as Gerard, and the Banimers call it: major vulgaris, as Parkinson. Radices minus inorta, as the Banimers, major racgularibus folidis, as f. Banimus, and we. The greater Biflort, or Smoke-Root. 2. Biflota minor, as Gerard, minor mollis, as Parkinson; Celahuma minor, as Tragus, Alpina media, as C. Banimus, and we, The lesser Biflort, or Smoke-Weed. But besides these, Authors make mention of four Kinds more, as 3. Biflota Laxifolia, Brand ley'd Biflort. 4. Biflora Alpina major, and Alpina maximus. The Greater or Greatest Mountain Biflort. 5. Biflora
Chap. 76. English Herbs.

Alpina media, or Alpina minor. The latter Alpina Bifort. 6. Biforta Alpina panthe folia variis, Low Variable leaf Bifort, of all which we shall say nothing in this Work.

Great Bistort.

Small Bistort or Smoke-reed

III. The Description. The Greater Common Bistort has a thick, short, Tuberous or Knobbed Root, blackish without, and something reddish within, a little crooked or wrinkled together, and of an harsh or Instringent Taffe, with divers blackish Fibres or Threads growing thereon: From whence spring up every Year, several Leaves standing upon long Foot-stalks, being somewhat long and broad, not much unlike to a Dock Leaf, and slightly pointed at the ends.

but that it is crooked, if of a bluish green color on the upper side, and of an Alb colored grey, and a little purplish underneath, having several veins running therein: from among which, rise several small and slender Stalks about half a Yard high, almost naked, and without Leaves, or with very few narrow ones, bearing a slight bath of pale, fresh colored Flowers, which being put, there is found a small, brown, cornered Seed, not much unlike to Sorrel Seed, but greater.

IV. The Lesser English Bistort has a Tuberous Root, small in proportion, but something crooked or turned like the former, being of a blackish color without, and somewhat whitish within, of the same action, stumpy, or binding together, with the former: This Root sends forth 3 or 4 small narrow Leaves, scarcely an Inch broad, and near four Inches long, green above, and grey underneath: The Stalks are slender, and with but one or two Leaves set thereon at the tops thereof, stand long, round, spiky heads of white Flowers, with several small green Leaves among them, after which comes a reddish Seed, almost round, which being dry, becomes blackish, and is bigger than that of the former, about the biggest (Jays Gerst) of a bare.

V. The Places. The first grows at the Foot of Hills, and in shadowy moist Woods near to them, in many places of Germany, and in England in like places, but is chiefly with us nourished up in Gardens. The other grows in the North of England, as in Lancashire, Yorkshire, and Cumberland, in several places; also in Westmorland, at Crosby, in Lancashire, at the head of a Park formerly belonging to Mr. Pickering, from whence it has been brought, and dispersed into Gardens. The Bistort is also laid to grow in a Meadow, about a Stones call above the Abbe Hill at St. Albans, about an Acres breadth or more from the River side, where it is said to grow in great plenty.

VI. The Times. They both flower about the end of May, and the Seed is ripe about the beginning of July.

VII. The Qualities. They are cold and dry in the third Degree; Astringent, Stupefic, and Vulnerary Cordial, Hysteric, Alterative, and Alexipharmick.

VIII. The
The Virtues.

X. The liquid Juice. Taken inwardly 2, 4, or 6 scruples at a time in a Glass of Red Wine, or other Spryck Wine, it presently stops any internal Flux of Blood, refits the Poison of Vipers, or any other Serpent, and the bitings of any other Beat, or asp, against the Plague, and all other Malign and Pestilential Fevers.

XI. The Distilled Water. It is a singular remedy to stop any Bitings of any Poisonous Creatures, as Spiders, Toads, Serpents, Vipers, Rattlesnakes, or the like, and has the Virtues of the Juice, but not with equal power or force. It is good also to wash Sores or Cancers which happen in the Nose, or any other part; more especially if the pouder of the Root be applied thereto afterwards.

XII. The Powder of the Leaves. Taken to a draught, it is good to kill Worms in Children; prevails against a Diabetes, and helps such as cannot keep their Water, but are apt to pifs a Bed, and this more effectually if given with Juice of Plantain.

XIII. The Powder of the Root. Being given to a draught, more or less, in Wine, or other fit Vehicle, it prevails against the Malagity of the Purples, Measles, and Small Pox, and expels the Poison of the Plague or Peltillence, or of any other infernical Diffacles, driving it forth by Sweating. It stops also all manner of inward Bleeding, as Dyfenterie, Spitting, Vomiting, or against Blasen, and is proverbial against Reptiles in Children, or Elder Persons; it is also good for any Contusion, or Bruice caused by Blows or Falls, dissolving the congelate Blood, difculfing the aggregated Humors, and easing the Pain of Gastro-enteria. Given to one draught in the Distilled Water, in which some red hot Iron has been quenched, it is said to help or cure a Gonorrhoea, or Running of the Urine, Universal being thereby promoted. And being boiled upon any Cat, or Wound of a Vein, or were there is a great Flux of Blood, it presently stops it.

XIV. The Powder of the Root compound. It is made of equal quantities of Biffert Root, Root of Pettitory of Spain, and of Barnall Alum. This Pouder being made into a Pilsse with a little Hony, and some of it put into an hollow Tooth, or held be-ween the Teeth, if there is no hollowwound in them, eases their Pain, and stops the exsudation of Rheum upon the Part, denuises the Head and Brain, and Cures an evacuation of abundance of Rheumatic Matter.

XV. The Decoction of the Root. If it is made with Water, with the addition of some Pomara- cocci Pools and Flowers, it makes a most admirable Lotion, and is very good to wash any little lodged there, stops the over-flowing of the Terms in Women, and cures a long continued Flux of the Urines, days up Ulcers in that part, and througheous the Lymphatics of the Jaw or Worm, being relaxed, whereby the Worm seems to prece or fall down. If the

Decoction is made with Wine, it stops all manner of inward Bleeding, as Spitting of Blood, Vomitting Blood, and all Fluxes of Blood, whether in Man or Woman, is available against Ruptures in Old, or Young, diffolves congealed Blood, and diffuses Contusions to admission. It is felt to cure the Jamaund, and being inwardly given, and outwardly applied, it is eminently good against the biting of Vipers, or any other poisonous Serpent, and the bitings and flunging of any Ven- nemonous Creature whatsoever. Given to Woman with Child, it prevents Abortion, or Milkcarriage, and helps such as cannot hold their Water; and used as a Gangrarium in the Mouth, it allays inflammation, heals Ulcers, and tuffens the mental Teeth.

XVI. The Decoction of the Root compound. To Bi- 

flour Roots six ounces. Angelica Roots, Zedary, of 

each four ounces; Virginia Snake-root three ounces: 

Close-root an ounce and half; Westerns Common 

one ounce: all being bruised, insafe in Red Port 

Wine, or Canary, five quarts, for four hours: Then 
giving it true or three boils, take it from the Fire and 

strain it clear of any dregs, put half a dram into a 

little, then decent the Clear from the Laccus, and 

sweeten it with Syrup of Lime, or Syrup of Vine-

ager. It is a noble Medicament against the Meatles,

Chin Cloaks, Spiders, and Small Paul, and even the Plague it self, being given either prevent- 

ively, as two or three Spoultis of it Morning,

Noon, and Night: or Curatively, in which four or 

five doses in a day and a half, and to be 

repeated as need requireth: It is an excellent thing 

against the bitting of Mad Dogs, Vipers, Rattle-

Snakes, or the bitings or transient of any other Vo-

nemonous Creatures. It also prevails against any Ve-

getable Poison, which is taken inwardly, if timely 
given.

XVII. The Diet Drink. It is made of the Roots, 

Leaves, and Seeds, boiled in half Wine, half Water. It 

is an excellent Traumitzick, cures all curable In-

ward Wounds, and Ulcers, and Fluxes of Blood, of 

what kind soever, and also being regularly drunk, 

contributes very much to the cure of Wounds, and 

old Ulcers in the External parts.

XVIII. The Spirituous Tincture. It defends the 

Heart against Poison, whether inward or outward, 

whether a Vegetable or Animal Poison, or the Ma-

lignity of the Plague, or of any other infernical 

Diffacles, one, or two drams at a time, two or 

three times a day, in a Glas of Wine, or other Ve-

hicle.

XIX. The Acid Tincture. This is more peculiar 

against the Plague, and other Malign Fevers, and 

infectious Diffemors than the former. It al-

ways the inflammation of the Jaws, Almonds of the 

Fars, and Throut, being often taken inwardly, and 

also used as a Gingle, by mixing it with the De-

coction in Water or Wine aforegoing. It also heals 

Cancers and Sores of the Mouth and Throut, if of 

often wafhed therewith; and being swallowed, cures 

tough Floges, and clears the Throut.

XX. The Oily Tincture. It is good against Pun-

tures, and Wounds of the Nerves, eases their Pain 

and cures them, being bathed thereon, and applied 

thereto; and repeells the Flux of Humors attending 

them.

XXI. The Saline Tincture. Outwardly used, it 

penetrates, and contributes to the curing of Rup-

tures. Old Ulcers being washed therewith, it clean-

ses them, and disposeth them to healings; and Phleg-

mons or Inflammations being bathed therewith, it 

abates the heat. Inwardly given, it cleans the 

Reins, Ulcers and Blanders, after the use of it, for 
some time; if there be any Ulcers in those parts, 

they are cured by giving Inwardly the Decoction in

Wine,
Chapter 77. English Herbs.

Wine, Juice, or Eulence, and continuing it for some time. This Saline Tincture is also prevalent against the Jaundice. Dose from half a dram to a dram and half, in any convenient Vehicle.

XXII. The Fixed Salt. It is good against Poifon, and all malignity of the Plague, opens Diffutations, refuits Putrefaction, and defends the Vitals against any kind of Infection, or the malignity of Evil Airs. It provokes Urine, and cleanses the Urinary Passion, carrying off the Restreems of the Humin by those Passages, by which it has been found good against the Jaundice and Dripos. Dose from ten grains to a supple in Ale, Beer, Cider, Mead, or Wine.

XXIII. The Essence. It refuits Poifon, Plague, or Pestilence, and all forms of malignant Fevers, drops all Flowers of the Belly, as Diarrhoea, Dyenteria, Lienterita, and the Hepatic Flux, as also all Hemorrhages whatsoever, whether inward or outward, the overflowing of the Terms in Women, and the preternatural flux of the Whites: but in the last Case, Universal Sagacity cannot be premised. In a word, the Essence has all the Virtues of the Liquid Juice, that Ponder of the Root, and the Decotion in Wine at Sec. 10, 12, and 15, strobegon. But it peculiarly drops the suffix of Humin to any part, being applied to the fame outwardly, and also taken inwardly. Dose is from two to six ounces in Wine, or any other Vehicle, proper against the Difficul for which it is given. Note, The Root of this Plant is that which is chiefly used, as having most Virtue in it.

C H A P. LXXVII.

BITTER-SWEET.

II. E Names. It is called in Greek Τριχηθέλανθον, Chrysanthemum, & c. Anvia dulcis, and evergreen. Strifyllanthemum, i.e. Solomon arborifocum; but no Greek Author, that I know of, has said anything of it; but some of the Moderns have impo\ldots

---

1. The Liquid Juice. 2. The Essence. 3. The
Salmon's Herbal.  Lib. I.

The Virtues.

X. The Liquid Juice. Being given to two or three ounces, it purges well, and powerfully opens Obstructions of the Liver and spleen, and helps such as are Althamptic, or are troubled with difficulty of breathing, being taken every MORNING falling for some time.

XI. The Efficacy. It has all the Virtues of the Juice aforesaid, besides which it is a powerful Medicament against a Pitch-flick, and for the Cure of the Yellow and black jaundice, as also the Drop- sic : It brings away the After-birth, and effectually cleanses Women newly brought to Bed ; you may give it from two ounces to four in a glass of White Wine every MORNING falling : It is also good for inward bruises caused by any fall or blow, dissolving the coagulated Blood in what part of the Body it is over. It purges well, and not curiously.

XII. The Decidium. You may make it thus: 

Express the young tender twigs or woody substance, and of the Leaves; bruise them well, and put them into a Glass of Beer, or bolt-head, affix thereon a White Port Wine to fill it, cover it with a blind head, and leave it in a Sun heat for twelve hours; and then make the best so great as in it may boil gently, which done, decoct, and drain out for use. It has the Virtues of the Efficacy, is a Specific for the Jaundice and Drop-sie, according to Tragus and Dodoens, is good against the Vertigo and Megrim, and other Head Disorders, cleanses Women in Child-birth, and repels Hysterick Vapors. Dose four ounces every MORNING: it purges the Body very gently.

XIII. The Spirituous Tincture. It purges not, but very much strengthens the Viscera, chiefly the Liver and spleen, and repels Vapors attending from the Stomach, and other parts, to the Head and Brain, causing Vertigo's, Megrim's, and other Distempers of that Ventricle. Dose two drams, or more, every MORNING falling, and Evening at Bed time in a Glass of generous Wine.

XIV. The Acid Tincture. Let it be made with Spirit of Wine acuated with Spirit of Salt. It powerfully provokes Urine, cleanses the Reins, Ureters, and Bladder, and cures the Drop-sie to a miracle, but it ought to be taken a considerable time, and always in the Decidium of the same Plant, or in a Decidium of Century, Gentian, and Roman Wormwood. Dose from half an ounce to an ounce, more or less, so as to give a pleasant Acidity, Morning and Evening ; and it is to be put into all the Ale, Beer, or Wine the Patient drinks.

XV. The Saline Tincture. Bathed with it, it takes away Scurf, Morphee, and falt, and sharp breakings out of the Skin; inwardly taken to one dram, it provokes Urine, and cleanses the Urinary passages of Slime, Viscous, or Tarrators Matter, which is commonly the matter that breeds the Stone and Strangury.

XVI. The Complexion. It is to be made of the leafful Berried, and Robin in fine Powder. This applied to Felons, which commonly come on the Fingers ends, cures them in a very short time.

CHAP. LXXVIII.

BLEW-BOTTLE.

T HE Names. It is called in Greek, Κιάνος, to Flora Cyanus, vel Corallino color. In Latin, Cyanus : and in English, Blew-bottle, or Cornflower.

II. The Kinds. It is twofold: 1. Single-flowered, of which in this Chapter. 2. Double-flowered, of which in the next. The single flowered is also Cyanus magnum, vel Cyanus major vulgaris, Cyanus sarcophi. The greater Common Blew-bottle, or Garden Blew-bottle. This some call Cyanus montanus, Hermodactylus takes it to be the Lenciscum Discolor, Celospius to be a kind of Struthium Theophrasti : Vahlus Columa, thinks it to be Paeonian Heracleum Theophrasti, and Label questions whether it be not a Species of Chondrilla. 2. Cyanus minor vulgaris, Cyanus fecator, The lesser Common Blew, or Bell Blew-bottle. It is called by some flue Fragmint, Corn-flower : Batriscula (as Rey has it) and Bopiscula, or Bupiscula, from its turning the Edges of Sickles in cutting down Corn, Straw, &c. it is a Secundo Fidibus, being taken for a Sickle in ancient Times.

III. The Description. The Greater or Garden Blew-bottle has a root which creeps under ground, spreading it self divers ways, so that its leaves with green Leaves will alwaye all the Winter, (which in the other sorts do not so, but perish wholly after Seed-time, rising againe of their own Spring before Winter) and grows nearly into new shoots and springs, by which it very much increases : from this Root rises up a crazed or rather winged Stalk, of a whitish green color, about two or three Feet high, on which are set divers Leaves, something long and broad, without any division, or denting in about the edges, green on the upper Side, and growth underneath, each
of them encompassing the Solit, about, or the lower ends, which is divided at the top into a few Branches, bearing somewhat large, fiddy, green heads, without white, or Silver-like edges, from the midst of which comes forth a larger Flower than in the smaller kind, thinly set, and of a deeper Violet-blue color: in which Heads, after the Flowers are past, there is found a Vese, containing some few white Seeds, like those of the former kind, but a little larger, and flatter.

Conyon Blew or Corn Flowers

IV. The latter Common, or Field Blew-bottle, or Corn-flowers, but Roots somewhat long and large, which pierce every Year, but are Annually removed by its own leaving, often by springing up before Winter, and shedding green all the Winter Season, until the next Spring and Summer, when it flowers, Seeds, and perishes again. The Leaves are long and narrower than the former, of a whitish green color, deeply cut in on the Edges in some places, but some more than others, something like unto Scabious leaves. The Stalks are two or three Feet high, according to the goodness and fertility of the Ground, set with fuch like Leaves, but fatter, and little or nothing cut in on the Edges: the tops are spread forth into several Branches, bearing many small green, fiddy Heads, out of which white Flowers, consisting of five or six, or more, long and hollow Leaves, small at the bottom, and opening wider and larger at the brim, matched, dented, or cut in on the Edges, and standing round about many small fhaft leaves, in the middle. The colors of these Flowers are manifold, and very variable, for some are wholly Blew, or White, or blue, or of a Rod or ftript Purple, or of a light or deep Red, or of an over-warm purple color, or else mixed of these colors, in some, the edges White, and the reft Blue or Purple, or the edges Blew or Purple, and the reft of the flower White, or Stript, Spotted, or buffled, or conftricted, one part of one color, the other of another, and others mixed also in the middle standing in many of them, for in some the middle Throat will be of a deeper Purple than the outward Leaves; some will have it reddish, deeper, or paler white.

Leaves are White, or blefs. The Flowers being pale, the heads or bottle contain a Vese, in which the Seed is wrapped, which is small, hard, white and shining. None, that the flowers of that Blew grows Wild in the fields, is for the most part only Blew.

V. The Place. The first grows Wild in Germany upon Sandy Hills, but with us it is nourisht up in Gardens: The other with Blew flows grows Wild, in many Corn Fields throughout our Kingdom: It is found in Fields of Wheat, Rye and Barley, but is also Sown in Gardens, which the skilful Artift, by looking after, makes to become of other colors, as in the Description thereof is declared.

VI. The Time. They flower from the beginning of May, to the end of Harffet, and their Seed comes ripest in the mean Season.

VII. The Qualities. They are temperate in respect to heat or cold, and dry in the first Degree, but Schrader says, they are cold and dry in the second Degree: They are Alumfrigit, Optimulac, Cardiac, Alterative, and Alexipharmick.

VIII. The Specification. They have a peculiar faculty for the curing of sore and blefed Eyes, and reftoring the force of Poifon.

The Virtue.

X. The Flowers. They are cold and dry in the 1st place, and especially good to take away Redness and inflammations of the Eyes, and pains thereof: they cool in FEVERS, refit Poison, and help in DROPSIES. You may make an Acid Tincture of them with Spirit of Wine, mixed with a part of Spirit of Salt, which in FEVERS, PLAGUE, &c. may be given from 20 to 40 Drops, in any fit Vehicle.

XI. The Powder of the dried Leaves. It is taken in Tincture or any other, for the curing of inward troubles, and to heal a rupture of the VESSELS, whereby they void much Blood at Mouth. Give it in Plantain, Comfrey, or Horfe-tail-water, seasoned with a little White Wine Vinegar.

XII. The Essence of the Juice of the Leaves and Flowers. It has the all the former Virtues both of the Acid Tincture and Powder: It helps in DROPSIES, refuits all manner of VENOMS and POISONS, and is peculiar against that of the Scorpion, FALALGAN, VIPER, MAD-Dog, and Plague, as also all other Pellaginous Fevers, and Infectious Diseases: being droped into the Eyes, it takes away their heat, inflammation and pains.

XIII. The Collyrium, or Eye-Water: Of the Blew-flowers as many as you please: put them into Rye-Dough or Poffe, bake them in the Oven with Household Bread, then taking it forth, distill all, viz. Flowers and Rye Poffe, in a Glass Bully in Water, and keep the Water for use. With this the Eyes are to be washed three or four times a day. It is admirable for the cure of most inflammations of the Eyes, especially those, inflammation, Pain, Blood-Gouts, &c. It clears, strengthens and preserves the Eyes-sight, especially of old People, for which reason some are pleased to call it Break-Spectacles-Water; for that those that use it, need never come to the use of Spectacles: If the Displeasure is excessive or stubborn, use it twice or thrice a day.

Salmon's Herbal. Lib. I.

Chap. LXXIX.

Blew-Bottle Double-flowred.

I. The Name. They are called in Latin, Cyanus multiflorus; and in English, Double-flowred Blew-bottle, or Corn-flower.

II. The Kinds. They are of the latter Kind of Blew-bottle, and are twofold: 1. Cyanus ceruleus multiflorus, Double Blew-flowred Blew-bottle, or Corn-flower. 2. Cyanus purpureus multiflorus, Double Corn-flower Purple-flowred. To these we add, Cyanus floridus Tauricus, Cyanus floridus orientanus Tauricus, Cyanus Orientalis, which is also Major and Minor. The Turky Blew-bottle: The Turky Sweet-scented Blew-bottle, and the Sultan's Flower, because the Grand Senior clipping it as he was walking abroad, liked it, and wore it himself, for which reason his Vassals held it in great esteem: of this there is a Greater and a Lesser.

III. The Description. The first of these differs not at all from the small Field Corn-flower in the former Chapter, neither in the Root, Stalks, Leaves, nor Seeds, but only in the Flowers, for that the flowers of this Plant, are of a fair Blew color, and very double, whereas the other are single.

Blew-Bottle Turkey.

IV. The Second of these is also like unto the former in all respects, facing in the color of the flower, for whereas that is double, and of a fair Blew; the flowers of this are also double, and of a bright purple color.

V. The Third is a Plant or Flower of much beauty: It has a Root like the other Blew-bottles, which persists every Year; the Leaves below are not much greater, but larger, and more gathered on the edges; the Stalks are three feet high at most, and lower than in the other, best of the like Leaves, but smaller, and branching into several parts; each of them bearing a larger heavy head than the former; and bigger in the Greater of this kind, than in the Lesser, with Blew-bottle thick flowers, but larger, and consisting of eight or nine hollow Leaves, with wider open bracts, and small, pale or almost white threads in the middle, the circling Leaves are of a fine beautiful purple color, very glorious to behold. This Flower is of no exceeding a fine form, that it surpasses (for Parkinson) the boldest that is. The Seed is blackish, and enclosed in a Dorsey substance like the former.

VI. The Flowers. The two first are often found in Corn...
**Chap. 80. English Herbs.**

Corn fields, and are also nourished up in gardens. The fall was brought to us from Turkey, or Chattan-temple, and grows in the Gardens of some Herbs.

VII. The Times. They flower for the most part those all the Summer, and their Seed ripens in the mean between.

VIII. The Qualities, Specification, Preparations, Virtues and Uses, are all exactly the same with those in the former Chapter, so that we shall say no more thereof in this place.

---

**C H A P. LXXX.**

**BLITES White.**

I. **T H E Name.** It is called in Greek & Latin: In Latin, Blitum; and in English, Blites. Yet Parkinson lays, that none of the Ancients have made any mention of them.

II. **The Kinds.** There are two principal Kinds, viz. 1. Blitum album, the White Blite; and this is both Majus and Minus, of which we treat in this Chapter. 2. Blitum Rubrum, The Red Blite, which is also Majus and Minus, of which in the next Chapter.

---

**Great White Blite**

---

**V. The Places.** The first is a garden plant, and grows chiefly there, but is in some places found Wild. The second is as a Weed, growing Wild, tho' also in Gardens.

VI. **The Times.** They flower and flower all the Summer long, their Seed is ripe in August and September, and grow very green even in the Winter time.

VII. **The Qualities.** The Blite, Lys Colen (lib. v. Sec. Med. Supr.) is a Pot Herb, which serves for Meat, cold and moist (in the second Degree) and Hysterick, and Solutive. Yet Parkinson, will have them to be Cold, Dry, Afflicting or Binding.

VIII. **The Specification.** They are peculiar against fluxes and Diarrheas of the Womb.

IX. **The Preparations.** You may have thereof, 1. A Liquid Juice. 2. An Essence. 3. A Decotion in Winter. 4. A Syrup.

---

The Virtues.

X. **The Liquid Juice.** Taken to five or six ounces in a Glass of Wine, it purges by force, makes the Belly solvable, and cools the Bowels; but sometimes it over turns the Stomach, and cleanceth it by vomiting.

XI. **The Essence.** It does the same thing with the Juice, but with less detriment to the Stomach; and being taken Morning and Evening from two ounces to three, or four, it flows the Waters in Women, and makes a Corrode in Men, Universals being premised.

XII. **The Decotion in Winter.** This is yet left clyster HEALTH to the Stomach, and has the Virtues of the Essence; but not altogether so powerful; and may be taken without any danger by a Woman with Child.

XIII. **The Syrup.** It is not only Hysterick, but Pectoral also; it cleanseth the Womb, Breast, Stomachs, and Lungs, or Spleen, and Vitious or Tarruous Matter, called Croup, and taken for some time, helps Affluence, and thorns of Breath.
CHAP. LXXXI.

BLITES Red.

I. The Name. It is called in Latin, Blitum Rubrum, and in English, the Red Blite.

II. The Kinds. There are two Species of it: 1. Blitum minus Rubrum, Blitum Rubrum Hortense, the greater Red Blite, or Garden Red Blite. 2. Blitum minus Rubrum, Blitum Rubrum Sylvaticum, the lesser Red Blite, or Wild Red Blite.

III. The Description. The first is almost exactly like the Great White Blite described in the former Chapter, except that the Stalks, and Leaves, and also the rest of the Plant are reddish, and reddish mixed with a dark green color, and in all other respects they seem to be like.

IV. The second, lesser, or Wild Blite, is almost like to the Wild White Blite, differing that in this, the Stalks and Branches trail upon the ground, and are reddish, like the former for their color; the Seed is small and clustering together, green of color, and almost like unto the Seed of Coronopus Ruckii, or Buck's-horn.

V. The third Kind differs little from the first, since that the Leaves are longer, and it is much fuller of Seed, and with a multiplicity of spiky heads.

VI. The Places. The first or Greater is a Garden Plant, and a Pot-herb: the other grows Wild, but for the most part in Gardens, and is taken for a Weed: but it is sometimes found Wild in other places.

VII. The Times. They Flower all the Summer long, and their Seed is ripe in August and September, and keep alive in Winter also.

VIII. The Qualities. They are cold and dry in the second Degree, Astringent, Hypotrochick, and Solutive.

IX. The Specification. They are peculiar to stop the Terms in Women.

The Virtues.

XI. They are exactly the same with those Preparations in the former Chapter, only, that whereas those are peculiar for stopping the Whites in Women, and Gonorrheas, these are peculiar for stopping their Courses when they overflow, and are also of great use to stop other Fluxes of Blood in either Sex.

CHAP.

Chap. 82. English Herbs.

| I. The Name. It is called in Greek, Heparick, and in Latin, Borago. 
| II. The Description. It grows chiefly in Gardens, as a Pot-herb, almost throughout the Kingdom. But Parkinson says, it is sometimes found growing wild.
| III. The Properties. It is of a hot nature, and is of a bitter taste, which is the most remarkable property of this herb.
| IV. The Uses. It is of great service in the treatment of several diseases, especially in the cure of fevers.

"The Virtues."

VI. The Virtues. It is of great service in the treatment of several diseases, especially in the cure of fevers.

VII. The Uses. It is of great service in the treatment of several diseases, especially in the cure of fevers.

VIII. The Preparations. It may be made into a liquid, as a Syrup, or a Tincture, which are very useful in many diseases.

IX. The Liquid Juice. It takes from one ounce to four, either alone or mixed with wine, or by the exterior use in the form of a poultice.

X. The Tincture. It is of great service in the treatment of several diseases, especially in the cure of fevers.

XI. The Syrup. It is of great service in the treatment of several diseases, especially in the cure of fevers.

XII. The Acrid Tincture. It is of great service in the treatment of several diseases, especially in the cure of fevers.

XIII. The Acid Tincture. It is of great service in the treatment of several diseases, especially in the cure of fevers.

XIV. The Saline Tincture. It is of great service in the treatment of several diseases, especially in the cure of fevers.

XV. The Balsam. It is of great service in the treatment of several diseases, especially in the cure of fevers.

XVI. The Cataplasm. It is of great service in the treatment of several diseases, especially in the cure of fevers.

XVII. The Poeder. It is of great service in the treatment of several diseases, especially in the cure of fevers.

Salmon's Herbal. Lib. I.

...thought came our name Borage, by the alteration of one Letter; but this name is too be found in any of the Ancient Writers: In English, we call it Borage.

II. The Kinds. There are several Kinds hereof: as 1. Borage Vulgaris, Borage Hortense, Mercurialis Garden, Common Garden Borage with Blow flowers. 2. Borago flore albo, Borage with a White Flower. 3. Borago semper Vivens, Everliving Borage.

Roragge.

III. The Definition. It has a Root, thicker and shorter than that of Bugloss, something blackish without, and white within, possessing after Seed time, but after again of its own growing, in the Spring of the Year. The Leaves are broader, thicker, greener, rougher, and more crumpled than are the Leaves of Bugloss. The Stalks hereof are not so high, but branched out into many parts, wherein stand larger Flowers, and more pointed at the end than Bugloss, and of a paler blue color for the most part, yet sometimes the Flowers are reddish, each Flower consisting of five Leaves, standing in a round white hairy black, divided into five parts, or stamens, in the middle of the flower green forth a number of star black Threads, standing out, pointed at the end, and broad at the bottom, which being puff away, there succeeds several roundish black Seeds.

IV. Borago heribus albis, Borage with white flowers, is a plant like to the other in all respects, except the color of the flowers, for as they are perfectly blue, these are purely white, and in this particular the difference only consists.

V. The Everliving Borage, has Roots black, thicker than either of the former, and more spreading, not dying in the Winter, but yielding green Leaves all the Winter long. It has very many broad Leaves, rough and hairy, more resembling Comfrey than Borage, yet not so large as either, or a black, dark, green color, among which rise up stiff hairy Stalks, but not so high as those of our Common Garden Borage, upon which do grow many small, fair, blue Flowers, very like to the Flowers of Bugloss for the form, and of Borage for the color: There are Buds, Flowers, and Seed, all at once, for which reason it is called Everlasting, and that very properly, because it not only yields both Summer and Winter, but it yields without Study, Flowers, and Seed, ripe and unripe together, by which it wonderfully increases.

VI. The Flower. The full is common in almost all Gardens: The second and third are not so common, but they grow with us in Gardens, as easily as the former.

VII. The Flower. They Flower throughout all the Summer Months, till the Autumn is well past, and their Seed ripens in the mean season.

VIII. The Qualities. They are Temperate in respect of heat and cold, and moist in the part. They are, in due Degrees, inebriating, Emollient, Cordial, alterative, and diaphoretic.

IX. The Speciation. They wonderfully cheer the Heart, expelling Stomachs and Melancholy, according to the Vertue.

Studios, Leprose, Tubialis, Timidis, Furiosis, Diēt Borago, gando semper ago.

Purifies Sanguisignium, Cor dehiscit. It purifies the Blood, and makes the Heart merry.

X. The Preparations. You may have these tisanes:
1. A liquid Juice.
2. An Essence. 3. A Diffused Water of the whole Flower.

The Virtues.

XI. The liquid Juice. It effectually purifies the Blood, and is of excellent use in all Poisons, Maligines, Spotted and Pestilential Fevers, to defend the Heart from their Poison and Malady, and to expel the same, as also the Poison or other Stomachs. It cools, opens Obstructions, clears the Blood and Humors, and is effectual in the cure of the Yellow Jaundice. Dole from three to eight spoomills or more, in Wine, or mixed with the Diffused Water, or in some other fit Vehicle, two or three times a day.

XII. The Essence. It has all the Virtues of the former, more excited, and therefore more powerfully and effectually cheers the Heart, and expels Melancholy. It is an excellent Cordial, to revive the Spirits, freshens Nature, is good against Coughing and Swooning Fits, and other Pains of the Heart, and relieves such as have been long wailing in a Consumptive. It may be given in doses to four or six ounces at a time, and that two or three times a day, in Wine, or some other fit Vehicle, and it may be given to make a fresh Syrup of Borage. This Essence is Thymatick, and contributes very much towards the curing of Wounds, or old Burning Ulcers, and all such, in Bodies of an ill habit.

XIII. The Diffused Water. It has the Virtues of the former, but nothing near so powerful, but it may be used as a Vehicle to convey the other things in.

XIV. The Syrup. It is of the Nature of the Essence, tho' not so Strong and Lufitual; it is Cordial, opens Obstructions of the Bött and Lungs, helps Coughs, Colds, Wheezings, Asthmias, Throat- and Breaths, and mixt with Juice of Fumitory, it cooks and cleanses the Blood, and is profitably against the Yellow Jaundice. Dole two ounces.

XV. The Infusion of the Herb in Wine. It is very feebly and admirably recreates the Spirits, and gratifies or pleases the Stomach, is good against the Cardinal Fallon, and Melancholy, and is prevalent against the Falling-Bloods: If it be a strong Infusion,
It is good against redness and inflammation of the Eyes, they being washed therewith.

XVI. The Confect of the Flowers. They are chiefly used as a Cordial Sweet-meat, and to restore such as have been long in a Contemplation, being often taken with new Cows Milk, or, such as is warm from the Cow, and in which the heat is preserved all day, by the help of the heat of a Sand Furnace.

XVIII. The Acid Tincture. It is an admirable Stomachick and Cordial, refires the languishing Stomach, and eases of a good Appetite: it prevails against the Scourgy, Pneumonia and Gonorrhea; removes Sickness at Heart, and from a vehement and preternatural Vomiting. If used as a Gargle, by mixing it with some of the Distilled Water and Syrop, it cures Canker, and Ulcers of the Mouth and Throat, and allays inflammations of the Tongue. This Tincture is a notable thing against all burning, malign, purd, and pestiferal Fevers, and profligates even the Plague itself; for it immediately allays the violence of the heat, quiets the thirst, refires the putridity of the Humors, and profligates the Plague of the Very Pestilence itself. It cools, opens Obstructions, and relieves the Diffusate of the Blood and Humors, beyond many other more Specifics, and much Celebrated Medicaments.

XVIII. The Balm. It is an excellent Venerable; it cleanses old Ulcers, and other Purulend and Running Sores, and heals green Wounds to a miracle; I commended it by Experience to my Countrymen.

XIX. The Aefic. If they be boiled in Mead or Honeyed Water, it will be a Gargle for the curing inflammations of the Throat and Tongue, Ulcers of the Mouth, &c. And if they be boiled in fair water, and that water mixed with Juice of Fumitory, it will make a Lotion against Seabs, Itch, Tettars, Ringworms, Scurf, Morphil, and other breakings out, and inflaming the eyes.

XX. The Spirits. It is made of the Juice of the Plant, fermented with Honey, Sugar, Meloloff, or Leave, and then Distilled in a Alembick. It is a great Cordial, much exciting the Spirit of Wine to the Blood and Sotions: it heals the Spirits, recreates Nature, and makes Merry, proftigates heart and stomach; cures of Melancholy, Difeoe, Drunken, or two, four Drunken, alone, or dulcified, otherwise to be mixed with a Grains of Wine.

CHAP. LXXXIV.

BROOM Common.

The Broom. Here we have two kinds, which we shall take notice of in this Book: 1. The English Broom. 2. The Spanish. The English Broom is twofold, viz. 1. Scoparia, or Gentiana vulgaris, our Common Field or Heath Broom. 2. Genista, Chamaemelum Dwarf Broom. Gerard calls it, Chamaemelum Anglicum.

Common Broom.
also found in Hungary: about thirty Years since as I was a walking, I found it in some Waffle and Barren Grounds about Low-Laying near London: This is supposed to be Commonfly in Hungarian Panomasia Tartarica.

VI. The Times. They Flower sometime earlier, sometimes later in the Summer Months, as in June and July, to the end of August, and the Seed ripens in the main fall.

VII. The Qualities. They are both hot and dry in the second Degree, and fail to be of one and the same, and equal Virtues: They are Aperitive, Abberitive, Diureticke, and Troulturmicke and Vulnerarvm, Hepaticke, Spleneticke, Hyftericke, Nephriticke, Architick, and Altemative: but the Seed some say is Catharticke.

VIII. The Specification. It is of peculiar use against the Dropple, Jaundice, Gout, and Kings-Evil, as also Diftempers of the Reins and Bladder.

The Virtues.

X. The distilled Water. Whether it is made of the Flowers, or of the green Branches, or both, it is said to be good against Scurvy, and taken with equal quantities of the Jeffery Current Water, and the Patient laid down to Sweat upon it, it is said to alter the Flies of Agues. It is a good Vehicle for all of the following Preparations.

XI. The Decotion in Wine. It is good against the Dropple, Jaundice and Gout, and to cleanse the Reins, Uretters, and Bladder, of Sand, Gravel, and other Tartareous matter.

XII. The Liquid Juice, made of the young Branches, and flowery Heads. It purges downwards Phlegm and Watry Humors, and therefore is good for fight as have the Dropple, more especially if it is used with White Port, or Rhemf Wine: but possibly in some other cases it may be better used with Water. It is profitable against the Gout and Sciatica, and other pains of the Joints and Limbs. It eaves pains in the Sides, and is good against Tumors of the Spleen. It cleanses the Reins, Uretters, and Bladder, of Stones, Sand, and Gravel, or any Tartareous Matter Outstraining, them, bringing forth the offending Matter by Urine, which it admirably provokes. Dole three, four, or fix t'once in Wine, twice or thrice a day, as you see need requires.

XIII. The Infusiate Juice. The Virtues are the same with the former. Dole from 3 to 6 t'ounces: dilute it in Wine over a gentle heat, and so drink it.

XIV. The Effence. It has all the Virtues of the Liquid Juice, before enumerated: it opens Obstruc- tions of the Liver and Spleen, is good against Pains and Stitches in the Sides, difficulty of Breathing, and thorony of Breath: and as it cleanses the Reins and Urinary parts of Gravel and Stones, it is useful to speciall to remove the Cattle, as to hinder their ever breaking again. Moreover, it prevails against the Kings-Evil, and powerfully strikes at the Root of the Cattle. It opens Obstruc- tions of the Womb, and provokes the Terms in Women, where they are short: Dole five, or fix or eight t'ouncials, in White Port or Rhemf Wine.

XV. The distilled Oil. It is made from the Seed and Roots dried, as Oil of Saffron, and other like things is made. It is said to be External to Anoint with, to take away Spots, Freckles, Pimples, and other deformities of the Skin.

XVI. The Spirituous Tincture. It is a peculiar thing against the Scurvy, and to strengthen the Stomach and Bowels, whilst the Dropple is in cutting.

Dole two doses.

XVII. The Acid Tincture. It is often and long taken, it destroys the Scurvy, Dropple, and Kings-Evil in their Roots, and destroys the præternatural heat in all Burnings, Malady, and Petty-Werry Fevers. It opens Obstru-ctions of all the Vessels, and, as a wonder, performs all that the Liquid Juice or Effence can do, and with this advantage, that this may be taken where there is an extreme weakness of the Stomach, when the other things cannot. It helps throes of Breathing, and difficulty of Breathing, strengthens a weak Stomach, and causeth a good Appetite in such as loath their Food, or cannot endure to see it in their sight. Dole from a quarter to almost half a Dole, in Ale, Beer, or Wine, three, four or five times a day.

XVIII. The Only Tincture. It is good against all external Excrements, and Obstructions of the Skin, as Spots, Freckles, Lentils, Pimples, Warts, Scars, Morphew, and such other like Dicaties; eaves Pains and Aches from a cold caufe, in what part of the Body it occurs: and being taken internally from ten drops to twenty, or more, in any Diureticke Vehicle, it gives present eafe to Pains of the Back, though never so extreme, provokes Urine, takes away the heat and cauling thereof, and expells Sand, Gravel, and Tartarous Matter.

XIX. The Saline Tincture. It is good in hot Tu- mors, and all hot Excrements, and deformities of the Skin, proceeding from heat, or where they happen in hot Constitutions. Inwardly given, it powerfully provokes Urine, and therefore may be of good use in the Dropple Scurvy, to drain the water out of the whole Body. It kills small Worms in the Skin, which breed in an extravagant manner in some People, chiefly in the Forehead, Nofe and Cheek.

XX. The Syrup. If it is made of the Juice, it has the Virtues of the Juice, and Effence, but not full out fo powerful; however it is better for Children, Ladies, and such as are Queale Stomached: It purges gently the Caloric exccedings from the Recumens of Humors. Dole two ounces or four in a Glass of Port Wine: It is a singular thing against the Drop- ple Scurvy, and Kings-Evil.

XXI. The Fixed Sal. It is made of the Ashes by Elixiviation in Water, being drunk daily in Ale, Beer, or Wine, it is said alone to cure the Dropple, and to be a Specificke for the same. Dole from a dram to half a dram, in every good draught of Ale, Beer, or Wine. And to be taken in White or Rhe- msh Wine, it is not only a Specificke against the Dropple, but as Authors say, it curseth the Green- fields also: however it is not to be used in such a great a quantity, lest it should by its vehement aper- tive and aftertive Qualities, fret or hurt the Bowels, but it may be given in the Liquid Juice or Effence, whereby it expels their Virtues, and makes them the more powerful to all the intentions they are proposed for.

XXII. The Powder of the Leaves and Seed. Take a dram, or dram half, in plain, in Beer or Wine, it purges downwards Cold, Phlegmatick, and Watry Humors, expells the Water in Dropplies, helps the Gout and Sciatica, and by a cocontual use thereof in Wine,
Wine, it cures the Black Jaundice, and preserves from the Gout and Stone.

XXIII. The Conference of the Flowers. Made with Sugar or Honey, and then eaten, it walls and diverts the Humours which feed the King-Evil.

XXIV. The Old. It is made of the young Branches and Flowers, boiled in Oil, till they are Chrip, &c. It is a fire and fire Medicament to kill Lion, Nits, and other Vermin, in the Head or Body, and being applied to the Scabitas, it helps it.

XXV. The Ointment. It is made of the young Branches bruised, and the Flowers, by boiling them in Oil, adding Sheep’s Suet and Wax to bring it to a Body, &c. This being applied to Sides painted, or where Stitches are, or to the Spleen, eases the pain, and removes it at twice or thrice using.

XXVI. The Balsam. It is made of the young Twigs and Flowers, &c. being applied to Green Wounds, or foul, running, and purulat Ulcers, it cleanses, incamas, and heals them in a very short time. The same will be done by a Balsam made of the Liquid Juice and Turpentine, boiled to a thickness, adding a little Oil and Wax.

XXVII. Genitalia. It is made by boiling the Liquid Juice and Honey to a thickness. It cures green Wounds precociously. It also cleanses old, running, and purulat Ulcers, fills them with Heat, and heals them. And apply’d to Kibes in the Feet, with powder of Sandmony, it cures them in a very short time.

XXVIII. The Cataplasm. It is to be made of the tender Tops and Flowers, beaten till they become a Minc in a Wooden Mortar. Being applied, it is said to help the bitings of Serpents, and other Venomous Creatures.

XXIX. The Pickle. The young Buds of the Flowers are usually Pickled; and they make an excellent Sallet for the Winter time, but it is of use thro’ the whole Year; it excites the Appetite, causes a good Digestion, opens Obstructions of the Liver, Spleen and Reins, and provokes Urine.

CHAP. LXXXV.

BROOCH Spanijb.

I. The Names. It is called in Greek Ελήμον, in Latin, Spartium, and Spartum Hispamum; and in English, Spanish Broom.

II. The Kinds. There are, 1. Spartum Hispamum, and Spartum Hispamum frutez (to distinguish it from the Sedge or Rush, that is so called) Spartum Graecum, Genii Hispamum, and Spartum Hispamum vulgaris, Common Spanish Broom.

III. The Description. The first of these has a tough, woody Root, spreading it self under the Earth many years, from whence rises up a stalk five or six Feet high, with a woody Stock below, covered with a dark Grey, or Ash-coloured Bark, and having above mentioned, long, and slender, clefted green leaves, whereof, in the beginning of the Year, are set many small, long, green Leaves, which abide not long, but fall away when the Plant comes to flower. Towards the tops of these Branches, or Twigs grow the Flowers, fashioned like unto Broom Flowers, but larger as yellow as they, and smelling as well, after which come small, long, round, yellowish red Coils, crafted at the back, whereof it is obtained blackish fair Seed, fashioned very like unto the Kidney Bean, but the Coils (for Gerard) rarely contain more than one Seed, seldom two.

IV. Spartum Hispamum major bore albo. The greater White Broided Spanish Broom, has a Root like the former, from whence grows up a Stem much higher than the yellow, even to five or six Feet high, whose Branches are more tough, are to be had, and compact, than the former, or that following, being Q. 2 small.
Small Leaves on them like the others, and as soon fading; the Flowers also stand upon long Stalks, and are like the others, for form, but larger, and of a White color; and of little or no smell; which being past away, there come small round Pods or Cods, like the others, but smaller, each one containing, for the most part, but one Seed, something less than the others also.

V. The third Kind, or Pseudofpartum Brote Luteo, is a smaller Spanish Broom, which has also a hard, tough, sandy Root, from whence grows a Stem or Stalk of the biggest of those Thumb at bottom, and grows to be about two feet high, whose bark is rough, and broken all along, sending forth many green, slender, pliant Branches, which divide themselves again into many other smaller Twigs, whereby for a while after they are fort forth, abide a few small Leaves, until they begin to shoot out Flowers, and then fall away, leaving the Branches naked, and without Leaves all the rest of the Year after; from the Sides and Joints of the smaller Twigs, shoot forth small long Stalks, bearing many Flowers, smaller and yellower than the former Spinaria, without any Scents for the most part; after which come small round skinny Cods, containing for the most part but one Seed in them, and fashioned somewhat like unto the Kidney Bean, which when they are ripe, will by the flashing of the Wind, make a noise in their Pods.

VI. The Places. They all grow in Spain, Italy, France, and other Southern Countries; but the first of them grows with us in Gardens, only, as an Ornament, says Purtinjung, among other delightful Plants, to please the Smiles of Seeing and Smelling.

VII. The Times. The first and second Flowers in April and May, and beginning of June, the third Flowers in February; and their Seed is ripe before Winter; the first, which grows in our Gardens, its Seed is not ripe till very late in the Year.

VIII. The Qualities, Specification, Preparations, Virtues and Uses, are the same in all respects with English Broom, excepting, that these Spanish Brooms are stronger in operation, and more effectual to the purposes intended, in so much, that being given inwardly in many of their Preparations as the English, they not only work downwards, butclese the Stomach and Body by Vomiting also: this being well, we shall lay no more of them here, but refer you to the former Chapter.

CHAP. LXXXVI.
BROOM Rape.

T. H. E Name. It is called in Greek Ακόρινχο, in Latin, Ostroechus, Cynia Leonis; Chelus calls it Hemodoron, as Theophrastus, Lib. & cap. 6. or Lemondora, as others have it: and in English, it is called Broom-Rape.

II. The Kinds. Of this Broom-Rape there are several Kinds, as, 1. That which proceeds from the Roots of the English-Broom. 2. That which proceeds from the Roots of the Spanish Broom. 3. That which proceeds from the Brooms Weeds: all these have but one Definition, though arising from the Roots of those several Plants. Libus and Chelus make other Varieties. 1. That which has longer and smaller Flowers than the other, or common sort has. 2. That which has larger Flowers, and those of a yellowish color, and is sometimes found among Corn. 3. That which is parted towards the Top into several Branches, whose Flowers are either Bows, Purple or White, and is sometimes found amongst Hemp.

III. The Description. Broom-Rape has a bulbous Root, or a Root round and fatty, which adheres or grows unto the Roots of Broom, big or large below, and smaller above, covered with blackish Scales, and of a yellowish Pulp within; from this Root does rise up a Stalk of the biggest of a Finger or Thumb, and about a foot long, sometimes a Foot, or two Feet high, which has a flow of Leaves on it, and many Flowers about the Top of it, somewhat rotundish, alm
most like to those of dead Nestles; or something resembling the flowers of Orchis, but larger, and of a dark yellow color, as the Stalks and Leaves after which given forth long, thick and round stalks, in which are contained very many Seeds, yet good for nothing, but Parkin's says, it perfects without Seeds.

IV. The Places. Gerard says, that Brown-Rape is not to be found anywhere but where Brown grows. It may be found in a Brown-field at the foot of Shooters-hill next London; upon Hemphill's Heath, and in several other places. But Parkin says, it grows more often where no Brown grows, viz: by Fields and Hedge sides, and upon Heath's; and other Authors lay, in Corn-fields and Hemp-lands.

V. The Times. It rises up and appears, and is in its chief perfection in the Month of June.

VI. The Qualities. It is Temperate in respect to Heat or Cold, Dryness or Moisture, Aperitive, Alterative, Diuretic, and Vulnerary, Hepatic, Nephritic, and Alterative.

VII. The Specifics. Its peculiar property is to provoke Urine, and help the Strangury.

The Virtues.

IX. The liquid Juice. It is an extraordinary thing to cure not only green Wounds, but also running Sores, old, filthy, running Ulcers, and malignant breakings out whatsoever.

X. The Effence. It is thought to be as effectual in opening Obstructions of the Renis, Ureters and Bladder, provoking Urine, and expelling Sand, Gravel, Stones, or any Vitreous, Tartarous or Slime Matter out of the Urinary passages, as Brown it self.

Dose three or four ounces at a time, Morning and Evening, in a glass of White Wine.

XI. The Decoction. It has the Virtues of the Effence, but not all so powerful.

XII. The Infalated Oil. It ought to be made of four or five repeated Infusions of the top Stalks with the Flowers, firmly spread and cleared. It is said to cleanse the Skin of all manner of Spos, Freckles, Lentils, Sun-burnings, Tumors, and other like deformities which rise through heat of the Sun, or supernumerary of malignant Humors.

XIII. The Balm. It is cleansing, incipient, and healing, and therefore beneficial against all forts of old, putrid, malignant, and running Sores and Ulcers: It heals Wounds admirably, and conglutinates their Lips in a very short time.

XIV. The Cataplasm. It is good against Burns and Scaldings, cattle Palf, discouls Swellings and Compressions, where the Skin is not broken, and allows hard Tumors.

III. This Plant has lain in the Dark for many Ages, ever since the Times of the Ancient Romans, to whom it was well known, and by whom it was much used, as Abicon, Deficeris, Play, Galun, Aquatia, Aerv, Orleus, and others, telling, whereby it is manifest, that in ancient times it was famous for its cures, which it performed in the Roman Armies, which in Britain and the Latin Countries, they inhabited under, being chiefly the Svarry, or Scoubrick Diptemps, as Daborad's, or Fluxes of the Bowels, Pals or Aches, Lordfeck of Teeth, &c, for which refton Claudius Cesar carried it along with him to Rome, ordering it to be spread upon the Pages of his Triumph, and to be hung up in the Capitol, and New hamlet took care of it afterwards for its Culture, by casting it to be Norton up in the Garden of Rome. But it seems when the Goths, and other Barbarous Nations over-run the Roman Empire, and the greatest part of Christendom, destroying and rooting up every thing they came near, that this Plant was buried or lost, in that Universal Destruction of almost all things, and
and has lain forgotten for above eight hundred years, till our Author discovered it anew.

IV. The name of this Plant, Britannica, came not, says Manning, from the Island of that Name, but is borrowed from the fourth book of the English Language, Beti identifying Confudores, vel formas, Tun, Denr, and to, things going forth, which, as much as to say, to fetch lief Teeth, the lodofh of the Teeth and Gums being one of the Grand Symptoms of the Scurvy. But by that great Man's labour, we can give little credit to that form, which is always a thing known, that the pride of the Ancient Romans was too great to invent, or investigate any thing whatsoever with a Latin Name, whole Etymology should arise from the unqualified Particles or Words of Barbarous Authors: Without doubt the Romans had no regard in England or Britannia in great plenty, tho' afterwards they might find it in Friesland, and other places of the Low Countries, gave it the Denomination from one of the Country they first found it in, and so called it Britannica, or Benfia Britannicas, and this is that which I adhere to, and read there.

V. All the Botanists of the last five or seven hundred years, knew nothing at all of it: indeed they have named Britannica, but they never durst venture to fix it, so as to define it, or figure it in Sculpture. And according to the several Ages, several kinds of Herbs or Plants, were taken to be this Plane of ours, as, Bifloria, Benorina, Benockangia, aquatica, Bugle, Calcidora, Hepatagyllon, Plantago, apanitis, funnelis varis, Tormentella, Veronicas, and several others; all which were falsely, in their several Ages, laid to be the Britannica of the Ancients, and the two famous Bathers, who spent their whole time in the Botanic Study, made it a great mistake, to us to take Collectrea, or a Fort of Snake-meet for it; And Cambdole makes our English Herbs into a Scurvy, that Scurvy grass was the true Britannica Plinia, than which nothing is more remote: with doubt this our Hydrocephalum nigrum, is the genuine or true Britannica of the Ancients, its description agreeing exactly in every particular with their descriptions, and performing every thing, and more than they ascribed to it.

VI. The Description. The Graft of this, which is an European or English kind, but a Taberous Root, large and roundish, sending forth from it almost round about, several Arms or Branches, of a coniferous white Colour, altogether of one kind or yellow, and ill stopt: From this Root, rises up several Leaves pretty large, not much unlike those of the largest Dock, but every way broader and longer, growing upright, and sharp pointed, sometimes of a blackish green, sometimes of a purplish green, and sometimes of a yellowish green color, sometimes stopt, and sometimes not. From the midst of these Leaves rises up, one pretty large Stalk, sometimes three or four feet high, of the spongy and color of an ordinary Dock, except that sometimes it is inclining to a reddish green, it has a kind of points, whence springing forth Leaves like the former, but much lighter and from the same place it sends forth manifold Branches, not much unlike to the Common Water Dock, but more numerous, larger, and higher. The Branches grow all over these Branches, almost from their very beginning, up every one, their several Tops, in a kind of Wife or Hack, each set upon a similar slender, short stalks, and of a brownish color, being stopt, the Seed is contained in Chaffy Focks, not much unlike to other Dock Seed, especially that of the Water Dock.

VII. The American or Virginian Britannia has a Root confiding of a Head thick and greasy, but not of a round taberous body like the former, from which Head grows downward into the Earth, several Arms or Branches, which are thick, brownish without, and yellowish within: from this Root rises up one upright South of several feet high, which has long, broad Leaves upon it, long and large Leaves, strong and hard, not much unlike to Blake Rhubarb, but that these are much longer. The Stalk is very like that of other Dock's, rises up often times to a considerable height, about the middle of which it sends forth a great number of Branches, which is unlike the European, which have fewer from Leaves, like the others upon them, but much less. The Flowers grow in soft numbers upon each single branch, and each upon a small short Forks, even from their beginning up to their very tops, set in Places at certain distances, in a seeming Uniform manner: After the Flowers are full grown, the Seed comes, which is contained in a Chaffy Dock like the first, and differs not much from it, neither in shape, nor color, nor maginitude.

VIII. The Places. It commonly grows in Marshy and Fen Grounds, banks of Ditches, and moit Places, and in Isles of Ditches, and water Lakes which are between the Land Ground and Fen Grounds in several parts of this Kingdom: I found some of it in the Borders of the Fens in Cambridge, one near and Dantongery, and in other moit and watery places. It grows plentiful also in Friesland, Everijet, Gelderland, and Holland, and profibly in many other places in the Low Countries.

IX. The Times. It flowers forth its Leaves in April, its Flowers in the latter end of May, or beginning of June; and its Seed is ripe in August, The Root is to be gathered in the beginning of the Summer, or in Autumn, viz. in March or September, the Leaves and Flowers in June and July; and the Seed in the latter end of August, or beginning of the next Month.

X. The Qualities. It is temperate in respect of heat or cold, but little in the latter end of the second Degree. It is Aftingean, Aperitive, Digestive, and Traumatick, Stomachick, Hepatick, Hydriack, Arthriticck and Alterative.

XI. The Specifikation. It is peculiar for the curing the Scurvy, and all sorts of Fluxes of what kind, fever, and Attaining Saws, it is a Specifick against Poiens and Convulsion.

* The Virtues.

XIII. The liquid Juice. Given to five or six poorents, or more, either by it self, or mixt with Red Port Wine, it strengthens and confirms the Stomach and Bowels, and powerfully relieves the Scurvy in all its appearances, viz with all its Symptoms, as Ulcers and Canker in the Mouth,-abortion of the Teeth, wandering pains, weaknesses and infirmities at Stomach, &c. It is good against all manner of Fluxes whatsoever, as Dianthae, Dysenteries, Leuceraies, Hepatick Fluxes, overflowing at the Term in Women, &c. It is to be taken Morning and Evening for some time.

XIV. The Effuence. It has all the former Virtues, besides which, it is used to cure Pleuritics, Quiilities, the Hemorrhoids, and all sorts of inflammations, and is very powerful and successful in the cure of Hydrophobic Difterences, more especially if it is impregnated with the Fixed Salt of the same Plant. It is also an extraordinary Traumatick, to take the curing of Wounds and old Ulcers, being taken Mon-
The English Herbs.

Chap. 88.

Brooklime.

I. The Name. It is called in Greek, Anagallis; in Latin, Anagallis aquatica, and Beckwithia (from the German word) and in English, Brooklime, and Water Pimpernel.

II. The Kinds. There are several Kinds of this Plant, as, 1. Anagallis aquatica vulgaris, Beckwithia, as Parkinson calls it, Common Brooklime, which Mr. Roy calls Anagallis relutans Veronica aquatica minor, folio oblonga, flore carinato, as J. Basbin. 2. Anagallis relutans Veronica aquatica folio rotundato-oblongo, Beckwithia major, the greater Brooklime, and greater round-leaved Brooklime. 3. Anagallis aquatica major folio oblongo.

III. The Description. Our Vulgar Brooklime has a Root white, flat, and creeping, with fine fibres springing therefrom at every joint; from whence arise six flat, thick Stalks, which are round, and divided.

It is an excellent Traumatick, and Antifcorbutick, and prevails against spitting and pilling of Blood, and all other Fluxes of Blood what ever.

XVI. The Spiritus Vapores. It has all the Virtues of the Juice and Essence, being strong and good against the Scour in a cold and moist habit of Body, a very great vamatick, strengthening that Vitals in all its faculties: It is a kind of Panacea, and a Specifick, against Convulsion, and Poison, yes the Plague it self; it stops all sorts of Fluxes, and strengthens the Viscera to a Miracle: but if (as also the other Preparations) ought not to be given to Convulsive Bodies, by reason of their Affections.

XVII. The Spirit. It is made of the Juice by Fermentation: and is used (being dulced) as a Cordial Antifcorbutick, and to comfort and strengthen the Bowels in Hydropick and Contumative Perons, and such as have been in long Fluxes: being held in the Mouth, it strengthens the Gums, and relieves Toothache. Dose from half an ounce to an ounce twice a day, or upon any Existing or Vile Disease.

XVIII. The Balsam, or Ointment. It cleanses, incanates, and heals singularly well: it cures Green Wounds at two or three times dreelling, by reason of its Syrupcity. Applied to the Hemorrhoids, and the Gout, it eases the pains of those Parts.

XIX. The Fixed Salt. It is singular against Quinsies, Pleurisies, and other Inflammations of the Viscera, opens Obstructions of the Reins, provokes Urine, and absores the Aeds Humor, which is the cause of Fluxes of the Bowels: it also helps to carry off the Watry Humor in Dropifies. Dose from fifteen to thirty grains, in any Homogene Liquor, Decoction, &c., proper against the same Diseases, two or three times a day.

XX. The Powder of the Root. It may be given from half a dram to two drams, Morning and Night, in any Flux of the Bowels, whether Simple or Bloody: it is also good against the Tumors in Women, spitting and pilling of Blood, or any weakness of these Parts: it strengthens the Stomach and reliefs Vomiting. It may be given in Fort Wine, or other Vehicle proper against the Dilemper. Serrated upon moss and running Ulcers, it dries up the Humor, and dispites them to heal.

XXI. The American has the same Qualities, Specification, Preparations, Virtues and Uses with the former.
Salmon's Herbal.

Lib. I.

The Virtues. 

XII. The Distilled Water from the whole Plant. It is good against Stone and gravel in the Reins, Ureters, and Bladder, opens Obstructions of the Urinary Passages, and is used as a Vehicle, to convey the other Preparations of the Herb in. Dose five or six ounces twice or thrice a day.

XIII. The Spirit. It is made as Spirit of Scurvy-grass. It is good for a weak Stomach, relieves Cramp, and removes Nephritick stone. It strengthens the Body, and gives new strength and heart. It is a very effectual thing against the Scourvy, which the Greeks call the Stomach Difficilis, as having its Root and Foundation there. Dose: thing or half drops in Wine, or some other proper Vehicle, Morning and Evening chiefly, but it may be given at other times of the Day upon any occasion of Stomachick fevers. It is an excellent thing in cases of Conflufions, but such as are of a hot habit of Body are to forbear it.

XIV. The liquid Juice. It is said to be effectual to break the Stone in Reins and Bladder (it made of a gritty friable substance) and to expel it, for it opens all the Urinary Passages, and powerfully provokes Urine, giving ease in the Scrammery, Diuretik, and other like afeßections of tho' parts. Dose from two to four spoonsfuls of Spirituous Filth in a Glass of Ale, Beer, Mead, or Wine.

XV. The Essence. It has all the Virtues of the Liquid Juice, besides which it is profitable against Ulcers of the Bladder, to provoke the Terms in Women, and expel the Dead Child. It is a figured thing against the Dropflie Scurvy, if it is impregnated with the Fixed Salt of the Plant, and be daily given in all the Liquor the Parish, drinks. It purifies, or cleanseth the Blood from all ill humors, and perfectly eradicates the Scourvy in a cold habit of Body, Universals being also promised. It is best taken in the Spring time, and Fall of the Leaf, because then the Blood and Humors are thin and fluid, and more apt to puls a deperation. Dose from one spoon to three spoonfuls Morning and Evening.

XVI. The Spirituous Filth. It has the Virtues of the Spirit afterwards mentioned, at Sect. XIII. a prolonged, but much more powerful, and may be given from twenty to forty drops in any proper Spirituous Vehicle, or Cold Water.

XVII. The Acid Filth. It is a potent Anti- diarrhick, and may safely be given as well in a hot as a cold Diuretik. It powerfully opens Obstructions, provokes Urine, and the Colics, breaks and dissolves the Stone, expels Territorial Matter out of the Body, helps in Rheumatisms and the Gout, and gives ease in wanton pains running over the whole Body. Dose to many drops at a time, as may make a Glass of Ale, Beer, Mead, or Wine greatly sharp, as if the Juice of an Orange was squeezed into it.

XVIII. The Saltn Filth. This, tho' given inwardly, powerfully provokes Urine, and opens Obstructions, yet it is mostly used in outward applications, as to dissolve Swolleds in the Legs in the Dropflie, by remitting them therewith, to ease pains of the Gout, and to prevent an incipient Gunereal. It clears the skin of Scant, Mawth, and other like deflemens, if often washed therewith.

XIX. The Oil. It is good against the Paffe, and Convulsions of the Nerves, being often applied to the Palsied parts. It removes the Scars of Pains in any Part, proceeding from a cold Caufe, and being applied to most Wounds, it defends them from Accidents. Being well anointed upon any Tumor or Part inclining to a Mortification, it prevents it, and conduces much to the Care.

XX. The Fixed Salt. It is Deobstrufer and Diuretik, bringing away much Water in Hydropick Periops, and carrying off much of the Morbid- caufe of the Scourvy, by Urine, being given in White Port, or Rhumbo Wine, or some other proper Vehicle, three, four, or five times a day. Dose from fifteen grains to half a dram.

XXI. The Cataplasm. It is made of the Leaves or Herb, boiled, and beaten in a Stone or Wooden Mortar, Applied to swollen Places, or any other part Troubled with the Dropflie, it is said to affect or share the Tumor. It is made into a Cataplasm, with the addition of Horse Lard, the Vapour of Alkali-mallow Roots, and the poudres of Hogmuck fixed and Linseed, and be applied warm, it takes away any Swelling in Arms or Legs, and is also powerful in defending Wounds, so as to prevent their Apathematizing, and to prevent any other ill accident which may happen to them. Furriers sometimes use it also in curing Horsies, to remove Tumors, and heal their Sclafs, with other like Difficults incident to them.

C H A P.
Chapter 89. English Herbs.

BRYONIE White.

I. The Name. It is called in Greek "Amenitis" and in Latin, Vitis alba, not that it is a Vine, but because it is something like one. Also "Bryonia" and "Bryonia" of late, from purging tooth, because it purges many Branches and Tendrels, whereby it climbs up the adjacent Bushes, Hedges, Trees, or other things adjoining to it. It is also called by some "Rhus," because the Seeds or Grains of it were formerly used to take away Hail. In Arabic it is called "Fefre," "Fefrea," "Fefrea," and "Fefrea;" in Latin, "Bryonia," and "Bryonia alba," "Vitis" alba, "Vitis," the roots, are good for Vitre, and good for Grains; also "Vitis," "Vidalum," "Apo- fistium," "Apo-fistium." In English, "Bryonie," White Bryonie, and Wild Vine. The Wine or Berries are many times called in English, "Terter Berries," because of their Effects in curing Tereus.

II. The Kinds. There are two principal Kinds of Bryonie, 1. The Black, of which in this Chapter. 2. The Black, of which in the next. The White is also of three-fold, 1. Bryonie alba vulgaris, Vitis alba vulgaris, with all the names above mentioned. Our Common White Bryonie. 2. Bryonia alba vulgaris frutica nigra, Vitis alba bacca nigra, White Bryonie with Black Berries; which come from the Blackness of its Berries call Bryonia Nigra, and riot Nigra, but erroneously, for this is not the Black Bryonie, but a Species of the White, 3. Bryonia Dioecos of Honorius Bella. Bryonia dioeca maculata, of Bishin, Bryonia Cristata, and Cristata Dioecos, by Parkinson, White Bryonie with Double Berries.

IV. The Common White Bryonie with Black Berries, forms to be absolutely the same with the former, except that the Root of this is of a pale yellow color on the outside, and somewhat brownish on the outside, and the Berries after their growing is half, change not into a red color, but into a perfect black, when they are through ripe, but as to all other parts of the Plant, as to its leaves, tendrils, and climbing Branches, form of its Leaves, Tendrels or Claspers, and Color, Shape, Magnitude, and Mode of its Flowers, it is exactly the same with the former, so that one cannot be known from the other.

V. The Bryonie Dioecos, has a root very long, but never growing to be bigger than a Mustard's, of a brown color on the outside, and not so thick within as the common. From this Root spring forth

==BRYONIE OF WILD VINE==

Vitis alba. White Bryonie

III. The Description. The Common White Bryonie, has a Root which grows to an exceeding large-size, weighing sometimes half an hundred weight, and of the bigness of a Child of a year old, with one

ny long Branches or Arms growing from it, of a pale yellow color on the outside, and whiter within, of a firm, bitter, and wholesome taste. From this Root proceeds many long, rough, but very tender Branches at the beginning, which as they grow up, climb upon Hedges, Trees, or other Bushes adjoining to it, from these Branches come forth many very rough broad Leaves, divided into five partitions for the most part, in form very much like a Vine leaf, but smaller, rougher, and of a whitish, or busky green color, spreading very far upon Trees or bushes, or whatever it is which stands next to it: from the Joints with the Leaves come forth small Tendrels or Claspers, which round about whatever small thing it next it; at the several Joints also with the Leaves and Claspers (especially towards the base of the Branches) come forth a long Spike, bearing therein many whitish Flowers in a long Tife, as it were in a Clatter, confounding by few small Leaves opposite and open like a Star, after which come the Berries, hanging more open or separate one from another than in a Clatter of Grapes: they are green at first, but very red when they are through ripe, about the bigness of Nightshade berries, of no good or pleasing smell, and of a hardish taste prevailing to Vomit, or causing a nauseousness in the Stomach.
Salmon's Herbal. Lib. I.

many long, rough, trailing Branches, in the same manner like the former in all respects, from which falling in droops, making it self apart any thing which stands near it, as the other does. It has broad Leaves, with such divisions therein, as the other have, but that they are somewhat smaller, greener, and fringed with white fringes through the middle, at likewise in the Veins which go to the Corners. The flowers are somewhat greater than the former, of a pale yellow color, hanging every one upon a little longer footstalk, which being past, there come Berries in their places, which are at first green, but red when full ripe, and differing in form from the others, for standing Semi-circular upon the Stalks they are imbed at the bottom, as if it were a one Berry, but are parted at the top into two parts, wherein are contained two Seeds, from whence arise the Sitname of Drococils.

VI. The Place. The Leaf grows on Banks, or under Hedges where are Trees, Shrubs, or Quiddocks, in many places throughout the Kingdom. The second is found in like places, but where the former with red Berries is not, and is found in some places in Germany, Bohemia, &c. The leaf grows plentifully in Condua, from whence Honorinus Bellus sent the Seed to Chefun, and others.

VII. The Times. They all flow in the Month of July and August, some earlier, some later, according to the Climate they grow in, and the warmth or coldness of the Season of the Year, and their Fruit or Seed is ripe in some little time after.

VIII. The Qualities. They are hot and dry in the third Degree, Armatiue, Afflortive, Cephalick, Nephritic, Hyfterick, Hyperbatic, and Cathartick, purging as well Choler as Plegem, and Watry Humors.

IX. The Specification. It is a peculiar thing a-against the Dropie, and Kings-Evil.

The Virtues.

XI. The Diffiluted Water of the whole Plant. It is good against Scurf, Morpheous, Lepofpica, Managins, Scabs, Tumours, Tumours, Sunne, Cancer, &c. The Face, and Skin being often waffed therewith.

XII. The Juice of the Berries. It has all the same Virtues, but is much stronger, and is said to be a peculiar thing for the cure of Tettan and King- worms, Herpes, Scabs, Ich, and other breakings out.

XIII. The Juice of the Root. It is thus Made. Take in April away the Earth, and uncover the Root, which done, make a deep but narrow wartwoart cut or gulf into it, and put under Goose Quill a little under the Hilt, letting the Quill be hinging or leaning downwards, when thrust into the Root, but let it be made a hole with your Knife to get in the Quill, then placing a Receiver under the Quill, you will get a great flow of the Juice, which will drop or run upon the Mother. A spurious hereof taken from thence is made by tainting of their Mothe, it helps them, and it is likewise profitable against the Apoplexy, Epilepsy, Puffes, Vertege, and other Eke Ulcers of the whole Body, and Brain, which it performs by a Spectick Virtue, which it has in attracting or drawing away Fluxes, and Rheumatick Humors which oppress and afflict those parts. It may be also used in the Throat, and in the Head it will so way also it purges the Head and Brain admirably, evacuating all such Superfiances Humors, which cause Lebbings, Megmas, Head-ach, or any of the aforesaid maladies. It is not without great effect, and it may also be used against the Head and Brain, and Brain in the Stomach.

XIV. The Efficace. It has all the Virtues of the aforementioned Juice, and may be given from half an ounce to an ounce, more or less, according to the age and strength of the Patient. It is a peculiar thing against the Dropie, Kings-Evil, Rheumatick, and Gout, but it purges with great Violence, troubling the Stomach, so that it works both upwards and downwards, and therefore according to the Opinion of Authors, it ought to be conconnected with Ginger, Cinnamon, Winter's Cinnamon, Nutmegs, Cloves, Pepper, Juice of Quinces, &c. It is very profitable against Watry Humors, which it extraces abundantly, both by Vomit and Stool, and therefore is a peculiar thing against the Dropie. It may be mixed with White Port Wine, and it is drunk. It opens Obstructions of the Urinary parts, provokes Urine, and cleanses the Rank and Urinates from Sand, Gravel, Stone, and other Vices and Tartamorous Matters apt to be lodged in those parts. It opens Obstructions of the Splene, and takes away the hardnes and swelling thereof. It is good (being outwardly applied) to cleanse the Skin of Scurf, Morphew, Lepofpica, Scabs, Ich, Maligna, and other Ulcers, Herpes, Tettars, King-worms, Flecckles, Lentils, black and blow Spots, which come from hills, bulles, and the like, and dissolves new Swellings, and expells the Dead Child.

XV. The Decoction of the Root in Wine. It has all the Virtues of the Efficace, but not full out so powerful, and therefore ought to be given in a larger Dose, as from one ounce to two, three, or four, according to age and strength. It is an excellent thing against Hyperick Fits, and Vapors in Women, for it opens Obstructions of the womb powerfully, and facilitates the birth of Women in Travel, but you ought to be sure the time is neat, left it do mischief, let it be correced with hot Spices in the making, as before directed, because they also promote and expel the dead Child.

XVI. The Syrup. It may be made either of the Juice, Efficace, or Decoction, according to which, it will be of more or less Strength. It has all the Virtues of those things of which it is made, but not altogether so effectual, because of its being cloged with such a quantity of Honey or Sugar, which is necessary to bring it into a Syrup. But it is better to make it with Cinnamon and Cardamoms, because of its pleasantness in taking. It is good against Gouttes, Colds, Thrombus of Breath, Affamm's, and kills Worms in the Body: Dose, one, two, or three ounces in a Glass of Wine.

XVII. The Pouder of the Root. It has the Virtues of the Juice and Efficace, but is thought to work stronger: being taken in White Port Wine, from a A glass to a fashion, it is good against the lings of Venemous Creatures, and kills Worms in Children, prevails against the Gout, Rheumatick, Dropie, and Kings-Evil, and provokes the Terms in Women, but it ought not to be given to Women with Child, because it may induce miscarriage or Abortion. If it is thus compounded, it becomes a famous Medicine against Lepofpica, and also in cases of Vomiting, and Cholerae Nervorea, which is to be taken in a Pouder, or in Powder eight ounces: Syrup of Poudre, six ounces: Auerum Vina four ounces : mix all together. It is a famous thing for the cure of the Gout, Sciatica, Rheumatick, Dropie, Juclidean, and Kings-Evil. Where
Where a Rheumatism has been so vehement that the Patient has ceased his Night and Day with the Velocity and Extremity of the pain, and has lain Bedrid for two whole Years together, not being able to use Hand or Foot, or in the least help himself, nor made much as to put their Hand to their Mouth; this Medicament, or Composition, being given but five or fix times, has perfectly restored them, beyond all expectation. I commend it against a Rheumatism, as a Composition which has no equal in the whole Republick of Medicine.

XVIII. The Eulogia. 8. Powder of Bryonie Roots, four ounces: Stadium in powder. Lignaria in powder, of each two ounces: Croce, Ginger, in powder, of each one ounce: Nativin in powder, Zed-signy, of each half an ounce: Tartar vitriolique two ounces and half: Honey clarified, thirty five ounces: mix and make an Eulogia. It cures the Scoury, Droptic, and Gout; and is an admirable thing.

XIX. The 1. I 2. I 3. Pernicious. It produces the Terms in Women, and expels the Dead Child; and cleanses the Stomach, and other Bowels, of Cold, Raw, Wind, Fomites, Tartaros and Grippings: Dote, in a Bolus, from one dram to two drams in the Morning fasting.

XX. The 2. Herbs. It has the Virtues of the Juniper andINESS, but not altogether so vital, it may be given, say Authors, from five to ten grains; but in strong Bodies you may give it from ten grains to twenty: mix it with Honey, the Pulp of a Date or Roasted Apple, or some such like Substanc, and let it be taken in the Morning being mixed with the Distilled Water or Essence, or any other proper Vapours, it cleanses the Skin, and takes away Wrinkles, Prockles, Lentils, Spots, black and blew Marks, Tanning, Sun-burning, and the like; let it be laid upon the Skin, and suffered to dry on.

XXI. The Pesto. It is made of the solid Substan of the Root: being put to the Womb, it provokes the Terms in Women, opens Obstructions of the Womb, and expels both Birth and Afterbirth, as also the Dead Child.

XXII. The Saline Fluid. Taken inwardly to a dram, or more, in some proper Liqueur, it provokes the Terms, and facilitates the Birth: and outwardly applied, it removes all the Vices and Defects of the Skin, as effectually as other Essence or Fuscata. You must wash thereof, and litter it to dry on, repeating it several times a day, if the Disease is inveterate.

XXIII. The bath of the Root and whole Plant. It is peculiar against all external Defacements of the Skin, as also to open Obstructions of the Womb, and expels the Terms, and to cleanse it from all other Recrements of Humors, the Patient sitting for some time therein, and repeating it, if need be.

III. The Description. It has a Root which it sandy, or containing in blackish on the outside, in some places by long standing, but white within; it is large of it grows in most grounds, but much smaller and shorter, if it grows in dry, hard, and sandy places, or Ditch-champion says, sometime but, and of a sharp taste is from this Root arise long trailing Branches, without any clasping tendrils, but by reason of the full number of Branches, and their tenderness, it is taken hold of, and thus either those things which stand next to it, the easily be had thereby, contrary to other kinds. The
Salmon's Herbal. Lib. I.

Leaves are somewhat broad, and like unto the Leaves of the rough or prickly Bindweed, and terminate in a sharp point. The Vines come forth at the Joins upon long Stalks, many clustering together, in long, thin, or four-angled Shoots, each one consisting of a small white Leaf, and after they are fallen, there come in their places small Berrises, full green, and red when they are ripe, and sometimes changing a little blackish, as they grow old.

IV. The second Kind, has a great thick Root, long, and not much unlike the former, bearing a common kind of Juice: from which rises up many, long, and four-angled Branches, more hard and woody than the other, and without any Clusters at all. The Leaves are somewhat like those of the Great White Bindweed, of a flaming color, a little unworthy to be seen about the edges, and standing upon long Footstalks: towards the tops of the Stalks at the Joins, with the Leaves come forth white Flowers, every one standing on a short Stalk, which afterwards give five close Berrises, green at the first, and red when they are ripe, not much less than Cherries, in which are contained four or five somewhat larger, round, and blisters.

V. The third and last Kind, has a Root somewhat great and blackish on the outside, but of a yellowish color within, and full of a common musty Juice, which is proper to your Fingers: whence coming forth many long green Branches, on which grow several broad Leaves, somewhat long pointed, and not divided on the edges at all, of a fat or dark green color, bowing at the Joins, with the Leaves, clasping tendrels, by which it takes hold, and minds it self about any thing which stands next it: Towards the tops come forth long Branches of white-topped Flowers, which being full, there come Berrises, which are green at first, and black when they come to ripeness.

VI. The Place. The root of these grow on Banks, and under Hedges, and Woody places in many places throughout this Kingdom. The second grows in several places in Germany, as in Hesse, Saxony, Werfphoff, Pomernania, and other places where the White grows nor the Lent grows in Greece, Italy, Spain, and several Southern Countries, and is not with us unsafe nourished up in Gardens.

VII. The Times. They spring in March, and flower in May, June, and July, and their Fruit is ripe in August and September.

VIII. The Qualities. They are the same with the White, but much weaker in their Catharrick Virtue, as in purging Flegm, Choler, and Warty Humors.

IX. The Specification. It prevails against the Drople, King's-Evil, Dileases of the Womb, and Deninations of the Skin, whatsoever.

X. The Preparations. 1. The roasted Root. 2. The Juice. 3. The Essence. 4. The Declination. 5. The Powder. 6. The Cataplasm. 7. The Fuschia.

The Virtues.

XI. The roasted Root. Matthioli says, that the Root of our Common Black Beanie being roasted in the Embers, and eaten, is a powerful Medicine to increase Lust, provokes the Infrumments of Generation to that effect; but Label sharply reproves him for it, as not believing it.

XII. The Juice. Mixed with Wine and Honey, and applied externally against the King's-Evil: and simple of it, it cleanseth the Skin of Spots and Marks, Morphew, Scurf, Leprosie, Tereats, King-Worms, &c. It eases Pain, strengthens the Nerves, dissolves Concretions, &c. Dole half an ounce, to one ounce, or more.

XIII. The Essence. It purges Flegm, and Warty Humors, provokes Urine, and is good against the Falling-Jeckets, Pailie, Hysterick Fits, Vapors from the Spleen and Womb, with other like Dileases of those parts. It is prevalent against the King's-Evil, all sorts of Knots, Knobs, and hard Swellings in the Neck and Throat, or other parts. Dole, two, three, or four Spoonfuls in a Glass of Wine, according to age and strength.

XIV. The Declination in Wine. It has the Virtues of the Essence, but not altogether to powerful, and may be taken to six or eight ounces: it is prevalent against the Drople, Jaundice, and King's-Evil, and such other Dileases as proceed from the Planitude and Corruption of Humors.

XV. The Powder. It is made of the Root, and may be given from a frapule to two frapules, to purge away Cold, Serous Flegmatick, and Warty Humors, and to remove the Original Coals of the King's-Evil: it has the Virtues of the Essence.

XVI. The Cataplasm. It is made of the Root beaten to a Pulp in a Mortar, and mixed with a little Honey. This being laid or spread upon Sheep's Lather, whilst it is yet fresh and green, taken black or white Marks, and all Scars and Destinations of the Skin, ripens and breaks hard Aphtemises, draws forth Splinters, Thorns, and broken Bones, dissolves congealed Blood, and being applied to the Hips, and Huckle-bones in the Scrotum, Shoulders, Arms, or other parts, where there is great Pain and Weakness, it effectually removes the same as a very powerful Medicine, and applied to any place out of Joint, it is good to ease the Pain, to collantine and strengthen the Nerves, that they may not easily again be put out of their places.

XVII. A Cataplasm of the Leaves. Being bruised and sprinkled with Wine, and applied to the galled Necks of Oxen, which are hard with the Voke, it heals them: I suppose it will heal Gallings and Sores in Mankind also, being applied.

XVIII. A Cataplasm of the Berries. It removes Sun-burnings, Tanning, Spots, and other blemishes of the Skin, takes away black and blue Marks, which come from falls, blows, bruises, &c. being applied to them.

XIX. The Fuschia. It has the Virtues of the Powder and Essence, is very powerful to the purposes intended; it is prevalent against Afe, or Stabs, Mange, Leprosy, King's-Evil, Drople, &c. Dole. It may be given in Wine or Broth from ten grains to a frapule, plus minus, according to the age and strength of the Patient.

CHAP. XCI.

BUCKS-HORN.

I. T HE Names. It is called in Greek Respera, from the semillitude it has to a Craws foot; but the true Greek name is Aspera: the Latins call it Corna Cervi, or Cerovino, Coronourelli, Cerque, Chep, and some form of the Leaves.) Sanguinaria and Sanguinolites (from its flowing Blood:) Horenaria, (from the Sardiness of the place it grows in:) and Nathuriam Vericnllents, (from the likeness of its Scent to Warts:) And we in English call it, Bucks-horn, Swines Crofts, and Wart Crofts.

II. The Kind. It is twofold, 1. Coronourelli raraeufi, 2. Antqueo Matthioli, Upright Bucks-horn, or

dries 
and 
heals 
Ulcers, 
or 
running 
Sore, 
Strengtheneth 
the 
parts.
Salmon's Herbal.

Lib. I.

CHAP. XII.

BUGLE.

This is a Plant unknown to the Greeks as far as I can find; and there
ford has no Greek name: It is called in Latin Bug-
ula, and Buglum, Conflata medio, and Soliluga-
num. Matthiolus calls it Laurantia, and Herba
Laurantiana: And in English, Bugle, middle Con-
fused, and by some Siecleworts.

II. The Kinds. Authors make six kinds of this
Plant, but all that grow with us, are referred unto
Two. 1. Bugula vulgaris, Bugle flore Caralva, Com-
mon Bugle, or Bugle with a Blown flower: This
Tragus calls Prunella caralis prama, vel major;
but most Writers call it, Conflata medio pratetis
Caralva. 2. Bugula flore alb, Bugle with a White
Flower.

III. The Description. The Root of these has a
braxy Root, spreading under the earth round as
but, like unto Money-wort, or Penny-royal, from
whence rises up a hairy figure Stalk, about a foot or
so, and half high. The Leaves long, flat, and smooth
like those of Penny-wort or Self-heal, but larger, and
a little longer; some green on the upper side, others
more brownish, a little dentd about the edges, and
somewhat hairy. The Stalk is also set with many like
Leaves, which stand thereon by Compass, from the
middle almost shored upwards, and the Flowers
singly in roundels, encompassing the Stalk of a fair
blue color, with Leaves also, but smaller and bros-
er than those on the Stalk below: these Leaves and
Flowers are set at distances, being between every
roundle leaf or void place. Among the Flowers are
also small ones, at base of Self-heal, of a buffish,
and sometimes of an Ash-color, fashioned like the
Flowers of Alehoof or Ground-Ivy: which being
put, there followeth small, round, blackish Seed.

IV. Bugula flore alb., Bugle with a white flower
differs not in its form or magnitude, either in its
Roots, Stalks, Leaves, Flowers or Seeds, from the
former, excepting in the color of the Stalks; and
Leaves, that these are always green, and never brown
as the former, and in the color of the Flowers, that
they are always White.

V. The Places. They grow in Woods and wet
Coffes and Yields, generally throughout England,
but the Latter is not so common to be met withal.
Gerard says, that he found the quit of these Plants
in a meadow ground upon Black Heath near London,
and near a Village called Charlton, but the Leaves
were green, and not brown.

VI. The Times. They flower from May until
July, and produce their Seed in the main season: But
the Root and the Leaves next unto it, lying as it
were upon the Ground, remain all the Winter until
the next Spring.

VII. The Virtues. They are Temperate as to
heat or cold, and dry in the fifth Degree: Affrim-
gent, Affetive, Incarnative, Traumatick and Vulne-
rary, Neurotik, Stomachick, Hepatick, and Alterna-
tive.

VIII. The Specification. They are peculiar for the
Cure of Wounds and Ulcers.

IX. The Preparations. You may make therefrom,
1. A Liquid Juice. 2. An Efficace. 3. A Decotion.
4. A Syrup. 5. A Distilled Water. 6. A Spiritu-
ous Tincture. 7. An Acid Tincture. 8. An Oily
Tincture. 9. A Saline Tincture. 10. A Lotion.

The Virtues.

X. The Liquid Juice. It is excellent for such as
are Liverwound, or troubled with the Rickets: It
strengthens the whole Body, and being drunk in-
wardly to two, three, or four ounces at a time, it
contributes to the healing of old Ulcers, running
Sores, and Fifful's, and to the uniting of broken
Bones, and Coagulating every Member out of
Joint.

XI. The Efficace. It Dries and Affringes modera-
tely, and is of good use for such as have got a full,
and are inwardly bruised, for that it diffuses the
congested Blood, and disperses it. It has all the
Virtues of the Liquid Juice, and is very effectual
to strengthen the inward parts, and to cause to heal
all manner of running Sores, fisht Ulcers, and Fif-
ful's, whether they be old or new. Doze five or
fix spoonfuls in a Glass of Red Port Wise.

XII. The Decotion in Wine. It has the Virtues
of the Juice and Efficace, but not full out so power-
ful: it is good to cleanse old running Sores and
Ulcers, by washing them therewith.

XIII. The Syrop. Whether it is made of the
Fisch, or of the Juice. It is an excellent thing against
Coughs, Cold, Headaches, Wheezings, Sorenesses of
Breath, difficulty of breathing, Soreness of the Breth
and Stomach, and other Distempers of those parts:
it stops spitting of Blood, and cures Ulcers of the
Lungs.

XIV. The Distilled Water. It is a good Vehicle
Chap. 93. English Herbs.

to convey the other things in: But mixed with half its quantity of the Juice or Essence, it is good to wash a Sore or Ulcerated Mouth, and to cure fitch Sores or Ulcers which happen in the Secret Parts of Men or Women.

XV. The Turpentine Tincture. It heals admirably any Sore or Ulcer, whether inward or outward. In Ulcers of the Lungs it may be mixed with the Syrup aforesaid, thus: Be of the said Syrup, one ounce; of the distilled Water an ounce and half of the Tincture two dram: mix for a dose to be given in Ulcers of the Lungs. Outwardly mixed with the Juice or Essence, it cleanses old Ulcers, incar- rates and heals, and sometimes heals simple Wounds at once or twice dreffing: you may make it thus: Be of the Juice or Essence four ounces: of the Syrup an ounce and balf: of this Tincture one ounce: mix them, to wash the Ulcer withal.

XVI. The Acid Tincture. It is an admirable application against inward Wounds, Thrushes, or Stains into the Body or Bowels, and is excellent to be mixed with all Wind Drincks, and to be given mixed with the Syrup tofeild the Riches in Children: it fops the running of Burggrees, being applied, and opens Obftrufions of the Liver, and Gall; and is good to be mixed with Waters for fore Mouths and Throat. Dole inwardly from thirty to forty drops, in any fpccific Vehicle.

XVII. The Oily Tincture. It cures Wounds at a few times dreffing, but chiefly Wounds of the Hands; for which it is a Sovereign thing. Nerves is prick'd or wounded, it profontly eflar the pain, and prevents the return of Convulfions upon that account.

XVIII. The Saline Tincture. It is cleaning, and is good to wash and bathe tho'fe parts which are apt to break out with Bitches, Boils, Scabs, Itch, Scurf, Morphew, and other Defecations of the Skir.

XIX. The Lotion. It is made of the Juice thus: Be Clarified Juice of Bugle a pint; Honey three ounces; Allum five drams: mix and difpofe over a gentle fire. It is good to wash infefted and running Sores with, which are very foil, and have been of long continuance; and is as powerful and effectual to heal all running and Ricking Ulcers in the Secret Parts of both Men and Women, and is an excellent Gargle for curing Sores, and Canker in the Mouth and Throat.

XX. The Ointment. It is made of the Leaves of Bugle two parts: of Self-fheal, Sanicle, and Scl- bions, of each one part: bruifed and boiled in Hog Lard, or in a mixture of equal parts of Sheep's Surt, and Oil Olive, until the herbs are crisp, and then strained forth, and kept for use. It is a very good thing for healing any ftreth or green Wound, the lacerated, torn, or biffled: it brings it to digestion, cleanses, invacimates, and speedily heals it. Parkinson says, that he could with that all the good Wo- men and Ladies, that defire to do good to their own Families, or their poor Neighbours, not to be with- out this Ointment, always ready prepared, and at hand by them.

XXI. The Balsam. It has the Virtues of the Ointment, but more digestive, cleaning, and invacimate, and therefore more fit for complicated Wounds, which are accompanied with Contusions, Dilacerations, and other ill Symptoms.

XXII. The Compound. Made of the green Herb, it is good to abate Inflammations, and other hot Swellings in the Neck, Throat, and other Parts. It diffuses Contusions, dilates congealed Blood, and is probabiley applied to their Parts which are hurt by any blow of tall: it is alfo profitable to be ap- plied to all farts of Ulcers, whether recent or of

CHAP. XCVIII.

OF BUGLOSS Garden.

I. The Name. It is called in Greek Buglossa, but it is rather the name of Bore, for the Greeks called that Plant, and this our Buglos was rather the Lesser Bugloss, also Bore, with Dolemen: which Parkinson says was unknown to the Ancients. In Latin, Buglossa: and in English, Buglos (after the Latin name.)

II. The Kinds. There are several sorts of it, as, 1. The Garden, which is Buglossum Hortense. 2. Buglossa Sylvatica, Wild Buglos. 3. Echium, Vipers Buglos. 4. Wall and Stone Buglos. 5. Lye- montium, Marsh Buglos. Of these four we shall treat in the fourth Chapter. 6. Anchofa, Al- konest, of which we have treated in Chap. 6. afore- going.

BUGLOSSA.

III. The Garden Kind, of which we treat in this Chap., is twofold, viz. 1. Allium, Lomatium, Bug- losis Valgares, which is the Greater Buglos. 2. Buglosis Luteum, which is the Lesser Buglos, and
and by some called Ox-Tongue, or Garden Ox-Tongue.

IV. The Description. Our Common Buglows has a Root which is black within, and white within long thick, and full of a small Juice; as the Leaves are (as the Seeds also are) which continue and persists not every Year, as the Root of Borage does; from this Root comes up several long, narrow, hairy, whitish green Leaves, among which rise up two or three very high Stalks, branches at the top, wherein stand many small flowers, consisting of five small round pointed Leaves, with a small bimetal in the middle, which are very slender, shining, and of a reddish purple, whish they are buds, and not blown open, which being fallen, there grows in the green Heads, in which the Flowers stand, three or four roundish black Seeds, being that Thread or Faint, finding itself in the middle of them.

V. The Leifer Buglows, which some will believe to be Ox-tongue, is much rifer than the former, the Roots are long, and springing on the ground: and the Leaves are very rough, and ruffer indeed than the former, like the rough Tongue of an Ox or Cow, (wherein came the name) the Stalk is about two feet high, more or less, and surrounded of a reddish color: at the top of the Branches grow the Flowers in rough, sandy heads, which Flowers are composed of many small yellow Leaves, much like those of Dandelions, and fly away in the Wind, as to when they are blown, these Flowers are bitter of taste, unbebe Lobel calls it, Buglossum Echioides Fustum Hieracioc cognatum.

VI. The Places. The first is only nurted up in Gardens, to this also is the second: but this latter is found to grow wild in many places, as between Redriff and Depsfard, by watry Ditch sides, as General says.

VII. The Times. They flower in May, June, and July, to the end of Summer, and the Seed ripens in the mean Season.

VIII. As to their Qualities, Specification, Preparations, Virtues and Uses, they are altogether the same with those of Garden Borage, of which we have treated before in Chap. 83, to which you are referred. But this is to be noted in Buglows, that its Roots are much more Mussilagious, Vileous, or Clammy than those of Borage, and therefore are held not to be convenient for opening Apertures; but being made into a Lachsc or Licking Elixirs, may be prevalent against the Cough, Hoarfeck, and Colds, and to condenfate thin Difflations of Flegm upon the Lungs.

C H A P. XCIV.

Of Bugloss Wild, or Ox-Tongue.

I. T H E N a me. It is called in Greek Buglossos, in Latin, Buglossum Syvcerifl: and in English, Wild Buglows, or Ox-Tongue.

II. The Kinds. There are several Species of the Wild Buglows, as 1. Buglossum Syvcerifl minor, more inferior, The Great Wild Buglows. 2. Buglossum Sycnerifl minor Altemareus, Rough Wild Buglows. 3. Buglossum dulce, ex Infulis Lancifcris, Sweet, or Lancifcrile Buglows.

III. The Description. The first of these differs little from the Garden Buglows, but in its great ars, this being larger in every part: and in the color of the Flowers, which are of a deep purple color, that they are accounted as Black.

IV. The second Kind, has a small long Faint; its Leaves are fowwed, short, and rougher smaller than either the former Wild Kind, or the Garden Kind, and something more unevenly densed on the places: the Flowers grow at the Tips, of a bluish purple color, but smaller than the former, and the Seeds grow three or four together, and blackish white, like the other Kinds.

V. The rough Wild Buglows, has a Root like the former, but its Leaves are much rougher than any of the other Kinds, and sharper or smaller towards their ends: the Flowers on the Tops of the Branches, are more like the Flowers of Galbeons, or Blacklow Dead Nettles, than any of the other Kinds of Buglows: in some Plants they are of a bluish purple color, and in some they are white, but both colors are never found in one Plant.

VI. The Lancifcrile Buglows, has a great Root, blackish on the outside, and divided downwards, in several large Arms or Branches. From whence flows forth many slender Stalks, a Root and half high, more or less: the inner Leaves which near the ground, are much fether than those of Borage, and of a white green, and somewhat rough, but those which grow on the Stalks are fiffer, leaving the Flowers set at the Joints with them, while those before they are blown, are of a reddish color, but when they are open, of a bluish purple, somewhat like those of Vipers Bug- lows, or between them and Borage Flowers, of a very fower, or Many like Vipers.

VII. The Places. The first, second, and third grow Wild in several Countries, and are sometimes found growing Wild in England. The fourth was found by Mr. Hecker growing in one of the Islands about Lancifcrile.

VIII. The Times. They all flow in June and July, and their Seed comes to ripen in a short time after the Seed growing ripe, even in the time of Flowering.

IX. The Qualities, Specification, Preparations, Virtues and Uses, are mostly the same with those of
of Bugloss, of which we treat in Chap. 95. next following.

CHAP. XCV.

Of Bugloss Vipers.

I. The Name. It is called in Greek, "Epes," "Aephes," "Aephes," and in Latin, Echium, Alechimium, Alchium, "Alchium," (from the first finder of it, one who being bitten by a Viper, and gathering this Herb, and disinfecting it, and rafflowing down the Juice, and applying the root of the Herb to the bitten place, was cured thereby.) It is also called Echium Viperarium, and Syngdbc Viperarium, as some lay, from the effects of the Roots in curing the bites of Serpents; but as others say, from the color of the Stalks which are speckled like a Serpent's skin. In English Vipers Bugloss, Echium Vulgarum, Common Vipers Bugloss. 2. Echium vulgare, Echium Valigare, flore albo, White flowered Vipers Bugloss.

Vipers Bugloss.

to the skin of a Viper, upon which grows such like long, rough, prickly or hairy green Leaves, something narrow, the middle rib being for the most part white. The Flowers stand at the top of the Stalks, branched forth into many spik'd Leaves or Flowers being or turning like to the Tumble, all of them opening generally on the one side, which are long and hollow, turning up the brims a little, of a purplish violet color, where they are fully blown; but more reddish, where they are but yet in the Bud, or not blown open, as also when they are upon their decay and withering; but in some places they are of a fea for purple color, with a long Pointed in the middle, feathered, or pointed at the top. The Flowers being fallen, the Seeds grow inclus in round heads, which growing to be ripe, are blackish, covered, and pointed something like to a Vipers Head.

II. The Kind. Authors make twelve several Kinds of Vipers Bugloss, of which all, two only are said to grow with us, viz. 1. Echium vulgare, Echium Valigare, Common Vipers Bugloss. 2. Echium vulgare, Echium Valigare, flore albo, White flowered Vipers Bugloss.

III. The Description. The root of this has a Root which is found but large and blackish, and grows noddy at the approach of Seed time, perishing in the Winter: by scentence springs forth many long, rough Leaves, lying on the ground, and from among which rise up several hard round Stalks, which are very rough, as if thick set with prickles or prickly hair, having many black spot on them, not much unlike

The Virtue.

X. The Liquid Juice. The Juice of these Plants are wonderfully clammy and slimy, so that it is hard to Express the same; for which reason, after you have well beaten the Herb, you must set it close covered in a cold Cellar, or some other cold and moist place, for two Days and Nights, and then press forth the Juice in a Wooden press, after which you may clarify it with Whites of Eggs, beaten into Glair, and paffed gently thro' a thick Hops cops Bag. It is a famous thing against the biting of the Viper, and of all other Serpents, or any other Venomed Creature, and prevails also against Pois and the Malignity of Poisonous Herbs. You may give five or six Spoonfuls at a time in a Glass of Wine, and repeat it as you see Occasion.

XI. The Efficacy. It has all the Virtues of the Liquid Juice, besides which, it is an excellent thing against the Plague or Pestilence, against Fever, Purple, and all other Burning and Maligne Fevers whatsoever. It is a most admirable Traumatick or Voluntary, so that scarcely any of the Venomed or All-heals go beyond it. It comforts the Head, Brain and Nerves, strengthens and recovers the Stomach, and cheers the Heart admirably. Do, three or four Spoonfuls or more, two, three or four times a day, in a glass of the Dilluted Water, or in a glass of Wine, or some other proper Vehicle.

S. XII. The
XII. The Syrup. Parkinson makes it thus. To one he rates, 5 pounds, two white Sugar of the Flor of flowers one pound; mix and boil these gently in the confidence of a Syrup, and thin the, to give a Suck, and is (says he) very effectual for commotting the Heart, and to expel Sadness and Melancholy. Dose two spoonfuls or more.

XIII. The Diluted Water. It is drawn from the whole Plant, when it is in its chieft strength, which is, when it is in Flower, it is probable for all the Difficulties aforesaid, being inwardly taken, and outwardly applied, and is used to convey the other Preparations in.

XIV. The Tincture of the Flowers. It is highly Cordial, and Alexipharmick, and refits Poisons of all kinds; it defends the Heart from the Malady of Peltential Fever, and of the Plague, it fift, and suppreffes Melancholy Vapors: It has the Virtue of the Efficence, and may be given in the Diluted Water to two Drains.

XV. The Powder of the Seed. It is Alexipharmick, comforts the Heart, expels Sadness and Melancholy, tempers the Blood, allows the hot Flies of Agues, circumscribes Milk in Nouris, and ease pains in the Lungs, Back and Kneelicks. Dose one dram.

XVI. The Decotion of the Root. It prevails against Poison, and the Plague, and the biting of Vipers, and other Venemous Creatures, and is a singular good thing (it made with Wine, or Wine and Water) to be drank as a Diet Drink by wounded Persons, and such as have Infirmities, filthy, and running Ulcers, and Fiflith's Etc.

XVII. The Ointment or Balsam. They are Venemary, cure admirably both Wounds and Ulcers, and are of especial use to be applied to Wounds made by the bittings of Venemous Creatures, as Vipers, Mad Dogs, &c. or made with any Poisoned Weapon, it extracts the Poison or Venom, and induces the healing.

XVIII. The Creaphism. Applied to the bittings of a Viper, Mad Dog, or other Venemous Creature, it extracts or draws forth the Poison, and so secures the life of the Patient, other Alexipharmicks being given in the mean season inwardly.

CHAP. XCVI.

OF BUGLOSS, WALL and STONE.

I. The Names. The first of these is called in Greek, γυλοφθυς; in Latin, uter, Levatis, and by Dioscorides, Levatis Echis alterae Speciei; and in English Wall Bugloss.

II. The other is called in Greek, υγυλοφθυς; by Galen, κρήμνην ουλιαού, ψήθων Ποίημας; in Latin, Ophio- me; and in English, Stone Bugloss.

III. The Kinds. Of the Wall Bugloss there are two Kinds, 1. Levatis Echis folia, That with a Vipers Bugloss, 2. Levatis Anglica, the English Wall Bugloss. The Stone Bugloss, is a bigger Plant of its Kind.

IV. The Description. The first kind of Wall Bugloss have a Root which is somewhat woody, long, and often as a finger, with some fibres thereof, it is of a brownish red on the outside, but little or nothing color the Bingers at the Anchis of the flower, yes, of by Dioscorides, it was called by several Names, and when it was accounted a kind thereof, but it is much like to Echium, and other sorts of Wild Bugloss. From this Root a little Leaves which spread upon the Ground, which are many, long, rugged, hairy, and of a dark green color, found at bi to Echium, or some other Wild Bugloss; These Leaves abide in this manner, some years, without shedding form of any Stalk, or Flowers at all, which latter having taken notice of thought that it never did bear Flowers or Seed; But truly though it bears no Stalk for Flowers in Seed some years, yet it has been found to bear them in some others, for that some Nants hereof have been found as well with Stalk and Flowers, as with or without; When a Stalk bears a Leaves it rises up about two feet high, bearing much like Leaves of green below, but yet one different from another, without order, and smaller up to the Top, where the Flowers stand upon their Sermoches, Branches, which are spread about, as also come forth with the Leaves at the Front, like unto the bottom Flowers of Echium, or Wild Bugloss, with Vessels and getting dented brim, or edges, of a pale purple color, with a long Style or Filament in the middle growing out of the Vessels above the Styles, Thro a little Office which follows the Seed, much like to Bugloss Seed, but not altogether so great or black.

V. The English Wall Bugloss has a Root little reddish like the other, but giving as little color: but as to its Leaves, Stalks, and Flowers, it differs very little from the former: the only difference is, the Flowers do all grow at the Top of the Brancher, and are of a deeper purple color, with divers threads shooting out of them.

VI. Stone Bugloss is Iard by Dioscorides to have a reddish Root, but his narration, rather Stone, Echium, or Seed, which thing he says also of Lycoptis, and Cynoglossum, both which are known (in divers of their Plants) to have all the three, and therefore of any Stalk, or Flowers at all, which latter having taken notice of thought that it never did bear Flowers or Seed; But truly though it bears no Stalk for Flowers in Seed some years, yet it has been found to bear them in some others, for that some Nants hereof have been found as well with Stalk and Flowers, as with or without; When a Stalk bears a Leaves it rises up about two feet high, bearing much like Leaves of green below, but yet one different from another, without order, and smaller up to the Top, where the Flowers stand upon their Sermoches, Branches, which are spread about, as also come forth with the Leaves at the Front, like unto the bottom Flowers of Echium, or Wild Bugloss, with Vessels and getting dented brim, or edges, of a pale purple color, with a long Style or Filament in the middle growing out of the Vessels above the Styles, Thro a little Office which follows the Seed, much like to Bugloss Seed, but not altogether so great or black.
Chap. 97. English Herbs. 131

 differing from them in its Virtues. It has many long and narrow smooth Leaves lying upon the ground, not above an inch broad, but about four inches long, to the depth of the lesser Alkanet.

VII. The Place. The soft two grow upon Stone Walls, and in other places; and in the first place the first has been found about Frontenian near Monpeller in France, as Pens and Label say: The second Label observed to grow in the Wild Country, in the way from Brygel and Ruth to London.4 The Stone Bugloss grows in Rocky and Stony Places.

VIII. The Times. The Wall Bugloss flower in July, and sometimes in August, and the Seed is ripe in the following Month. The Stone Bugloss is green all the Year; but its times of blooming and seeding (if it does so) has not been as yet observed.

IX. The Qualities. Wall Bugloss is temperate, or rather cold and dry in the first Degree, Alterting, Sypptic, Traumatick or Venemous, Pectoral, Hupatic and Alternative. Stone Bugloss is hot and dry in the second Degree, Apertive, Cleansing, Hylletic and Alternative.

X. The Specification. The Wall Buglosses are peculiar Venemous for healing Great Wounds. And Stone Bugloss is a Specifick for the speedy Delivery of Women in Labor.

XI. The Preparations. The Wall Buglosses have all the Preparations and Virtues of the Wild Buglosses, to which we refer you:

1. The Flower, 2. The Oil, and even some peculiar Virtues. Of the Stone Bugloss you may make also: 1. A liquid Juice. 2. An Essence. 3. A Powder of the Leaves. 4. A Decoction.

The Virtues.

XII. The liquid Juice of Wall Bugloss. Taken alone, or mixed with Honey, it stops Catarrhs, falling upon the Fausces and Lungs, and refills Fluxes of the Bowels: and being applied upon Inflammations, as a Pelson, Erythemas, &c. it cools them: inwardly taken, it is a good Traumatick.

XIII. The Essence of Wall Bugloss. It is Altrenting and Sypptic, stops Catarrhs, and all Fluxes of the Bowels; it also all Fluxes of sharp Humors, to running Stones and Ulcers: and so renders them safe of cure. Dose one ounce at a time, Morning and Evening, in any Sypptic Vehicle, as a mixture of Plantain and Poppy Water, an Infusion of Carcous in fair Water, &c.

XIV. The Oil of Wall Bugloss. It is made by boiling the Leaves and Roots in Oil Ollere to Gripples, &c. It admirably heals Green Wounds, abates Inflammations, and cures Burnings, being anointed upon the Part, and also mixed with the Oy, and applied: Parkinson says, that this Oy cures S. Anthonys Fire, but usually Oyl and Greeh Bodies do mischief in that cafe: to bathe with the liquid Juice is much better, and to apply over the Erythemas, Cloths often wet with the same: or a folt Calaphm of the Juice mixt with Barley Flower.

Virtues of Stone Bugloss.

XV. The liquid Juice. It provokes the Temper in Women powerfully, and therefore ought not to be given to Women with Child, lest it cast them to miscarify: a spoonful or two of it may be given Morning and Evening in a Glas of White Wine.

XVII. The Determ. It is a powerful Flower of the liquid Juice, and is very effectual to cause freely Delivery to Women in Labor. It cleanses the Womb of all its corruptions, refills Vapors, and helps against Fits of the Mother. Dose one or two ounces in a Glas of Wine to Women in Travel.

XVII. The Powder of the Leaves. It is good against Vapors and Fits of the Mother, and taken at p. dram in Wine by Women in Travel, it facilitates and hastens the Delivery, for which it is said to be an excellent thing; it has the Virtues of the Juice and Essence, and therefore ought not to be given to Women with Child.

XVII. The Decoction in Wine. It has the Virtues of the Essence and Powder, but not altogether so powerful.

Chap. 127.

I. The Name. It is called in Greek, "Limenuon," 2. medica, by Dioscorides, so called, because it grows in certain, and is not generally distributed: it is Latin, Limonum: and in English, Marth or Sea Bugloss, and Sea Lovender.

II. The Kind. Parkinson makes seven Kinds of it: Mr. Ray, eleven; but we (because here in this Book we treat chiefly of English Plants) shall only describe three Kinds, viz. 1. Limenion major, greater, the Greater Common or Sea Bugloss. 2. Limonum medium Anglicum, The English Marth Bugloss. 3. Limonum Virginicum, which is the Limonum Congener Clusii, Virginian Marth Bugloss.

Sea or Man Bugloss.
Salmon's Herbal. Lib. I.

IV. The Description. The first or Greater Marth Buglofs, is a Root somewhat thick and long, like unto a small Red Beet Root, whence comes several faire, long, thick, or fat green Leaves, somewhat like unto Small Beet Leaves, (and that is the reason that Pliny refers the Limonium unto the Beets, and calls it a Wild Beet, though Galen will have it, that there is no Wild Beets in Rome;) or Leaves of the Limon Tree, from among which rising up several bushes, placed Stalks, without Leaves, near half a yard high, branched at the tops into several parts, wherein scownd, manie small blithe purple Flowers, all on one side for the most part, something like unto Buglof's Flowers, but smaller, after which come small reddish Seed, inclosed in the barks, which the Flowers, and from thence, produce a small blithe purple Seed, with a pale yellowish white colour, like unto the Seed of the Common Beet Root, which is somewhat the same colour; yet the difference between them seems to be only in the magnitude.

VII. The Virginian Marth Buglofs is a long Root, an inch thick in Diameter, or more, and going down into the ground, sending forth from it several Branchers, and small Fibres: It is a very strange Plant, from this Root springs forth very Strange Flowers, such as are not to be seen in any other Plant that we know of, being nine, or ten, or more, rising from the head of the Root, of enormess, each by itself, being small below, and growing great-
CHAPTER XC XVIII.

OF BURDOCK GREAT.

1. THE Name. It is called in Greek, Αιμών, daimon; in Latin, Arctium, Pro- fygium, Propolis, Persicaria, Lappo and Bardana, in Shops: in English, Burdock, and Chicory.

II. The Kinds. There are several Kinds herein, as, 1. Lappa major, Lappa minor, Bardana major vulgaris, The Common Burdock. 2. Lappa Virginiana, The Virginian Burdock. 3. Lappa minor Bardana, Lappa minor Galeni; but it is indeed the Lappa minor altera Matthioli.

III. The Uses. They are all cooling and drying in the first Degree, yet Gerard says, that the Roots are moderately hot: they are Astringent, Digestive, Digestive, and Traumatic, Cephalick, Nervick, Neprick, and Hypertick; Alternative, and Alexipharmick.

X. The Specification. The Burdock is peculiar against the Poison of Serpents; and other Injuries of the Reins, Bladder and Worms.

XI. The Preparations. You may have hereof,

1. The Leaves. 2. The Juice. 3. The Essence.

4. The Saline Tincture. 5. The Oily Tincture.

The Virtues:

XII. The Leaves. Being applied either dry or green, they cool, moderately dry, and diffuse withal, as Galen says; whereas they are good to heal old Sores and Ulcers, and help the Croup, or thinking of the Sinews.

XIII. The Juice. The Juice of the Leaves mixt with Honey, provokes Urine, and takes away the Pains of the Bladder; and mixt with Wine, it is wonderfully good against the bites of Serpents, Mad Dogs, and other Venomous Beasts.

XIV. The Essence. It has all the Virtues of the Juice, besides which it is excellent against Pox inwardly taken; and is good, being given Directly, against Vomited Difeases, as the Pox, Gonorrhea.
in Outwardly, in II.
and is taken after and the takes Women. called old and the and the

The

Sand, Gravel, and Tartarous Matter out of the Reins, Urin and Bladder. Do one or two drams in White or Red Wine, &c.

X. The Powder of the Seed. Taken to one dram, in a proper Vehicle, it is an excellent thing against Sand, Gravel, or Tartarous Matter in Reins or Bladder, and gives eafe in the Strangury, and other like Difficulties of those parts: and drank with Wine for forty days together, it wonderfully helps the Scuriety.

XX. The Concoction of the Roots. It is helpful in Concoctions, and good for those as are troubled with the Stone, or any Flux of the Bowels.

XXI. The Mixture. Take Juice of the Root, which make with Abiece two pounds; Old Tent, a pint and half; mix them. Four ounces of this being drunk Morning, Noon and Night, (after due purging) is good against the Running of the Reins in Men, and the Whites in Women. Or thus: Take Juice of the Root, made as before said, twelve ounces; old Tent eight ounces; Yokes of new and old Eggs, &j. iii.; powder of Acorns, an ounce and half; Nempting in powder half an ounce; mix them. It has the Virtues of the former, besides which, it easeth pain in the Reins, and wonderfully strengthens a weak Back.

XXII. The Capsule. Made of the Leaves bruised, with the White of an Egg, and laid on any place burnt with fire, it takes the fire out, gives sudden eafe, and afterwards heals it. The Roots made into a Cataplasm by being beaten with Salt, and applied (as Apidreiter says) to the biting of a Mad Dog, cures it, and in speedy cures the Patient from all danger. Columella says, the Cataplasm made of the Leaves beaten up with Salt, being laid upon the biting of a Viper (the part being first ferrified with a Lance) draws out the Poison. The former Cataplasm of the Roots with Salt, is much more efficacious than the former against the Poison of Serpents; and being applied, is also good against the King's-Evil.

XXIII. The Salt from the Ashes. Taken in White Wine, Arseny, or Pertry Water, from a dram to half a dram, it is good to provoke Urine, cleanseth the Urinary Passages, and to carry off the Watry Humor in Dropes.
Chap. 100. English Herbs.

II. The Kinds. It is the largest sort of the Burdock, and singular of the Kind.

III. The Description. It has a small Root somewhat long and fleshy, and perishing every year: from which Root arise up a number of Stalks, and two feet high, breaking out into several Branches, with many blackish spots upon them, with two much smaller and outer Leaves at every Joint, standing upon long Stalks, which Leaves are usually divided into three parts, somewhat like unto a Marsh Mallow leaf, unevenly nod'd or dotted about the edges; at the Joints of the Stalk and Branches with the Leaves, towards the tops of them, come forth small Flowers, which abide not long; and after them, two or three small, close Bars, a little pointed at the top, where in by two or three small lank Seeds, somewhat like unto an Oat, which fall not out, nor do the heads open.

IV. The Places. It grows in many places of this Kingdom, as particularly in two or three places between Tidenham and Chepnes, in the foot way, in the Highway between Stanes and Elpham, and between Drgon and Bare, two Miles from Colerne, and at Southwark-feet in Hertford.

V. The Tincture. It Flowers and Seeds when the great Burdock does, viz. in the Summer Months, June, July, and August.

VI. The Qualities. It is temperate as to heat and cold, dryness and moisture, yet Gent will have the Seeds to be hot and dry, digestive, also diuretique, magick, and genetique, Spurrius, and Hydrius, Alternative, and Alchymurique.

VII. The Specification. It is singular against the pain and hardness of the Spleen.

VIII. The Preparations. You may keep hercule.

1. The Juice.
2. The Essence.
3. The Salute Tincture.
4. The Oily Tincture.
5. A Powder of the Roots.
8. A Salt.
9. A Decoction of the roots.
10. A Lotion, or Wash.

The Virtues.

IX. All these Preparations have the same Virtues, Utis, and Dotes, with those of the same name in the Chapter of the Great Burdock, to which you are referred, but there are some peculiar Virtues in this Plant, not observ'd to be inherent in the former, for which reason we shall say something more of its Essence, Decoction, Lotion, and Cataplasm, in the Sections following.

X. The Essence. It strikes at the Root of the Leprosie, prevals against Fainting and Sweatings, opens Obstructions of Liver and Spleen, but more especially of the Liver, and gives ease in pains of the Hypochondriac and Bowels. Dose three or four Spoonfuls Morning and Evening in a Glass of Sherry Wine.

XI. The Decoction. It is to be made with Wine; and has the Virtues of the Essence, it confirms the hardness of the Spleen, being taken inwardly Morning, Noon, and Night, to fix ounces, and as often basted warm upon the part affected.

XII. The Lotion. It is made of the Burrs, before they are ripe, being bruised and laid to steep in Water, or Wine, in which a little Nitre is dissolved, for twenty four hours. It diffuses Tumors, and gives ease in Pains, being basted warm upon the part affected. If the Hair is sometimes washed therewith, it makes it become yellow. It is an excellent Cargle for a sore Mouth and Throat, taking away the Inflammation, and healing of it in a very short time.

XIII. The Cataplasm. It is made of the Roots or Green Burre, being beaten to a Pulp in a Mortar, and mixed with a third part of Malt; being applied upon hard Kernels, or Swellings in the Flesh (as those proceeding from the Kings-Evil) it is laid to soften and dissolve them: but more especially, it is in the mean fevers, the Juice, Essence or Decoction in Wine aforementioned be daily given inwardly two, three or four ounces at a time, and that Morning, Noon, and Night, for the Preparation of very much sweats, clear the Blood and Juices, and correct the Difeases of the Humors.

CHAP. C.

OF BUTTER-BUR.

I. The Name. It is called in Greek Μαρμοςτρος. In Latin, Petafites; (from the langueds of the Leaf,) it being large like a plate, a hut.) first take it to be θεομορφος, and some to Πεταλοιτος Πλιν; in English it is called also Petafites, and Butter-Bur: The Germans call it Flabifchen, or Burdt-vur.

II. The Kinds. It is of two sorts, a Greater, and a Lesser, and differing also in the Flowers, but so very like one another, that one Description will serve for both. Camerarius calls it the more common Mazz, the other Fenima: but in his Epitome of Mathurum, he calls the Greater, Tadillo major, for that some will have it to be a kind of Olive-tree.

Butter Bur with out flower

III. The Description. It has a long Root and thick, spreading under ground, blackish on the outside, and whitish within, sometimes Worm eaten, and of a bitter and unpleasant taste; it springs up very early in the Year, with a thick Stalk about a foot high, on which are a few very small Leaves, or rather
Salmon's Herbal. Lib. I.

rather pieces, and at the Tops a long, slender head of Leaves, in the one (which is the leaf, and the more rare to find) wholly white, and of a better scent than the other (though some say it has no scent) in the Greater, which is the more common with us, of a bluish, or deep red color, according to the Soil in which it grows; a deep ground bringing forth a paler color, somewhat swarthy, and before the stalk has stood with the Flowers a Month above ground, it will be tender and eaten, and blown away with the Wind, after which the Leaves will begin to spring, which when they are full grown, will be very broad and large, big enough to cover the whole body, at least the Head, like an Umbrella, which hides from Sun and Rain; they are somewhat thin, and almost round, almost thick red Foliage, being about a foot or more long, fixed under, or towards the middle of the Leaves, the lower parts of which, are divided into two round parts, close almost one to another, of a pale green color above, and hoary underneath. That which brings white flowers, brings forth smaller flowers than the other, having divers ribs and veins therein.

Butter Burr.

IV. Gerard has another kind of Description, which in some measure explicates the former, for which reason I think it necessary to insert it here. Butter Burr (say he) does in a manner bring forth its Flowers before the Leaves, as Coltsfoots does; for which reason some have thought it to be one of the kinds of Coltsfoot, and for which reason Mafield and Camerarius in their Epitome, have called it Tutchago major, as it is before mentioned: 1) Those Flowers, says he, are Small and Moister, tending to a purple color, which are made up into a big Ear, as it were, and quickly open, together with its Stem (which is thick, full of Subtance, and bristle) sable and full of Burs, or small Butter Burs, which are very great, like a round Cap or Hat, called in Latin Persis, of such a wideness or largeness, as that of it self one leaf is big enough to keep a Man from the Fall, of Rain, and therefore are much larger than the Leaves of the great Burdock; their color is somewhat white, but

whiter underneath; every Stem bears his Leaf, which is sometimes small, and long, and sometimes wide, which stands, as it were, under the Leaf in the Center or Middle ofl the Circumference, like to one of the greatest Mushrooms, setting aside the Chief or inner part of the Leaf near the Stem, especially when they are perfuming or withering away: at first the upper superficial or outside of the Mushroom stands out, and when they are withering it stands more in, and the edges, as it were, turn up: so is it in the Butter Burr Leaf, which bar on the out side a certain faltine hoilmeufes.

V. The Plants. They both grow in andmost Grounds by Rivers and Water side, and upon the Banks and Banks of Lakes and Ponds, almost every where.

VI. The Times. The Flowers rise and decay in February and March, and then fade away; Gerard says, in March or April: when they are gone, then come up the Leaves, which remain all Summer, even till Winter, now ones still growing up, and being added to the former.

VII. The Qualities. The Roots, which are mostly used, are hot and dry in the third Degree, Digestive, Diaphoretic, and Sedative: Cephalick, Nerontick, Stomackick, Hysterick, and Cordial Alternative, and Alcoharpick.

VIII. The Specification. It has a peculiar power and force against Poison of all kinds, and the Infection of the Plague.

The Virtues.

X. The Powder. Being given to one dram, and drunk in Wine, it is a most excellent thing against the Plague, and all forms of Petitioner Fevers, as Spotted Fever, Purples, Measles, Small Pox, &c. because it is Sudorific or provoking Sweat, and drives from the Heart all Forms of Venom and Poison; it kills Worms, and is powerful against Hysterick Fits, or Vapors and Bublication of the Mother: If it is thrown on old and filthy running Ulcers, it cleanses, dries, and heals them. It also provokes Urine, and the Monthly Terms in Women.

XI. The Juice. It is expressed out of the Root by being beaten in a Mortar, and squeezed out with White Port Wine. It has all the Virtues of the Powder, and may be given from one ounce, to two or three ounces, Morning and Evening, as a preventive against the Plague, and every four hours after Infection.

XII. The Eflence. It has all the Virtues of the Powder and Juice, but more powerful to all the Intentions: It provokes Urine, and the Courtilers, and kills the flat, beaded Worms in the Belly. Dose one or two ounces mixed with Wine. It is a powerful thing in the cure of the Yellow Jaundice, and the BITINGS of Vipers, &c.

XIII. The Spirituous Tincture. It is good against Poison, and the Bitings of Mad Dogs, and all a Gaining and Sweating Fits, and is a famous thing to relitice the Distemper of the Stomach. Dose one or two drams in a Glass of Canary.

XIV. The Decoction. It is good against Coughs, Colds, Ahhma's, Wheezings, difficulty of Breathing, and other Distempers of the Lungs, causing Expectoration. It kills Worms, provokes the Terms, destroys all other Scares and Fright after foregoing, but not full out to powerful: Dose from two ounces to tour of six, as hot as it can...
can well be taken, Morning and Evening, to prevent the Infection of the Plague: and as much every six hours, for those who are already infected with it.

XVI. The Mixtures. It is thus made: Take of the Juice expressed with Vinegar, or the Wine, twelve ounces; Juice of Rue four ounces; Venice Tusscke, or Maltbrake two ounces: mix them well together by boiling. It is an Antidote against the Plague or Peste. To be Spotted Fever, Purple, Small Pox, Meallas, Poison, biting of Vipers, or other Sar-pants, and the bitings of Mad-Dogs, or of any other Venomous Creature. Dose two ounces at a time, as often as need requires.

CHAP. CL.

OF BURNET.

I. T H E Name. It is called in Greek by Nicholas Myrthesfer, Φύτσα, or as Gynius has it, Φύτσας; in Latin, Pimpamella, Sanguiflora, Espap넬, Pimpamella, Sanguiflora, Sanguiflora, Sanguinaria, or Sanguinea. Fluxus fictus: In English, Burnet.

II. The Kinds. It is fourfold; 1. Pimpamina fluxa minor, The Common or Lesser Burnet. 2. Pimpamella undulata, Smalle's Burnet. 3. Sanguiflora fum Pimpamella Major fum Sylvestris, Great or Wild Burnet. 4. Pimpamella Maxima Americana, The Green or American Burnet. Where Note, that some Authors think our Garden or Field Burnet to be the Sanguinea f. f. D. of Sylvestris, but I think them to be mullaken, because this latter answers in the form of the Flowers to our Burnet.

III. The Description. The first of these has a Root which is small and long, and of a blackish brown on the outside, growing deep into the Earth, with some fibres therefrom; from whence comes forth many long stenged Leaves, set upon the Ground, which confist of drinkers small roundish, or rather quadrate, green on the upper side, and greyish underneath, densely dented about the edges, set on each side of a middle rib; amongst which rise up several crested brown Stalks a foot high or bettter, and in rank ground sometimes a foot and half high, with some smaller Leaves set in some places therein, divided into several Branches. At the Tops grow small round boose heads, upon long footstalks of a brassy color, from whence start forth small purplish Flowers, and after them curved Seed. The whole Plant has a pleasant quick Smell and Tafte, much like to the Tafte of a Smell, and put into a Glass of Wine, gives it a pleasant Relish.

IV. The Venemous Burnet in Roots, Stalks, Leaves, and Heads, is altogether like the former, save that the Leaves are not so round, but something longer, and have no manifest Smell or Tafte in them.

V. The Great or Field Burnet, has a Root black and long like the first Kind, but greater, from whence spring up such like winged Leaves, but nothing so many, and each of those 1 comes on the Wings, are twice as large, or leath as the other, and nestled about the edges in the same manner, of a greyish color on the under side; Stalks are greater, and rise higher, with many such like Leaves set therein, and greater round heads on the Tops, of a brownish green color, out of which come small dark purple Flowers, very much like the former, but greater: The Plant is soft for every little of Smell or Tafte in it, which can be perceived.

VI. The American great Burnet, has a Root much greater than the former, and woody, longer also, and blacker than the last, but in all its other parts, it is like our Field Burnet, but much greater, after times all its Leaves are of a blackish green on the upper side, and folded half way together inward, so that the under sides of the Leaves, which are greyish, throw themselves upwards, and they are denser fower what deeps about the edges, with greater dents, which makes them more the more comely and pleasant. The tops of the Stalks bear smaller, and much longer,
the Juice in equal quantities, and the Patient laid to Sweat thereupon. Do three ouces.

XVII. The Spirituum Tinctura. It comforts and warms the Stomach and Bowels, strengthens Nature, and takes away the weakness of the Stomach and Intestines, thereby stopping Fluxes of the Belly of all kinds; it strengthens the Heart and Liver, and other principal Parts, and therefore is good against Fainting and Sweating. Do one spoonful at a time in a Glass of Wine.

XVIII. The Aurum Tinctura. This has all the Virtues of the Vinegar foregoing, but is much more powerful than it, to all the purposes and intentions there specified: besides this is an extraordinary Stomackt, and therefore powerful in stopping Vomiting, and also in the Blood, being given in a Glass of Canary, or Red Port Wine. Do thirty or forty drops, to fifty or sixty, two or three times a day.

XIX. The Powder. Ufed outwardly to old Ulcers, moist and running Sores, it drys them up wonderfully, and prepares them for healing. It may be made of the whole Plant.

XX. The Oil. It is used to abate Inflammations, cafe Pains, strengthen weak Parts, cure Burns and Scaldings, and to draw malignity out of Wounds made by the bites of Venemous Beasts.

XXI. The Ointment. It has the Virtues of the Oil, but penetrates not so much, yet is more effectual for the cure of Wounds, Ulcers, and other Rampant Fiery Diseases.

XXII. The Balsam. It is made of the Juice, or green Herb, it is one of the best Valerianas in the World: it dries up, cleanses, strengthens, and heals all green Wounds, old Ulcers, running Sores, and other ill nature Skins of that kind. It is certainly a most excellent Wound Balm. If it is mixed with Powder of Senna, it takes away scurfy Heel, and destroys Pestilence or Clumsiness.

XXIII. The Spirit. It stops inward Bleeding, comforts the Heart and Bowels, and is an excellent thing against Fluxes of the Belly of all kinds, more especially the Bloody-flux, and the overflowing of the Terms in Women: and this it does the more powerfully, if a little Cæretica be diluted in it. It prevails also against the Contagion of the Plague. Do from one dram to half an ounce.

XXIV. The Seed made into a Powder. This, says Parkinson, is not less effectual, both to stop Fluxes, and to dry up moist or running Sores, being given in the same manner (to one dram) in Acid Water, that is, if Water in which hot Goods of Seed have been quenched, or if Wine, in which Old Nails have been infinced for three Months beforehand: The powder of the Seed may also be mixed with Ointments or Injections.

XXV. The American Burnet has all the same Properties with our English, and the same Virtues, Uses, and Doses.

CHAP. CII.

BUTTER-WORT.

I. The Names. It seems not to be known to the Greeks, and therefore we have no universal received Greek name for it, only Gesner thought it to be Poliothlyium Plini; Lagendensius thinks it may be Oris Apvri, and calls it Consedh; Pallas calls it Consedh, or Gesner, and from him all others call it so: others Lingula Persica,
Plaint, Viola lamia, Viola Palustris: Basch in calls it, Sanicula montanu; these calcareous dunes; with us it is called, Sanicula Eboracensis (because it grows to plentifully in Yorkshire.) In English it is called Butter-wort, and Butter-root, because of the Un-oddity of the Leaves, as the from Fettering, as Gerard says, who also faith, they call it White Root, and not White Root, because the Country people think, that if their Sheep should eat it, that it would give them the Root, and if they give them the Epithite White, from the color of the Leaf: as they have another which they call Red-Root, which is Petaluris, Red-Rattle.

II. The Kinde. It is a singular Species of the Sanicula, being Genus to none cile.

Butter wort.

III. The Description. It has a Root coposed of divers white Fibres, or small Strings, which die not in the Winter, but while all the time with green Leaves upon them: From this Root spring forth divers fat and long Leaves lying upon the ground round about, it, broad at the bottom, and pointed at the end, of a pale green color on the upper side, but white underneath, folded together as their first risings; which are more White. From among these Leaves, rise up two or three, or more, slender naked Stalks, about five or six Inches high, bearing but one only Flower at top of each Stem, set in a small green bush, in form somewhat like a Violet Flower, or those of Lark Heels or Spurs, having a small Hoel or Spar behind, in some of a purple, in others of a more blew color, and in some white. When the Flowers are fall, there come in their places small pointed round Heads, in which is contained small, long, black Seed.

IV. The Places. It is chiefly found in the Common Field, and in several Bogs: on the Hills in York-shire; and in many places also in the West Country, and Wales: as also in a Common, about a Mile from Oxford, near a Village called Herrington. Gerard says, it grows in England in Equally wet Grounds, and will not yield to any Transplanting or Cultivating of it; and that it grows especially in a field called Crug-Clefe, and at Grwy, and Re-

confeibath in Westmoreland, upon Ingleborou Fells, twelve Miles from Lancaster; and its Horne, in the same County, near to Blackburn; ten Miles from Preston in Andermatt upon the Bogs, and Murh Grounds: and in the Baggy Meadows about Bever-Halfield; also in the Fens in the way from London to Whitefear, in Huntingtongshire: It grows also in Hampshire, and in great abundance in many places in Wales.

V. The Times. It flowers towards the later end of May, and all the Month of June, even to July, (according as the Weather proves,) and the Seed is ripe not long after.

VI. The Qualities. It is Temperate in respect to heat or cold, and Drying in the Second Degree. It is Astringent, and Cirtarick, like Rubarb; Con-ffoldative, and Traumatick, or Vulnery.

VII. The Specification. It is dedicated to the cur- of Green Wounds, and healing of Recent Ruptures in Children.

VIII. The Preparations. You may make there-from, 1. A liquid Juice of the Plant. 2. A Syrop. 3. An Ointment. 4. A Balsam.

The Virtues.

IX. The liquid Juice. Country People, who live where it grows do use to wash their Hands with it, when they are Chapt by the Wind or Weather: and in Yorkshire they anoint the Dogs of their Kine, with the Fat and Olly Juice, when they are bitten with any Poisonous Worm or Fly, or are Chapt or Riff by Weather, or any other means.

X. The Syrop. The Poverr sort of People in Wales, make a Syrop thereof, as of Rosaes, and there- with Purge themselves, and their Children; they mix it with Broth for the fame purpose, and so it purges Efficacly and quick. From two to four lippucals.

XI. The Ointment. They also with the Herb make an Ointment, which is held to be finguarily good (and that by the Experience of some Physicians) against the Obstruptions of the Liver.

XII. The Balsam. It is said to cure Ruptures in Children, being applied Plaister-wife: it is a fingu-iar Vulnery, for it digests, cleanses, and heals Green Wounds in any part, being highly Astringent, Drying, and Conffoldative, not much inferior to any of the Wound Herbs.

CHAP. CIII.

CABBAGE.

I. THE Names. It is called in Greek, Ἱππαρχος: in Latin, Brassica Capitata: in English, Cabbage, or Headed Cabbage.

II. The Kinde. It is twofold. 1. Καταφθανος, Brassica Capitata Alba, White Cabbage. 2. Καταφθανος μαυρος, Brassica Capitata Rubra, Red Cabbage.

III. The Description. The Common White Cabbage has a Root going right down, but not deep, not spreading far, and usually dies in Winter: from which Root springs up one thick Stalk, bowing at top thereof a great thick Head of crowded Leaves: this Head is cloed bort and round, and has at first great large thick Leaves, of a greenish green color, each thick, great, and lying open with part of the Summer, without closing: but towards the end of the Sum-mer, being grown to have many Leaves, it then be-
gins to grow close and round in the middle, and as it doth, the Leaves grow white internally, yet there are four kinds, which will never be so close as these, but will remain half open, which are not accounted to be so good as the other. In the middle of this Head, the next Year after the Sowing (in other Countries especially, and sometimes in ours) if the Winter is mild, you may see in divers Gardens a great thick Stalk to three foot, which is divided in the top into many Bicohes, or Branches, bearing thereon divers small Heads, sometimes white, but most commonly yellow, made of four Leaves, which being pale, turn into long, round, and pointed Cods, containing therein small round Seeds, like to Turnips Seed. Now here is to be noted, that by reason of the hard Promiscus, and Cold of our Countries, for the preventing the danger of the Gale Winter Willis, do advise take up such Cabbage (as they intend to reserve for Seed) with their Roots, and tying a Cloth or some such thing about the Roots, do hang them up in their Houses, that thereby they may be defended against the Cold; and then set them again after the Promiscus are past.

V. The Red Cabbage is in all things like unto the White, excepting in the color, this being deeply Red, or else in the magnitude, the Red being for the most part left than the White, and though it is many times found large, yet it is scarcely ever found so large as the large ones of the White. In this after the color of the Leaves is very variable, in some it is Green striped with Red, in others it is more Red, and again in some, it is a very deep Red, and sometimes declining to purple.

V. The Places. They are found growing with us only in Gardens, being nourished, and brought to perfection chiefly by the care and industry of Gardiners.

VI. The Times. They Flower for the most part in June or July, and the Seed is ripe in August.

VII. The Qualities. They are Temperate in respect both of coldness, and must in the fifth Degree: they are also Opening, Alleviative, Diuretic and Emetic: Allo Phlegm, Hepatic, Nephritic, and Hydric; Galled, Gouty and Alleviative.

VIII. The Specification. It is in use to be particular, for the old be nauseous, some having espoused Physicians out of their Territories for Five Hundred Years, did maintain their Health by using and applying Colleges and Emollients as their only Medicines, or Remedies, in every Disease. And therefore, they thought them to be useful against all Diseases of the Body, whether inward or outward, so Chrysipus wrote a Volume of their Virtues, applying them to every part of the Body.

IX. The Preparations. You may make therefrom,

The Virtues.

X. The liquid Juice. Drunk in Wine to three or four ounces, it is good against the bitings of Vipers, or other Venemous Creatures: mixed with Honey, and taken, it is good against Hornetings, and lobs of the Voice, and helps to restore such as are in Contusions: mixed with Wine or Vinegar, and drank, it is good against the Venom of Mulfrooms;Golden applied to the Temples of such as had the Head-acht, arising from Trunkkicks, it cleanseth so strongly, that it is said to cure the Leprosy.

XI. The Decoction. The first Decoction is fit to open the Body, but the second does Attache or Bind, for that the Nitrous quality is quite confirmed or spent. If it is made in Water, with an old Cock tureen to pieces boiled in it, it prevails against Contusions, and helps such as are troubled with Gulpings, and pains in their Stomachs and Bowels, it is also good for such as are troubled with Obftructions of Liver or Spleen, and the Stone or Gravel in Ribs or Bladder. It restrains the Vapors arising from Wine, and suddenly makes them fonder again. It takes away the Swelling and Pain of Condy Knee, being bathed warm therewith, dispersing the Humors. It also cleanseth and heals old and filthy Ulcers or Sores, and Scabbeds, being often washed therewith, as also Pustules and Wheals which break out in the Skin.

XII. The Syrup. Made of the Juice, has the Virtues of the same, but in a more peculiar manner it is good against Coughs, Colds, Wheezings, rheumats of Breath, Contusions, and other Difficulties of the Breff and Lungs: dropt into the Eyes, it assuages Films, Clouds, or other things which obfuscate the Sight, and heals Sores and Ulcers in the eyes.

XIII. The Eltherum. It is made of the Pulp of the great middle Rib of the great Leaves, boiled for in Almond Milk, or Cows Milk, and compounded with Honey, it is profoundly useful for Coughs as are Hoars or Wheezes, or are Puffies or Short-winded, being taken three, four or five times a day, as much as a Wætern.

XIV. The Afti. They are made of the Stalles, and are of such a drying Quality, that as Earklin for faith, they become almost Calmific: being mixed with Oil Olive, and Beef Burt, in a small proportion, they are found to be effectual to assuage the Sides of Coughs as have had vehement and inveterate Pains there, as also it is good for Pains in every other cause, caus'd by the access of Melancholy and Phlegmatic Humors, helping mightily to difficil and scatter them, and therefore must be very profound, against the Gout.

XV. The whole Substances. It is usually boiled in Water, or in Mutton or Beef Broth, full to every Part, and so with Butter, Vinegar, and Pepper, it is eaten as a Salter, and for Food: and so eaten it nourishes, cleanseth the Bowels, createth Seed, all Milk in Nerves.
Chap. 104. English Herbs.

Nurks, helps Coughs, and Hoarseness, and restores in Consumptions, being very Stomatchick (for Stomatchicks are indeed the greatest restoratives.)

XVI. The Collyrium. It is made of the Juice mixed with Honey, and boiled to the thicknes of a thin Syrup. Drop'd into the Eye, it clears the sight, and cleans it of Clouds or Films, or any other matter which hurts it. It prevails against an Ophthalmia, and heals Sore or Ulcers of the Eye, removing the weaknes, and much strengthening the part afflicted.

XVII. The Seed. If it is bruised, and mixed with a fifth part of Mustard Seed, and so drunk with Wine, it kills Worms in the Stomach or Bowels; it also expels Wind in the Bowels; and eases the pains of the Ventricle caused from Acid, or Cold and Moiht Humors. Dose one dram, Morning and Evening.

CHAP. CIV.

CALAMINT Common and Small.

I. THE Names. It is called in Greek, Καλάμνη (καλάμας vel utileς Μελή) in Latin, Calamintha; and in English, Calamint, or Mountain Mint.

II. The Kinds. It is chiefly twofold, 1. Calamintha vulgaris, Common Calamint; of which in this Chapter. 2. Calamintha angustifolia, Calamintha areosa, Field or Wild Calamint; of which in the next Chapter.

IV. The Description. Our ordinary Calamint has a Root small and woody, with divers small twigs, or fibre, spreading within the ground, not dying Annually, but obsolet many Years; from which Root rise up several square hoary and woody Stalks, about a foot high, seldom higher. The Stalks and Branche'd have two hoary Leaves set at a Joint, about the base of Marjoram, or not much bigger, a little dent'd about the edges, and of a very piercing and quick Scent; as the whole Herb is: The Flowers humid or several
Salmon's Herbal.

lib. I.

several places of the Skirts, from the middle almost upwards, which are small and growing, much like to those of Mint, and of a pale bluish color. The Flowers being gone, there follows small, round, blueish Seed.

V. Calamintha Pratitator America, has a woody root, which abounds, and yields forth new Branches every Year. It is a Sweet Herb, and rises up to be about a foot and half high, with square, hard, and hardy Seeds, which are many, and more slender than those of the Wild Mint, on which are set at every Joint, two small, and somewhat round Leaves, deeply divided like the edges, but larger than those of the Wild kind, being somewhat hairy, but not very hoary, rather of a fad green color, of a very fweet Scent, and not strong or badly at the other. The Flowers are gaping, and like the former, but larger, and of a purple color, which being gone, then comes the Seed, which is black, small, round, and something like unto Purslane Seed.

VI. The Small Calamint, is another sort of the first, and is like new in all thing, except the magnitude, being something less, and growing chiefly on the homers, which are not so large by one half, and therefore demands it to differ from the first.

VII. The Places. The herb grows in many Gardens, and in Dry and Uphill Grounds, and in Heaths in many places of England. The second grows in many places of English America, it having been found in several old Plantations, after they have been thrup for roll, as also in the Borders of several Woods. It has also been found on the Eauenoe Hills near Padova, on Hills near Venetia in Italy, on rocky Cliffs of Serena in Provence, as also in Germany: Label also found it growing in England. The Small Sort is found for the most part in those places where the first is also found, or not far off from them.

VIII. The Time. They all flower about the latter end of June, and in July, and their Seed is ripe in some short time afterwards.

IX. The Qualities. It is hot and dry in the third Degree: Albergent, Carminating, Digestive, Diffusive and Sudorific. It is also Cephalick, Neurotic, bromatonic, Pelcorial, Cordial and Hysterick: Alciphumific and Alterative.

X. The Specification. It powerfully provokes the Terms in Women, and facilitates the Delivery of Women in Labor.

XI. The Preparations. You may make therefrom,

Tree Virtue.

XII. The Powder of the Leaves. Made into an Elettuary with Salt and Honey, it kills Worms in the Body, helps the Leprofe, and affs as troubled with Pains of the Head.

XIII. The liquid Juice. It provokes Urine and the Terms, eases fits of Breathing, and Cholerick Torments of the Stomach and Bowels: It alfo Equalizes the Delivery of Women in Travel, and expels the Dead Child, and therefore Women with Child ought to forbear the use of it. Dropped in to the Ears, it kills Worms in them, and opens Obstructions of the Liver, Spleen and Worms. And the Body being fift well purged, if it is given from two to four ounces, to such as are troubled with a Tertian Ague, it cures it.

XIV. A Decotion in Wine. It has all the Virtues of the Liquid Juice, but not full can so powerfully cure, but as it is left in power, it is so much more pleasant to be taken, and therefore may be given in the larger Dose. It brings down Woman's Courties, and provokes Urine, and is good for those who are troubled with much vomitting, or are troubled with Convolutions, Cramps, or Thrombus of Breath. It helps the Yellow Jaundice, and Rats Vomiting, and is good against the brassings of Vipers, or other Venemous Creatures: It provokes Sweat powerfully, and therefore is singular good against all malign Fevers, as Meafeles, Small Pox, Spotted Fever, and the Plague it Dofe. Dropped from four to fix or eight ounces.

XV. The Distilled Water. It has all the Virtues of the Decotion, but much weaker, and therefore is chiefly used as a Vehicle to convey any of the other Preparations in.

XVI. The Syrup of the Juice. It is highly Pelcorial, and therefore most excellent thing to open Obstructions of the Lungs, and expel Phlegm. It powerfully cures Convolutions in the Bowels, Stomach, or in any other part of the Body, it strengthens Nature, cleans the Heart, revives the Spirits, and is an excellent thing against cold Sweats, Fainting, Sweatings, Fits, and all sorts of Deliriums of the Spirits or Heart, and other Bowels, proceeding from Cold, or a cold and moist Caft. Dofe half an ounce in a Glass of Wine, Morning Eating, and Evening, for some considerable time.

XVII. The Spirituorum Tinctura. It is a singular thing against all manner of Malady, Poison, and all manner of Fevers, or powerfully cures Convolutions in the Bowels, Stomach, or in any other part of the Body, it strengthens Nature, cleans the Heart, revives the Spirits, and is an excellent thing against cold Sweats, Fainting, Sweatings, Fits, and all sorts of Delirious of the Spirits or Heart, and other Bowels, proceeding from Cold, or a cold and moist Caust. Dofe half an ounce in a glass of Wine, Morning Eating, and Evening, or in the time of the Paroxysm.

XVIII. The Distilled Oil. It has all the Virtues of the juice and Wine, but much more efficient than either of them: being droped in or taken drops into Sugar, and soak drunk in a Glass of Wine, it gives immediate relief in the Cholick, and so given to a Woman in Labour, it quickly forces away the Child, either alive or dead, universally anointed upon parts Paralytic, or afficted with the Gout, it powerfully gives relief in the latter, and in some few times stirs up the former.

XIX. The Acid Tincture. It is most admirable against the Plague, Spotted Fever, and all other sorts of Malignant Fevers, as also against the Pothion of Spotted Fever, Dips of Mad Dogs, or other Venemous Creatures, the Acid destroying all sorts of malignity and Poison whatsoever: It may be given inwardly from half an ounce to two ounces every fix hours in some proper Vehicle, and outwardly bathed upon the Region of the Heart, or upon the place bitten or hurt, and Coaths dirt thereon may be laid on, and this three, four, or five times a day.

XX. The Oily Tincture. Given inwardly to two draughts, it gives ease in the Cholick presently, and opens Obstructions of the Reins and Winds, provoking Urine, and forcing away Scur, gravel, and other Taratious Matter, obstructing those parts: Anointed upon Spots, it cures them in a short time: and well rubbed in, Morning and Evening for several days, upon that part troubled with the Polia, it refires them, comforting the Nerves, and warming and strengthening the Parts afflicted: It is also profitable against the Piles, proceeding from a cold ​​caule, (it not broken) they being anointed thereon twice or three times.

XXI. The
XXI. The Salve Tincture. It is good to wash fitch parts as break out with any sharp or salt Hurts, as the Leprofis of the Greeks, Scurf, Mouth, Scald Hands, Dandriff, and the like: bathed upon parts troubled with the Gout or Scatica, and continued for some time, Morning and Evening, it gives ease of the Pain, does much good, and in time removes the Diseafe.

XXII. The Spirit. It is Cephalick, Neurotick, Stomachick, Condit, and Alexipharmick: It stops Vomiting, strengthens a weak Stomach, cheers the Heart, revives the Spirits, and is good against Painting and Sweating, Vapors, and Fits of the Mother, and prepares (being taken in a Morning taking) from the Infection of the Plague, or of the Spotted, or any other Malign Fever. You may take a spoonful or two of it at a time (if Dullness) and that twice a day, or upon the spot, if any Paroxysm is prefent: It is also good to bathe with, if any thing like a Coup de Skene is feared.

XXIII. The Balsam. Being applied to a cold Gout, it gives ease to the Pain, and anointed upon the Hemorrhoids, or Piles, it heals and cures them.

XXIV. The Ointment. It is good to anoint Women Breasts, which are swollen and painful, proceeding either from Cold, or Curled Milk, or some external Violence.

XXV. The Pearl. The green Herb made into a Pearl with Wool, and put up the Regina Uteri, it provokes the Terms, eases the pains of the Mother, refurbs the Bags and Hyperick Fits, and if it is near the time of Travel, hastens and facilitates the Birth.

XXVI. The Conspicuous. It is made of the green Herb, with Lard, Crumbs of Bread, or Powder of Bay-berries: being applied to any part pains with the Gout, it eases the Pains; abates the Tumor or Swelling, and diffuses or draws forth the Humors. It must be continued Morning and Evening for some considerable time, by which means it is said to perfect those Cures. Being applied upon places black and blew, or yellow, or otherwise discolored, it takes away the ill color, and cleanses the skin.

CHAP. CV.

CALAMINT, Wild.

I. THE Names. It is called in Greek, Κάλαμις: In Latin, Calamintha officinalis: and in Englifh, Wild Calamint.

II. The Kinds. We shall treat here of three several Kinds of it: 1. Calamintha officinalis verticillata, five Axiata Labellæ, Field Calamint with whorled Coronets. 2. Calamintha alba edora Valeri, folis macrophylo, Calamin having the Pennyroyal Smell, and with Spotted Leaves. 3. Calamintha major incana, The latter hoary Calamint.

III. The Description. The first of these has a small Root, slender, long, and not purging after Soect longs, and not purging after Soect longs: From which Root come forth several square hoary Stalks full of Joint, and two small, and almost round, hoary Leaves set thereon, up to the tops, something like to Pennyroyal leaves, of a brisk, floreal, and quick Scent, yet Sweet and mild, like unto Pennyroyal. Towards the Tops of the Stalks and Branches there stand, with the Leaves, many purplish Flowers, several being set together, in a kind of Witches or Coronets: after which comes small blackish Seed.

IV. The second or Spotted Calamint, differs not much from the Common Calamint in the former Chapter, but that it grows nothing near so great nor so high, it has square, hard, hoary Stalks, and hoary Leaves thereon like it, but spotted here and there, of a very strong Scent like unto Pennyroyal. The Flowers grow in the same manner as the Common Calamint.
Salmon's Herbal.  

Lib. I.

Calamint in Cap. 104, Sect. 4, is smaller, and of a pole purpurish color, having much like small blackish Seed.

Calamint.  Left Hoary.

V. The third, or Left hoary Calamint, has a fibrous Root like the others, and not perishing yearly. From which spring up small, low, and slender hoary Stalks, not above a foot high, on which, at every Joint, are set two Leaves, as in the other Kinds, but smaller, and more hoary, yet smaller than the leaf Bath Balf. The Flowers are very small, but like the leaf described, and of a leaf hoary, as well as hoary, but something hoary.

VI. The Places. The first grows in many places of England, both in plowed Grounds, and moist Meadows. The second, Pennys says he found on certain Hills in Lancashire, and in several places of our own Land, but not always spotted: I have found it in several places of South Carolina. The third and last is not common with us, but only nourished up in Gardens: It grows in London, from whence the Seed came first to Caticanurium.

VII. The Places. They Flower in June and July, and their Seed is ripe soon after.

VIII. As to their Qualities, Specification, Preparations, Virtues and Uses, they are exactly the same with those in the former Chapter, and therefore to those I refer you.

CHAP. CVI.

CALTROPS, Land.

1. Their Names. They are called in Greek Τετρανης, 2. Tetrane: in Latin, Tribulus: in English, Caltrops. The Arabians call this Plant Ἡφασις, and Ῥέσσα, 3. The Spaniard, Abrader, and the French, Salgat.

2. The Kinds. It is twofold, first of the Land, called in Greek, τετράνης, 4. Tetrane: in Latin, Tribulus terrestris, and in English, Land Caltrops, of which in this Chapter. Secondly, Water Caltrops, of which in the next.

III. The Description. Land Caltrop, has a Root which is white, grows downwards, and has many Fibres or Strings. From this Root rise up several hard, small, long Branches, full of Joints, and spread abroad upon the ground, which are furnished with many winged Leaves, having a middle Rib, on which stand several small Leaves, on both sides the said Rib, after the manner of Orobus or Verches. As the joints come forth singly, small, pale, whitish Flowers, consisting of four small Leaves, like the Flowers of Turmentis. These being put, there comes forth little, rough, prickly heads, full of Prickles, and having five or six Corners, within which prickly Hacks lies the Kernel or Seed.

IV. The Places. It is said to grow plentifully in Spain in their fields, being sometimes hurtful to Corn: It is also found in most places of Italy and France: And, as Gerard says, it grows with us in England, but, it is found in a moist Meadow adjoining to the then Wood or Park of Sir Francis Corso, near Croydon, not far from London, from whence he brought Plants of it for his Garden. Parkinson says it grows amongst Rubbish, and the Ruins of Buildings, and by Walls sides.

V. The Places. It Flowers in June and July, and the fruit or Seed is ripe in August.

VI. The Qualities. It is cold, in the first Degree, and dry in the second. It is Astringent and Repulsive, it is Alterative and Alcipharmick.

VII. The Specification. By reason it is of thin Parts, it is said to waite the Stone, Tartar, or Gavel in the Reins, and parts adjacent.

The Virtues.

IX. The liquid Juice. Being applied, it abates the Inflammation, and cures an Erysipelas: It hinders the breaking of Inflammations and Apotheques,
and stops the flux of Humors, and being drank from two ounces to four, it breaks or wals the Stone in the Reins, expelling Sand, Gravel, and Thymurum’s Horses, and stops all sorts of fluxes of the Bowels.

X. The Decollion. It has the same Virtues, and the more pleasant Medicine to take. It cures feve lues, being drunk into them, and almost the Inflammation, takes away the Blood-thro. If it is drank to two or three ounces in Wine, it prevals against the poison of the Vipers, and the bittings of other Venemous Beasts.

XI. The Decollion. It has the Virtues of the Juice and Effusion, but not all out so powerful: It may serve, as a Vehicle to convey the Powder of the Root in.

XII. The Poudier of the Root. It stops Fluxes of the Belly, and bindings: given to two drams, it is good against the bittings of Vipers; consoles Noxes and Kernels in the Neck, or other Parts, and in a great measure mitigates the Soreness.

XIII. The Calthiaum. It is made of the Juice or Effusion made into a thin Syrup with Honey. This paffed into the Eye three or four times a day, stops fluxions of Humors into the Parts, cools and takes away the Inflammation, and heals Sores or Ulcers therein.

XIV. The Caltiaum of the Leaves. It is good against a hot Gout, repercuses the flux of Humors, hinders Apoplexy, and diffuses Swellings in the Less, or other parts of the Body.

XV. The Latium. It is made of the Decollion in Wine, in a quart of which, Honey three ounces, and Rock Amal half an ounce, is dissolved. It is made to heal corrupt Sores and Ulcers of the Mouth, Throat, and Gums, and to cleanse Fiftula’s, as also Ulcers newly broke, or opened, by infilling it with a Syringe.

XVI. The Seed or Fruits. It is Aecophilanthum; Caltrop, or Plenty Bay, that the Thracians, who dwelt near the River Sormus, lived themselves of the Fruit or Kernels, making them into a sifter and five kind of Bread, which something bound up the Belly: And that with the Herb they fed their Horses. But this making Bread of the Kernels is allowed by none, to be only meant of the Fruit of the Water Caltrop, following.

CHAP. VII.

CALTROP, Water.

I. The Names. It is called in Greek "Talisman;" in Latin, Tribulus aquatica, Tribulus marinus, and by Others, Lychtrares: in English, Water Caltrop, Saltpeter, and Water Nuts.

II. The Kinds. There are two sorts of Water Caltrop. 1. The Greater Water Caltrop. 2. The Lesser Water Caltrop. And of the Latter, there are also two Kinds, viz. The Former and the Latter.

The Greater Water Caltrop, is called in Latin, Tribulus Aquaticus major: Tribulus Aquaticus, and Callophleum aquatica. The Lesser sorts are called by Colus, Tribulus aquatica minor: and ditrigulatus, by him, the former of which he calls, Tribulus aquatica minor prior; and the latter, Tribulus aquatica minor ulterior.

III. The Description. The Greater Water Caltrop has a Root which grows somewhat long, and full of joints, with a Tuff of Hairs or Fibres at each of them. From the top or head, a Root runs under Water, risse up several long slender Vessels, which rise from the bottom of the Water, mount above the same; at the top of each of which, there are broad, and more than half round Leaves, in some places Spotted on the under side, and denoted about the Edges. The Vessels on which these Leaves stand, are smaller at the lower end near the Root, than they are at top of the Water next to the Leaves. Among these Leaves rise up many round Stalks, no higher than the Leaves, bearing white Flowers at the Top. After which come thick, hard, andWoody, almost round beads, with three or four sharp pricks or points sticking out, of the bigness of Holf Nuts, and blackish in some places: some of them are as large as great Walnuts, having a sweet white Kernel within, which is not much unlike to a Cereus.

This Fruit, with its outround black, or Shell, in hard, triangle, sharp pointed and prickly, in shape almost like to those things called Caltrops, which in War they cast in the way of the Enemy, to annoy the feet of their Horses, and from whence this Plant took its name. The Kernel is tasted almost like a Corinthus, and are usually eaten green: And being dried, they are ground to powder, and so force to make bread of.

IV. The former letfer Caltrop, the whole Plant, is commonly covered over with Water, having very long, slender, creeping Roots, from which several Parts or Branches come forth几千 small tubors or Strings, which take hold of the Mud. From this Root, at the lower Joints thereof some forth thin, flat, woody Stalks, of a reddish color, three, four, or five feet long, or longer, according to the depth of the Water in which it grows, which being dry, are plant, and flexible, and fit for many occasions. They are directed towards the Top, into many Parts or Branches, carrying single Leaves at the lower Joints, on both sides, being about two inches long, and half an inch broad, thin, and almost transparent, or as it were thinning. So wonder, wrinkled, or cramped on the Edges, that they can to to them, and for the most part of a reddish green color. The Vessels are somewhat long and thick, and rise up from among these Leaves, which always grow two, one opposite against another, in a common manner, which grow below on the Stalk. From the Joint
Salmon's Herbal.  Lib. I.

With the Leovers come forth small footstalks, bearing at their cats small, whish, long and thick flowers. Gerard says, out of thefe Stalks, as the Totes, grow small cresce-like Heads, out of which grow small reddish yellow, like the Shay of the Oak, every flower having four very small round Coen Leaves: everR every flower, there comes commonly four sharp pointed Greena growing together, containing within them a little white Kernel.

V. The latter small Water Caltop, has a Root not much unlike to the former, but longer, and fattier of single Fibro or Strings. From small spring up Stalks, not flat, as the former, but round honed, and always bearing two Leaves at every Joint, one opo- pugne against the other, greener, shorter, and leffer than the other, sharp pointed, and not much wrinkled or crumpled on the Edges. Cottons fay, that they are not at all crumpled. But our English Herbifler never observed any without crumplery or wrinkles.

The Flowers grow on short small Footstalks, of a whish green color, like shefe of Muscicella Corioli, cal- led by Gerard, Radix cava minima viridi flore, to see, two flowers at the top of every Footstalk, one ope- pugne against another, every flower containing four small Leaves: which two flowers being fall, there comes up eight small Hanks, making six several ways a füewe of flowers.

VI. The Flower. The greatest is found in several Lakes and moift places in Germany, as also in Eng- land and Hollanders, and in many places of Italy near the Sea. One Purchas a Merchant of London found it in the left Country in the Mogul's Country, where it grew like a Weed in moift Ponds there, the Ker- nel of which, he fays, is much eaten by the Natives. See Purchas his Pilgrims, lib. a, cap. a, feld. 9, pag. 229. Cotton fays it grows in Germany in Midday Lakes and Pitches, and in Ditches which have Mud in them, as also in Standing Waters, and sometimes also in Running Waters. And Matinhall fays, it grows not only in Lakes of Sweet Water, but alfo in Ditches by the Sea fide near Venice. The se- cond or former ifier grows in standing Waters, or Ponds, Ditches, or Fifty Ponds: It was found in Ponds adjoining to a diffolved Abbey called Dartfoot, which divide Hampshire and Suffolk, and in other standing Waters in several places. The third or lafer small ifier grows plentifully in the River by Drev- ford in Hampshire.

VII. The Fower. They all flower in June and July, and give their Fruit or Seed in Auguf.

VIII. The Fruit. They are all cold and moift in the firft Degree, and more Watery than the Land Cattoop. They are Emoluntil, Repercutive, Neph- tick, Alterative and Aleycamphick.

IX. The Speciation. They are good against the Obftuation, from the Reins, Gutter, Tafar in the Urinary Paffages, heat of Urine, and plifying of Blood.

The Virtues.

XLI. The liquid Tisue. Being applied, it cures an Erypifales and is good against Inflammations in any part of the Body, and cures the King's-Evil. Running Sores, or Ulcers, by walking with it.

XLII. The Decufion. It makes in White Woffe, or in Wine and Water, it opens the Obftuation of the Reins and Hepafes, expea Taffar, Sand and Gravel, out of the Urinary Paris, and helps Radding of the Water.

XIII. The Difaflewed Water. It is drunk with a little Roch Allum dissolved in it, it stops the plifying of Blood, and is profitable against the Diabetes.

XIV. The Latm. It is made of the Decufion in Water with the addition of Honey, Gerard fays, it perfectly cures Cancers of the Mouth, Throat, Al- monds, and Ee Gums.

XV. The Caffapluf of the Herbs. Diffwirk fays, it is good against all kinds of Inflammations, or hot Swellings. It may be profitably applied in a hot Court, after fufficient cleaning of the Body, both with Eternicks and Catharticks.

XVI. The Nuts. Eater raw, they refit Polon, and are faid to be good againft the bilings of Ve- nomous Beifs: Eater alfo, and drinking White Wine with them, they are faid to be good againft Stone and Gravel. In like manner eaten, and also beaten, and applied to the place, they refit the Po- lon of the bilings of Venomous Beifs.

XVII. The Powder of the Nuts. Gerard fays, it is given to drink as fuch as Blood, and are troubled with Gravel, and that it binds the Belly. It is doubtlefs a fignal thing against the Bloody Flux, and other Paffages of the Reins, if it is given from a dram, to two drams, in a Grift of Sherry, or Madera Wine: being dried, and ground to Powder in Quantities, a prefent kind of Blood may be made hereof.

CHAP. CVIII.

C A M O M I L.

Camomil Com.
II. The Kinds. There are four several kinds here-
of, viz. 1. The Common Garden kind, which is cal-
led in Latin, Chamomilla hortensis, and Chamomile-
hortensis. 2. The Naked flowered, called Cham-
emelum nudum. 3. The Double flowered, called Cham-
emelum flore pleno, and Chamemelum Anglicum 
florê multiplicate. 4. The Roman, called Chamemelum 
Romanum. As for the Wild Kinds, one Otao, Par-
rkinson thinks them to be not so much of the Camo-
nil kind, as of the Parthenium, or Heathermone, of 
which see Mr. Wred.

III. The Descriptions. The Common Camomil 
has a small and fibrous Root, from whence spring 
many weak and stivle Branches, trailing or leaning 
to the ground, which take hold on the Top of the 
Earth as it rutes, whereby it much encreases. The 
Leaves are very fine, and much jagged, or deeply 
eat, of a very strong sweet smell. Among which, at 
tops of the Branches come forth flowers like unto 
the Field Daffie, having a border of small white 
Leaves, with yellow thrums in the middle, treacle-
close together, as it is that of the Daffie, or Heathermone, 
but larger, and not so hard, but more soft and gentle 
in handling; which grow a small white Seed, not ob-
formed by many, but being found, or cast into the 
ground, will bring forth Plants as other Seed doth.

Camomil naked flowered

Roman Camomill

IV. The Naked flowered, has Roots, Leaves, Stalks, 
and Branches like to the former, and creeping upon 
the Surfaces of the Earth as that doth; but its Leaves 
are finer, and shorter, and it bears naked flowers, 
which consist only of the middle yellow Thrum, with-
out any pale or border of white. Leaves round about 
it, being much larger. As for the Double flowered, called the 
Noble Plant is of a pleasing smell, for which reason some 
have given it the Epithet of Oloratum, as Gerard 
says.

The Double flowered has also Roots, Leaves, 
Stalks and Branches like to the first, it creeps as

much on the ground, and yet grows higher, and more 
upright: Its Leaves are of a lighter green color; 
and in its Flowers the white Leaves going round the 
flame are manifold, or much doubled, in height than 
the yellow thrums in the middle: little feet, so 
that it seems but a little yellowish feet. This Plant 
is of a sweeter Scent than the first, and is more 
tender to be kept in Winter. It has oft been in 
the middle of the flowers, which being broken and cast 
into the Ground, will produce Double flowered Camo-
mil.

Camomill naked flowered

Roman Camomil

VI. The Roman Camomil, has a Root somewhat 
thicker than the former, but fibrous without, from 
tolerance rise up many slender Stalks, yet ficker, and 
stronger than any of the others, for which reason it 
stands more upright, and does not creep upon the 
Earth, as the rest do. The Leaves are fine, but ra-
ther shorter, and of a much lighter color, tending 
something to the color of Wood Leaves: the flowers 
are like to the first, having a single border of white 
Leaves, and a close yellow Thrumb in the middle, 
after which comes small white Seed, like that in the 
Common Camomil: The whole Plant has a very sweet 
Scent.

VII. The Places. The first grows in most Gardens 
throughout England, besides it grows Wild (as 
Parkeston says) in many places of this Land: the 
other three kinds grow with us only in Gardens.

VIII. The Times. They flower for the most part 
through all the Summer Months, and their Seed 
comes to perfection in the time of Summer.

IX. The Qualities. They are all of them hot and 
dry in three: Aperitive, Morbidie, Digestive, Di-
cultive, Diuretick, Sudorific, Alterative, and Alexi-
pharmic.

X. The Specification. The Egyptians dedicated it 
to the curing of Agues: and experience has con-
formed it an admirable thing against Diuretics of the 
Plague.

XI. The Preparations. There are, 1. A Liquid 
Juice. 2. An Efficacy. 3. A Syrup. 4. An In-
fusion. 5. A Decotion. 6. A Powder. 7. An Oil by 
Infusion. 8. An Ointment. 9. A Balsam. 10. A
The Virtues.

XII. The liquid Juice. It is Antiscurvickick, refists the Infection of the Plague, and being taken inwardly to four or five ounces, two hours before the coming of the fit of an Ague, whether Quotidian, Tertian, or Quadrant, it commonly cures at one or three of Doses, besides which it cures an exquisitly Pleurific, more especially if a little Salt of Blood (whether of Man or Beast) is added to it, and this I have had experience of in my own Person, and since that have cured several others by the fame Medicament. It provokes the Terms in Woman, oups the Urinary passings, and gives ease in the Straining to a Miracle.

XIII. The Efficence. It has all the Virtues of the former, besides which it facilitates the Birth, and helps to the Recovery of the Child, whether Dead or Alive, as also to the Afterbirth: It cautes a free Breathing, is good against Colds, Coughs, Altima, and other Obstructions of the Lungs, as also Stitches in the Sides. Dose four Ounces, Morning and Evening, is good.

XIV. The Syrup. Made of the Juice of Double-flowered Camomil, Nine Bushins, but of our Common Garden Camomil, say Pots and Label, with the Flowers also, and a little White Wine, being taken three or four mouthfuls at a time, is a remedy against the Jaundice and Dropitie, as also the evil disposition of the Spleen.

XV. The Infuion. If it is made in White Port Wine, it provokes Urine, opens Obstructions of the Urinary Parts, expels Skins, Gravel, and Tartar, and helps a flowing Breath. It has the Virtues of the Juice and Infuion, but not stronger to powerfull.

XVI. The Decotion. If made in Wine, or part Wine part Water, and taken inwardly, it has the Virtues of the Juice and Infuion, but very much weaker. Yet it prevails powerfully against the Cholick: Parkinson says, it takes away all Pains and Stitches in the Sides. Tired Limbs being lathed throughly, and being away their Weariness, and Pains to what part of the Body forever it is applied. It comforts the Nerves that are over-strained, mollifies Tumors, and diffuses Arch, which are not very hot, and moderately comforts Arch, which have need of warmth, or are chilled by any Cold Paralytick Humor.

XVII. The Tender. Made of the dried Herb, but chiefly of the Flowers, being given from half a dram, to one dram, it helps the Gripping of the Guts, Wind, and Pain of the Stomach.

XVIII. The Oil by Infuion of the Flowers in Oil of Olive. If the Person troubled with an Ague, be anointed with this Oil, before a good fire, from the Crown of the Head to the Soles of the Feet, and after that, be laid to Sweat in a Bed, being so warm covered that they may Soeet well, it cures it, for the Ague be what it will. This is an Egyptian Medicine, and Gibson fays to correct it: For in Egypt, that the Spof of Egypt, Contaminated this Herb to the Sun, for its Virtue in curing all sorts of Agues. But therein, says Galen, they were deceiued, for it cures only those where the Humors are already digested, but this is very profitable (Gals fays), for all other sorts of Agues, which come either from Heat or Malignantly, or from an Inflammation of the Bowels, for these (says he,) Camomil is a Sovereign Remedy to be applied, the Humors being left Concocted. It is good against cold Grains, coldfits of the Limbs, and Pains and Aches proceeding from Cold and Moisture.

XIX. The Ointment. It heals Wounds in a Cold, Scorbatic habitude of Body, gives colour to the Gout, and mollifies Tumors proceeding from an afflux or Humors.

XX. The Balsam. It is more excellent for healing Wounds than the Ointment, and being mixed with other proper things, it brings Apopenyms and Tumors to suppuration, and prevails regularly against the Gout, whether it proceeds from a hot or a cold Caufe, and it will be so much the more effectual, if Camphor be added to it, which contains in it a subtil Fire, which draws forth the Effence of the Gout through the Pores of the Skin.

XXI. The Concoction. Being applied, it is useful to diffufts, or diffive Tumors, and Wind, in any part of the Body, and to ease Pains and Aches in the Joints. Being applied to the Ribs, and Hypochondriues, as hot as it can be endured, it evacuates the Spleen, expels Wind, and gives immediate relief in the pains of the most exquisite Pleuritie: It also takes away Pains and Stitches in the Sides. It weakens the throat in want of breath and cures painfully an enteritis of breathing.

XXII. The Distilled Water. It is good against Coughs of the Heart and Head, and generally against Stomach and Bowels. It expels or lessens the Vapors and Fits of the Mother, as also Pains and Dilemmes of the Spleen, but it is chiefly used as a Vehicle to convey the other Preparations of this Plan into the Body. Six ounces of it being drunk with a scarce or half a dram of Salt of Camomil diffolved in it, prevails wonderfully against Rupage of Urine, and is helpful against the Strangury.

XXIII. The Spirituosum Tinctura. Made from the Flowers, or the Herb and Flowers together, it prevails against Painting and Swooning Fits, coldfits of the Stomach, and Rickets at Heart. It comforts all parts which have need of warmth, it digests crude Humors, diffufts Wind in the Stomach and Bowels, alleviates the Pains and Turfovers of the Belly, and provokes Urine gently: It induces Sweat, and expels cold Aches and Pains in what part of the Body forever.

XXIV. The Acid Tinctura. It digests, looths, caues Pain, is highly Antiscurvickick, Antisick, and strongly Diuretic. It powerfully opens Obstructions of the Lungs, and helps such as have a thoroughness of Breath, difficulty of Breathing, are Hoartic, and Whistle much, so as in a manner they have lost their Voice. It Attemperates, Cleanses, Purges, Opens, Expectorates tough Flatus, and is profitable for all Diseases of the Brest, caused by the Afflux of moist and phlegmatic Humors, whether Thin or Thick, Tough, Rotten, or Corrupt, causing the flame to be spit forth. You may make it pleasant and grateful with Syrup of Violiers, or Clove-thistle flowers, or a pure Tincture of Spungel Juice of Liquors, and so to be taken often in the Day, and that for many Days together.

XXV. The Only Tinctura. This being rubbed in daily, Morning and Night, before a good Fire, all along the Back-bone, from the Head to the Anse, and also over all the affected Limbs, it cures a Falfe above all other things in the World. It also expands the Hardness caused by Venoms of any sort, or the parts affected twice a Day, and continued for some time. It expels Cold, caues Pains, diffusets cold and windy Tumors, cures the Pains of the Elbows, after-part of Wound, and whenever it is laid over a little above the Shone Bone, and twenty drops of it given inwardly, in a Glas of Canary. In all outward applications, if you add a little Campshire to it, one ounce of Camphir to a pound of the

of CAMMOCK, or REST HARROW.

I. The Name. It is called in Greek by Δέσμαρις and Πυτος; in Latin, Anonis; and in Arabic, أهنات. There is a vast difference in the Sciences, wherefore there are many kinds of it; but those which are only Common with us, are these following five: 1. Anonis sparsa fibre purpurae, Common Rest Harrow, with purple flowers. 2. Anonis sparsa fibre alba, Rest Harrow, with white flowers. 3. Anonis sparsa fibre aures, Rest Harrow, with yellow flowers, the left. 4. Anonis non sparsa fibre purpurae, Rest Harrow not thorny, with purple flowers. 5. Anonis non sparsa fibre major, Rest Harrow not thorny, with yellow flowers, the greater.

II. The Spirit. It is a singular Cordial, chews the Heart, revives the Spirit, strengthens Nature, and makes the Body able to withstand Difficulties. It is good against Convulsions, and prevails much against Wind, Pain, and the Sicknesses of the Womb, and Difficulties in the Urinary parts, for which it is a Specific. It comforts the Head, Nerves, and Brain, and is so great a Stimulant, that there is but two draams, being to be taken.

XXVIII. The Spirit. It is a singular Cordial, chews the Heart, revives the Spirit, strengthens Nature, and makes the Body able to withstand Difficulties. It is good against Convulsions, and prevails much against Wind, Pain, and the Sicknesses of the Womb, and Difficulties in the Urinary parts, for which it is a Specific. It comforts the Head, Nerves, and Brain, and is so great a Stimulant, that there is but two draams, being to be taken.

It is good against Convulsions, and prevails much against Wind, Pain, and the Sicknesses of the Womb, and Difficulties in the Urinary parts, for which it is a Specific. It comforts the Head, Nerves, and Brain, and is so great a Stimulant, that there is but two draams, being to be taken.

Of Cammock, or Rest Harrow.

Cammock or Rest Harrow
Salmon's Herbal. Lib. I.

150

It grows in the meadow, where it is not free from the root, and consists in roots, very tough and hard to break, whetst it is green and fresh, and as hard and tough as a horn when it is dried, the root being in length from four to six inches, and from one to three feet deep into the ground, and spreading itself like a wort about, every little piece, though cut off from the Stock, being apt to grow again, if it be left in the ground. From this Stock it rises up, with hairs tough woody twigs, three or four feet high, first at the Roots without order, with little roundish Leaves, sometimes more than two or three at a place, of a dark green color, without thorns while they are young, but afterwards armed, or furnished with several thorns, the thorns being flat but sharp. The Flowers come forth at the top of the Twigs and Branches, the same as in fifteen much like the Prest or Brune- bloomy, butiffer, fuller, and somewhat altered, of a green purplish color. They being cast away, there flowers small Pods or Coles, containing within them several Seeds.

IV. The Second Reft Harrow differs not from the former in the Roots, Stalks, Branches, Thorn, nor in the Leaves, save that these are of a little fewer green color, but the chief difference is in the Flowers, which are very white in some places more than in others; in all other things they are alike.

V. The third, which is the Lesser yellow prickly Reft Harrow, or (for the larger green not in England) has Thorns or Prickles thereon as the others; but the Plant is lower, and smaller, not rising little above half a foot, not differing in any other way from the last.

VI. The fourth, which is the Purplish Reft Harrow without Prickles, has no other difference in it from the third excepting on the Grounds, but in this, that it has no Thorns or Prickles upon the Springs or Branches, no not in the Autumn, or declining part of the Year, when the other will be full of them. Of this there is one in one which bears white Flowers, which makes all the difference.

VII. The fifth and last has a Root which is long, tough, rough, and blackish, spreading much about from this Root spring forth several woody Twigs, very flexible and tough, branching forth on all sides, covered with a brownish red Bark, covered with a brownish red Bark, covered with Leaves, which are for the most part three standing together, and apt to be put upon a long Foot, and much unlike to Vetch, but somewhat small, long, and narrow, with notches at the ends, much overthrown with a strong Scented cloumnitas, which still sticks fast to the Hands of both sexes; and this having been dried, is only in the heat of the Year, and in hot Countries, that is difficult to get off again. At Tops of the Branches or Twigs, find many Peas-like little Hairs, of a fair yellow color, which being put away, there comes forth small and long Coles, with a crooked point at the end of each, in which is contained small flat darkish Seeds: of these there is a fair sort, and also another with a more reddish Color.

VIII. The Plores. The first, second, and fourth grow in many places of England, both in Arable Land, and wild Grounds. The third, Label faith he found growing both about London and Berks, but Parkinson says, he never found it growing naturally. The fifth and last I found in several places of Holland, as in the Southern Provinces of Carolina. It also grows about Harvone and Mangolerne in Flanders, as also in Spain and Portugal.

IX. The Times. They all flower about the beginning or middle of July, and the Seed is ripe in August.

X. The Qualities. Let them, that the Root of Red Harrow is ho, in the third Degree; it is also drying, without exceeding the second Degree; it is a Stimulant, Aperitive, Astringent, Diuretic, and Auristic, and Alterative.

XI. The Specification. It is peculiar to destroy Viscous Mollets, Spots, and other Skin and Urinary parts, to open their Obstructions, and to cleanse them.

XII. The Preparation. You may have therefrom,

1. A Decoction in Wine from the Bark of the Root. 2. A Decoction in Vinegar.

The Bark of the Root is that in this Plant, which is chiefly used.

The Virtues.

XIII. The Decoction in Wine. Take Red Harrow Roots thin sliced, four pounds; choice Cinnamon a gallon; mix and put it into a Stone Pot, which let be close stop, and let that Pot be put into a gentle boiling Saline for twenty four hours; so will you have a noble and pleasant Medicine to open Oldfogans both of the Skin and Urinary parts, to provoke Urine, and to break and drive forth the Stone; as also Gravel and Sand out of the Knees, Urine and Blood; and also cures the Hemorrhoids, and the like.

XIV. The Decoction in Vinegar. Being ground in the Mouth, it acts the Tooth-sach, more especially when it proceeds from Rheum, it also heals Cancers in Children Mucous, and other running Sores, and Ulcers in the Gums, Mouth, and Throat, if they be three or four times a day gorged, and wash therewith.

XV. The Powder of the Bark of the Root. Parkinson says, it is good to provoke Urine when it is stop, and to break and drive forth the Stone effectually, being taken to one or two drams in generous Wine. Matthioli says, that he knew divers freed from thole Difficulties, that usd the said Powder in Wine for many Days together. The said Powder is also good to help the Herna, Carums, or Hothy Suppur, which Hothy Carumoly is confused by little and little, taking it constantly for some Months together; and this it has done when the Physicians have done nothing else with them; them over as desperate, or no other ways to be cured, but by cutting, &c. being fired upon the heart, colics from of edges of Ulcers, or if the said Powder be mixed with a powder of Bland, and applied, it confines the hardness, and cures the Ulcer to heal.

XVI. The Diluted Water of the Roots. To every pound of the Roots, flower it, put a quart of Camomile: digust forty eight hours warm, then draw off the Water to dyse in a gentle Bolline. It is good for all the purpases aforesaid, and to cleanse the paviljs of the Urine, not letting any Turgour, Vicious or Chamy matter to gather together in those parts, so as to harden, or to become a Stone.

XVII. The Spirituous Tincture. It is a very good Stomacher, and admirably strengthens the Bloods, Roping Vomiting, and all sorts of Fuirves thereof, as Dintia, Djerconia, Limeria, and the He- netick Flux; and also being put to them over, and cleanse the Urinary parts of any Preeminent Matter lodged in them, yet it stops and cures piling of Blood, and specifically heals any Wound or Ulcer in those parts.

XVIII. The Acid Tincture. It is more Stomacher than the former, and an excellent Stiphrick, it stops flushing of Blood, and heals Ulcers of the Lungs, it gives more strength to the Body, and by its Aperitive, Altemative, and Incite power, it brings to presc...
or diffuses Gritty Stones in the Reins or Bladder. 

Doat sixty or eighty drops, in Ale, Beer, or Wine.

XIX. The Oily Tincture. This is more excellent, if there be no Wound or Ulcer in the Reins or Bladder; for many of the parts being bruised, this Homonge and Oily Body wonderfully comforts the Parts, gently cleanses them of all Foreign, Tartarous, Viscous, Grannys or Sharp Humors, purifies the Pain, and in some short time heals them. If there be no Wound or Ulcer, but only Obstruc- tions, or a weakness in the Reins and Back, it eff- eetually opens them, smoothly cleanses them, and makes the Patient Pale, and afe, and virtual to strengthen the Back, and eases the Pains thereof, as if there had never been any such Weakness, or Difficulties there. Doat twenty drops in a Glass of Wine.

XX. The Salute Tincture. Being bated upon any parts affeeted with Pimples, Scurf, Morphew, Dandruff, or other like Putridal Eruptions of the Skin, it cleanses it, and takes them away. It was informed by a Gentlewoman who had used it for some time, that it had taken away Tumefcions, Sun-burnings, and Freckles, and cleared the Skin of ad- marition. Inwardly it is given to one dram in White Wine against Stools, Gravel, Sand, and other Obstruc- tions of the Reins.

XXI. It is reported, that in former times the young Shoos, and tender Salses, before they become prickly, were pick'd up, to be eaten as a Saver for Mearr: and that they were wonderfully commend'd against a thinking Breath, and to take away the small of Wine in such as had drunk too much.

CHAP. CX.

CAMPIONS, Garden.

1. THe Names. They are called in Greek, by

Dafiorides and Theophrastus, e.JvJtv (from alywLychnis), and 

Lychnis, Lychnis coronaria rubra, a kind taught by Hadrianus for

Niciod, for that in former times they used the

Leaves of Campions in their Lamps, to burn instead of Welks: they also called it Anderis, el eff, im-

morato, quod diutius vegetatum fioam retinet: in Latin, Lychnis, Lychnis Coronaria, Lychnis Salvia,

Lychnis coronaria rubra, & Reyn Græca: in English, Campions, and Rose Campions.

2. The Kinds. They are two-fold, or

Lychnis coronaria rubra, & Reyn Græca, Garden Campions, of which in this Chap- 

ter. 3. Lychnis Coronaria, Wild Campions, of

which in the next Chapter. The Garden Kinds, are,

1. Single. 2. Double. The Single are, Lychnis

Coronaria rubra simplex, The single red Rose Campion.

3. Lychnis coronaria alba simplex, The single white Rose Campion. 4. Lychnis coronaria al-

bae, five inamora maccia, & non maculae sim- 

plex, The bluf Rose Campion, spotted and not

spotted. The Double, 5. Lychnis coronaria rubra 

MULTIPLEX, The Double red Rose Campion.

3. The Descriptions. The Single red Rose Campion, has a Root small, long, and woody, with many 

flowers annexed unto it, and oft times flowers forth once, and sometimes afo deate and perifhes. On the 

Top of this Root, there are divers thick, brown, or woody, long, green Leaves, whilch green all the Win-

ter, from young which in the end of the Spring, or 

beginning of Summer, there flowers forth two or three 

hard, round, woody Stalks, with some Juices there-
Salmon's Herbal.

I. The Qualities. The Seed, which is chiefly used, is hot and dry in the second Degree. It is Valerianate, Alterative, and Alexipharmick.

X. The Specification. It is peculiar against the Poison of Scorpions.

XI. The Preparations. There are but few Preparations of this Plant; the chief things taken from it are the Leaf, and the Seed; of which there are said, 1. The Green Leaf. 2. The Powder of the Seed. 3. The Spirituos Tinure. 4. The Acid Tinure.

The Virtue.

XII. The Green Leaves. Being applied whole, or beaten in a Mortar into a Camphirum, with a little Hops, Lard, and Turpentine, and applied to any old or fresh Ulcers in the Legs, Arms, or other parts; it does cleanse and heal them.

XIII. The Powder of the Seed. Gather affirms it to be hot and dry in the second or third Degree. And Dioscorides says, that being drunk in Wine, it helps those who are hang by a Scorpion; and so it is also thought to be good against the malignity of the Plague or Pestilence. Dose one dram at a time, Morning and Evening.

XIV. The Spirituos Tinure. It has the former Virtues, but more powerful against the Plague or Pestilence, the Spotted Fever, bitings of Serpents, Mad Dogs, or other Venemous Creatures. Dose half a spoonful, or a spoonful, in a Glass of Wine, Morning and Evening.

XV. The Acid Tinure. It has the Virtues of the former, is more Stermonic, and more powerfully refills the Malignity or Poison of the Plague, it destroys that, and the Fever together. Dose forty or eighty drops, or more, in generous Canary.

CHAP. CXI.

Of CAMPIONS WILD.

I. THE Names. They are called in Greek Ακροφαίαν. In Latin, Lychnis Sylyvestris: and in English, Wild Campions.

II. The Kinds. They are manifold, 35, 1. Single.

III. The Double Wild Campions, are, 1. Lychnis planaria Sylyvestris multiplex, Armoraria praetens flore pleno, The feathered Wild Campion Double.

2. Lychnis aegreps multiplex of Leach, Ozymonies flore pleno. 3. Camerarias, Lychnis Sylyvestris purpurea multiplex, of Gerard, flore pleno rubra, of Parkinson, Red Bachelors Buttons. 4. Lychnis Sylyvestris multiplex, by Potts and Leach, Ozymonies, of Tiberiustanis Lychnis Sylyvestris alba multiplex, by Gerard, flore alba pleno, of Parkinson, White Bachelors Buttons. 5. Lychnis aegreps albo rubra, of Potts and Leach, Ozymonies, flore vars, Bachelors Buttons with green Flowers.

IV. The
IV. The Description. The first of the Single Wild Campions has a Root white and long, spreading forth divers Branches in the ground, and bearing after Seed-time from whence come forth many long and somewhat broad, dark green Leaves, lying upon the ground, with several Buds therein, not much unlike to Red-root Plantain, but somewhat hairy, broader, but not so long. The Stalks are very tall, and rise up in the midst of them, three or four feet high, and sometimes more, with several large white Flowers at several places thereon, and two such like Leaves thereon up to the Top. From these large Stalks some forth divers Branches also at their various joints, all which bear on various Footstalks white Flowers at their several Tops, consisting of five broad pointed Leaves, every one cut in on the end unto the middle, making them to look like two slices: They bear something fuscet, and each of these stand in a large, green, fringed, hairy Husk or Cape, large and round below next to the Footstalk. The Seed is small and greyish in the hard beak which come up afterwards.

V. The second Single Wild Campion, has a Root like the former, which perishes after Seed-time. This Red Campion grows after the same manner as the former, but its Leaves are not so perfectly ribbed, are something shorter, rounder, and more soft or woody in handling. The Flowers are of the same form and bigness, in some of a pale, in others of a bright reddish color, cut in at the ends more finely, which makes the cut or jagged Leaves seem to be more in number than the other. The Seed is like the former, small and greyish.

VI. The third Single Red Wild Campion, which is the leafer, has a Root like the former, which perishes after Seed-time, as they do. This white Plant is very like the foregoing, but smaller and lower, yet very much branched, and replenished with dark or green Leaves. The Flowers are reddish; but smaller, and not so much cut or dashed in at the ends. The Husks and Seeds are also like the former, but every way leffer.

VII. The fourth, or Corn Campion of the Gardens, has a Root, long, white, and woody, with several branches springing from it, (and is but an Annual Plant) from which rises up for the most part but one round Stalk, spreading it self out every way into several Branches, bearing two long Leaves for opposition at the base, being broad at the bottom, and encompassing the Stalk and Branches, not much unlike to Through-wax, ending in a small point, of a pale green color. At the Top of the several Branches, stand divers Flowers, consisting of four Leaves a piece.
Double Wild Campions.

XII. The first of these (in our Account) is the Double Feathered Wild Campion, which in its Roots, Stalks, Branches, Leaves, Flowers, Husks, and Seed, is like unto the Single Feathered Wild Campion; excepting only in two things; 1. That the Flowers are very Double. 2. That the whole Plant in its magnitude and manner of growing is smaller and lower.

XIII. The second, or Red Batchelors Buttons has a thick large Root, white and long, with many Branches and Fibres springing from it; from whence come up many rough broad Leaves, somewhat wavy and hairy, among which rise up long soft and hairy Stalks, branched into many Arms, two or three feet high, or more, with the like Leaves, but leaves:
The Leaves grow at the Joints, two opposite one to another, up to the top, and from these joints other Branches spring forth, at top of every one of which Flowers grow compendiously of a multitude of Leaves, and of a red color. These Flowers are very Double, composed of a great many red Leaves, very thickly packed or crowded together, and commonly set in a short or broken Husk, whereby the Flowers seem to hang on one side, but are not jagged, or cut in the tops, at the Flowers of other Campions are, but altogether smooth. It is like in all its parts to the Single Wild Campion as to its manner of growing, excepting that it is every way left, and its Flowers are Red, and very Double.

XIV. The third, or White Batchelors Buttons: As the Leaves of the former Red Buttons were like unto the Leaves of the second Single Kind, with Red Flowers, so the Leaves of this are like unto the Leaves of the first Single White Kind, and the whole Plant differs nothing from it, but in the Dumbness of the Flowers, nor very little from the Red Batchelors Buttons, but in the color of the same, these being wholly White, and so very Double, that by the multiplicity of Leaves being crowded together, they break the Husk in which the Flowers stand, as the other does, so that there is not one flower in a great many which is whole. Gerard says, That the want of which these Flowers (both of Red and White) hove to the ragged Cloth Buttons, formerly worn in this Kingdom, gave occasion to our Lads, and other Worthy of those times, to give them the names which now they bear.

XV. The.
Chap. 112. English Herbs.

XV. The fourth, or Green Butcher’s Buttons, have no difference from the two former in the Root, Stalks, Branches, Leaves nor Seed, facing only in the Flowers, which in this are of a Greenish color, and sometimes through the nift of them they send up Stalks, bearing also Tarts of the like Double Flowers.

XVI. The Plants. Of these, the three first Single form grow for the most part in Country Fields, by Hedge and Ditch sides in many parts of England. The fourth grows in many Corn Fields in Germany, but with us is nourish’d up in Gardens. The fifth, or White and Red Sea Campion grow by Hare Cattle near the Rife of, and in the field Rife in many places by the Sea side: They grow also by the Sea side in Lancashire at a place called Lytham, five Miles from Wigan, in which place grows that with Red Flowers also. Johnson found it also growing in great plenty in the Marsh Grounds in Thames, which lie directly opposite to the Town of Sandwich: The Red has been found about a Mile from Southampton, and both them chiefly in the Southern parts of England, on the moift Stony Banks by the Sea side. The fifth grows in several grounds by Caldeffery, and in a Field called the Mifffield, behind the House of Sir Thomas Lucy’s near Caldeffery. The fourth is only nourish’d up in Gardens.

XVII. Of the Double Wild Campions, the first grows here only in Gardens. The second and third grow Wild in several places, but with us are chiefly nourish’d up in Gardens, for the beauty of their Flowers like. The fourth also grows in Gardens.

XVIII. The Times. They all Flower in the Summer Months of June, July and August, some earlier than others, some later, and their Seed is ripe soon after.

XIX. The Qualities. They are all of them hot and dry in the second Degree: Astringent and Alterative; and much of the nature of the Garden Kinds.

XX. The Specification. They have been found good to stop the Fluxions of Blood and Humors.

XXI. The Preparations. The three Preparations may be made of them which we have fail to be made of the Garden Kinds in the former Chapter.

The Virtues.

XXII. Authors have fail little of their Virtues, nor have we much to say of them by Experience; the general use is for the beauty of the Garden, the Flowers being very beautiful in their Seasons. Parkinson says, that being Drying and Astringent, the several Preparations of them may be probably applied to lay the Fluxes of Blood and Humors in any part, and thereby also contribute to the healing of old and moist Running Sores and Ulcers.

XXIII. Gerard says, the Seed of Wild Campion being given to two draughts (in powder) and so drunk, that it purges Choler by Stool, and is good for them that are Bitten or Stung by any Venomous Creature.

C H A P. C X I I .

OF C A T C H - F L I E .

I. T H E N A M E S. It is called in Greek by Theou-iris, θεούρίς; in Latin, Lychnis viscosa Viscofa, Lychnis, Viscago viscosa Nepeta, Nepeto- pulus (quae muscae copiant) Viscaria, Silent Tens- 

III. The Descriptions. The first has a small Root, somewhat Fibrous, which perishes after it has given Seed, and afterwards refer again of its own Seed, if it is suffered to seed it self. If it sheds a seed, it springs in the latter end of the Tear for the most part, or else in the Spring, with five or six small Leaves, very like unto the Leaves of Bank, and of the same Willow, or whitish green color, but a little broader and shorter. When it begins to shoot up for Flower, it bears another Leaves on the Cormy or Viscous Stalk, which Viscopy is strong enough to hold any small thing or the which lights on it. These Leaves are broad at bottom, compising the Stalks and branches, being set two at a Joint, one again another. The tops of the Stalks are closely branch-ed into several parts, every Branch having divers small red Flowers, not muched, but smooth, hanging out of small, long, round, sharp Points, which after the Flowers are past, contain small, greyish Seed. This Parkinson accounts of the Species of Campion, being a pretty thing to furnish and deck out a Garden.
V. The second has a Root small and fibrous, from whence come forth many Leaves lying upon the ground, which are thick, fat, and hoary, white, somewhat like to the Leaves of the yellow Acrilis Urti, Bean Ears, or French Cowwills, junct on the edge, and a little pointed, which do so obtrude the first Year of the sprouting; the Stalk riseth the next Year to the height of three or four Feet, with two Leaves at each Joint, and forked on both Sides into Branches from the ground, which are Viscid, Glutinous and Clammy, catching every light or small thing to cleave thereon, as bits, Pijometers, Down, Street, &c. at the top thereon, and at the Joints next below them come forth many Flower together, running in Clusters, but very small, whose small Hills contain every one of them a small greenish yellow Flower, parted in two at the broad end; the Seed is small and blackish in the Hills, and generally Sewn it self.

VI. The third, which is Gerard's fifth, and by him called Viticaria or Lime-wort, and which he well knew to be of the Stock and Kindred of Wild Gillflowers, or metastylisus Chafisus has joined it with the Wild Campion, and Label; among the Sweet Willi-ams) has a Root which is large, with many Fibres, from whence spring many Leaves like those of the Crow-flower, or Wild Sweet William, among which rise up many reddish Stalks, with Knives or Joints at certain Spots, set with Leaves by couples one against another, at the Top of which come forth fine Red flower. They being poll'd, there come in place small blackish Seed. The whole Plant, as well Leaves and Stalks as Flowers, are in most places overgrown with a very thick and viscous or clammy matter, like to bird-time, which if you touch or take on your Fingers, the viscidness is such, that your Fingers will stick and cleave together, as if you had touched Bird-time. If they do so light upon it, they will be so entangled therewith, that they cannot bear away, so that in four hot Days you may see many Vines catch thereby, from whence came the name, Catch-fly, or Clammy.

VII. The fourth, or Narrow-leaf'd Catch-fly, has a Root thick and black, with many Fibres also springing forth smaller Branches, cloathed with the like Leaves, but much leis: the Flowers grow at top of the Stalks, many together, Toft Edition, of a bright red color. The whole Plant is furnished of a viscinous-nesse, or Clammy, like the other Kinde; but in a leis proportion.

C H A P. CXII.

Of CATS-TAIL.

I. The Name, it is called in Grecce, Téos: In Latin, Typhus; and by some Cebrum Morin-ns, as Dodonaeus Gairn, by some Typhus aquatica, or Paludins, to put a difference between it, and that kind of Typhus which is among Cora, called Typhus Cerealis: and in English it is called Cats-tail, from its flat, downy, and Reed-Mace.

II. The Kinds. Authors say it is a Man between the Rushes and the Reeds, and is threfold, 1. Tpyhus aquaticus, The greater, or greaten Cats-tail. 2. Typhus minus, The lesser Cats-tail. 3. Typhus minima, The least Cats-tail.

III. The Determ tions. The ffrth of these has a Root which is white, somewhat thick, hard, with long, and vivid Fibres, as thick as a Rush, but far more thick; the Flowers grow upon the Root itself, short, and thick, and smooth, and furnish the Flowers with a short, and vivid blackish Seed. The whole Plant, as well Leaves and Stalk as Flowers, are in most places overgrown with a very thick and viscous or clammy matter, like to bird-time, which if you touch or take on your Fingers, the viscidness is such, that your Fingers will stick and cleave together, as if you had touched Bird-time. If they do so light upon it, they will be so intangled therewith, that they cannot...
Chap. 113. English Herbs.

**Red or Reed Mace.**

I. The third differs not from the former, but is being smaller than it, in both Leaf and Stalk, while it is more hard and rough, and in the head or top, which in fome places bears a smaller spike shorter, the head being greater, with a small dilution between them, and a small Leaf at bottom of it.

II. The Place. They grow in roads and flowing Waters, and sometimes in various Streams, as also in the middle of watry Ditches or Ponds, and by their Banks and Sides in many places of this Kingdom. Gerard says, he found the smaller for growing in Ditches and Marshy Grounds in the Isle of Sheppey, going from Sherbey to Faversham. I have also found them growing in many places in the Kent, and in Mollit and Standing Waters in Fenney Grounds in Cambridge-shire, and the Isle of Ely. And in the Shool's of Cambridge, at the head of Stone River, in the Marshes near the New Oar leading into Wad-moanshow River, which are overflowed with every Tide, I have found them growing plentifully.

III. The Time. They flower in June and July, and their Heads, Torchels or Mace, are ripe in August; but the Down hardly flies away till the end of August, or Month of September.

IV. The Virtues. They are cold and dry in the first Degree: Astringent, and very Syrpeck, Alterative, and Annapatick.

V. The Species. The Down is a Specific to stop the bleeding of External Wounds.

VI. The Preparations. You may have, 1. The Down. 2. A Powder of it. 3. A Compotry.

The Virtues.

XI. The Down it self. Applied dry to bleeding Wounds, it instantly curbs their bleeding: applied to running ulcerated Kiled Heads, it quickly cures them: So also used to moist Sores, and running Ulcers, it dries almost to a Miracle, incarminates and heals. In the Forth Countries, it is sometimes used to make Beds of, for poor People to lie on, and mixed with Butter, as a Bait for Rats and Mice, it kills them by choking them.

XII. The Powder of the Down. Matthiolus says, it is good to help the bloody fluxes, and ruptures of Children, wherein the Incontinences fall down into the Cods. This others come against, as being dangerous to be taken invasively, as being rather fit to Triangle than help them, because it choaks Rats and Mice. But this latter opinion I think to be an Error, for as it is used to check and kill Rats and Mice, it is used likewise, and not in the Powder, whereas, if it is reduced to a very small Powder, as Matthiolus orders it, it can no ways be able to effect any such thing. This Powder may be given, says Gerard, mixed with Powder of Beeswax, Roots of Gladio, and Lwes of Herborages. This is to be mixed with the Yolk of an Egg, and to eat it, it is (says he) a most perfect Remedy against Ruptures in Children, and must be Administrated every Day falling, for thirty Days together, one dram at a time: it not only helps Children and Schriplings, but grown Men also, if in time of their Cury they use convenient Ligatures or Trullings, and fit proper Empolies upon the general place, according to Arts there be. For my part I have had no Experience hereof, and therefore can say but little to it, having, I confess, not much Faith in the Prescrifion, yet think it not of such a dangerous consequence, as some would have it, nor have I a great opinion of any Internals, given for this kind of Rupture, for that those Medicaments passing through the Intestines, can nevercome actually to the part where the Wound is, and so can do little in order to the Cure.

XIII. The

V. The third differs not from the former, but in being smaller than it, in both Leaf and Stalk, while it is more hard and rough, and in the head or top, which in some places bears a smaller spike shorter, the head being greater, with a small dilution between them, and a small Leaf at the bottom of it.

III. The Place. They grow in roads and flowing Waters, and sometimes in various Streams, as also in the middle of watery Ditches or Ponds, and by their Banks and Sides in many places of this Kingdom. Gerard says, he found the smaller for growing in Ditches and Marshy Grounds in the Isle of Sheppey, going from Sherbey to Faversham. I have also found them growing in many places in the Kent, and in Mollit and Standing Waters in Fenney Grounds in Cambridge-shire, and the Isle of Ely. And in the Shool's of Cambridge, at the head of Stone River, in the Marshes near the New Oar leading into Wad-moanshow River, which are overflowed with every Tide, I have found them growing plentifully.

IV. The Ventures. They are cold and dry in the first Degree: Astringent, and very Syrpeck, Alterative, and Annapatick.

X. The Species. The Down is a Specific to stop the bleeding of External Wounds.

XI. The Down it self. Applied dry to bleeding Wounds, it instantly curbs their bleeding: applied to running ulcerated Kiled Heads, it quickly cures them: So also used to moist Sores, and running Ulcers, it dries almost to a Miracle, incarminates and heals. In the Forth Countries, it is sometimes used to make Beds of, for poor People to lie on, and mixed with Butter, as a Bait for Rats and Mice, it kills them by choking them.

XII. The Powder of the Down. Matthiolus says, it is good to help the bloody fluxes, and ruptures of Children, wherein the Incontinences fall down into the Cods. This others come against, as being dangerous to be taken invasively, as being rather fit to Triangle than help them, because it choaks Rats and Mice. But this latter opinion I think to be an Error, for as it is used to check and kill Rats and Mice, it is used likewise, and not in the Powder, whereas, if it is reduced to a very small Powder, as Matthiolus orders it, it can no ways be able to effect any such thing. This Powder may be given, says Gerard, mixed with Powder of Beeswax, Roots of Gladio, and Lwes of Herborages. This is to be mixed with the Yolk of an Egg, and to eat it, it is (says he) a most perfect Remedy against Ruptures in Children, and must be Administrated every Day falling, for thirty Days together, one dram at a time: it not only helps Children and Schriplings, but grown Men also, if in time of their Cure they use convenient Ligatures or Trullings, and fit proper Empolies upon the general place, according to Arts there be. For my part I have had no Experience hereof, and therefore can say but little to it, having, I confess, not much Faith in the Prescrifion, yet think it not of such a dangerous consequence, as some would have it, nor have I a great opinion of any Internals, given for this kind of Rupture, for that those Medicaments passing through the Intestines, can never come actually to the part where the Wound is, and so can do little in order to the Cure.
XIII. The Carphyes. Made into a Carphynia with Hoggs Land, it is good to heal Burnsings and Stullings with Fire or Water.

XIV. The Leaves are usually kept to make a fine sort of Mats of, and other like purposes.

C H A P. C X I V.

Of Carrots, Garden.

I. The Name. It is called in Greek, Carphyes, in Latin, Caput-Radices, and for short, a Capra or Carpe.

II. The Kinds. Carrots are either Garden or Wild. The Garden, sec. 1. Polyctenum semperviride fexulis, or Yellow Garden Carrots. 2. Polyctenum tenuifolia altera fatis altera rubra, Red Garden Carrots.

III. The Description. The Yellow Carrot has a long, long Root, great as thick, and yellow, big above, and small pointed below, without any Rings or Twists, of a pleasant sweet Taste, and therefore generally set for Food. From this Root spring forth several long Leaves, and well spread, made up of many thin, cut, deep, green Leaves, divided into many parts, among which arise a round Stall, a yard, or more, high, bearing large Tusses of Umbels of white Flowers, which crowd close together, and spread as much, but turn into small which rough dry Seed, sticking one to another.

IV. The Red Carrot has a root round and long, thick above and small below, running to a point at the tips, and differs from it only in the color, which is wholly red quite throughout: From this Root rise many single Leaves, much cut and divided into many other Leaves, and those cut again, and divided into many parts, of a deep green color like the former, some whereof in autumn will turn to be a fine Red or Purple: The beauty of which makes several Persons many times to gather the Leaves, to stick them in their Hats, or Heads, or Belves, or put them on their Scevies instead of Feathers.) From among which Leaves rises up a Sixth, bearing many Leaves likewise upon it, but so high as the Persons, being about a yard high, bearing many Tusses or Umbels of white Flowers, which turn into small rough Seed, seeming as if it were hairy, and jutting gracefully enough, if rubbed between the Fingers. In a word, the whole Plant differs very little from the former, except in the redness of the Root.

V. Now here is to be noted, 1. That the Yellow Carrot is of two sorts, viz. The long and the short. One of the long sorts is of a pale yellow, and this has the greatest and longest Root, and likewise the greatest head of Green: this for the most part is the worst sort of Carrot, not being so sweet and firm as the other. The other long sort is of a deep Gold yellow color, having a smaller head of Green Leaves upon it, and this is always the best and sweetest. Paracelsus says, that yellow Carrots, by sometimes fowing themselves, do oftentimes make their Roots become White. The short Roots are also divided into pale and deep yellow, or Golden color. 2. That the red Carrots, besides those which are red quite throughout, there is another, whose Root is red without for a pretty way inwards, but the middle is yellow.

VI. The Places. They are only Sown in Gardens, or other manured Fields, chosen and fitted out for that purpose, and delight to grow in a Sandy and light ground, that their Roots may the more easily pierce deep downwards, which in a stiff clay ground they cannot so well do.

VII. The Times. They are to be sown in March and April, the first year they only strike down their Root and the year following they bring forth their Flower and Seed. In Carolina I saw a Carrot above four years old, which brought forth its ripe Seed in the fifth year: The reason thereof I conceive to be, because the Mudder of the Roots cut off every year its green Tops, that it might not Seed, whereby the Root grew very great, as also the green head the fifth year, which was four or five times as big as any ordinary Carrot head; This head he let stand for Seet, and it produced him an incredible quantity thereof, very fair, and nearly twice as large as ordinary Carrot Seed.

IX. The Qualities. The Seed is hot and dry in the first Degree, Aperitive, Difflusive, Diuretiee, Carminative, Stomassick, Nephtick, Hysteriek, and Alterative: The Roots are Sweet, Flatulent, Ana- leptic, and spermatorgetie.

X. As to their Specifications, Preparations and Verses, they are the same with those of the Wild Carrot, treated of in the next Chap., up to which we refer you, but with this note, that those Garden Kinds are nothing near so strong and powerful as those of the Wild Kinds, the Seeds of both being chiefly used in Medicine: As for the Root, the Garden Kind a thousand fold exceed the Wild for Food, not only for the pleasure of Eating them, but also for their Analgetic or Nourishing faculty.

C H A P.
CHAPTER CXV.

OF CARROTS, Wild.

The Name. It is called in Greek Ποικήθαλονplexos, in Latin, Pastina renatula Sylvestris, by Matthiolus, and others; Pastina renatula Sylvestris, by Echinus, Curdus, and Tabermoni; Staphisopus Synteres, by Tragus and Cephalinus; Dacrus agricola, by Galen, in libro de Alimentis, (and yet truly it is no Dacrus.) Dacrus Valga, and Other names, by Lelch and Clusius: and in English, Wild Carrot, and Birds-foot.

II. The Kinds. We shall only describe two Kinds, viz. 1. Pastina renatula Sylvestris Anglica, The English Wild Carrot. 2. Pastina renatula Sylvestris Germanica, The German Wild Carrot.

III. The Descriptions. The first of these has a Root, small, long, and hard, and therefore unfit for use, being somewhat sharp and bony: from this Root rise up Leaves, in a manner altogether like the Garden kinds, but that they are somewhat whiter and rougher, or more hairy, and so are the Stalks likewise, which bear large fleshy tafts of white Flowers, with a deep purple foot in the middle, part being hollow and one, the outward Stalks rising higher, all which are so crossed or controlled together, as makes the whole Umbel thou, when the Seed is ripe, like unto a Bird's Nest, for which reason it has been called by some Birds Nest, as much alike to the Flowers of the Ginglymus verum.

IV. The German Wild Carrot has a white Root, which is often a Root long, sometimes single, and sometimes divided into two or three parts, not much unlike in Shape and Smell to Parsley Root, but better in the Mouth for a long time. These Root rises up a Stalk half a yard high, or as thick as one little Finger at the bottom, being something round, but plainly clefted or covered, very hairy, and full of joints, at which come forth large clefted Branches of ragged Leaves, encompassing the Stalk at bottom, a foot in length, and divided into several Leaves, and they again to other smaller parts, very rough and hairy edges, and of a yellowish green color, from between which Leaves and Stalks at the Faints, come forth other clefted Stalks, and the like Leaves at their joints, but softer, which do very much resemble our Garden Coree Lascus, but that they are longer and softer, if one does handle them hard, but rough on the back and edge, being gently touched. From every one of these Taints, both of the Stalk and Branches, arises a certain long bark, consisting of six small long leaves, close for together, which when it opens, forms forth a small Leaf, or close Umbel of white Flowers, and sometimes yellowish, and a little fruit after which follows a roundish Seed, two always joined together, and very pithy on the back side, the inner side being flat, and more yellow than Carrot Seed, otherwise much like to it.

V. The Places. The first grows plentifully in England by the field sides, and in unseeded places, almost everywhere; the other grows in like places in Germany, but with us is sometimes nurtured up in Gardens, where it grows very well.

VI. The Times. They flourish and flower in June and July, and the Seed is ripe in August.

VII. The Qualities. The Seed and Root are hot and dry in the second Degree: Carminative, Alterative, Diureth, and is a Bird's Nest, for which reason it has been called by some Birds Nest, as much alike to the Flowers of the Ginglymus verum.

VIII. The Specification. Both Seed and Root are Lithontripitches, and good against the bitings of Venomous Beasts, Wind, and Riting of the Mouth.

The Virtues.

X. The Powder of the Root or Seed. It expels Wind, and eases Stitches in the sides, provokes Urine and the Terms, and helps to break and expel the Stone. Dose one dram in White Wine.

XI. The Decoction of Root or Seed. If it be made in White Port Wine, it has all the Virtues of the Powder, and is peculiarly good against the Dropt, and such whole Bodies are touched with Wind. Dose six or eight ounces, Morning, Noon, and Night, it induces the Terms, provokes Luft, and facilitates the Delivery of Women in Labour.

XII. The Spirituous Tincture. It has the Virtues of both Powder and Decoction, but is a singular thing against the Cholick, and good to help Conception. Dose one spirituall, Morning and Night, in a Glass of generous Wine.

XIII. The Acid Tincture. It is good against Stone and gravel in both Reins and Bladder, and is very powerful to refit Vapors and Hysteric Fits, as also to cure the bitings and thuggings of Venomous Creatures: and Dysenterie, lastly, it is so powerful, that if it is taken beforehand, their bitings shall not hurt. Dose forty or sixty drops in Wine.

XIV. The Oily Tincture. It opens Obstructions of the Reins and Urinary Parts, relieves Pains, and eases weekness of the Back and Legs, provokes Urine, and the Courses. Dose twenty drops.

XV. The Saline Tincture. Outwardly bathed what, it draws forth the Poison and Maligunity of Venomous Creatures, takes away Scars, Morphea and Sun-burnings, as also other deformities of the Skin.
Skin, and being taken inwardly to one dram, it provokes Urine, and prevails against the Dropit.

XVI. The Spirit. It curseth the Head, Stomach, Heart and Womb; pdfs Poison, and the Plague, expels Wind, and gives ease in Pains and Stitches of the Side. Doke one spoonfull.

XVII. The Seed Sox. It provokes Urine powerfully, and expels Sand, gravel, and other Tarraceous matter from the Reins, Ureters and Bladder: it is powerfully opened and cleansed, and given from a grapple to half a dram, or more, in a tepidial of Juice of Lemons, it flows Vomiting, and admirably strengthens the Stomach.

XVIII. The green Leaves. Disgusts and Gorden both Say, that the Leaves being applied with Honey (1 supped in form of a Grapalamin) to running Sores or Ulcers, do cleanse them.

CHAP. CXVI.

OF CARROTS of Candy.

1. The Names. in Greek, Δακτυλός; in Arabick, Daucus; in Latin, alfo Daucus, Daucum, and Daucium, and Daucus Criticus; in English, Daucus, and Dauce, and Candy Carrots.

2. The Kinds. Parkington makes sixteen kinds of Daucus, many of which are nothing to our purpose: Those which we are chiefly treat of in this Chapter, are the Candy or Critical Kinds, which Disgust makes to be three, viz. 1. Daucus Critical versus Disgust: the True Daucus of Candy. 2. Daucus Schleidana, the Parley-Lead Daucus. 3. Daucus Coriander folius, Daucus tertius Disgust, Belles, Coriander Leaved Daucus, or Belles his third Daucus of Disgust. 4. To these we think good to add a fourth kind of the Daucus Schleidana, which is Daucus Schleidana maxima, the greatest Parley-Lead Daucus.

![Daucus or Wild Carrot of Creet](image)

III. The Description. The True Daucus has a Root small, long, and white (lesser joys Gerard, than the root of a Parsley, which is of a great size, and almost as quick and sharp in Taste as the Seed, but stilt not our Winters here in England, with all the skill we can use, so that we are forc'd to use it anno every Year. From this Root rise up several Stalks of Winged Leaves, as finely cut as a Hair, but thicker, for at distances one against another, of a white or yellow color, smelling a little sweet. From among which rise up divers slender Branches or stalks of a Foot high, bearing at their top Stalks about inches of white Flowers, and after them small white Fruitfuls, Tawshut, round, and rough, and of a sharp or quick Smell and Taste.

IV. The second Daucus has a Root somewhat great, thick, long and white, with a bulk of hairs at the Head, as many other Umbelliferous Plants have, and of a box and sharp taste, as the Seed also is from among which rise up large Stalks of four-leafed broad pale green Leaves, bigger than Parsley, with many divisions of the same fashion and manner, next the ground: And also large Stalks about two feet high, with the like Leaves at the tops, but thicker, and at the tops fewer rachis of white Flowers, which turn into long crested Seed, bigger than ordinary Fennel Seed, and of a yellow brown color.

V. The third Daucus of Dioscorides, according to Honorius Bello his book, has a Root great, thick, and short, persisting yearly. The whole Plant is Aromatic, and both Root and Leaf are eaten by the Cremlax as a common Sallet Herb. From this Root spring several Stalks of five cut Leaves, not much Unlike to the Leaves of Coriander, but larger and thicker. The Stalks are near two Foot high, with great and azure flowers, and therefore called by some Sefeli nodoqu, towed Hartwort, but by Balthus, Daucus Criticalis nodoqu Umbella lutea) and smaller Leaves at them, at the tops whereof green yellow Umbels of Flowers (but white with us in Eng- lund) which being bell sway, there comes much Seed, much larger than that of Fennel.

VI. The fourth Daucus, which is the large or largest kind of the Parsley-Lead, is at the same time as large as once Arm, or being young, of the bigness of once Thumb, parted into several Branches at the bottom, and covered with a ragged brown Bark. Of a faint or thin leaf, the First Autumn, and longer afterwards, so as to cause Spitting, having at the top many hairy Heads, from whence come several very large, and great White Leaves, much divided and dotted about the edges, much like what the last, but bigger, and of a pale or faint green color, a little flashing on the upper side, and of a greenish blue color underneath. Among these Leaves rises up, a large, great, crested Stalk, of a Fingers thickness, with Jones, Leaves at the front, and several Branches also between them: at the tops whereof stand small Umbels of white Flowers, and somewhat like Seed to the second kind, but larger.

VII. The Flowers. Candis is the Natural place of their Growth, but with us in England they are only nourished up in Gardens. This flora has been found upon several Mountains of Germany, and upon the Hills and Rocks of France near Geneva, from whence it has been transported into several of our more Northern Regions.

VIII. The Times. They flower in June and July, some earlier, some later; and their Seed is ripe in August, some of it ripening in the time of flowering.

IX. The Qualities. The Seed and Roots are hot and dry in the third Degree; the Herb freely exceeds the second Degree of heat, and therefore is left powerful. They are Appetizing, Attractive, Digestive, Carminative, Dinetic, Cephalic, Stomatie, Nephritic, Hydrick, Lachrymopick, Alterative, Aperifharmick and Sermentegmatick.

X. The Specification. It is chiefly dedicated to the Sunberg, Stone, and Boppage of Urine.
The Virtues.

XII. The liquid Juice of the Herb and Root. It helps the Stomach, provokes Urine, and the Terms, and expels both Birth and Afterbirth, and is good for those who have been bitten by the Phalangium, or any other Venemous Beast. Dose four spoonfuls in Wine.

XIII. The Efficacy. It has all the Virtues of the liquid Juice, and is stronger, finer, and a much more noble Medicine: It prevails against Vapors and Hyperakic Fiss, as also the malignity of the Plague, or Pesteon. It also works two other cure in generous Wine, Morning and Night, or three or four times a Day, as the necessity or extremity may require.

XIV. The Powder of the Seed. This (according to Authors) has that powerful heat in it, that it becomes a principal thing to help the Stomach, to call the urine, and remove all Poppages of Urine. It provokes the Terms, facilitates the Delivery, and brings away the Dead Child, and Afterbirth.

XV. The Dose. Take one or two spoonfuls in generous Wine, Morning and Night, and in course of a Paroxysm.

XVI. The Diffusion of the Seed in Wine. It has all the Virtues of the Powder, but I fear not full out to effectual. Dose half a Pint, Morning, Noon, and Night.

XVII. The Decoction of Seed, Root, or Roots. It ought to be made in White Port Wine, and so given to drink, two, three, or four times a day, half a Pint at a time: It has the Virtues both of the Efficacy, and Powder of the Seed, and a most famous thing against the Plague, the Patient being put to Bed, well covered, and to made to Sweat upon it.

XVIII. The Cataplasme. The Herb, but more especially the Roots made into a Cataplasme, by beating in a Mortar, and to mixed with Hog's Lard, and applied, does eafe, diffuse, or allay Tumors or Swellings in any part. Made into a Mixture of Cataplasme with Honey, and applied to the Throat, it cures an Infeatious Cough.

XIX. The Diffiluted Water. It prevails against Stone, gravel, Sand, Stomach, and all Poppages of Urine, but is weak in respect to the Juice, Efficacy, and other more noble Preparations of the Plant, and therefore is only used as a Vehicle to convey other Preparations of the same.

XX. The Spirituous Tincture. It is an excellent thing against the Plague or Pestilence, and against all other malign Fevers, as Purples, Spotted Fevers, Measles, Small Pox, and Fevers derived from the bringings of Serpents, as Vipers, Rattle Snakes, and others of like kind: It provokes Sweat greatly, and defends the patient after an admirable manner. Dose two, three, or four draughts in the Diffiluted Water, or rather in it.

XXI. The Acid Tincture. It has all the Virtues of the Spirituous Tincture, and if the Fever is very high or intense, is much the better Medicament; besides the Above destroys the Malignity much more powerfully. Dose to one drachm, or more, in the Diffiluted Water.

XXII. The Oil Tincture. In an extremity of the Strangury, this is the most powerful Preparation, being given to thirty drops, or more, in a dram of White Port Wine: It is powerful to diffuse Gripping Pains, and Torments of the Bowels, to facilitate the Birth, and bring away the Dead Child: It cures Convulsions, and Heals Wounds in the Body or Bowels.

XXIII. The Saline Tincture. It cleanses the Reins and Urinary Fissages, being taken to one dram, or more, in White Wine, but has not like the Oil Tincture. It digests humors, and provokes Urine, and the Terms in Women.

XXIV. The Diffiluted Oil of the Seed. It hits all the Virtues of the Juice, Efficacy, Powder of the Seed, Decoction, Spirituous, Acid, and Oil Tinctures: and therefore may be given from eight drops to sixteen, being first dropped into Sugar, and then mixed with the Diffiluted Water, or some other fit Vehicle. It helps the Strangury upon the spot, cleanses the Reins of all Tartarous Materials, and all the other Urinary Parts, provokes the Terms, refills Vapors, and expels Spleen. Dose one or two spoonfuls in generous Wine, Morning and Night.

XXV. The Potestates to Powders. They have all the Virtues of the Oil, and are also more subtle and penetrating, and more pleasant to be taken, being more easily mixed with Wine, or any other possible Liquor. Dose from two to four draughts.

XXVI. The Elixir. This is yet more excellent and noble than the Powders, being the Tincture of the Seed or Root extracted by the Solvent of the Potestates; by which you have all the noble parts of the Plant concentrated in one Medicament: and to has all the Virtues of the Juice, Efficacy, Powder, Tinctures, Oil, and Potestates, in a most pleasant solution. Dose one dram to two drams in a Glass of Wine, Morning and Evening.

XXVII. The fixed Salt. It is Strongly Diuretick, strengthens the Stomach, being given in the Acid Tincture, mixed with the Diffiluted Water, or some other fit Vegetable. Being taken for some time in White Port Wine, it destroys all Preternatural Acids, in what part of the Body they are, and diffolves the Stone, if it is of a gritty, gritty, or bricke substance. The Dose is from a Scruple to half a dram, or two Scruples, Morning and Evening.

C H A P. CXVII.

Of CARAWAY.

T H E Name. It is called in Aramick, Kerss, Karssea, and Carv in Greek Καρυκ, in Latin, Coram, also Carvi, as the Apothecaries call it: Simon Serbi calls it Carabadian: it took its name from the Country of Caria, from whence it came: Some call it Corvine, some Carum, as in the Shops; and in English, Caraway.

II. The Kinds. We shall here enumerate but two Kinds: 1. Carvi communis, or our Common Caraway. 2. Carvi praegrans, Meadow Caraway.

III. The Descriptions. The first has a Root solid, firm, small, and long, somewhat like a Parsley, but with a more wrinkled Bark, and much hair, having a little hot, and quick taste, stronger than the Parsley.
The Virtues.

X. The Root. Parkinson says, that it is better Food than that of the Parsnip, and is pleasant, and commendable to the Stomach, helping Digestion.

XI. The Herb. Being dried, and made into Powder, and steeped upon moif and running Sores and Ulcers, it dries them up, and in short time alter heals them; it also heals Ribles in Childrens Feet.

XII. The Seed. It is used whole in Bread, Cakes, Apple Iyes and Puffies, to give a relish to them, and to add a remotick and warming Quality, in room of Spice, to be made into Comfits to correct the Wind in the Stomach. Being bruised, tvred, and laid hot in a Bag, or double Cloth, to the lower parts of the Belly, it relieves the Wind, and eases the pain of the Cholick.

XIII. The Juice of the Herb and Root. It is proper against Wind, and all cold Diffemers of the Head, Nerves, Stomach, Bowels, Womb and Joints; gives ease in the Cholick, and gripping of the Guts, appeases Vapors, and Hysterick Fits, and provokes Urine. Doie two ounces in Wine.

XIV. The Efficac. It has the Virtues of the Juice, but more efficacious in opening Obstru&ions of the Reins, Urinaries and Bladder, and expelling Phlegm matter from choy parts. It prevails against the Cholick, and all Diffemers of the Bowels proceeding from cold and moffurn.

XV. The Decoction of the Seed. It has the Virtues of the Juice and Efficac, and is very good for such as have the yellow Jaundice, and Virgins troubled with the Green-Icknels, and such as are daily afflicted with Wind in the Stomach and Bowels. It ought to be made in Wine, and Bowels be taken to half a pint at a time sweetened with White Sugar.

XVI. The Powder of the Seed. Taken to one dram, daily Morning and Night, mixed with five Leafl Sugar, it has been found to sharpen the fight, to expel Wind, and help a bloody Flux, and other Fluxes of the Bowels, though they have been of a long standing. And by the constant use thereof, a periodick Cholick has been often cured.

XVII. The Caftaldfm. Made of the Powder of the Seed with White Bred and Sherry Wine, it difficures flambler Tumors or Swellings, eafe pain in any part proceeding from Cold, comforts and strengthens weak Limbs, and takes away the black and blow foops of Blows, Bruises, and the like. The same laid as hot or as can be endured to the lower parts of the Belly, gives eafe in the Cholick.

XVIII. The Dilufed Water of the whole Plant. It is only used as a Vehicle to convey Somnainic and Carminative Medicaments in, down into the Body.

XIX. The Spirituous Tinfure. It is good against Lethargies, Carus, Vertigo, Apoplexy, Fainting, and Illness of the Stomach, ficknefs of Heart, swooning Fits, Convulsions, coldnefs and weaknefs of the Nerves, and all other Diffemers for which the Efficac is proper. The Dofe is half a fpoonful in
Chap. 118. *English Herbs.*

in a Glass of Wine, Morning, Noon and Night, in all cold and moist Constitutions.

XX. The Acid Tinctoria. It admirably helps Diga-
tion, creates a good Stomach, repels Vapors, and is good against Fits of the Mother. Dofe thirty or forty drops in any Liquor the Patient drinks, or in a Glass of Wine two or three times a day.

XXI. The Oily Tinctoria. It is Diuretic, eases pains of the Back and Reins, being taken inwardly to twenty or thirty drops in any proper Vehicle, outwardly bathed upon the part, it gives ease in Pains of the Gout, proceeding from a cold Cause, and is eminently good against Cramps in any part, Convolutions, and the Palies, if it be well applied

XXII. The Spirit drawn from the Seed. It revives
the Spirits, cheers the Heart, comforts Nature, preffes Melancholy, warms and strengthens a cold Stomach, and is good against Painting and Sweating Fits. Dofe half an ounce, or more, at a time, being dulcified, upon occasion.

XXIII. The Distilled Oil from the Seed. It has all the Virtues of the Juice, Efficacy, Decotion, Feaver Tinctures and Spirits, but much more powerful to all the Find purpofes and Intention. Dofe from eight to fifteen drops, drop by Sugar, and then diffolved in any proper Vehicle the Patient likes, and is also answerable to the Medicament in refilling the Distil.

XXIV. The Oils. They have all the Virtues of the Oil, but much more laber and penetrating, and more pleafant and wife to be taken by delicate and weak Stomachs. Dofe two or three drops in a Glass of generous Wine, Morning and Night.

XXV. The Elixir. It provokes Urine, having all the Virtues of the Spirit, Tincture, Oil and Powers exalted and breaks the Stone, if it be cold and gritty, expelling Gravel, Sand and Turdus Matter from all the Urinary Vessels. It opens Obstructions of the Liver and Spleen, cleans the Blood from con-
suped Humors, and is commanded against the Ca-
thexia, or evil disposition of the whole Body, arifing from a cold, moist, and weak habit of the same, and therefore, in the going off of a Droppe, when the Bowels are much weakened, and the Bones of them extremely hurt, it fo comforfs and strengthens them, as to make the Body to withstand the return of the Difeafe, into which if the Patient should relapse, it is generally fatal. The Dofe is half a Spoonful in Sherry, Canary, or Madeira Wine.

C H A P. CXVIII. 

C E N T O R Y the Great.

I. *The Name.* It is called in Greek, *Cenamone,* in Latin, *Cenamone major.* In English, *Century* the Greater, or *Century* the Great.

II. The Kinds. There are four Kinds of this Century, 1. *Cenamone major vulgaris,* *Cenamone major* cold and moist Constitutions. 2. *Cenamone major alternus,* The Common Great Century. 3. *Cenamone major Americanum,* or Canadianum, *Cenamone folius Gynae,* *Cenamone Pyrenaicum,* The American Century, with Aridshock Leaves. 4. *Cenamone major latem,* The great yellow Century.

III. The Descriptions. The leaf of this has a Root which grows to be more than two feet long, and as large as a reasonable great Paracut-pot, blackish on the outside, and fomenting of a reddish yellow within, abiding many years, and sending forth fresh Leaves every Spring, those lying for the most part which are green all the Summer, which Leaves are many, large, long, and soft, deeply cut in the edges, of a pale green color on the upper side, and whitish underneath, without any thing of the great bitterness which is in the lesser Century, which is no Species of this Plant. The Stalk is long and round, and three or four feet high, divided at the top into many Branches, on which fland large, round, fey.

IV. The second Great Century has a Root growing to be as great or greater than the former, and black in the cut side, but yellowish within, yielding a yellowish red Juice, which is a little bitter, but more Aromatic than the former. From the head of this Root come forth many Leaves lying below upon the ground, which are long, and as large almost as the former, but without any jaggedness or division at all in them, yet deeply dented about the edges, and of a deep green color. The Stalk is round and great, but riper not up fo high as the other, doe, nor divides it self at the top, into so many Branches, but bearing only two or three Heads on a Stalk, which are fey, in the same manner, and in it fey like Thrums or Thrusty Flowers, of a pale yellow color, which being soft, there comes such like Seed in the heads, lying in a Vaux or Downy Subflance, and every one bordered in the same manner, but a little blacker.

V. The third, which is the American, or Floriditis Great Century, has a Root great and black on the cut side, but larger than the first, and of the biggest of two Knit. It has larger Leaves in the first, and more jagged, or cut deeply on the Edges.
Salmon's Herbal. Lib. I.

frequently resounding on Artichoke Leaf in the droop- fess of the Leaf, & some Felty Caryatids, given them nish and gray, as it was bowery underneath. The Stalk rises about a yard high, angled and bowery, having several smaller Leaves, and last topped, set there up, and by the top into some Branches, each bear- ing a few small Leaves, under the Heads, which are much greater, and more feant, with fruite prickis at their ends, like a little Wild Artichoke Head. The loft of Flowers, which are the Flowers, are more purplish than in the fist, and the Seeds are white, wrapped up in Dew in like manner.

VI. The fourth, or Yellow Great Century, is a Root which grows in time to be greater than any of the former, having many Heads which shew forth new Leaves in the Spring, the old Leaves going away or dying upon the ground every year, which is wrinkled, and black on the out side, and yellowish within, full of a visous or flamy moisture, and striking deep into the ground, with some greater Branches, and a few small fibres. The new Leaves which this Root sends forth in its first year, are green and tender from the Root than the others, some of the lowest having fewer divisions in them, than some others of them have; but they which grow upon the Stalk, as also some of the other Branches, and very much divided into many parts, making every winged leaf to consist of fourteen or sixteen Leaves, the great rib in the middle between them being whitish, each for the most part for against another; at an end one at the end, and every of them being narrow and long, without any dents on the edges, and of a whitish green color. The Stalks are manifet, round and strong, a little freked down length ways, each being divided into some other Branches, which bear feant Heads greater than any of the others, and larger spread then the others in the middle, of a delicate pale, but lovely yellow color, which continue in their glory and beauty for a long time, without decaying; but they seldom yield any Seed here with us in England, because that the feant Heads are so full of moisture (as is Hopkins) which binds the Seed to grow ripe therein, so if they are but a little pressed between the Fingers, there will slide out on all sides small clear drops of Water, amount of a Holly like Sweetwater, and that in use but at Noon-time of the Day, as Brahmin is pleased to say, but also at all other times of the Day, and may be for one only time and more, but often times, and even upon the tip of the Nose, and as long as the Flowers are free, and not yet withered, but when it perfects its Seed, it is not much unlike to the Seed of the second kind, but a little softer, bluer, and more shining.

VII. The Virtues. The first delights in a fit and fruitful Soil, and in Sunny Banks, full of Grass and herbs. The first and second grow upon the Alp, and Mount Baldar & Dofcordeis fifth, they grow plentifully in Lyrica, Felipontum, Arcadia, &c. The third grows upon the Pyrenean Hills, and upon Rocky Hills near Lisbon in Portugal, near the River Tagus. It has also been found to grow in America, upon the Ordinon Continent, near Canada, New England, Virginia, and parts adjacent to them. The fourth not far from Lisbon, near the Tagus, and al- so on Mount Baldar, as Passif's fifth: With us, they are only nourished up in Gardens, where they thrive, and flourish very well.

VIII. The Times. They all flower about the end of June, and to July, and the Roots may be gathered in Autumn. The American Salmone Flowers with us, because of the coldness of our Climate, nor does it live, unles with much care.

IX. The Edges. It is hot and dry in the third Degree. It is Aperitive, Altefrive, Albrigenus, Di- gatifice, Digestive, Incuravive, Amody, and Tran- mutacite, or Vultuary. It is dedicated to the Star of Altrude, Liber, Liver, Spleen, Reifs and Womb: It is Altrude, Spleen, and Altrude.

X. The Specification. It is a noble Wound Herb; Pity and Thoepolus set it down among the number of Panaceas, All-heals, or Wound Herbs, this Great Century, (belonging to the Llist of which in the next Chapter.) Pity, lib. 25. cap. 4. reciting the words of Thoepolus, says, that they were found out by Chiron the Centaur, and that from thence they were called Centauriae, and in cap. 6. he repeats and affirms again the same thing, and thereupon, he faith, they were both named Chronia, though in truth they, viz. the Greater and Smaller, are no Kin one to another, nor being Species of the same Genus, and so have no relation but only in name. It is reported, that Chiron was cured here with of a Wound in his Root, which was made with an Arrow, which fell upon it, when he was entertain- ting Hercules in his House, upon which it was called Chronia; or else from the curing of the Wounds of his Soldiers, for the which intention it is most excellent.

The Virtues.

XII. The liquid Juice. Being taken to two or three ounces, or more, Morning and Evening, opens Obstru- tions of the Liver and Spleen, and prevails a- gainst the Dryple & Yellow Jaundice, Stops feett- ing of Blood, and is prevalent against Reapars, Cramps, and Plurifies, and for those who have an old and continued Cough, or are thirst Waxed, and can hardly draw their Breath.

XIII. The Essence. It has all the former Virtues, but more powerful to every Intention; besides which, this Preparation is profitable against Agues, eases the Cholick, and all Forms of Griping Pain, both of Belly and Worms. It is also a singular Tra- mutacite, for it heals all inward Wounds and Exco- tions of the Bowels, and outwardly applied to Wounds, running Soes and Ulcers, it digests, cleanses, dries, destroys, and heals Ulcers, and newly healing. Dole two or three ounces in a Glass of gene- rous Wine.

XIV. The Infusion. It is a weak thing compared with the former Preparation, yet being made of fresh Wine, it opens Obstru- tions of the Viscera, and is good against the Jaundice, pains of the Pleural, or Spleen in the Side. Dole four or five ounces Morning and Evening.

XV. The Decotion. It is something more power- ful than the Infusion, and is good for the same Diff- iculties which that and the Essence are good against. Sweeeted with Honey, or Sugar Candy, it is good against Weakness, Headknots, Obstru- tions of the Lungs, Thrombosis of Blood, and an Incurable Cough. It is good against the Strangury, or pitting by drops: and also as a Lotion, it cleanses Wounds and old Soes, and running Ulcers; and as a Grasaffin, it cleanses and heals Cancers and Ulcers in the Guts, Mouth and Throat, and Sore Throat half a Pint at a time, it expels the malignancy of Wounds made by the bit- tings or lings of Venerous Creatures. Droped into the Eyes it clears them, and sharpens the Eye- sight.

XVI. The Pouder. It has all the Virtues of the Juice, Essence and Decotion, being taken one dram, or dram and half at a time, Morning and Evening,
Chap. 119. English Herbs.

In Wine: leaves which, being stewed upon malt, running Sorts, is an emetic, dries, and heals them.

XVII. The Daffom. It heals Wounds at once or twice dressing: if they be cutted, it digests them, cleanses and healeth. Applied to foot, corrupted, rotten Sores, and old Ulcers, it digests them, cleanses, dries, and in an instant heals almost to a Miracle. Applied to the Gout, it draws the humor out through the pores of the skin, and so cures it.

XVIII. The Oatmuc. It is valuable, drying, and healing, good against burning, fealding, and fluxes of those Humors, which it reproves by virtue of its Astringency, the Sore, Ulcer or Wound, being first washed with the Juice or Essence: then the Pouder of the Root being stewed upon it, and afterwards pledges being dip in the Oatmuc, and laid over all, with a De Minus Emplifier upon that to hold it on: by this means desperate old and running Sores and Ulcers have been suddenly and effectually cured.

XIX. The Camphor. It is an excellent Anodyne and Diffusive, prevalent against allulent Tumors: if it is made up into a Perfpic with the Pouder of the Root, and put up the Womb, it provokes the Terms in Women, and educeth the Dead Child and After-Birth.

XX. The Spirituous Tincture. It is good against Convulsions, Lethargies, Palpits, Coughs, and Aches in the Limbs, as also in the Stomach and Belly, Colick, and all Dificulties of those parts proceeding from Wind: Let it be taken inwardly three times a day, from two to four in any proper Vessel; and outwardly, let it be bathed upon the part affected Morning and Evening, till health is recovered.

XXI. The Acid Tincture. It is good against Melancholy, and the Poison of Pusulent Fevers: is good against the bitings or stings of Venomous Creatures: opens Obstructions of the Lungs, helps against Coughs, Cold, rheums of Breast, Wheezing, Hoarinf, &c. being taken in all that the Patient drinks, whether Ale, Beer, or Wine, as many drops at a time as may make the Liquid pleasingly fhall.

XXII. The Oily Tincture. It opens Obstructions of the reins, Ulcers and Bladder, is prevalent against the Scurvy, pains and weaknecfs in the back, being taken from ten to twenty or thirty drops in White Port Wine twice a Day, once Morning and Night, and withal being bathed well in upon the Spin Dors, or Back Bone.

XXIII. The whole Plant, as well Herbs as Root, is available in all sorts of Wounds, Sores and Ulcers, to digest, cleanse, dry, conglutinate, and heal them: and therefore are principal ingredients, and should be in all valuerly Ointments, Balms, Drinks, Lotions, and Injections, according to some of the above-mentioned Preparations, respectfully had to the parts afflicted, and the way and Method of Application or Exhibition, whether Inward or Outward.

CHAP. CXIX.

of CENTURY the Leffer.

I. The Names. It is called in Arabick, Kanzurion Sagos, and Cantaurion Sege, or Segar: in Greek, Kanzurion or Sargs: in Latin, Centaurion minus, & parum: in Eune, Centaurea, fabirjuga, from its Quality, Pot Terra, from its excessive bitterness, Desmoderex Syr, it was called Limnemus, and Phyl, Libdon, because it loves to grow in moist places. It is thought to be that Plant which Theophrastus called Leposphyum: in English, Century the Leffer, and Leffer Century.

II. The Kind. It is no Species of the Greater Century, nor claims any the least Kindred with it, having no Relation in any kind, but only in the name, and therefore is Genus or General Itself. It is in fold, as growing with us, viz. 1. Centaurium minus vulgare florae rubente, The Common Red Small Century. 2. Centaurium minus albo, White Flowered Century. 3. Centaurium minus luteum, Small yellow Century. 4. Centaurium minus luteum perfoliatum ramatum, Branched through-leafd Small yellow Century. 5. Centaurium minus luteum non ramum, Small yellow Century, not Branched. 6. Centaurium minimum intumae, The very small, or small leafed yellow Century.
Salmon's Herbal.

Lib. I.

V. The third, which is the Small Yellow Century, is a little like to the second, and a little greater than it: the Leaves are also larger and broader, and broad at the bottom, but yet not so broad as to encompass the Stalk, as the next does: the Flowers are also a little greater, and yellow, which is the principal thing in which it differs from the last; and withal the whole Plant is not altogether so bitter.

VI. The fourth, which is the Through-leaved Century, has a root small and white, like the former, from whence comes some Leaves next the ground.

The fifth, which is in a Small Yellow Century not Branch'd, and differs not in Leaf or Flower from the fourth: the Stalk bears perfoliata Leaves, but spreads not themselves forth in Branches, as the former doth: it bears also but one only Flower at the top, which thing, together with its not being branch'd, makes it to be different, and among the finest of the perfoliata kind, the whole Plant is less bitter than the fifth.

VIII. The sixth, and footleaf of the Yellow Century differs very little from the fifth, or least describ'd Through-leaved Century, excepting in this, that it is wholly less in every part of it, and whereas the former bears but one Flower at the top of it, this bears two or three, and sometimes more, small Flowers at the top of every of its Branches.

IX. The Place. The fruit grows in great plenty throughout all England, in most Pastures and Grassy Fields; and indeed they are all of them found in many places of this Kingdom, but the first or common is almost every where, in Fields, Pastures and Woods, but that with the White Flowers is more sparingly to be had than the fifth. The fruit found growing in the South parts of Cornwall, in many Plantations, but particularly in that, formerly Captain Ather's, up Wandes River, about five Miles from Chardes Town: the third of those enumerated in this Chapter, grows in many places in Kent, as in a Field next unto that which was formerly Sir Francis Carew's House, at Bedlington near Croydon; and in a Field next beyond Southwark Church towards Gravesend, and in many other places, where also the other kinds are sometimes found.

X. The Times. They all flower in July and August, and their Seed is ripe in about a Month after. They ought to be gathered in their flowering time: but some people out of a mere Superstitious, gather them between the two Leafings.

XI. The Qualities. They are generally hot and dry in the second Degree: but Gerard says, that our third, which is the fifth yellow Century, is hot and dry in the third Degree, and yet it is not so bitter as the fifth. They are all highly Emetic, Perforal, Heparatic, Splenatic, and Hypertick: they are noble Apertifives, and Antiperifives, Vomififes, Altematives, and Emmenagogueks.

XII. The Specifics. It is Antifebric, and good against Distempers of the Stomach.

Chap. 119. English Herbs.

The Virtues.

XIV. The liquid Juice. Being given from four to six ounces two hours before the coming of the First heat, and cures female Green Wounds, and in the same quantity Morning and Evening for some days it removes the Fl, and perfectly cures the Ague. It evacuates and carries off Cholerick and Grofs Humors, and prevents against the Sciatica: And yet with Doce- nes, I do not perceive that it has any tertifile Purging, or Cathartic quality, though in the mean- time, many things which are not purely Cathartick or Purging, are found to be very cleansing, and in pulling off themselves, carry many other Humors along with them.

XV. The Efficac. This has all the Virtues of the Juice; it opens Obstructions of the Gall, Liver, Spleen, Renais, Bladder, Kidneys, and the other Hypochondriack Melancholly, and the Yellow Jawndic; it eases Pains in the Sides, and hardness of the Spleen, making thin both Blood and Humors. It is as effectual against Fat as have the Droprie, or Green-Tinkets, because it strengthens the Stomach, and all the other Vifcers: I know some will not al- low to use the Droprie, but this I know, that if the Redropick Humors are carried off by other means, and the parts afflicted are once emptied of their Water, that if this Efficac be daily given, it fo strengthens the Bowels, that Diaperie returns no more. It kills Worms in the Belly, and dries up Rheums.

XVI. The Infusion in Wine. It cleanses grofs Hu- mors, and eases pains in the Hips, the Gout, and other like Diaperies proceeding from Tarraic Hu- mors: It is good in Agues, strengthens the Stomach, helps Digestion, and causes a good Appetite. It also prevails against Stitches, pains of the Sides, and other difficulties of the Person.

XVII. The Decocation. It has the Virtues of the Infusion, is good against Agues, Catarrhs, and the vehement pains of the Colick: It provokes the Terms in Women, and brings away the Birth, whether dead or alive, very speedily. It drives away the pains of Mother, and causing an effectual Clean- ing after Delivery. It is good against the Rickets in Children, evacuates Tartar out of the Urinary Pultures, and expels the Foul and Gravel, hopp- ing the pallige of the Urine.

XVIII. The Powder. Taken to one dram in Wine, it gives eafe in the Colick, kills Worms in Chil- dren, and (as Papered to three times a day) is a wonderful good medicine against the Biting and poison of a Viper or Adder. Served upon molife, and running Sores and Ulcers, it cleanses, dries, and heals them.

XX. The Oil by Infusion or Bending. It is Ana- dys, eases the Spleen, and pains of the Mules, and is very effectual in all old pains of the Joints, and Limbs, as Gouts, Sciatica, Convulsions, Cramps, &c. proceeding from a Cold Cause. It is also a very good thing to assimone Women Breast which are fwo, hard, or pined, through Cold, or Curing of the Milk, or any other accident, as a blow, &c.

XX. The Quinacrin. It has the Virtues of the Oil, but is more strengthening and fanative: It cleanses, dries, and heals foul Ulcers, and other spreading Scabs of the Head, and to anoint the Back-beth and Jlocks in case of children, as have gotten the Rickets: It strengthens and gives eafe in pains of the Back, by anointing therewith.

XXI. The Balfam. It is an incomparable Val- uable, and cures simple Green Wounds at the first intention. If they are compoumed by bruising, and discansion of the flesh, it mift digests, then clean-

les, dyes, and heals them: It also cleanses foul and hard Ulcers, fills them up with Bath, and con- dures their lips. It heals old running sores, cleans- ing, incarnating and drying, and perfectly caring them, tho' Hollow, or Fideulous.

XXII. The Chalupinum, or film of the green Herb. It has the Virtues of the Balfam, but is an effectual thing for cleansing and healing purit Ulcers in what part soever, if duly applied three a day: washing the hollowed or folidous part also with an Expepped Juice of the Fls. with an

XXIII. The Diluted Water. It has the Virtues of the Infusion or Decocition, but is plasteranie, as being less bitter; but by too much, it is the lefts ef- feetuals: and is many times used as a Vehiculo, to convey other Preparations of the Herb in: It is laid to take away Tanning of the Skin, Sun-burn- ing, and other like difficulties.

XXIV. The Acid Tincture. It is excellent against Vapors, Fits of the Mother, and other difficulties of the Worm. It strengthens a weak Stomach, relieves Vomiting, causes a good Appetite and Digestion, removing Jaundice and ficknefs. It is good against Poifon, as also all Purif, Malign, and Peltiffential Diffilues, being taken in all that the fick drinks from twenty to forty drops at a time, at least five or six times a day it takes away the malignity of the Diseases, particularly abates the pantil heat of the Fever, whether Continent, Continual or Contemperating.

XXV. The Oly Tincture. It carries off the yellow Jawndic, as also the Mortifick caufe of Ob- struction of the Reins and Ulcers by Urine: being given from one dram to two dramis, in a good draught of Cordials Pofter-drink, it has been known to cure Agues in more effectual than the Spiriti Dolli fhow be effectually beneate therewith, from the Verte- brae of the Neck almost to the Ance. Applied on the sides, it eases their Pains; and given inward, it gives eafe in the Colick. It can drive to a Woman in Labor from fifteen to thirty or forty drops, in some convenient Vehicle, it facilitates the Delivery, whe- ther alive or dead, and effectually brings away the After-birth.

XXVI. The Sulphur Tincture. It is good against foul Ulcers, and spreading Scabs of the Head, or other parts; takes away Contusious Deformities, as Tannings, Sun-burnings, Spots, Marks, scorf, Dand- rif, Morphew, and other like defects of the Skin: It being long applied, is said to remove Freckles, that of great continue.

XXVII. The Spiritus. It strengthens the Stomach wonderfully, clears the Heart, revives the Virtue, and fortifies the Universal Oconomy of Nature: it is good against Vomiting, and Indigestion, and causes a good Appetite to Food, makes a fresh and lively Contenance, and refreshes the Blood of the Bowels. It is a very good thing against Diarrheas, Dysenteries, Listeria, &c. and the Hepat- itick Plague, and gives eafe in an exquifite Colick, when sometimes many other things will not help. Dofe from one spoonful to two, in four parts Vehicle.

XXIX. The
Salmon's Herbal. Lib. I.

XXIX. The Calftrium. It is made of the Liquid Juice, or Essence, mixt with an equal quantity of clarified Honey. Being put into the Eyes, four, five, or six times a day, it cleans them from Dimness, Mills or Clouds, or any thing which obfuscates or binders the sight; and if a little Spirit of Wine (about an eighth part) be added to it, it becomes profitable for sore, inflamed and running Eyes; it strengthens the weakened part, and powerfully stops the Fluxion. It also cleanses Ulcers in the Eyes, days, and heals them. And I was was informed by a very skilful Chirurgion, that he once cured a Fluted Labryntith therewith, by injecting it in, with a proper Syringe. This I am sure of, that it singularly cleanses, and drys hollow Ulcers in other parts of the Body, and discloses them to an effectual healing; and drys up moist Scabs, and other breakings out like Scurf or Morphea, though of long standing, if it is assiduously used, and applied for some time. Taken inwardly, from half an ounce to two ounces at a time, it prevails against Colds, Congs, Heartbeats, Wheezings, shortness of Breath, difficulty of Breathing, and other disfactions of the Lungs. Being thus continued for some considerable time, I have known it to cure Ulcers of the Lungs, the Patient drinking with it, new Milk warm, steeped with double refined Sugar, drinking no other Liquor, and wholly forbearing all Wines, and Mauled Drinks.

XXX. The Fixed Salt. It is highly Antifebritick and Diuretic. Diluted to one dram in the Diluted Water, and so drank, it carries off the Morbidcaut of all Fevers by Urine, and cleanses all the Urinary parts of Genet, Sand, and Tartar, lodged in them. It is also excellent good against the yellow Jaundice, and all Obftractions of the Liver, Splen, Reins, and Womb. It dissolves Choler in the Body, and calls it out by Urine: Take of this Salt half an ounce; of the distilled Water a pint mix and dilute. This cures Cutaneous Difeases, and takes off Freckles from the Face, if constantly used for some time; and also removes other deformities of the Skin.

XXXI. The Essential Salt. It has all the Virtues of the Liquid Juice and Essence, and may be given in all those cases from one dram to two or three drams at a time, in a glass of generous Wine, Morning and Evening. It is a great Stone-trick, and Sweeter of the Blood; a noble Antifebritick; and Kills Worms in Young or Old, being taken for some time. It is highly Traumatick, and therefore good to be taken Dietetically, by such as have Wounds and Ulcers about them.

CHAP. CXX.

Of CELANDINE.

The Name. It is called in Greek, Xanthion, Χανθιον; in Latin, Chelidonium, and Chelidonium majus, Hirondinaria major; In Aryan, Chelinion, Chel cow; and in English, Celandine, and Celandine the Greater. This latter name is given to it, because another Plant letfe which has the name of Celandine given to it, and is called the Lesser; and yet it has no Kin or Relation to it; and therefore for distinction sake this is called Celandine the Greater. It is also sometimes called Swallowwort, in answer to the latter name. The name is said to arise from Swallows curing the Eyes of their young ones when they were hurt, therewith; but as it is a thing wholy fabulous, we leave it.

II. The Kinde. It is two fold, 1. Chelidonia majus vulgare, Common Great Celandine. 2. Chelidonia majus vanillata, Chelidoniwm majus latifolium, Jagged Celandine.

<table>

</table>

III. The Description. Common Celandine has a Root somewhat great at the Head, shooting forth several other large Roots, with small reddish Fibres or Strings; Springing from them, the infide being yellow, and full of a yellow Juice; from this Root Springs...
Chap. 120. English Herbs. 169

up several tender, round, whitish, green Stalks, with larger Fruits than are ordinary in other Plants of like magnitude, like as it were knots, very brittle, and much preferred to the former Species. The Leaves, of a dark bluish green color on the upper side, like unto Columbines, and of a more pale bluish green underneath, full of a yellow Juice or Milk, which flows forth, when any part is broken, of a bitter Taste, and Hiring Smell. At the tops of the Branches, which are much divided, grow golden yellow Flowers, having four Leaves a piece, after which come small long, green, much bluish Acid therein.

IV. The Jagged Celandine, grows in its Roots and Stalks, and almost in all things else like unto the former, save that the Leaves are thinner, and the divisional branches, and more cut in on the edges; the Flowers are also of four Leaves a piece, and are of the same golden yellow color, but somewhat larger than the other, and are each of them cut into on the edges, as the green Leaves are, for which reason Clusius calls it, Caltha alternata laciniata. Here, as the other, by flooding its Seed, rises again before Winter, and so continues flowering the next Spring, and seeding in Summer.

V. The Plague. This herb is nourished up by many in Gardens, but is also found growing Wild in many places by old Wall sides, and by the Hedges and Way sides in untilled ground in several parts of this Kingdom. It belongs to the Family of the Buttercups, and the Common place of its growth being in Heath, it is extremely running forth. Here, this, as the other, by flooding its Seed, rises again before Winter, and so continues flowering the next Spring, and seeding in Summer.

VI. The Times. They both flower, all the Summer long, from the Month of April, and in the month after the Candles come to perfection, and yield ripe Seed.

VII. The Qualities. They are both hot and dry in the third Degree, and of an Ablative or Cleansing Faculty, and good for the Liver, and Hepatitis, Arthritis, and Acute andPhthisic.

VIII. The Specification. It is held to be a peculiar thing against the yellow Jaundice.

IX. The Preparations. You must have therefrom,

1. The liquid Juice.
2. The Essence.
3. The Extraction in Wine.
5. The Infusitate Juice.
6. The Distilled Water.
7. The Spirituous Tincture.
8. The Acid Tincture.
9. The Saline Tincture.
10. A Conopium.
11. A Mixture.

X. The liquid Juice. Being taken fasting from one ounce to two ounces mixed with a dram or two of Mustard, and a Glass of Wine, it is of singular use against the Plague or Pelticene, the Patient being laid to Sweat thereupon. The Juice dropped into the Eyes, cleanses them from Films, and Clouds which hinder the sight, more effectually if mixed with a little of the Distilled Water, to assit it. It is also to good purpose used in old running Sorens, and filthy and corroding Ulcers wherever, to hinder their malignity, and stop their running and festering, and to curate them the more quickly, often applied to Warts, Corns, Tettars, Ring-worms, or such other like spreading Sores, destroys their Acrid Ferment, and allates them.

XI. The Essence. It has all the Virtues of the Liquid Juice, but much more powerful to the Intentions, and may be given in the same Dose in Wines. It opens Obstructions of the Gall, Bladder, Liver, and Spleen, and prevails against the Dropsie, and yellow Jaundice.

XII. The Distillation of the Herbs and Roots in Wines. You may boil with them a few Aniseeds also. It has the Virtues of the Liquid Juice, and Essence, but nor altogether fo powerful. You may then, and so is helpful against the Yellow Jaundice, and gargled in the Mouth eases the Tooth Ach.

XIII. The Powder of the Root. Put upon Aching Gums or Tooth, or upon a loofe or hollow Tooth, it will take the Pain presently, and as Authors say, quickly cause them to fall out. Via Graeco. The over Credulous may easily make a Tisay.

XIV. The Infusitate Juice. This is thought to be better for the Eyes than the liquid Juice, because many of the hard Particles by the Insipidation are Evaporated. You may diffuse it with a little Breast Milk, or Cows Milk, and so drop it into the Eyes, it is good against Clouds, Films, Blood-throat, Inflammations, Pearly, and other Difficulties of the Eyes.

XV. The Distilled Water. It is held to be a good thing to clean the Eye-fight, and taken with a little Mirthbrane or Peace Tincture, and Sweating thereon, it is good against Maligns and Pestidilential Difficulties, and may be used as a Vehicle for other Preparations.

XVI. The Spirituous Tincture. It has the Virtues of the Essence, and is a singular good thing against cold and moist Dittemers of the Head, Nerves, Stomach, Liver and Womb. It prevails against Various Ulcers, Sores, Carbuncles, Piles, Fissures, Warts, Lacerations, Numbrums, and Concomitances of the Bowels. By the continual use of this Tincture for about six or seven Months, I know a Man of about thirty fix years, and thirty eight Years of Age, permeated of the Pacific. Dose one, two, or three drams at a time, Morning and Evening (and in very cold habits of Body, Morning, Noon, and Night) in a Glass of Modern, or other generous Wine. Thence, in Churns and Convolutions it would be good to bathe the parts affected therewith: and in Palls, to bathe those parts of the Back Bone, whose Vertebrae tend Nerves to the places afflicted.

XVII. The Acid Tincture. It has all the Virtues of the Liquid Juice, and Essence, and is indeed a powerful thing against all Malign and Pestidilential Fivers, for it actually destroys the malignity, and abates the heat of the Fever, it cleanses much, it is found of singular good use to take away discolorations, or defilements of the Skin.

XVIII. The Saline Tincture. It is good for those who are troubled with the Liver, or have old Sores in their Legs, or other parts of their Bodies: it also takes away Tanning, Sun-burning, Scurf, Morphew, black and blew Spots, and other discolorings of the Skin.

XIX. The Conopium. The Green Herb, with the Roots, being bruised, and made into a Conopium, with a little Oil of Camomile, and powder of Oriz Roots, and Zelitory, and applied hot to the Navel, it eases the Gripping pains of the Belly and Bowels, as also the pains of the Mother. And applied to the Left side takes away Stitches, and cures the pains of the Spine. Applied alo to Wombs, Breast, who have their Confinces too great a measure, it stops them, and gives great relief to discolorations of the Mammary parts.

XX. The Composition of the Acid Juice four ounces: Of Olive one ounce: lozenge of Sulphur or ounce and half: mix them. It cures the I itch, Morphew, Scurf or Dandruff, Foul Heads, discoloring of blowes or Wounds, Tettars, Ring-worms, and other like discolorings of the Skin, being applied therewith, Morning and Evening, for some time.
Salmon's Herbal. Lib. I.

CHAP. CXXI.

OF CHARLOCK.

I. *The Name.* I do not find that this Plant was known to the Greeks, and so have no Greek name for it. It is called in Latin, *Rapistrum,* and in English, Charlock, Carlock, and Chadlock.

II. *The Kinds.* Some would have it to be a Species of the Wild Turnep, others of *Sinapis,* some of *Brysinum,* others refer them to the *Lampiferae* of Phytoferics: but it took its name *Rapistrum,* from which reason it was that some have called it Wild Turnep. But taking it as *Genus,* there are several kinds of them to be found in England, viz.: 1. *Rapistrum Commune,* Common Charlock. 2. *Rapistrum Sylvestre,* one *Arumum,* Wild, or Field Charlock: Attiobius calls it *Lampfina,* so also *Anguifolium,* *Lonicera,* *Lagado-nectis,* *Gerard* and *Gafiier,* in *Hortis.* *Fochaen* and *Turner* call it *Lepon,* *Bauhin.* *Rapistrum* *foe* *Itet.*

3. *Rapistrum alterum Arumum,* a Second Field Charlock, which is also called by all the former names. 4. *Rapistrum album Arctiolum,* White Field Charlock, which is the *Lampifera* of *Turner* and *Geoffrains,* who also calls it *Fidia Sylvestris.*

5. *Sinapis grecof* of *Trogus:* *Rapistrum flore* albo *Eruc* folio *Lollei,* *Armeria* *Tobiniana.* *Rapistrum* flore albo *filipes* *articularis* *Bauhinii.* 6. *Rapi-* *strum* *Anniferum* *Bankii,* One-Grained Charlock.

III. *The Description.* The fifth of these has flowers on the Roots with several fibres or filaments hanging at them, which perishes when the seed is ripe. From this Root rises Leaves admirable like to the *Rapum* *Sylvestre,* but taller, and smaller at the bottom, not jagged: among which rises a rough, slender, brittle, and somewhat hairy Stalk, a foot and half, or two feet high, having larger Leaves than the former, and somewhat jagged and Waved: The Stalk towards the top is divided into many Arms and Branches, on which do grow little yellowish Flowers, which make a great show, but sometimes they are found to be of a purple color, which being past there follows long Yeds, sharp towards the end, containing several flatish seeds, of a whitish yellow color.

IV. *The second,* has a Root long and white, which grows scantly when it runs up to Stalk and Seed, and perishes after Seed time. From which Root springs forth many long and broad rough Leaves, or Green, lying upon the ground round about the Root, somewhat deeply gashed on the edges, and round pointed: from among which rises one slender hairy Stalk, seldom many, branching from the middle upwards into many Arms, with their several Leaves on them to the tops, on which stand many yellow Flowers, having four or five Leaves a piece, which in a Hemp Land, or Corn Field make a mighty and glorious show: but such as the Owiners dispritte: after these Flowers are past, there follows long rough Yeds, not very slender, with divers round, small, reddish brown Seed therein, like unto Mustard Seed, but larger, as quick and sharp in taste, but more bitter than it.

V. *The third has a long Root,* with many Fibres at it, like the former, which dies every year, from whence spring up many large Leaves cut into, a little rough or hairy, but not cut or jagged as the former, the upper Leaves being whole edges. The Stalk rises up rough and hairy like the others, of about eighteen inches high, or more, spread out into many Branches, at the tops of which are a great number...
number of pale yellow flowers, which being puffed away, long pointed Pods follow, rough like the former, and with a few of desiccates in them, in which are contained little round, and also Albo-coloured, sometimes reddish Seed.

VI. The fourth has a Root small and long in some Plants, in others thicker and rounder, near to the bigens of a small long rooted Turnep, which is Annual, or perishing every Year: From this Root there comes forth several Leaves than in the former, but smaller and rougher, and in some little or nothing jagged, but in others more: The Stalks are rougher and lower than the others, which also spread forth into Branches towards the top, and on the tops of which grow the Flowers, not so many as in the Common, or second kind, nor yet altogether so great or so yellow, but either of a pale yellow, or more white, after which come forth smaller rough Pods, with few or Drisiform in them, in which are contained smaller, brownish Seed, nothing near so fiery or hot, as in the first or second kind: Of this kind also, some have been found with a purplish Flower.

VII. The fifth has a Root long and white, and somewhat Flavour, from whence spring forth its lower Leaves, which are somewhat large, thick, and hairy, of a very fresh green color, and its Stalks both edges at the bottom, but broader at the ends, where they are only covered: The Stalks also are a little rough and hairy, of about twelve or sixteen inches, or more, high, yet with a few few leaves as the last, but females, towards the top they branch forth into long spikes of golden yellow Flowers, the length of three, four, or five inches, which being black, there come in their places small, round, striped Seeds, with a little point at the end, containing in every one of them but one Seed, from whence came the same.

VIII. The sixth, which is the Water Charlock, has a Root long, rough, and full of strings, creeping and putting forth many Stalks, from whence comes forth Stalks of a Yard high, and sometimes more, with many Branches, fuculent and smooth, in respect to any of the roots, which are not with rough divided Leaves, deeply indented about the lower parts of the Leaf. The Flowers grow at top of the Branches in Umbels or Tyffs, sometimes of one color, and sometimes of another: The Seed Vells are short and small, containing in them small Seed.

IX. The Places. The first has been found growing in several places of England, as well as from Shore Fishing by Bethnal-Green to Hackney: The second, third, and fourth are found growing in Corn Fields, Hemp Lands, in Barren Grounds, and often by the Borders of Fields and Hedges, Bank-flys and Un-tilled Grounds, and in such like places: The fifth grows in many places of Germany, and with us is nourished up in Gardens. The sixth grows in moit Meadows, and Marsh Grounds, and in Water Ditches, and other plathy places.

X. The Times. They flower all April, and continue flowering till the Summer is far spent; and the Seed ripens in the mean time.

XI. The Qualities. The Seed is hot and dry in the third Degree: Infomuch as some do make use of it instead of Mustard Seed, or mingle it thither. It is Cephalick, Neurotick, Smorackick, Nephrick, and with a few of desiccates in them, in which Diuretick: Alterative, Parishick, Multificative, and Alexipharmick.

XII. The Specification. It opens the Obstructions of Brain and Nerves, and is good against the Palsies, weakness and trembling of the Nerves.

The Virtues.

XIV. The Oil by Expressions. It diffuses any cold Tumor, and exsudes pains proceeding from a cold Gaue, being anointed upon the part warm, and well rubbed in. It is of good use to make Soap virthial, instead of Oill Olive, and much exceeds Train or White Oil for that purpose, and where Butter and other Oill are wanting, it may serve to Fry with.

XV. The Emulsion. It is made of the Seed by grinding it with hot Water, in a Boul, with a Bolte, then filtering the Flumes through a Piece of Muslin: This liquid part being sometimes flufft up the Noffrits, as to its may come out again at the Mouth, purges the Head and Brain effectually, by the Noffrits, of cold, moist, and inveterate Humors, and by that means prevails against vehement and invertebrated Head-aches, proceeding from a cold cause, Vertigo's, Lethargies, Corns, Apoplexy, Epilep-try, Convulsions, Palsies, and other Difestutions of the Brain and Nerves. And I have known by often using of it, in some who have been Dim sighted, or almost Blind, and in others who have had a continual flux of Rheum into their Eyes, for some considerable time, that it has cleared the sight, diverted the Rheum, and strengthened the Eyes so admirably, as if they had never ailed anything at all.

XVI. The Sence. It is made as Mustard, and so to be used: It strengthens the Stomach, sharpen the Appetite, and causes a good Digestion: but it is nothing near so pleasant as Mustard; applied immediately upon a Corruption where the skin is not broken, it diffuses the Tumor, and prevents the affix of Humors to the part.

XVII. The Spirit. It is admirable against the Screev in a cold thirst of Body, it excites the Animal Spirits, and causes liveliness and cheerfulness in such as are Sleepy, Drowsie and Lethargick: and is indeed an excellent thing for men commonly to take of, who are Paralytick and Incontinent; for it dries up numbheads, tremblings, and other weakkles of the Nerves; more especially, if it is also bathed down along the Back-bone, and parts affected, Morning and Evening, and also taken from one dram to two drams, or more, Morning, Noon, and Night, in some convenient Antiparalytick, and Antispasmodick Vehicle.

XVIII. The Spiritous Tincture. It has the Virtues of the Spirit, and in some causes more effectual, being more Smorackick than that is, and being bathed upon any part afflicted with a cold Tumor or Swelling, or with cold and moist Humors, or with Rheumatick Pains proceeding from cold, it warms and comforts the Part, diffuses the Humors, and eases the Pains: mixed with White Wine, and used as an Eirhine, it purges the bowels, and expels Cold Phlegmatic Matter which offends it, causing Head-ach, Vertigo's, Drewminds, Lethargies, &c.

XIX. The Oily Tincture. It is used chiefly outwardly, in Gouts from a cold cause, the same being admirable cafe. As also in Nervous, Trembling of the Limbs, and Palsies, in all which cases, it ought to be bathed all aloft upon the Back bone, from the Vertebra of the Neck, almost to the Ass, and this is to be repeated oftentimes, and well rubbed in both Morning and Evening, the pars af-

Z 2 teted,
felled are likewise to be bathed with the same. An
ointment upon a Nerve prick or hurt, it eases the
Pain and Anguish, and abates the Tumor, if any be
present.

XX. The Saline Tortilla. If given inwardly,
from half a dram to two drams, it opens Obstru-
cions of the Urinary parts, and of the Bowels; but
it is of greater use in outward Applications against
Tumors, Sun-burnings, Scarf, Morthew, Dandriff,
and other like Dehuminations of the Skin; for it
deliques after a regular manner, by rustion of its
Volatil Particles.

XXI. The Casparia. Made of the Green Herb,
but principally of the Seed, with the additio of a
quarter part of Mkhitrate, and so much Orce
powder as will bring it to a consistence, and applied
to cold furulent Tumors, it diffuses them; if Na-
ture designs the Tumor for breaking, it brings it to
more or less extent, and that in a little time,
because of its heat. If it is applied to the Gout, it
eases the Pain, and attracts the Morbidick Humor
through the Pores of the Skin, in manner of
Sweet.

CHAP. CXXII.

Of CHERRY Winter.

I. THE Name. It is called in Greek, Σταφήλια
Staphelia; in Latin, Alkekengi, Hellicacba-
um, Salicina Hellicacbus Theophrasti, Vescorium
Pisum, Saxifraga quarta rubra Bruntelli, and Salu-
num Vescarium: In English, Winter Cherries.

II. The Kinds. Parikington says, it is one of the
kinds of Salica, or Night-shades, fix forth and
spoken of by Dioscorides and Galen, and one of the
two of Theophrasti. We make two Kinds there-
of; 1. Hellicabum five Alkekengi Vulgare, Our
Common Winter Cherry. 2. Hellicabum five Al-
kekengi Virginianae, The Virginian Winter Cherry.
There is another Plant, which some Authors have
joined with Winter Cherries, and called it,
Hellicabum Pergirenum, Vescorum Vescrum, and
Hellicabum Report, Winter Cherries Creeping,
as Tragia, Eufbeira, Gynher, Matrutilas, Bude-
ness, and others; but Corbis oppolcses, and it is
another Plant: Bambusus puts it among the
Peafs, as a kind thereof, and calls it Pismum Ves-
carum: Labbi thinks it to be the Syzygium Dief-
cardia, and calls it, Cor Indian, Pismum Indicum,
and Pismum Cordatum, for all which reasons,
being rather a Genus than a Berry, we have be-
orn to put it in this place: and so much the
more alo, because it is no Native or Planton of
our Countries, nor does it grow naturally, as some
think, in any Part of Europe.

III. The Description. Our Common Winter Cher-
ry has a running or creeping Root in the Ground,
and must not much unlike to the Roots of Witches
grape, running very far abroad under the upper crust
of the Earth, coming in greatly to encrease; it is
sometimes of the thickness of one little Finger, shoot-
ing forth at several joints, and in several places,
by which means it quickly fills a great piece of
Ground, from this Root rise up a Stalk two or
three feet high, round, fliender, Smooth, and some-
what reddish, reeling this way, and that way,
by reason of its weaknefs : upon which come forth
many broad and long green Leaves, not much uni-
to the kind of Common Nightshade, but larger:
that at the Joints adhere, and among which Leaves
come forth whitish flowers, conflating of five small
Lavory spots: In the middle of which Flower
there is a Berry, green at first, and red when it is
ripe, like almost in color and bigness to our Com-
mon Red Cherries (whence the English name,)
These Berries are enclosed in Skins, or Bladders,
of a pale reddish color. In the Berry is contained
a reddish Pulp, and the Seed lying in the same, which
are many, small, and flat, and of a pale yellow
color.

IV. The American kind, has a small Root spread-
ing under ground, but not so far, as the former, and
berries every Year. From this Root come forth
Branches with Leaves on the ground, scarcely ri-
Sing up so much as the other, seldom above eighteen
or twenty inches high, (which I observed when in
its perfeflion, and growing upon fertile ground,) but
the Branches are greater, as alfo are the Leaves,
and something more uneven about the edges of a
fruit, or deep green, almost of a Sea-green color: as
the Joints come forth the Flowers flanny, to wit, one,
at a place, and more towards the bottom than up-
wards (I this observed not, for I always found each
Plant very full of Fruit, almost from the bottom to
the very top;) but as they grow to the height of the
Branches, both Flowers and Fruit are rather smaller
than those which are below: the Flowers are
covered of five small subtilf Leavws, with a Circle
of red, or every Leaf is spotted Cretewife towards
their bottoms: the Flowers being full there follows
the Fruit, enclosed in a thin Skin or Bladder, of a
whitch, or pale greenolv color: and not full out so
large as the former. Within this Hobc or Ball is
contained the Berry, which never grows full out so
large as our English Winter Cherry, yet subtilly re-
cent, fills almoft the Bladder, in which it is contain-
ed: when the Cherry or Berry comes to its per-
tation, it is never red, but of a pale whitish green
color,
color, sometimes of an Amber color, or of a light
pale yellow, and sometimes a light which the Sun
has in midsummer, may have some faint streaks of red,
mixed with Amber-colored and pale yellowish green
colored. The Berry contains a Paup like the English,
but bluish yellow, or green, in which Paup is con-
tained the Seed, which is small and flat, like the other,
and of a whitish color.

V. The Places. The first grow by Hedge sides,
and old Walls, and about the Borders of Fields, in
moll and thinly places (this it may possibly do,
in several Southern Regions and Countries beyond
Sea) but with us it grows chiefly in Gardens.
The other grows Wild in English Plantations in Virginia.
I found it growing in a Plantation up Wando River in Carolina,
and in several other Plantations
of that Country, where it grew spontaneously, and that
in vast plenty. Parkinson makes mention
of a third kind of Wolf Inka Althoengis, which I take
to be the same with that before described, and differ-
ted from it only in largeness, and strength of its
Stalks, Branches and Berries, which I believe affords
only from the differing goodness of the Soil, they
being planted in different places, as I have
found them both growing on the same ground, but
which could not possibly take them to be two differing
Species of the same Genus.

VI. The Times. They Flower about the middle
or latter end of July, and the Fruit is ripe about
the latter end of August. In Carolina they Flower
sometime earlier.

VII. The Qualities. The Herb is cold and mollif in
the second Degree, not Aperitive : but the Ber-
ries are of the same Quality, and Opening 3, Drur-
tick, Nephritic, Alterative, and Lithontrippic.

VIII. The Specifications. They are peculiar against
Obstructions of the Reigns, Ureters, and Bladder,
and to help in the Stomach, Stone, Gravel, Sand,
and Tartarous matter, lodged in those Parts.

The Preparations. You may have them,
1. A Distilled Water from the Fruits or Leaves.
2. A Juice of the Fruit made with White Wine.
3. An Infusion or Decoction of the Berries.
4. A Distill'd Water.
5. A Powder of the Berries.
6. An Oil of the Root.
7. A Cataplasm of the Leaves or Fruit.

The Virtues.

X. The Distilled Water. It is Cooling and Dia-
retick: it may be distill'd from the Fruit or Leaves
with a little Milk. It may be drank from two ounces
to five or six, swathed with a little Sugar,
Morning and Evening, against the Stomach, heav-
ly of Urine, and all the Dilemmers of the Urinary
Parts.

XI. The Juice of the Fruits. It may be given
from one ounce to two, in a glass of White Port Wine,
against Stone, Gravel, Sand, Tartarous Mucilages, or
what ever Rops the Urine in either Reigns, Ureters,
or Bladder : but it is not so powerful as the pow-
der.

XII. The Infusion or Decoction of the Berries in
White Wine, or Water. It opens the Urinary Parts,
and is an excellent thing against the Strangury, pro-
vokeing the Urine plentifully when it is stopped,
or grows hot, flux or painful in the passidge. It is
good to expel the Stone and Gravel out of the Reigns and
Bladder, helping (where it is composed of a gritty
Substance) to dissolve it, and to expel and
find it forth by Urine in form of Sand or Gravel.
It is good to cleanse toward Apoplexy, and
Uterus in the Urinary Parts, and to relieve such as
make a foul, thin, or fluxing Urine, or that gifts
Blood. It is probable also against the Jaundice,
by carrying off the Morbid Clint by Urine. Let
them take from four to eight ounces, Morning, Noon,
and Night: and to be continued as the Exigency of the
Disease requires.

XIII. The Distill'd Water. It is made of the Berries
put up into new Wine, when it is new made, that
working with the Berries therein, their Virtues may
be drawn forth into the Wine. Or because our
Country affords not new Wine in the Alay, you
may put them into new Beer, or Ale, as you list
them to Work, and also Tun them up therewith,
that they may easily Work with the same. The
proportion is two large handfuls, when green, to
a Gallon of Wine or Ale : and one large handful
well bruised when dry. This may be drank as ordi-
inary drink, but at least a Pint of it Morning,
Noon and Night. It has all the Virtues of the
Inflamation or Decoction.

XIV. The Powder. It is made of the dried Ber-
ries, in which the Seeds themselves are reduced into
a Powder. The Dose is from Half a Grain to half a
Drachm, Morning and Night, in a Glass of White
Port Wine. Or you may Infuse it in the fame
Wine, two ounces of the Powder to three Quarts of
Wine, letting it stand in a cool Digestion a Month
before hand, shaking the Bottle every day. When
you drink it, shake the Bottle, and pour it out thick
and thin together, and let the Patient take a quarter
of a Pint at a time, Powder and all, Morning and
Evening, and continue this course till he has found
the desired relief. This Powder, and thus taken,
is much more efficacious than either the Infusion,
Decoction, or Distill'd Water, and ought to be very much
valued of such as are troubled or afflicted with the
Stone, Strangury, or stoppage of Urine.

XV. The Oil of the Root. It is good against the
powerful Strokes of the Scorpius : this Oil being
applied, Parkinson says, it is powerfull to
fling out the venom of the Scorpius, and
that it be put to them, they will utterly booke
their strength.

XVI. The Cataplasm. It is cooling, and powerful
to be applied to alay the heat of Inflammations, and
to ease pains coming from a cold cause.

CHAP. CXXIII.

Of CHERVIL. Garden.

I. THE Names. It is called in Greek, καρβίζω
cherivl, and is thought to be χαρβίζω Thaerhi-
ζωι, 1 Th. 17, 7, translated by Gaza, Erthnabile;
in Latin, Cerifatn, and Chartifatn: in English,
Cervil.

II. The Kinds. It is threefold, 1. Garden, 2. Wild,
3. Tooth-pick Cervil. The Garden Cervil in three-
fold, 1. The Common Garden, called Cerifatn Se-
trium. 2. The Great Sweet Cervil, Sweet Cefy,
called Cerifatn magnum, mecryrhis. 3. The
Small Sweet Cervil, Small Sweet Cefy, called,
Myrrhus altera pone. The Wild we hail treat of

III. The Description. Garden Cervil acts a small
and large Root, which perishes every Year, and is rais-
ed up every Year, with Seed grown in the Spring,
as also in Autumn for Sowing. It rises up with
Stalks not a foot high, and in its Leaves much re-
sembles Parley, but after it is grown bigger, the
Leaves are very much cut in and jagged, somewhat
refers
Salmon’s Herbal.

Lib. 1.

Chervil.

V. The Small Sweet Chervil, (or Small Sweet Cilley) has a Root not like the former, but confilling of almost nothing but fibres, thick and sorted together; its Leaves, Stalks, and Umbels of Flowers differ not much from the last, excepting that they are every ways less. The Seed is long, smooth, small, and shaped like an Oxt, and in taste not much unlike that of Daucus Creticus.

VI. The Places. The two first grow in Gardens, and that almost throughout this whole Kingdom: The last is found in some parts of the Alps, as about Genoa, and other places, but with us in Gardens of Bosanf and hot as are curious of Plants.

VII. The Times. They Flower and Seed in May, and their Seed is ripe in July; and therefore are Sown again in the end of Summer.

VIII. The Qualities. It is hot and dry in the first Degree; Galingays in the second: Aperitive, Alteftive, Carminative, Digestive, Diuretic, and Amody. It warms and comforts the Head, Brain, Nerves and Stomach, is Pectoral, Nephritick and Hydrick: Alto Alterative, Achesipharmick and Spermagogenetic.

IX. The Specification. It is found by great experience to comfort the Stomach, and provoke Urine, even where it is flux.

X. The Preparation. You may have herefrom, 1. The Green Root. 2. The green Herb. 3. The green Seed. 4. The Distilled Water. 5. The Liquid Juice. 6. The Essence. 7. The Balsam, or Ointment. 8. The Roots Candied. 9. The Distillation of the Roots in Wine.

The Virtues.

XI. The green Root. Gerard says, they are excellent to be eaten in Sallet, being first boiled, and then dried up to the Table, as the Cook can tell bet, either with Butter and Vinegar, or Oil and Vinegar. They are good (says he) for old People which are Dull, and without Courage: they rejoice and comfort the Heart, Strengthen and provoke Lufh much.

XII. The green Leaves. They are very good, wholesome and pleasant, being eaten raw as a Sallet Herb with other Sallettes, giving the whole a little relift of Anisfeacks. Used as a Pot-herb, it is pleasant to the Stomach, and is used by the Dutch in a kind of Lobobilly or Hotchpoch, which they call Wermers.

XIII. The green Seed. Parkinfeon says, they are commendated, being put into a Sallet of green Herbs, and eaten with Oil and Vinegar, to strengthen the Agueil, and comfort a cold Stomach. Gerard says, that the green Seed eaten as a Sallet, with Oil, Vinegar, and Pepper, exceed all other Sallets by many Degrees, both in pleasantness of taste, firmness of smell, and wholesome for food, being good for a cold and weak Stomach.

XIV. The
Chap. 124. English Herbs.

XIV. The Distilled Water. Being drank to four or six ounces, it is good to dissolve congealed Blood, and provoke Urine.

XV. The Bitter Juice. It dissolves congealed Blood in the Stomach, Guts, Pleura, Lungs, Womb, or other Bowsels: it provokes Urine, and the Terms in Women, and to expel Sand, Gravel, and Stones out of the Reins, Ulcers and Bladder: and provoketh alfo against the Pleurisy, very much comforting a weak, sick, and cold Stomach. Doft four ounces, Morning and Night, in a Glass of Wine.

XVI. The Essence. It has all the Virtues of the liquid Juice, besides which it facilitates the Birth, and brings away the After-birth, is good against Poyon, and the Venemous bitings of the Phalangium, as Doforis and Bith, is nutritive, and refirbes in Contagions: Being often taken it breeds Seed, and very much provokes Lust, and has restored Some who have been Impotent.

XVII. The Balsam and Ointment. They cure concinfed Wounds, and digge deep into them, if Conflint or Lacerated: Applied to filthy, flaking, and fo- did Ulcers, they digge, clean, dry, conglutinate, and heal admirably: and applied to the Gout, they ease the pain thereof, drawing forth the Morbid matter thro' the Pores of the Skin.

XVIII. The Candied Root. They are very good to warm, comfort and strengthen a cold, and weak Stomach, and excite Venus: In Porkfife Dayes, they are thought to be a good Preventative in the time of Plague.

XIX. The Decoction of the Roots in Wine. It has the Virtues of the Juice and Essence, but not all our fo powerful: It is good against the bitings of Vipers, Mad Dogs, and other Venemous Creatures; is profitabe against the Phthick, and such as have an Imprecency, or are in a Mining Contagion. Doft, Morning and Night, from four to eight ounces.

C H A P. CXXIV.

OF CHERVIL WILD.

The Name. It is called in Greek Νααοτα, in Latin, Corfurifum, or Cher- falum Syphryfris; and in English, Wild Chervil.

II. The Kinds. This is the second Species of Corfurifum, and is threefold: 1. Chervifum Rume- bini, in Latin, Choreffyfum Syphryfris Vulpugi, Common Wild Chervil. 2. Aflisfrum Epizotramuros Edelz Co- fume, Small Hembock Chervil. 3. Cerifura alba Luflwnurs, Cerifura Ephysiris Camerarij, Wild Cilley.

III. The Decription. Wild Chervil has a white woodly Root, from which rise up about round it, round, red, and hairy Stalks, a yard long, or more, many times branched; and divided into the lower parts, which Stalks are not hollow, but full of Pith: towards the top they are divided into many Branches, which have on their tops Umbles of small and very fine white little Flowers, which being puffed away, are succeeded by longish Seeds. The Leaves are commonly parted into three parts, and each part again subdivided into six, which are falt against the edges, fift, hairy, and of a dark green, or reddish color.

IV. Small Henlock Chervil, has a Root small and white, which when it has perfified its Seed, perisheth every Year; from which rise up Stalks slender, hollow, fmall, not hairy, and falted exceeding the height of two feet. They are divided into several Branches, against the Leaves, fo that they spring out of them, as it were, of the Leaves, which carry many Umbles of small white Flowers; after which they have the Seeds, rough, furt, round, and long, about the bigness of a But, and growing one together. The Leaves are small, and finely cut or divided, as fife of Hemlock, but of a white color, and hairy.

V. Wild Cilley, has a Root very large, and divided into several parts, white, and spongy, of a plentiful things. It is, and with a hot and burning Effe: This Root, tho' the Seeds fade and perish, yet lives, and the Leaves are green all the Year. The Seeds, if they grow in good ground, come to be three or four feet high, are hollow, pointed, pretty thick, green, and much Saff, and the tree of the leaves many Branches, which have on their tops, Umbles of white Flowers, every flower consisting of five little Leaves, of which the bont is twice as big as the root, the two side ones left, the uppermost the left of all. The Leaves are large like those of Myrrhis, or Sweet Cilley, but of a dark green color, and those grown on the Tops of the Seeds, are commonly divided into three parts, and those again subdivided into several long sharp pointed and falt leaves, like those in Sweet Cilley, the Seeds are lengths, round, sharp pointed, black and shining. This Plant may very well be called Wild Cilley, for that it so much resembles the Garden Sweet Cilley, not only in its form, but, as Authors believe, in its Virtues too.

VI. The Places. The first grows almost everywhere in every Hedge, and by every Hedge side. The second, about Mud Walls, High Ways, and fish like places, about London, and many other parts of the Kingdom; it is but a small Plant. The third is found very commonly in all places, especially where the ground is moist and flat, in Meadows, Orchards, and the like.

VII. The Times. The first flowers in June and July, and the Seed ripens in the mean Summer, or
not long after. The second comes up in March, 
Howsers in May, and its Seed ripens in June. In 
Italy they eat the young Leaves in Salads, and call 
it Wild Chervil. The third flowers also in May 
and June, and its Seed ripens in the mean Summer, 
or not long after.

VIII The Qualities, Specification, Preparations 
and Preparers, are laid to be the same with the Gar- 
don Chervils, to which I refer you. Parkinson says, 
that Wild Chervil will help to dissolve any Tumor 
or Swelling, and that in any part of the Body, as 
also to take away the spots and marks in the Fleth 
and Skin, proceeding from Congelated Blood, by 
huttles or blows, in a short time, by applying it 
(britersf I flappdr) to the place.

X. A Catalogue of the green Herbs and Rents. 
I once knew a Man who had been for a long time, 
even for many years, afflicted with the Croup ; so 
that sometimes for four, five or six Months toge- 
ther he could neither go nor stand, which put him 
so much out of heart, as to think himself past all 
care. A Beggar Woman going by, and begging at 
the Door, at such time as the Sarsaparilla was upon 
him, and understanding by some Difficulties the 
Mutter's illness, told them she would cure him, 
the advised him to apply a Poltice of green Wild 
Chervil to the parts affected, and to renew it as of- 
en as he found need; (feeding to him also at the 
same time some of the Herbs, that he might know 
it;) he did so, following exactly the Begger Wo- 
mans advice, and he had in a little time, care, and in 
less than a Month time a perfect Cure. If at any 
time afterwards he found any Cribbling Pain, in 
the same parts, or in any other, he had still recourse 
to the same remedy, and avar'd upon his faithful- 
ful word, that he never apply'd this Cataplaun in 
 vain.

C H A P. CXXV.

Of CHERVIL Tooth-pick.

I. T H E Name. It is called in Greek, Τρύγδας: 
In Latin, Gingidium, and Bucata: In En- 
fh, Tooth-pick Chervil, and Strange Chervil. The 
Syrians call it Vignaga, as Romanius Sith.

II. The Kinds. There are three principal kinds, 
1. Gingidium verum, five Syriacum Discordia, Sy- 
rian Tooth-pick Chervil, called in that Language 
Vignaga. 2. Gingidium Hippunicum Mattthii, The 
Spainish kind. 3. Gingidium Chersoli, Iacis Ta- 
herusianum, Tooth-pick Chervil, with Chervil 
Leaves.

III. The Descriptions. The fifth has a Root almost 
like a Carrot Root, not great, but long, white and 
woodly, perishing every Year after Seed-time, which 
is in the same Year it is Sown, or efe Springing up, 
and not blossing up into Stalks for Seed, it will at- 
hide a Winter: from this Root it grows up with an 
upright Stalk, somewhat rough, branching forth from 
the very ground almeft, on which are few Stalks of 
fine Cut Leaves, fewer than Female, especially thofe 
of the Stalks and Branches, for the leafs are a lit- 
tle broader. At the tops of the Branches grow broad 
Leaves of white Flowers, somewhat puripifh in the 
middle, which Umbels before they flower, hang down 
their Heads, and after the Flower are pruf, the Um- 
bels do conftant, or draw themfelves rounder, the 
outside Leaf is broader than the middle, which 
then is fo {Hott, that it repreffent a Birds Nef, 
something like to the Umbels of the Wild Carrot. 
The Flowers being puf, there succeeds a great pro-

then is fo {Hott, that it repreffent a Birds Nef, 
something like to the Umbels of the Wild Carrot. 
The Flowers being puf, there succeeds a great pro-

IV. The Spanish Kind, has a Root long and white, 
from whence rises up a Stalk higher than the pruf 
Syrian kind, and is every ways greater, as to the 
whole,
Chap. 126.  English Herbs.  

whole, but the stalk is more slender than it, and the leaves more tender at the joints, thicker, and more finely cut at the edges, on which stand large Umbels of white Flowers, divided into many parts, and standing upon long stalks, which when the seed grows ripe and hard, being long and slender, will sever very well for Tooth-pickers. Gerard says, that in the North, where the Lathyrus is more bitter, it is like unto Wild Carrots, founding that the leaves are somewhat finer cut, and jagged, and tenderer, but not rough or hairy at all, of a reasonable good Smell, and a bitter Taste, among which rise also bulbous radders, or spoby Tufts, like thoe of the Wild Carrot or Bids Neft, which are closely drawn together, when the seed is ripe, at what time the sharp Neddles are divided into small paricles, that are all white, and finer, and for which purpose they very well serve, and from thence came the English name.

V. The third kind has a Root long, white, and bitterish, from which spring up divers Stalks of winged Leaves, very like unto the Common or Ordinary Garden Chervil, but not divided into so many parts: the stalk is round, frayed, and blackelish, about a foot and half high, with Tasts and Leaves like the others. The Umbels of white Flowers, are encompassed about with smaller and finer cut Leaves, when the flowers are full, the Umbel is covered together, which are clumsy, and in which lies small Seed.

VI. The Places. They all grow in Syria; the second in Spaine plentifully: but with us they are only nourished up in Gardens.

VII. The Times. They flower in July and August, and the Seed is ripe in October, but with us they flower late, and therefore the Seed is much later; so that if the Year is not hot and kindly, the Seed will freely ripen, or come to perfection with us.

VIII. The Qualities. They are fit to be temperate in respect of heat or cold, and dry in the end of May and June. They being of a double Degree, are Digestive, Salutary, and Alternative. They are more used as Nutritian than Medicine, both in former times and now, for Discommodies and Girden say more concerning their Edible Properties, being eaten raw or boiled, or otherwiseways ordered, according to several Mens liking, for that they are bitterish, and a little Siprick, and to the more welcome and agreeable to the Stomach: But Gerard says, that they are rather Medicinal and Nutritive, for that though they may have a temperate Quality, as to heat and cold, yet that they have a manifest bitterness and affringency, by which properties, though they may be very agreeable to the Stomach, yet they are more of the Nature of a Medicine, than of Food; for that by those Properties, they cleanse and dry up the moist Humors, which by superabounding, may offend the Stomach, and by it the Liver, and other parts.

IX. The Specification. Before strengthening the Stomach, as aforesaid, they are proper against Difficulties of the Reins, Ureters, and Bladder, and to provoke Urine.

X. The Preparation. You may have threetherein, 1. The Juice. 2. The Essence. 3. The Decoction in Wine. 4. The Spicy Perfume. 5. The Acid Tincture. 6. The Wine Tincture. 7. The Quale on which the Seed does grow.

The Virtues.

XI. The Liquor Juice. It is good against Vomitings, and strengthens the Stomach; it provokes Urine, and expels Sand and Gravel from the Reins and bladder. The Dose is three or four ounces, Morning and Evening, in a Glass of White Port Wine.

XII. The Essence. It has the Virtues of the Juice, but strengthens the Stomach more, and is without more Disturcan. Dose three or four ounces in White Port Wine.

XIII. The Decoction in Wine. It is an admirable Stomachick, and being drunk to fix or eight ounces, Morning, Noon, and Night, it opens Obstructions, and cleanses the Reins and Urinary parts of Sand, Gravel, small Stones, and Turbatures Siame lodged in those parts, but it is not full out so powerful as the Essence.

XIV. The Spirituall Tincture. It strengthens the Stomach, helps Digestion, clears the Heart, revives the Spirits, and conforms Universal Nature. Dose a Spoonful at a time.

XV. The Acid Tincture. It drops Vomitings, cures the Stomach of Tarat, and Vikodity, ass a good Appetite, and helps Wheezing, Hoofticks, and thornses of Breath.

XVI. The Oily Tincture. It is Nephritick and Disturcan, cleanses the Reins and Bladdar, and so is good against Stone and Strangury. Dose twenty or thirty Drops in White Port Wine.

XVII. The Quale, Needle, or Tooth-pickers. They serve to pick and cleanse the Teeth, and with Genius any thing sticking in them, which they do without any hurt to them, and leave a good bleat in the Mouth.

C H A P. C X I V I .

O F C H I L C H I L S C R I A L L S. Annual.

1. T H E Names. I do not find that it has any Greek name: The Latin call it Lathyrus, which is a kind of Pea, and differs from Lathyra, Square: we in English call it Chickling.

Salmon's Herbal. 55. Lib. I.

Chap. CXXVII. Of Chickweed Common.

I. The Names. It is called in Greek, Ἀνθίς. In Latin, Alpinum; in English, Chickweed.

II. The Kind. There are three principal kinds,

1. Anthis tardus, Alpinum, Common Chickweed. 2. Anthis tenuis, Alpinum squamatis, Water or Marsh Chickweed, of which in the next Chapter. 3. Anthis mollis, Barbula Chickweed, of which we shall treat in Chap. III. Of the common kind, there is 1. Alpinum mollis, Lactu-
III. The Descriptions. The first has a white thready Root, small, and consisting of several little fibres like hairs, from whence rise up Stalks a foot or foot and half high, and sometimes higher, a great many from one Root, long, and round, slender, full of Joints, with two Leaves growing out of every Joint, almost as large, and as long or longer than Pelitory Leaves, in which they are very like in shape or form, but smooth, without any hairs or downiness, and of a light green color. The Stalks are somewhat clear, and as it were perfumed, or transparent, and about the joints they are often of a very light red color. The Flowers are at the tops of the Branches, being white, and consisting of six Leafy Spikes, standing in long green Husks, not much unlike to the Flowers of Stitchwort, but lesser. Which being pell, in their places succeed long Knops, or Seed Pockets, but not great, containing within them small yellowish Seeds.

IV. The second has a Root white, and full also of little fibres, from whence spring many Stalks or Branches, as in the former, which for the most part rise upon the ground, the Stalks are small, round, long, slender, brittle, or very tender, and jointed, from which slender Branches spring Leaves, rejoicing the precedent, but much finer, as is likewise the whole Plant, which in no respect attains to the greatness of the former; the Flowers are also in like manner white and small, standing in like fashioned green long Husks, which being pell, the said Husks or Knops contain small yellowish Seeds.

V. The third has a Root which is white and long, creeping much under ground, and growing forth in divers places every year new plants, the old dying away every year; from this root come forth many flexible Branches full of Joints, rising higher than a Man, if it stands by higher or other things, where it may take hold, otherwise, through meadows, they lie upon the ground, and so from not so long or tall. At every one of the Joints stand two Leaves, one against another, much like to the Common Great Chickweed Leaves, but larger, and coming somewhat near to those of Pellitory of the Wall, and of a fresh green color. As the Turf rises, on both sides of the Stalks come forth other Branches, jointed and set with the like fashioned Leaves in the same manner, and at the ends of them large, green, round Heads, ending in fine points, with white Flowers growing out of them, consisting of five, and sometimes of six white Leaves opposite, cut in at the ends, as in which Heads, after the Flowers are pell, small and round Heads, like Berries, green at the first, and blackish when they are ripe, containing within them many flat, blackish, purple Seeds. This Plant has but one herby taste, like to the Common Chickweeds, and therefore the Learned Botanists refer it to them.

VI. The Places. The first grows almost every where throughout England, by Highways and Ditch sides, in moist and watry places, especially if the Earth is rich. The second is found also in many of the like places, as also in Gardens, where many times it is a most pernicious Weed. The third, Clumsy Fays, grows in several Places of Spain and Germany, as also in Flanders and England, as Peru and Label Fay, Parthenia Fay, that he had sometimes found it by Hedge sides in our own Land.

VII. The Times. Chickweed is mostly green in Winter, they Flower in Spring and Summer, and their Seed is ripe in June and July.

VIII. The Qualities. They are cold and moist in the second Degree: Emetic, Astringent, Analyst, and Alterative; Common and Orthisia Fays, they are without any Astringent Quality.

IX. The Specifics. The Juice is peculiar against the inflammation called St. Anthony's Fire.
Salmon's Herbal

The Virtues.

XI. The Juice. It is very Cooling and Emollient, without any binding property. Galen and others say, that it has the Virtues of Petallony of the Wall, but that it does, however it is commonly found to be as effectual as Purslane to all the purposes whereunto that serves, except for Meat or Salting only. Applied with Cloths or Spunges dipped therein, to the Region of the Liver, and as they dry, to have beech applied, does wonderfully attempt the heat of the Liver. The same also is effectual for all hot Apoplexy and Tumours whatsoever, and is used in Spain in Lyons face, or Stomach, and the like, as also for all redness of the Faces, head and the like. Use it twice in an Ointment with Land. It is good for all heat and redness of the Eyes, being dropped into them, also put into the ears warm, it eases their pain proceeding from a hot cataract. The Piles bathed, or touched therewith, it shares their pains, and takes away their heat and sharpness, and eases all other pains of the Body proceeding from heat and sharpness of Humors. It is good against hot and virulent Sores and Ulcers in the Privy Parts, Lungs, or elsewhere, they being often washed therewith.

XII. The Essence. It cools inflammations of the Lungs, without any binding property, and takes away the heat of the Stomach and Liver, breaking out into the Lips, caueth Appetite, being loath thereunto, is prevalent against Head and Fevers, as also the heart and pain in the Back, and the sharpness and fulness of Urine. Doth from one to two or three ounces Morning and Night.

XIII. The Distilled Water. It has the Virtues of the Juice, but much less effectual, and may be used as a Vehicle to take the Essence in.

XIV. The Oil. Made by boiling the Herb in Oil Olive, till it is crisp, and upgrading it three or four times with fresh Herbs, it heals all Loes, Ulcers, Wounds, Putres, Sore, and the like, and being anointed upon the hands up Sinews, it extends them, eases their pains, and makes them pliable again.

XV. The Compound Oil. Take green Chickweed, fresh Red Rose Leaves, each of two handfuls: Oil of Terebines, two pounds:可用 oil, and Brain out: repeat this boiling with fresh Chickweed, and Red Rose Leaves, twice or three times: Brain out, and keep it for use. Being anointed warm, and well rubbed upon Sinews which are strained, it is a most excellent tincture: Let it be used Morning and Evening, and in a little time the Patient will be cured.

XVI. The Virtues of the Althea Bacifera. Some Authors say, that it is no less useful to be eaten than the apple Nightshade; but others say, of the Cucubuln Plants otherwise, and that if the Leaves thereof be beaten with home Vinegar, and applied to the place flung with Scorpions or Serpents, it helps them: And that the Juice thereof, taken, with twice as much honied Wine, it eases the pains of the Back and Loes, also the Headache (from a hot cataract) if it is applied with Rose Water to the Forehead and Temples: and that being bound to Wess or Kernels, or they bathed often with its Juice, it dissolves them.

CHAP. CXXVIII.

Of CHICKWEED, Water.

THE Name. It is called in Greek, "Arum aquatica". In Latin, Althae Aquatica: And in English, Water Chickweed.

II. The Kinds. It is fivefold. 1. Althae acaulina, The Greater Water Chickweed. 2. Althae acaulina minor, The lesser Water Chickweed. 3. Althae acaulina minor, & fertilissima Buxhorni, The medicinal Water Chickweed. 4. Althae acaulina aquatica, Althae acaulina, Sea Chickweed: Label calis in, Hippocastanum, Cataplasms. 5. Althae umbellata, flore Cornace, Upright Chickweed. There is another which some account a Sea Chickweed, viz. Althae Poliflorus minor folio oblongo, which others more properly call, Portulaca marina, sea Purslane, and under that Title you will find it.

III. The Description. The first of these has a creeping Root, flowering out with diverse Flowers, very long, and of the thicknesse of a Wheat Straw, not much unlike to the Roots of Quitch-grais, from whence rise up divers upright Stalks, slender, and jointed from the bottom to the top, set with very large sharp pointed Leaves, standing by pairs at cer- tain distances, somewhat like those of Petallony of the Wall. At the tops of the Stalks grow small white Flowers, like to the other Chickweeds, or like to Stitchworth, but finer, having many small and point- ed Leaves in each flower, after which come small whiteish yellow Seeds.

IV. The second of these has a bushy fibrous Root, from whence several weak and tender Stalks rise up, jointed like the former, and with Leaves at the fronts, or in the other, not much unlike in shape and...
and higheft in the Leffler Chickweed, in the former Chapter. The Stalks rise up fometimes to be a part high, fmall of Branches, and fmall fong Loaves on fome, of a pule green Color. The Leaves are many, which at the tops of the Branches are fmall and white, confifting of fome Leaves apiece, after which follow in Clafks fmall yellowifh Seeds.

Smaller Water Chick weed

Sea chick weed.

VII. The fifth has a Root white and long, with fome fibres thereof, from whence rife up for the moft part fveral upright Stalks or Branches, jointed in feveral places, and divets fmall Leaves growing thereon at the manfпод Joint, fomewhat divided like unto Leaves of Rue, and a little refmbling a Trefoil Leaf: at the tops of the Jointes come forth fmall blew Flowers, confiftting of four Leaves apiece: which being put away, there appears fmall round Chickweed like Heads or Husks, with fmall Seed therin.

VIII. The Places. The fithfe, and the fifth, are found to grow in or near Waters, and Wamy places in moft Parms of England. The Serpillifolias may be found in Wamy places, between Ch damping Heath and Towing, and between Kentifh-Town and Hofted. And the fourth grows near the Sea Shore, and in Salt Marshy places, upon feral Coeffs of this Kingdom.

IX. The Time. Their Flowering time is in the heat of Sumfer, and their Seed ripe in the mean Season, and in a little time after.

X. The Qualites, Specification, Proportion and Virtues, are the fame with thofe in the former Chapter, to which we refer you.
CHAP. CXXIX.

OF CHICKWEED, Bastard.

I. Its Name. It is called in Greek, "Aiwro Todota", in Latin, "Althae mollis", and in English, "Bastard Chickweed".

II. The Kinds. There are many kinds hereof, but these following are chief.

1. Althae foliis falvatis in Veronica, Speedwell Chickweed.
2. Althae foliis ovatis, Germander Chickweed.
3. Althae sparsa prior Valerii, Alfina sole bedecta minor, Ivy-leaved Chickweed.
4. Althae herbae foliis undulatis major, Hairy Chickweed, with Hollow Far Leaves.
5. Althae Virosa, Clemmy Chickweed.
6. Althae Petrosa, Stone or Rock Chickweed.
7. Althae ficatissima, River Chickweed.

III. The Descriptions. The first of these has a small and thread-like Root, which penetrates not in the Winter, from whence many Branches spring up, and spread abroad, full of small and soft round Leaves, set in couples or pairs, very like to those of Veronica, or Paul Boeoni, called Speedwell, but not like to Haxine or Rhodin of any kind. The Flowers grow at the joints with the Leaves, from the middle of the Branches upwards, being very small, made of five blue Leaves, after which come small flat Seed Vesels like Bouches, in which is contained small round yellowish Seed.

IV. The second has a small long Root, full of many fibers or threads, which continue all the Winter, from which come forth several small weak Branches, spreading upon the ground, three or four inches long, set with small and fourteen round Leaves, which are denoted by the edges, and parted at the ends, flaring by simple one against another: as the joints whereof towards the tops, come forth small blue Flowers, and sometimes white, consisting of five round pointed Leaves, after which succeed small round Seed Vesels, two always joined together, having small round Seed within them.

V. The third or Ivy-leaved Chickweed, has a small and thread-like Root, from whence rise up hairy slender Stalks or Branches, many of which spread themselves upon the ground, set with two Leaves at a joint, hairy and Ivy-like, but nothing so large. The Leaves, says Gerard, resemble the back of a Bee when it flies. The Flowers grow at the tops,
VIII. The sixth, or Stone Chickweed, has a small and slender Root, which sends forth many small and upright Branches, thick set, which is intermixed one with another, that the whole Plant (which is indeed but a small Herb) seems like unto a small Bush. The Leaves are small and pointed, and the Flowers small and white, like the other Small Chickweeds. Which Kind was called, in the old time, Scurrilum; and which is grown in many places, like unto Cocksfoot, in which the Seed, (which is very small) is contained.

IX. The seventh is a Broad kind of Chickweed, growing by River sides, &c. in yearly fashion: Plant, but has an admirable thick white Root, like a Huf-fock, made up of a vast number of fibrous or thread-like strings, from whence rise up many slender Branches, stretching or reeling along the Stream, upon which grow long, Linear, having a long white Kid, upon which grows on each side thereof a great number of other slender Leaves, like those of Lenthils, or the Wild Verch. The Flowers grow at the tips of the Stalks, which are flat and white, after which comes in hoary Heads, a small Seed.

X. The Places. The sixth grows on Mountains, and in Stoney and Rocky places: the fourth grows in Rivers: the others grow in Fields, as well by Land, as by Water, and by Way Sides, &c.

XI. The Times. They do in Flower in Summer, form in the latter end of May, and some in June and July, some earlie, and some later than others; and their Seed is ripe quickly after, but the fourth or hoary Chickweed Flowers not till Autumn.

XII. The Qualities; Specifications, Preparation, and Uses. Authors affirm to be the common Chickweed, to which you are referred, and therefore we shall pay no more of them in this place.

CHAP. CXXX

OF CINKFOIL.

I. THE Names. It is called in Greek, Επιστανσα. In Latin, Pentaphyllum, and Quinquae-
folium, a numero foliorum: In English, Cinkfoil, and Five-leaved Grass.

II. The Kinds. Authors make at least seven Kinds, or more, many of which grow not in Eng-land, nor any place belonging to our Territories: The most usual with us are, 1. Pentaphyllum Vulgarum, Our most Common Cinkfoil. 2. Pentaphyllum majus album Vulgarem, The Greater Com-
mon white Cinkfoil. 3. Pentaphyllum magnum furo
lates vel albo. The Great Common Cinkfoil with a white or yellow Flower. 4. Pentaphyllum rubrum Patulaire, Red Marth Cinkfoil. 5. Pentaphyllum fo-
pinum Patellare facie, Low Silver-weed Cinkfoil. 6. Pentaphyllum maculatum reperit majus & minorum. The Greater and Lesser creeping hoary Cinkfoil. 7. Pentaphyllum rubrum majus & minus. The Greater and Lesser Upright Cinkfoil. The first of these is called generally by all, Pentaphyllum, or Quinquaefolium vulgare, and Quinquaefolium majus reperit Bahiana, Common Cinkfoil. The second, Quinquaefolium album, and Quinquaefolium album majus alterum Bahiana. The third is called, Quinquaefolium album majus confec-
tum Bahiana.

III. The Descriptions. The first has a Root of a blackish brown color, very rarely so large as one's little Finger, but growing long, with several Filaments springing from it, and by which small strings it quickly spreads over the place it grows on: from this Root rises up several weak Stalks, lying on, spreading and creeping on the Earth, with long fore-
der Branches, or Strings, like to the Strawberry Plant, which take root again, and shoot forth many Leaves. These Leaves are five in number, (sometimes seven, though but rarely;) long, finely dissected about the edges, and ending in a pretty sharp point, somewhat hard, and of a lightish green color. The Stalks are slender, bearing downwards, and bear many small yellow Flowers, with some yellow threads in the middle, standing about a smooth green Head, which when it is ripe is a little rough, and contains small brownish Seed.

IV. The
W. The second has a Root thick and long, blackish on the outer side, but reddish within, having many fibres appertaining to it. From whence spring forth stalks, with many leaves, also leaves growing from the root. The stalks are small, short, and a little hairy, and the leaves springing from them are fivefold, or divided into five parts, a little dentated and pointed at the ends, green on the upper side, and a kind of hoary white underneath: between these leaves grow white branches, leaning down to the ground near a foot long, with many stalks like leaves on them, but less than those below. The flowers are about the large fruits of the former, but not full out so large as the next following, of a white color, consisting of five rounder pointed leaves than the others are, having a neck in the middle, and several small yellow threads in the middle of the flower, set with a woolly head, having many small seeds set together like unto a Cowfoot head of seed. Of this kind there is another, in which the green leaves are not dentated about the edges, but differ in nothing else.

V. The third has a root somewhat thick and long, of a blackish brown color without, and reddish within. From the root spring forth many leaves, also stalks or branches, these leaves stand upon their own stalks, and are divided into five parts, as if they were five several leaves, dentated about the edges, and almost sharp pointed, very like to the kind or Common Cinkfoil, but that these are every way larger and a little hairy from which rise up flat or upright stalks for a while, till they are grown up to a considerable length, then they incline, or lean somewhat down towards the ground, as both the former do. These stalks are a little hairy also, and divided near the tops into two or three branches, and they go into others smaller, upon the tops of every one of which grows one flower, of a white color, and larger than in either of the former, consisting of five leaves, all the other parts do, in the middle of which stands a small downy head, encompassed with many reddish-yellow threads. This kind, says Gerard, is so common, and so universally known, that he thought it needless to give any description thereof. John fon upon Gerard says, it has many long slender stalks lying spread upon the ground, out of which grow leaves, made up of five or six leaves, divided into one or two or three flake, the flowers also grow upon the like footstalks, and are composed of five yellow leaves. The root is pretty large, of a reddish color, and round, but dry, it becomes square.

VI. The fourth, or Marigold kind, has a root of a woodiness substance, with some fibres, or threads springing adorning thereof: from which rise up leaves almost like to the former, consisting of five parts, notched about the edges, and standing close together at their lower ends, upon one long footstalk: the stalks are about a foot and half high, and of a reddish color. The flowers grow at the tops of the stalks, like unto the other Cinkfoils, few that they are of a dark red color, in a word, the whole Plant is very like to the other kinds, especially the great kind first before this described.

VII. The fifth or Silver-weed Cinkfoil, has a root slender, long, and blackish, like the first Common Cinkfoil: from which spring forth long stalks of leaves, divided into many parts near the ground, set on each side thereof, two at a piece, one against another, and an odd one at the end, all of them dented about the edges, very like unto Wild Tanley Leaves, but not hoary, or fitter like, as they are, but only green. The flowers come forth at the joints with the leaves, towards the tops of the stalks, which stalks are green, not nor stand upright, but hanging weak, and turn down towards the ground, having very long stalks of leaves on them. The flowers which grow on the tops of the stalks, are larger, and fitter described than those which grow below: they are single, every one by its self, small, of a pale yellow color, and with a head in the middle, which after it is ripe, is like unto the other Cinkfoil kinds of seed, viz. like in a small, hard, dry Strawberry.
Chap. 130.  English Herbs.  

vernous woody thick Stalks, somewhat red, wiry and soft, and of a brown color, which grow of unequal lengths from the Root, spreading themselves into many Branches, flothening the place where it grows. The Leaves on the upper side are rough and thick, and on the edge, as well as the Stalks, are woody like Torchwood, and are thought by some to be of equal force with it against Pox, and for which reason, some have thought it to be the Leucas Dioscoridis. The Flowers stand also upon long Stalks, and of a pale yellow color, and in some Places of a purplish color, which turn into Seed, much as the other kinds do: this is the Greater kind. But there is a Lesser of this Kind, which has smaller and thinner Leaves, of a yellow color on the upper side, and grey or brown undersides; the Stalks are tenderer, and lower, the Flowers on the tops smaller, and of a more Gold yellow color, in which consists the chief difference.

X.  The Places.  The first grows almost everywhere throughout England, by Highway sides, Ditch sides, and other Uplight places. The second is found in flaty and woody places, under Hedges, and other most places, and by Highway sides. The third is to be found growing almost everywhere upon good Ground, by Highways, in low and mossy grounds. The fourth grows in Moif and Marsh Grounds, and in Watry places; it grows in a Marsh Ground adjoining to the Land called Boura Fonds, half a Mile from Catholicon, from which place the Romans are said to have brought it for his Garden, in which they flourished and prospered well. The fifth, Gerard says, grew upon Brick and Stone Walls about London. The sixth, Gerard says, is a Plant found growing upon the Mountains of the Peak, and dry Gravelly Valleys. The seventh grows in many places of France and Germany, where it bears white Flowers and in Italy, where the Flowers are purple; but with us it is only nourished up in Gardens.

XI.  The Times. They are sown to Flower all the Summer Months, as May, June and July; even from the beginning of May, and the Seed ripens in the main Scion.

XII.  The Qualities. The Cakfoil are temperate in respect of heat, but dry in the third Degree. They are Allurive, Neurtick, Architick, Alterative, Annapletic, and Alexipharmick. Although it is supputed by Authors, that they have all one and the same Virtues, yet it is manifested, that some of them are stronger, and more effectual than others. Tho' those which are esteemed the most powerful, are the first, second, third, and fourth. Therefor the first are the chief for use, and strongest in effect, of all the rest, and are held to be as efficacious for all the purpuses whereunto Torchwood is applied, so that instead thereof, and where this is wanting, Cakfoil Fays Parkefick) may be used to as good purpuse.

XIII.  The Specification. It is an especial remedy against Agues and Fevers, and to keep off all sorts of fluxes, whether of Blood or Humors, in any part of the Body whatsoever.

The Virtue.

XV.  The Juice. It is good against all sorts of Agues and Fevers, whether Continental, Continental, or Conternming: whether they be burning Fevers only, Malign, or Pestifential. It cools and appeases the Blood, and Humors, and is an excellent thing for a Lotion, Infusion, Gurgle, and the like, for Scrofulous Ulcers, Eczema, Fistula's, and other corrupt, foul, and running Sores. The Juice is given to four ounces at a time, for some Days together, two or three Hours before the coming of the Fit of an Ague, whether Quoidal, Tetain, or Quaran. It is to be drunk it, but it ought to be drank Morning and Evening in the Intermediate Days also. And taken in the same quantity for the same time, viz., for thirty Days together, it cures the Falling Sicknes, as also the Quinsey, and all fluxes, and all fluxes in Man or Woman, as Whites, Reds, and Bloodly Flux, Diarrhae, &c. The juice mixt with a little Honey, prevails against Heartburns, as also the Cough of the Lungs.

XVI.  The Essence. It has all the Virtues of the Juice, but more effectual to all the purposes aforesaid; besides which it is very effectual to cure Consumptions of all fluxes, and to heal Ulcers of the Lungs: If the hands be often washed therewith, and it is suffered every time to dry in of it self, without wiping, it will in a short time help to cure the Pulse, or breaking of wind.

XVII.  The Infusion or Decotion in Red Pot Wine. They have the Virtues of the Liquid Juice and Essence, but not all out to effectual: yet however they are very powerful against all sorts of fluxes of the Bowels: But where there is a sharpness of Humors, the Decotion is best made in Milk. The Decotion outwardly applied, and inwardly drank as a Diet drick, very much contributes to the Cure of the Gout and Sciatica, as also to confolde the Ruptures of the Bowells.

XVIII.  The Powder of the Root. Taken to a dram Morning and Night, it is good against Fluxes of the Belly, fitting and pulling of Blood, Ruptures, and Agues of all sorts, but it ought alio to be given over and above on the day the Ague comes, three hours before the Fit, in a Glass of Red Pot, or Red Florence Wine.

XIX.  The Vinegar. The Roots boiled in Vinegar, and that held in the Mouth, is said to ease the pain of the Teeth; it is also good against all sorts of Nodes, Kernels, had Swellings, and as well any fluxes growing in the Throat, in any part, being applied thereto. It allays all kinds of Inflammations, and alleviates Anchoises Fie and the Stings, it prevails against Apomairs, and painted Sores of the Feet, as also against pain and pustulation, as also all other kinds of running Sores, Ulcers, Foul Soaks, itch, &c. It gives ease in pains of the Joints, and the Gout, whether in the Jaws, Head, or Knee, it is also good against bruises, or hurts by blows, falls, or the like, and to stop the bleeding of Wounds in any part inward or outward.
Salmon's Herbal.

XX. The Cohlufum. Made with Vinegar by boiling down, and which fottens hard Turbors, is good against Conjunctions, stops the Flaks of Humors to any part, and gives ease in the Gout.

XXI. The Distilled Water. It has some small manner of the Virtues of the Juice, Efflux and Dissection, but is chiefly used as a Vehicle, to convey other Preparations in.

XXII. The Spirituous Tinctures. It is a famous thing against all manner of Phlaxes of Belly and Womb, but especially those of Blood, it stops spitting, vomiting and pitting of Blood, and wonderfully strengthens the Stomach, Bowels and Womb; and it timely and pleasantly given, prevails against a Duplicates, because by its Spirituous Nature, it so admirably strengthens all the Vessels and Pallages. Doe two drams Morning and Night.

XXIII. The Arct Tinctures. It has all the Virtues of the Vinegar at Sed 10, distilling, besides which it is an excellent Stone on Stools Vomiting, strengthens the Stomach, and, in other cases, makes a good Appetite and Digestion, opens Obstrictions, and cleanses the Bowels: mixed in equal quantities with Tinctura Mortis, and given Daily, Morning, Noon and Night, in some convenient vehicle to one dram, more or less, it perfectly cures the Green-Sickness in Virgins, and the Yellow Jaundice in Elder People.

XXIV. The Oily Tinctures. It prevails against Deformations of the Skin, Sores, Dandrift, Morphea, and that kind of Dilataete called Scorz, Leaves, or the Spotted Leproze, inwardly taken to half a dram, or one dram in White Wine, it admirably strengthens the Back, and eases the pains thereof, opens Obstructions of the Urinary Parts, and expels small Stones, Gravel, Sand, and other Tartarrous matter.

XXV. The Balsam or Ointment. It digests con- turned Wounds; cleanses old, putrid, running Sores and Ulcers, dries them, and suddenly heals them. There are not few hard Venerealities than this Bal- sam and Ointment, and being applied to the Gout, especially the Balsam, it cakcs the pain, and so ef- fectually darts forth the Mortiblack matter, that for the most part the Patient remains perfectly cured.

XXVI. The Colphium. It is made of the Juice mixed with Honey, a quart of a pound of the juice. When it is taken the Eyes, it clears the sight, and stops fluxes of Rheuma falling down into them: there is nothing better for curing Ul- cers in that part, the eye being washed therewith three or four times a day. It is also an excellent Lotion to heal a foot and ulcerated Mouth, as also Ulcers in the Throat and Gums, the parts affected being often Gaupled and Walked thereof: and if the foot or Ulcer tends to be Inverte, or pitch- trid, the Colphium will be so much more excellent, it to the former quantity two or three ounces of Common Spirit of Wine be added.

CHAP. CXXXI.

Of CISTUS Dwarf.

I. The Name. It is called in Greeck, Ηθοδή, and in Saxons: in Latin, Helianthemum and Comestlierum: in English, Dwarf Cistus, and Small Sunflower.

II. The Kinde. Purkefoter makes Nine Kinds of this Plant, but a great part of them are Foreigners to us, and therefore not to be taken notice of.

III. Description. The first has a hard and woody Root, of a brownish color, and growing in time to be somewhat great, and very long, and divided into small Branches, or the lower end: from this Root come four smaller and weak, yet hard and at- most woody Branches, lying for the most part round about the Head of the Root upon the Ground, on which grow by pairs, many small and somewhat long Leaves, thick, fat, and full of substance, a little flat or narrow, or covered with a soft Down, with other small Leaves also growing between those: in the tops thereof stand three or four small pale yellow, and sometimes gold yellow colored Flowers, consisting of four round pointed Leaves above, with some yellow threads in the middle, of a pretty flavor or sweet in some Places, but few or none in others: which being fall out away, there follow small round Heads, in which are contained small yellow Seed, This Plant dies not, but continues many years, increasing in its Branches, which yield a Vigorous or Medicinal Juice, like unto Comfrey, and is of an Afflere, Astringent taffer.

IV. The second has a Root like the former, and differs not much from it, but that it grows up somewhat higher, the Leaves are a little longer, and not so thick, nor other parts, also more Woody and Dryness, thereby obtaining a whiter color. The Flower has the same number of Leaves, in like manner longer, and white wooly, being in some places a little scattered, in others little or nothing at all, and its Vafle is Astringent like the former.

V. The third has a Root very fibrous, spreading much under Ground: from whence rise up many red-
dishes. Branches like unto Wild Vine, with such like small Leaves set upon them very thick, or as it were in a double row, of a dark green color, and a little bit, have been used by the Ancients, and wherewith one of the kenners, which stand three or four together, every one on a pretty long hairy stalk, consisting of five small yellow Leaves, like unto the other, and Johnson.  

VI. The Places. They all grow in divers places of England, but the first and second more especially in Kent, in almost all places throughout it, which in some places are greater than in others: but that with the white Flower is more rare to be met with than the other. The third is that which Parkeston thinks is most usual with us in England. Gerard says, that the sole of our English growth, he has found in many places, especially upon the Chalky Banks about Gravesend and Southfleet in Kent, and for the most part all the way from thence to Canterbury and Dover, they delighting to grow in rough, dry, and Sandy places in open fields, and upon Mountains.  

VII. The Times. They Flower in Summer, viz. in June, July and August; some earlier, and some later: but their Flowers are to Eon falling, that they seldom endure above a day or two; and their Seed is perfected in some small time after.  

VIII. The Qualities. They are temperate in respect of heat or coldness, and dry in the second Degree: Astringent, Altering, Vomiting, Cardiac, Alterative, and Appetizing.  

IX. The Uses. They are peculiar for staunching Blood, and stopping all fluxes of Blood in any part of the Body whatsoever, whether inward or outward.  

The Virtues.  

XI. The Liquid Juice. It dries and astringes, stirs bleeding, spurs Blood, spitts Blood, overworking of the Terms, and all other fluxes of Blood, and heals Wounds, by strengthening the Parts, and conjuring their Ligs together: it prevents also against all manner of fluxes of the Belly, and condenses Ruptures. Dope from one ounce to three in a Glass of Red Port Wine.  

XII. The Effusio. It has also the Virtues of the Liquid Juice, besides which it is powerful to Wast and Gash gore Mouths and Typhus, and to heal them; as also to cure Ulcers in the Privy Parts of Man or Woman, and old running Sores in other parts of the Body, as in the Legs and Feet, which have been of a long standing, and which by reason they are depending parts, by a defluxion of moil and that Humors, are kept long from healing. It is also good against Coughs, Cold, and violent Cataracts, or defluxions of Rheum, which induces, by continuance, a Confumption. It cleanses, dries, and heals old Ulcers, and Confluentes the Ligs of Green Wounds, because it is very powerful in consolidating, binding and strengthening any part; and is as effectual as Cairofrey for Ruptures, strengthening neck Joints, or any other Glaringian property, to which Cairofrey gives cover.  

XIII. The Decoction in Red Wine. It has all the Virtues of the Liquid Juice and Effusion, but not altogether to effectual, but drank from four to eightounces, it stops Catarrhs, Coughs, and inward Bleedings, and heals a Rupture of any of the Veilds.  

XIV. The Powder of the Leaves. It is wonderfully astringent, dries up moisture in running Ulcers, cleanses and heals; it is a peculiar thing against flashing and putting of Blood, and the other kinds of Rheum; such as face, Neck, Breast, and Hands, or of any other Parts of the Body.  

XV. The Spirituous Tincture. It has the Virtue of the Juice, Effusion, and Decoction, herein which it is good against the flaming or burning of any Venenous Creature, flushing the farther spreading of the Poyson, and in a short time curing the life. Dope one or two drams in a Glass of Cud Ủy, Morning, Noon, and Night.  

XVI. The Acid Tincture. It prevails against the Maladyly and Venom of Serpents, or the bitings of any other evil Beast. It is good against allulilious Fevers, and the Infection of the Plague, and any other malign or infectious Disease; it may be instantly taken, and outwardly applied, in any of the cases aforesaid, where outward applications are rejected. It is good against a slight colic, or Spotted Leper, Scab, Morphew, and such like, it is mixed with the Distilled Water, and then the parts afflicted to be Wasted thence.  

XVII. The Syrup. It is an incomparable thing against Coughs, Colds, Caltus, or thorp and Salt dilutions of Rheum, and flashing of Blood, also all sorts of fluxes of the Bowels. Dope two spoonfuls in some proper Vehicle, Morning, Noon, and Night.  

XIX. The Balsam or Ointment. Being applied, it is good against the burning or flaming of any Venenous Creature, flushing the farther spreading of the malignity. Applied also in the Gout, from what cause soever, it rules the pain, proves the restitution, and quickly cures it.  

CHAP. CXXXII.

OF CISTUS. Male.  

I. The Names. It is called in Greek, Ἱστούριον, in Latin, Officinarum, and in English, Male Cistus, Sage Bays, and Holly Bays, as Gerard calls it.  

II. The Kinds. It is either Male, of which in this Chapter: Or, Female, of which in the next. Parthenia makes four several kinds thereof, of which the first of them, viz. Office mas, or Male Cistus, is the chief which grows with us.  

III. The Descriptions. It is a hard Root, and will stand some years much as it is; it is to be kept to keep it from the extremity of our cold Winters, which it will sorely endure. From this Root grows up a slender Plant, about a yard or more high, bearing many Tender, long, and very slender branches, covered with a whitish Bark, on which grow many whitish green Leaves, long, and something narrow, crumpled, or wrinkled, as in years, both winter, and some times hard in handling, especially the older Leaves, for the young ones are softer, something like unto the
Salmon's Herbal. Lib. I.

C H A P. CXXXIII.

Of C I S T U S Female.

1. The Name. It is called in Greek, Κίστος; in Latin, Cistum feminum: and in English, Female Cistus, or Sage Rose.

2. The Kinds. Parkinson makes eight several kinds of the Female Cistus; but two of them are chiefly nourished up in our Gardens; viz. Ciftus fémimus, The Female Cistus, specially so called. 2. Ciftus Annunus, The Annual or Early Cistus.

3. The Description. The first Female Cistus, has a woody Root like to the former, from whence grows a kind of shrub, lower and smaller than it, having bluish branches, leaves woody, and as to brittle as the Male. The Leaves are somewhat rounder and greener, but a little hard and rough without, growing in the same manner upon the Branches, as the other, by Clusters. The Flowers grow at the tops of the Branches, like to the Male kind, consisting of five Leaves, but somewhat lesser, and wholly white, with yellow threads in the middle, as soon fading, and of a little Smell as the other, but the Heads and Seed are somewhat larger.

4. The second, or Annual Cistus, has a small woody Root, which perishes as soon as its Seed time is past, for the Plant endures but a Year, and therefore requires you to Set it every Year, if you will have it: From this Root rise up Shoots, but slender hard Stalks, fit here and there confusely with long and narrow greenish Leaves, every leaf like unto the Leaves of the Gum-Cistus, being a little clumsy without. At the tops of the Stalks, and at the Joints with the Leaves, stand two or three pale yellow Flowers, consisting of five Leaves apiece, with a reddish stam, near the bottom of every leaf of the Flowers, which as soon fades as any of the former. The Flowers being past, small three-square Heads follow after, which contain within them small seeds like to the Female kind, but somewhat paler or yellower.

V. The Place. The first grows naturally in hot Countries, as Spain, Portugal, Italy, Languedock, The second in Cooler Countries, as Germany, Bohemia, Kriegsland; and with us they are both brought up in Gardens.

VI. The Time. They Flower in the Summer Months, as June, July and August, and their Seed ripens in the mean Season.

VII. The Qualities. Specification, Preparations, and Virtue, are the same with the Dwarf Cistus, so that no more need be said of them here.

C H A P. CXXXIV.

Of GIVES, or CHIVES.

1. The Name. They are called in Greek, Ciftus: In Latin, Scaphophatum, as though you should say, Tunicum Parrum, Ruff Leek: In English, Cives or Chives, which are a kind of Small Green Leeks.

2. The Kinds. They are either Scaphophatum farinum, Garden Chives: or Scaphophatum aegleifis, Field or Wild Chives.

3. The Description. Chives have many little headed Roots or Bulbs jaulted together, out of which grow down into the Earth, a great number of white little threads, or springs, which issue both the Smell and Taste of Onions and Leeks, jointly, so as if they were participating of both, from these Roots springing up about a handful high, long, flender, round, green Sprites, almost like to Raffians, amongst which grow up small and tender Stalks, which tend forth certain knobs, or heads, like those of the Onion, but much less, in which are contained the Seed.

IV. The Root, or Till Kind, has a small, and somewhat Bulbous Root, but nothing near so many joined together, from which spring downwards a great
Chap. 135. English Herbs.

great many white threads or strings. And from the same upwards springeth a great number of small blades, all of as high again as the former, border and of a darker green, and sometimes we distinctly round; otherwise (excepting their thick growing together) they are much alike, and differ but a very little in their Tylfe and Smell.

V. The Place. The first are nourished up, and grow only in Gardens; the other grow in the Fields, and by ways, sites in uncultivated places in several Parts of this Kingdom. I have found them by the sides of the Highway, and in the Field going from Canterbury to Rustington, towards the Boarded River, and that in several places as I walked along.

VI. The Times. They flourish long, and continue many Years, and well endure the cold of Winter.

VII. The Qualities: They are hot and dry in the third Degree, Appetive, Achterive, Digestive, Digestive, Diuretic, Diuretic, and Suppurative, Sormatic, Pelcorial, and Nephritic. Alternative, Emmenogogic, Lithiontropic, Alexipharmic, and Specumissemotic.

VIII. The Specification. They are peculiar against Disfeases of the Reins and Bladder.

The Virtues.

X. The Liquid Juice. It provokes Appetite, causeth thirst, heats, warms, and strengthens the Stomach, opens Obstructions, yet is something flattering; it loosens the Belly, provokes Urine, and the Conches, and is good against the Bitings of Mad Dogs, Serpents, and other Venemous Creatures.

XI. The Essence. It has all the Virtues of the Juice, but is indeed more powerful; the constant use of this Preparatory, or the Juice, admirably expels Seed, and excludes Venery, and the former Juice, being first slimmed up the Nutritia, it purges the Head and Brain, of cold, moist, and sanguinaceous Humors, and prevents against the Lachrymy, and other Difficulties of the Head and Brain, proceeding from cold and moliures. Dofe from one to two ounces in any proper Vehicle.

XII. The Distilled Water. Being drunk to fix ounces, or more, either alone, or mixed with White Port Wine, it provokes Urine, and is said by some to break the Stone, and drive it forth.

XIII. The Cataplasm. Made of the whole Plant with Mustard, and Pulpe of Peas, and applied, is good to ripen and break a Plague Stone, or any other Apomacter. It is probably applied to Scaldings or B่องnings by Water or Fire, or Gun-powder: As also to the Piles when extremely inflamed and dwelled.

XIV. The Seed. Made into Powder, and given a dram at a time, it increases Seed, and fails on Luft both in Man and Woman; and given to the Children which have Worms, it kills and expels them: It is also good against the bitings of Venenous Beasts.

C H A P. CXXXV.

OF CLAVER-GRASS.

I. THE Names. It is called of Dioscorides, as it is thought, in Greek, stamnion: from its being brought from the Medes into Greece, and fo the Medicinians, or Pomeratians, was so called, being brought first from Medes; in Latine, Claver; and in English, Claver-grass. The Arabians call it, Car, Alasfeleten, and Alasfeletet; and this is that very Plant which the Arabic call Siam Jon, which our Moderns have found so mighty to improve Land.

II. The Kinds. This Claver-grass it self is a Species of the Trefes, but being better known under this name, we thought good to give it the name of it here. Claver-grass is manifold, 1. Medicina Leoniana, Fernan Burgundianum, Trifolium Cavallon, Claver, Claver-gras, Meadick Fodder, Small Claver, Small Trefe, and Sain Jon. 2. Medicina Roscole, Trifolium Cavallon Polycarpum, Choffering Small Claver. 3. Medicina Rausco, Medicina minor, Trifolium Syrofamum, Sialus Cornus, Lenta major, for setting Campamentum, Woody Small Claver. 4. Medicina Marina, Trifolium Cavallon Marinorum, Sea Claver. 5. Medicina Cervina, Trifolium Cavallon, Heart Claver, or Trefle. 6. Medicina Lantana, Trifolium Lantana, Moon Claver. Ferakheus has four other Kinds, but these are the chief which grow in England.

III. The Descriptions. The first of these has a Root which runs deep down into the Earth, sometimes two or more, or it is this and feeds forth many tough thready branches, and continues long, sometimes ten, twenty or thirty Years. From this Root rise up several shoots, green Stalks, with divers small and green Trefle Leaves, for thence Nothing is. The Fowers grow upon long Stilts, coming from the Fruits.
Salmon's Herbal. Lib. I.

190

Thence and Tops of the Branches, clustering in a thick short Tuft, of a blosom purple in style which grow in our parts, but in others of divers and several colors, as more purple, near a violet, or paler, bluish, or with both blue and yellow colors, part ed: in some parts of Spain, and at Nation in France, they are of a yellow color also. The Flowers are about half, small, Sainst-libe, round Cod, follow, for together, not so much joined as many other Med- dicis are, containing within them small pale colored Seed.

Clove-Grass, or Snail Trefoil of Lobel.

W. Observ. 1. The Author of the Country Flor, gives a mighty commendation of this Plant; and says, That there is not any Public, or other Food which is more agreeable, and good for the Food of Beasts, than this Clove-Grass or Saint-Clove, called by the French, Saint Vein, not only for the nourishing and Entering of Cattle, but also to cure Beasts which are sick. It is called Burdago, Hay, because the Burdagoes have always been very careful in Sowing this Herbe, and managing Sandy and Barren Land therewith, for that it makes the World and Poor Land very rich and fruitful. The benefit of this Herbe is to great, that every good Husbandman ought to reserve a good part of his Ground to be Sown therewith.

V. Observ. 2. In Sowing of this Saint Vein Sow, though it grows well in fat Grounds freed from Weeds, yet it grows also very well in Poor, Lean, Sandy and Barren Grounds, especially such as are eafe to be Plowed, and such as have been three Sown with Grain, before this is put into it, that it may the easier take deep rooting in the Earth, which it naturally does; but in Sowing of this Seed, you must not be partial of it, for by much the more Seed you Sow, be so much the more will the Herb grow in thicke-ness; nor will there grow any other Grass or Herbs there, by which the profit will be so much the greater.

V. Observ. 3. As soon as it is Sown, it must be Harrowed several ways, as long ways, broad ways, and corner ways; and if it is a dry Season, and a dry Ground, it ought to be gently watered, but not in those Months between the latter end of September and beginning of April, lest any hand Fruit should come, which might nip it, and so kill it.

Authors also say, it ought to be Sowed, or Cut down, five or six times the first Year, and three or four times, but your experience must guide you in this; and in after Years two or three times a Year, by which great advantages are made of it; and that Land which has not been worth twelue Pence an Acre per Annum, by the Improvements of Saint Vein, have in a few Years been made worth Forty Shillings, and three Pounds an Acre, and sometimes more, which is much for the Encouragement of the Husbandman, to proceed in this kind of Husbandry.

VII. Observ. 4. The fit times for Sowing it down, are in May, June, July, and August, in the New of the Moon, but you must not let it lie up on hears any longer than a Day in the Meadows, for if it should lie any long time, it would endan ger the killing the Roots which are under it, and utterly destroy it, for which reason it is necessary to dry it forthwith, and as soon as may be,PER, and turning it every day from day to day, and then as soon as ever it is dry to carry it away.

VIII. Observ. 5. This is also to be taken special Notice of, That none of your Cattle ought to feed on the Grounds on which it is Sown, because it is apt to be killed by them, by bruising it with their Teeth in biting it off, whereas cutting it with a Sickle hurts it not: so meat Cattle be suffered to eat it green, because it is apt to make them Sick by reason of its heat and moisture; for which reason it is always cut down, dried, and made into Hay; and then it is to be given to your Beasts, but in small quantity, because it breeds much Blood, Heat and Fat, even to a Degree, as with Far thel to chock them.

IX. Observ. 6. You must always be careful to gather and reserve Seed of this Grass, to Sow again, when you see you shall have occasion for it: it must not be gathered the first Year it bears, by reason of its weaknells and poorness. But in all the following Years, to soon as the Heads in which the Seed is contained shall appear dry, and the Seed of Grains themselves are turned yellow, which will be in the Months of June and July, you may then gather them.

X. Observ. 7. That this Grass being Sowed in barren Land is very profitable there is no doubt, and it is considered that the first charge is the principal charge; even for a long time, even for the more valuable; for Land being once Sowed with this, it not only enriches the ground for the present, but for many years after: for this first Sowing will be sufficient for two hundred, let the ground be what it will, and as the Soil may be, it may last twenty or thirty Years, or more, according as it is carefully lookt after, and well man aged, which is a matter of so great weight, as ought to put every prudent Husbandman into the thoughts and consideration of it.

XI. The Second Kind has a Root long and running pretty deep, the ground, which extends from whence it has Branches lying upon the Earth, a foot or eighteen or more, set with small round Trefoil Leaves, or pretty large Footfalks: the Flowers of a purple color send forth at the Joint, on long Footfalks, small and many clustering together, after which come forth somewhat Rough, small, wrinkled Saint-libe Shells or Heads, in which are contained the Seed.

XII. The third, or Woody Saint Cleave has a long Root, consisting of many long Springs, and contain ing many Seeds, many Years, may be fat, and in a dry Ground, it ought to be gently watered, but not in those Months between the latter end of September
the Ground, about a foot or more in length, and divided into many Branches, on which grow small, long, and narrow Leaves, by three's on a long Footstalk, with thick middle Kifs, on the back of each: the Flowers are small, and many together, of a yellow color, and somewhat sweet, which being pressed away, several small, flat, twisted Seed follow, like to those of the first kind, but smaller, which contain within them smaller Seed likewise, flat, thin, and almost of a Kidney fashion.

XII. The fourth, or Sea Claver, has a Root somewhat thick, and enduring many Years, from whence rise up several heavy trading Branches, spreading them selves on the ground a foot or two long, with many small and very hairy round Trefoil Leaves, on short Footstalks. The Flowers are many, small, and yellow, growing at the end of the Branches, which being pull away, many small whiter Shells or Halks do follow, much like to the other small Small Clavers. There is also another kind of Sea Claver, whose Root perishes yearly, but it grows bigger and greener than the other, and the Flowers are small and yellow, coming from the Joints of the Branches, but are at a place, which are followed by small hard and round prickly Heads, and whose wandages are difficult to be discerned.

XIV. The fifth, or Heart Claver, has a thick and strong Root, which perishes every Year, from whence grow forth several very tender, small, and weak Branches, full of Joints, and round greenish Trefoil Leaves, standing upon long Footstalks, broad at the ends, and dinted in, in their middle, making the fa- cion of a Heart, with dull, red, or purplish, and sometimes almost blackish spots on them. The Flour- ers grow two or three together upon Footstalks coming from the Joints; they are small and yellow, which being pull away, leave behind them small prickly twining Heads, like unto the other small Claver- grasses.

XV. The sixth, or Moon Claver, has its Roots, Stalks, Leaves, and manner of growing, much like to the other Small Trefoils, or Clavers, before described, especially like to the first: the Leaves are hairy, and divided about. the edges: the Flowers are small and yellow, which being pressed away, crooked, flat Ods, of an indifferent breadth, after the Shape or Fashion of a Moon three quarters old, following: in which are contained Seed, in shape or form of small little Kidneys.

XVI. The Place. The first grows naturally in Italy, Spain, Portugal, and France, from whence it was brought into Flowers of England, in both which places it florishes admirably, and brings them and us for Hay for our Cartel, and Horses: in Spain they have no other Hay with which they feed their Horses, which makes them exceeding fats: the same they do in the Low country, whereby their Cows yield the greatest abundance of Milk. It is found in the Fields of Italy, Spain, France, the Low Countries, and England, for Food for their Beasts. The second grows naturally in Fields, Meadow, and Pasture lands. The third grows in Mea- down, by Hedge and Wood sides, and places some- what thaded. The fourth grows near to the Sea in several places, in all our Marbes and Fields at Wood- wick, Deyford, &c. and by the Sea side about West Chiffey, as also on the Mediterranean Sea shore, and about France. The fifth is found in our Fields and Meadows, and those Countries of Medica Arabica (I fippoke because it grows in that Country:) yet, with Johnfoane, we say, it grows Wild with us in our Meadows in England, having feen it. I believe an hundred times. The sixth grows also plentifully in our Fields and Pasture grounds.

XVII. The Times. The first of thefe, (the ground being fift made fit for its entertainment, by well Ploughing it up, and killing the Weeds therefore), is to be plow in the end of April, or something earlier, in the New of the Moon, and towards the end of the Day, that it may receive the re- freshing Dews of the Night, by which means it will the better, and more easily come up: after the Earth, and you may Mow it in June, July, and Augufl, for Hay, and after the fift Year somewhat earlier. The fift, and all the red flower in June and July, and their Seeds are very much; for the Seed of Augufl, or from after. But the Seed of the fift is not to be gathered in the fift Year, by reason of its weakness, as is before observed, but in all the following it may be gathered in July, or as soon as it appears ripe.

XVIII. As to the Qualities, Specifiaions, Preparations, and Virtues, of the fift, or the other five, Authors have obferved nothing concerning them, but that (especially the fift) are a good nour- ishing food for Horses, Cows, and other Cartel, and that the fift is so powerful to fatten them, that they utilely flant them to a quantity of ten to twenty, of fattening them, by reason of their growing too fat.

XIX. Observations. 1. From this it appears, that it is a nourishing Virus, and we hope it encour- ages Fleth and Fat, I am of the Opinion, that the Liquid Jucce or Effence, or Syrup thereof, may be very powerful in retorting such fech as are in Stagnan- tions: it is indeed good against Coughs, Colds, Wheezings, vehement Carasses, Obstructions of the Lungs, and other Diffemper of those parts.

XX. Observ. 2. The Signature of the Plant, chiefly of the Ods and Seed, the latter being homonome like a Kidney, made me believe it might be good against the Stone, gravel, and Sand, or Serus Atable in the Renes, Urethra, and Bladders, which occasions Strangurias, &c. I made tylral of the Juice, Effence, Syrup or White Wine, to the Patient, and in the fift Patient I gave it to, I found it ex- cellently to answer my Expection: I have fin- e made tylral of it upon several other Patients with
very good success; yet I cannot say, but in some cases it has not answered the end. The Decriptions of the Seed in White Port Wine, has the fame Virtue, but I believe not full as to power as the Juice and Effence of the Plant; but the powder of the Seed given to one dram is more effectual. So also the Fixed Salt of the whole Plant made by Incinuration.

XXI. Obscrve. 5. Dioscorides says the Green Herb has a cooling property, and for that purpose it is chiefly used. Aureus recommends the Oil made of it against the Trembling of the Heart. Geber says that a Liquor may be drawn out of it by fire (Parthenius supposes he means an Oil to be drawn out of the Seed, as out of Sweet Almonds) good against the Stone. From this I observe, and am apt to believe, that if an Oily Tincture, or a Saline Tincture, be made of the whole Plant, they may be very effectual for that purpose, being duly taken in a proper Vehicle.

C H A P. CXXXVI.

Of CLEVERS, or GOOSE-GRASS.

CLEVERS, or 
GOOSE-GRASS.

L T H E N ames. It is called in Greek, Ακρες, as the most usual Name, but it has also several others, γαρναρις, γυναρις, as Gulden out of Hipparatus Γάρναρις, and Гυναρις Γουναρις, as Dioscorides calls it (because the Seed is Navel fashion;) it is also called, καρυοτρις, καρυολοματις, καρυομανιας, and καρυοσαλς, for the same reason. In Latin, Aperine, Lupum minor Plantis, Aftergo 1 in English, Clevers, and Crefigrafs.

II. The Kinds. They are chiefly twofold, viz.
1. Aperine Vulgaris, The common or rough Clevers.
2. Aperine Levus, Smooth Clevers, not mentioned by any Author but Galen, and from him by Parthenius.

III. The Descriptions. The Common Rough Clevers has a small and very fibrous Root, growing much in the Earth, but dying every Year, from whence rise up divers very rough figure Stalks not bigger than the lower part of a naked Wheat Stem, creeping up to be sometimes two or three yards high, but has not any tall Bulbs or Trees near it, or any Hedge on which it may Climb, but yet without any Claspers, otherwise they are much lower, or lye upon the ground, being full of Joints, from every one of which Stalks forth a Branch besides the Leaves, which are commonly fix in number, set round the Stalk almost like a Star, or the Knave of a Spade. From hence the Leaves at the Joints, towards the top of the Branches come forth very small white Flowers, every one upon a small thready stalkful, which after they are fallen, two small round rough brown colored Seeds (but at first green) joined together like a pair of Tejicles, do appear. When they are ripe, they grow hard, and of a whithish brown color, having a little hole or hollows on the side (sometimes like unto a Needle) on which the Stalks grows to them. The Stalks, Leaves and Seeds are so very rough, that they will cleanse almost to any thing which shall touch them, and seem to be a little clumsy natural.

IV. The Smooth Kind has a Root like the foregoing, and grows much like unto it, but it neither grows so high, nor are the Leaves so great, and met at all rough or sticking to what is touched, as the former is. The Leaves are the same in number, and stand in the same order, and at the Joints also: the Flowers are small and white, consisting of four very little Leaves, like the other, and give rise like the Seed growing together in Pairs, but smooth also, and not rough as the fist is. There is another sort of this Smooth Kind, but it little differs from it, excepting in the Seed, which is said to be rough, much like unto a Coriander Cough.

V. The Places. The first Kind grows by Hedge sides and Dish banks in most places of England, and almost everywhere in Gardens, being there nothing but a Weed, and is rooted out with much labor and diligence, for that it will run upon every thing it grows next, and be apt to choke and kill it, if not Weed up. The second is a Native of Spain, but grows in England in the Gardens of the Curious, where it is apt to be as troublesome as the other is, if it is办事处 to Sow its Seeds.

VI. The Times. They Flower in the end of May, and in June and July, and the Seed is ripe, and falls by the end of July, or in August, from which it springs sthrew the next Year, and not from the old Roots.

VII. The Qualities. It is hot and dry in the beginning of the first Degree, according to Galens Judgment, and are Aperative, Astringent, and Astringent, Traumatick, or Vulgarly, Alternative and Aperient.

VIII. The Specifick. It is peculiar for stopping Fluxes, and healing Wound.

IX. The Preparations. You may have therefrom,

The Virtues.

X. The Green Herb. Parkinson says, that it serves the Country People well, instead of a thinnest to drinke to cleanse and clear their Milk from Fluxes, Hairs, or other gross things which fall into it.

XI. The Liquid Juice. Made of the Herb and Seed together, being taken in Wines, is good against the
the briers of Vipers, or the great Spiker Phidægurum, by preferring the Heart from their Potion, and Siphons ridel and Playy from him say, Galen says, that it cleanses moderately, and drys, and is of infulb parts. It is generally taken in Broth to make such Lungs, and Lumm, as are apt to grow fat. It is also good to heal Wounds, and Belsen Blood. Being applied to the Luc and Matthiser says, it is comest to communi- nate, or clothe the Lips of Green Wounds: drop into the Ears, it eakes their pain, though venem-

XII. The Essence. It has all the Virtues of the Juice, but more powerful, with which it is very efectual to strengthen the Bowers, and flop all for of fluxes of the Belly whatsoever: and being taken three or twice a day promotes the healing of Wounds, old running Soree and Ulcers.

XIV. The Root. It is an excellent Vulnerary, and coagulates the Laps of Green Wounds, being thressed thereon: it also cleanses old running Soree and Ulcers, drops up their moisture, and induces their healing. Taken internally to a dram in Red Port Wine, Morning and Evening, it stops spitting, vomitting, and piling of Blood, and cures the Bloody Flux, as also other Fluxes of the Bowels; and be- ing applied, the bleeding of Wounds.

XV. The Omentum. Being made with Aswning, i.e. Hogs-Lard, or other proper fat body, and an- olated upon the part afflicted, it helps all for of hard Swellings, or Kernels (proceeding from the King's-Evil) in the Neck, Throat, or other Parts.

XVI. The Balsam. It is a singular Vulnerary, and curc Green Wounds (not Corneous, Nacerated, or otherwise composd) at one, two, or three Dred- fings. It digests Apopns, as also complicated Wounds, then cleanses them, inates, dries, and suddenly heals them. It is indeed a very singular Vulnerary, or Wound Balsam.

XVII. The Calopfea. Being applied to any wound of place which bleeds, it presently stops the Blood, and in a simple Green Wound cures it at the first intention. It is left to be made of the Green Herb, by heating and ancie thick by the Poi- der of the same.

XVIII. The Difficult Water. It has in a weak- manner the Virtues of the Juice, Essence, and Deco- cption; and may be used as a Vehicle for the two first, or the Poiser.

XIX. The Only Timidus. It is an excellent thig to be applied to Wounds of the Nerves and Joints, and taken inwardly, prevails against the Jaundice, and givs prefered relief in the Colic. Dofe thirty or forty drops in a Glass of White Port Wine.

C H A P. CXXXVII.

OF CLARY, Garden.

I. The Name. It is called in Greek, Φίδαις, or Phidægurum, or Phidægurum, as Dioscorides says: in Latin, Horuminum, Sclarea, and Scillaries, Common Cordis, Gallicum TRYGS, and of Lachenmeni and Gerard: in Eng- lish, Clay, quoth Cleese-Eye.

II. The Kinds. It is, 1. Φίδαις μακέαν, Horuminum Hauricini, which is in this Chap- ter. 2. Φίδαις φρεια, Horuminum Syzygyl, Wild Clay, of which in the next. The Garden Clay,
under them at set Spacces about the Stalkes, of a whith purple color, smaller than the Flowers of any other sort of Clary, and standing in brownish purple Husks, which after the said Flowers are pull, where the Seed ripens (which is then black) turneth downwarde, by reason thereof, if it is not gathered in the time, it is lost. Gerard says the Leaxes are somewhat round, and lay'd over with a hoary Cottony Substances, not much unlike Horeshoed: the Stalkes are square, small and hairy, and the Flowers coming forth between these beautiful purple Leaves, towards the tops, are small, of a bliefish or watchful color, in fashion like to Rosemary-Flowers.

V. The third, or Colus Iovis, has a Knobly Root, which is coupled in many long stringes, by which it taketh strong hold in the Earth, and shoots many Years: from whence rise up several four square rough Stalks, a yard high, or more, which branch forth themselves into dozens four square Stalks or Branches. The Leaves are many, large, hoary, or of a whithish green, dented about the edges, and standing upon long belloulaites, rising from the Root, and four from the Joints of the Stalk, which are broader at the bottom, thinner aife, and somewhat fat or clumsy in bending, and somewhat hairy, as the square Stalks aife are. These Leaves upon the Stalks found by Couples, and are like the Leaves which grow below, but somewhat thinner. At the tops of the Stalks the Flowers come forth at set Spacces, set round about in Cormets or Whartes, which are standing, and like unto thefe of Common Clary, but of a joint yellow color, after which comes brown blackish Seed. Gerard says, that this kind of Clary, called Colus Iovis, represides in the very top of the Stalk, a Dijkolt, wrapped about with yellow Filaments, and that from thence it took its name, and that the Leaxes are like those of Nettle, rough, sharp pointed, and of an overworn green color, both Leaxes and Flowers being somewhat in fume Smells.

VI. The fourth, or Small Clary, has a Root of the thicknes of a Man's Thumb, black on the outside, with divers fiores springing therefrom, which perish not, but abide many years; from this Root come forth several square and somewhat hairy Stalks, a foot and half high, on which do grow large Leaves, very like unto our common Garden Clary, hairy, rough, and ragged, but not all out to large, nor of so white a color, growing two at a joint, on the contrary parts thereof, one unto another, and somewhat cut in on the edges, and deeply dented therewith, having also a leaf strong from than they. The flowers come at Spacces about the Stalks, to the tops, bearing their pink Heads, which are of a purple color, not much larger than Lavender-flowers, which being pull away, there comes after them, small blackish Seed.

VII. The Places. These are all nourished up with us in Gardens, the fourth of them being brought to us out of Germany; and all of them (except the third) are sometime found to grow WId in several places. The Colus Iovis, which only grows in Gardens here, is found to grow in great plenty throughout all Hungary and Austria, and in many other places.

VIII. The Times. The fifth is most usually sown, for the Seed ripes of its own shedding: The second sixth requires to be new sown in the Spring, for if it fentlich comes up of the Seed which falls, the Roots and Winter with us, for the most part, killing of it. They all flower in the Summer Months, as in June, July and August, some a little later than others, and their Seed is ripe in August, or September.

195

The Virtue.

XII. The green Herb. Because of its properties of Strengthening, and provoking Venery, it is very much used by some people, especially in Country Towns, to be fried in a Frying Pan, being first dip into a Batter made of Flower, Eggs, and Milk or Cream, and to be being fried up to the Table to be eaten.

XIII. The liquid Juice of the Herb. Used as an Elixir, it cleanses the Head and Brain of Cold, Flegmatics, and Vificous Humors, or other matter affilling those parts; and taken from three ounces to fix, mixed with a Glass of Tinct or Alcohol, it admirably strengthens the Back, and excites Venus: it thickens the Seed, warms and comforts the Woman, and is said to cause fruitful births in Women, being taken in the Morning and Night for some considerable time: it also cleanses, and heals green Wounds.

XIV. The Decrion. It has the Virtues of the li- quid J uice, besides which, it provokes the Terms in Women, warms and constrains a cold and moist Womb, and takes away the Weakness and Slipperiness thereof: it facilitates the Birth, and expels the Confinaments therewith; and as it is good to be given to Women which are barren, through a cold and moist disposition of the Womb, so is it also good to drop the Whites, and to comfort a cold and moist Weakness in the Back, and to expel Viscous Flegm. 

Dose: from one ounce to two or three, or four ounces, in a Glass of moderate Wine.

XV. The Syrup of the Juice. It has the Virtues of the liquid J uice, besides which, it is more efficacious with Honey. But in other cases as a Pectoral, it is much beyond them, for it cools better, than any other. Expectoration, and therefore good against Congis, Colds, Hoarseness, Wheezings, hoarseness of Breath, difficulty of Breathing, and other like Distempers of the Breast and Lungs. 

Dose: two or three ounces, Morning and Night.

XVI. The Decrion in Wine. It is weaker than the Juice or Elixir, but has all the Virtues of the aforegoing Preparations in a lower Degree. It helps to expel corrupt and putrid matter from the Lungs in Pleurisy, as also in Congis, and other Dis- tempers of those Parts; and profitable may be good for such as are troubled with the Scleata. 

Dose: fix ounces Morning and Night.

XVII. The Powder of the Leaves. Stewed up the Nativis causes freezing, and thereby purges the Head and Brain of Rheum, and cold thin Flegm, and Tumorous Matter affilling those parts, curing Head-aches, Vertigo, Apoptethes, Drownedness, Sleepleafs, and Toxaphans; and being taken inwardly to one Dram, Morning and Evening, in a little of the Syrup, it strengthens the Back, increases the Seed, and excites Venery.

XVIII. The Balsam. Whether it is made with the Juice, or with the green Leaves, it is as fangu- lar a Vulnerary as is to be met withal. It not only cures Green Wounds at once or twice dressing them, but also dries them, cleanses the broken part, or rotten and running Ulcers; and being applied, is an excellent thing to give care in the Scleata.

XIX. The Cataplasm. Being applied to Cor- rosions, it dries and cleanseth, and when applied to Green Wounds, it facilitates them.

XX. The whole Seed. It is used to be put into the Eyes to clear them from Films, Clouds, Tears, or other like things which offend them. It also cleans them from Pests, and white or red Spots, which chance to grow upon them.

XXI. The Powder of the Seed. Put into the Eyes, it clears the sight; and being taken inwardly from half a dram, to a dram and half, Morning and Night, in Syrup of Clark, it admirably clears the Vision, strengthens the Retins, and cures Pains of those Parts.

XXII. The Mucilage of the Seed. If it is made with Water, and applied to Tumors or Swellings, it diminishes and removes them. It also draws forth Splinters, Thorns, or other things gotten into the Skin. If made with Vinegar, it is good against hot Inflammations, as also Rites, Feces, and other hot Excresions in the Skin, more especially if it is applied to them before they are come to too great a head.

XXIII. The Eleuther of the Powder of the Leaves and Seed. Put into Sore or Ulcerated Eyes, it heals them; and being used Morning and Night, for some considerable time, it clears the Eyes of Pests, Films, Clouds, and other like things, and helps diminis of faults, washing the Eyes also bet-ween whites four or five times a day, with the Juice or Elixir of the Herb. This Eleuther being also taken inwardly: first to two drams, Morning and Night, for some time, helps Congis, and Ulcers of the Lungs, retorres in Consumptions, strengthens weak Backs, breeds Seed, excites Lust, and admirably fortifies the whole Man.

XXIV. Color J eans, yellow Chrys, or Jupiter's Disaff, is hot and dry in the second Degree, and its Juice and Efficace, are fingular good to cleanse and heal old Ulcers, and foot running Sores, being applied to the Parts afflicted, according to Art.

C H A P. CXXVIII.

OF CLARY, Wild. 

1. THE Nemer. It is called in Greek, Ψυλλος: In Latine, Horanimum Sylyphretum, Quo/ turor quorin, and by some, Commutans: and in English, Wild Clark.

2. The Kinds. There are several Species hereof, but the chief, and which we intend to handle in this Work, are these following, viz. 1. Horanimum Sylyphretum vulgaris, Clasch Christl, Wild Clark, espe/ cially so called by Cavendisch, Cordon, Chaffis, Vach/ tis, Gaffier, Gerard, Lach, Lunets, Ludgenemen, and Turner. Braggionis calls it, Satno agetriu, and Butler in his Hortus Effelenirs, Sibilia agetrius flor parvas: Gaffier and Tegion, Satno agetriu flor, Gallaglorium florum (in Italy) Ce/ psm, Sylva Sylyphretum Turbinamentum. 2. Hor/ manimum Sylyphretum incommune flor alta, Horanimum Sylyphretorum quartum Nivio flor Clofli, Sylorea Sylyphretorum flor alta Turbinamentum, Sylvia agetrius flor alta Effe/ lenirs, Henry Wild Clark with a White Flower. 3. Horanimum Sylyphretum Leucatum flor altae, Syl/ voea Hylanica Turbinamentum, Gallaglorium altera/num Gerward, Wild Clark with Laverter Flowers. 4. Horanimum Sylyphretum sylvestrii unus minus Baalbi, Horanimum Sylyphretum Mauthel, Ce/ psm, Galga/ nemus, Ocula altae florae, Horanimum Sylyphretum quinatum Clofli, Verbaeum angus flore flore parvum flore lobata, Sylva Sylyphretorum adaltrum Tra/ ge, Sage Leo Wild Clark, Authors make many other kinds, but thereby are all those that are found growing with us, either Wild or in Gardens.

C C 2

III. The
III. The Descriptions. The first kind, or Oculus Chriftii, has a Root which is long, tough, and black, attended with many Ellers, by which it takes firm hold of the Earth, from whence rise up many Square Stalks two or three feet high, on which grow broad dark green Leaves, denoted about the edges, and sometimes ragged and hard in handling 5 the Flowers grow along towards the tops of the Stalks, like unto the gaping or nodding Flowers of the Garden Clary, but smaller, and of a pale, or whitish yellow color, which being pull away, there come in small bunches, round blackish or brownish Seed, the whole Plant bore a strong Smell, but it is nothing so quick as that of our common Garden Clary. There are two other kinds hereof: One, the tops of whole Stalks are purplis, with Flowers of a deeper purple color, and somewhat larger Leaves. Another, differing only in this, that the tops of the Stalks are green, and not purple, the Flowers of a pale yellow color, and the Leaves a little iron on the edges.

Wild Clary

IV. The second kind, or Hoary Wild Clary, with white Flowers, has a long tough black Root, and much differing from the former, the Leaves in this being small like those, but more hoary, and a little deeper denoted in on the edges, the Stalks are square, and about a yard high, upon which grow the Flowers in the same manner, facing that they are wholly white, which being pull away, there follows small round grains, the Seeds.

V. The third, or Lavender Rowed Wild Clary, has a Root not much differing from either of the former Wild Charlies, from whence come forth square hairy Stalks, two or three feet high, for with borer, narrower, and smoother Leaves, more deeply denoted about the edges, and rounder pointed, the Flowers are much less than the former, and neither in hoary, nor color, are they greatly differing from the Plants of Spikes or Lavender, they growing in spaces and roundness as the rest do, the Seed is like to the others, nor does the Smell of the whole Plant differ much from them.

VI. The fourth, or Sage Leaf'd Wild Clary, has a long Root, tough and black without, but yellow within, which makes without perishing for many Years, as the Roots of any of the Wild Charlies do: from whence rise up low Square Stalks, much about half a yard high, wherein grow hard ragged Leaves, set two at a Joint, very like unto Sage Leaves, but not hoary at all, of a dark green color, and denoted about the edges: the Flowers grow at set Places round about the Stalks, as in bundles, in some Plants of a fair purple, viola color in others more pale, and in others yet, of a light or Almond, which being pull away, there come in fine bunches, round blackish or brownish Seed. The Smell of this Plant is more pleasing and soft than most of the former kinds. There is another Species of this fourth kind, which differs chiefly from it in this, that it grows much higher, has thicker Stalks, larger and thicker Leaves, spott'd with brown, which f奇妙s, and breaks therein, with form and color of Leaves and Flowers, no difference appearing.

VII. The Places. The first grows wild in England, almost every where by the Way side, and so does the other with the purple Stalks: but that with the green Stalks is not common with us, but grows in many places of Germany and Hungary: Gerard says, that the Oculus Chriftii grows in fl unten places, almost in every Countrie, especially in Holborn-fields, near unto Grays Inn, in the Highway by the end of a Britsh Wall (there it might possibly grow formerly, but none can be said there now:) also in the bithter end of Chelsea towards London, and in the highways leading from Richmond Palace to the Water-side, and in divers other places. The second grows not wild here, but only in the Gardens of the Curious. The third grow with Chiffon, of the Seed which he had out of Spain, but he faith it was found likwise near the Ridings-place of Greenwich, that it is manifest, that it is a natural inhabitant of our Countrie. The third grows Wild in Hungary almost every where, in their Vineyards, and by the Way side, but with us it is chiefly nourished up in Gardens.

VIII. The Times. They all Flower in June and July, as do the Garden Charlies, and their Seeds are ripe in the end of August, or no long after.

X. These Qualities, Speciation, Preparations, and Virtues, are the same with those of the Garden Clary, so that little more need be said thereof here.

XI. Observation 1. Dis舊onites Faith, That the Seed of Oculus Chrifti, or Wild Clary, drink with Wine, (from one dram to two drams) excites Luft, and being mixed with Honey, and applied, cleanses the Eyes from Films, and other imperfections lodge in them; and being put whole into the Eyes, it not only simply cleanses, but also purges them very much from Waterish Humors, and so frees them from Redness, Inflammations, and divers other Disturbances which happen to them, taking away their Pain and Smearing, one Seed, and no more, being put into the Eye at a time. This, says Gerard, is a general Medicine in Chirurgery, and other Countries thereabout, known of all, and used with good success.

XII. Observation 2. The Liquor of the Leaves, given from two glasses to four or five, mixed with a Glass of Generous Wine, and drank warm, diffuses congealed Blood in the Stomach, warms and consoleth, and is very useful against dimness, and to restore the Eyes to their Pitchine State.

C H A P.
CHAP. CXXXIX.

OF CLOVE-GILLIFLOWERS.

THE Name. It was unknown to the Greeks, as far as we can learn, but is called of the Latins, Caryophyllus bortens. Also Vetanica, Verbamia, Verbaterum, and Barbarum, Of some Centaures Plin., the Caryophyllus. Some have given them to be the Iphianum Theophrasti in lib. 6. cap. 6 & 7. others to be his Dios Antonius, or Dios Florus, but Bardinus faith that they were unknown on the Writters: and his judgment seems to be good, because the Gillyflower is not like to that of Vetanica, or Cantabri, but is a wonder, eyes he, that such a famous Heavens of so pleasant a form, and so good a Smell should lie hid, and not be known to the Ancients, which may be thought not inferior to the Rose, in its Variety, Smell, and admirable Beauty. The same Caryophyllus was given to it, I suppose, from its Smell, which is very like to that of the Indian Clove. We in English call it Clove-gilliflower, and Gilliflower: (poor July-flowers, because they begin to flower in the Month of July) some also are called Carvinae, but that name arises chiefly from the color.

II. The Kinds. They are either Garden or Wild: of the Garden Kinds we shall treat in this Chapter. The Wild are vulgarly called Pink, of which we shall say nothing here, but refer you to the Chapter under that Title, where we shall fully discourse of them. Of the Garden Kinds, or Gilliflowers, some are Single, and some Double. The Single Clove-gilliflower must have to be a Pink, but it is no such thing, for it is oftentimes produced by the Seed of most of the Double Clove-gilliflower, and differs from Pink in its Shape, Magnitude and Smell: That all the Kinds of Double Flowers produce Seed I am apt to believe; though some of them, as the Clove-gilliflower and Clove-carnation, do very often, and Parkin- ton says, that they seldom give any Seed, so far as he could observe, and here in England, are usually increased by Slips.

III. As to the Variety of Kinds of this Flower in respect to their various and accidental differences, they are little or few in their Roots, Leaves, Stalks, and manner of growing, but manifold in respect to the Flowers: as to their Form, Magnitude, and Color, some being of one Color, some of another, some of many, some Striped, some Spotted, some finely Dotted only, some Jigged or deeply Cut in, &c. I lay as to others, we shall take no notice, leaving that work to their connoisseurs, who make the Garden their whole business. Those which we shall treat of here, are only the name following, (which comprehend all the other Kinds, and so many Varieties under them): 1. Caryophyllus bortens pinn. rubro, The Clove-gilliflower of a deep Crimfon Red. 2. Caryophyllus maximus Anglicus, The Great English Carnation. 3. Caryophyllus minor flore pleno, The Lesser Carnation with a Double Flower. As to the fift of these, viz. the Clove-gilliflower, there are the Single Clove, and the Double Clove; only of the Double Clove, there are two or more Flowers together. As to the Last, viz. Caryophyllus Maximus, or Great Carnation, with that which we describe in Selt. V. following, Parkin- ton in his Garden of Flowers makes twenty several Varieties; to wit, The Great Eng-}

lih, the Grey Hul, the Red Hul, the Blen Hul, the Prince, the White Carnation, the French Carnation, the Ground Carnation, the Crypt or Cryptat- une, the Red Crypt, the fragrant, the striped Sa- nage, the Blush Sange, the Oxford Carnation, the King's Carnation, the Camberwell, the Grand Per, the Camberline, the Great Red Lomb- bard. As to the Caryophyllus minor, or Lesser Carnation, called a Gilliflower, we have in Parkin- ton thirty four Varieties, to wit, The Lesser Carnation, the Gallant or Well-carved, the Blurred, the Blushed, Red Dever, Light or White Dever, Four Maid, Queens Gilliflower, the Danny, Bright Gilliflower, Small Grand, the Turkis, Pale Dever, Pale Venetian, Dainty Lady, Red White Gilliflower, London White, Stemell, Purple Gilliflower, Peach Color, blue Gil- liflower, Blue Color, Great Temple, Light Temple, Red Temple, Deep Blue, Pale Blue, Indians Blue, the Great Blue, Marbled Temple, Prince's or Vari- able Temple, Blushed Temple, Tentred Temple, Speckled Temple, and Rose Gilliflower.
Clove-gilliflower, for the most part. The Flowers are
like unto the Clove-gilliflowers, and about the same
bigness and dainty, yet in some they are much
greater than in others, but of a pale yellowish
Carnation color, (tending somewhat to an Orange) both
big and small white Flowers, and crooked at the ends
in the middle, but some have none. The smell is
weaker than that of the Clove-gilliflower, yet delect-
able enough to that Sicil. This kind is more apt
to bear Seed than any other, which in small, black,
flat, and long, and bring Sicil, yields wonderful va-
cieties of Flowers, both Single and Double, some
being of a lighter or deeper color than the Original
or Mother Plant, some with stripes in most of the
Leaves; others are striped or spotted, like one of
the great speckled Carnations or Gilliflowers, in
various sorts or kinds, and thus both Single and
Double: Some again are wholly of one color, like
the Original or Mother Plant, and are either more
or less Double than it, or else are Single, with one
row of Leaves; like in Pink. And some of these
are also wholly of a crimson red, or deeper, or lighter,
or variably spotted, double, or single in Pink,
or bluish, either single or double, yet but very
faded white, whilst all of them in the green Leaves
of the Stocks nothing at all perceptibly differing.

Great
Carnation.

V. The second, or greatest English Carnation, has
a Root which is branched into several great, long,
and woody Arms or Parts, having many small Fibres
annexed to them, yet is very differently preferred in
Winter, for which reason it is not altogether so com-
mon as the other Carnations and Gilliflowers.
From this Root rises up a great thick Round Stalk,
divided into several Branches, somewhat thickly set
with Leaves, and at every Joint two or three large
Leaves, rather green than whitish, somewhat broader than
Clove-gilliflower Leaves, turning or waving two or
three times round; and in some other kinds of Car-
ations, they are plain, but bending their points down-
wards, and in some also of a dark reddish green
color, in others not so dark, but rather a whitish
green color: The Flowers stand at the tops of
the Stalks, in long, great, round, green Hooks, which
are divided into two points, out of which rise many
long and broad pointed Leaves, deeply jagged at the
ends, set in order, round and beautiful, making a
noble great double Flower, of a deep Carnation color,
almost red, spotted with many blithe spots and stripes,
more green, and some tints of an excellent, delightful
and plesant flower smell, not too quick, as many oth-
er kinds of this kind are, nor yet too dull, and with
two whitish crooked threads, like borage in the mid-
dle. This kind never bears many Flowers, but as it
is in growing so it is also in bearing, it is a
magnificent Flower, and shows a kind of stateliness;
for it will not endure to be often handled. This
description may serve for all the kinds of this kind.

VII. The other Kind of Carnation, has
a Root much like to the former, but something lef-
ter, having from it Stalks next the ground, thick
yet, but with smaller or narrower Leaves than the

Great
Carnation.

V. The second, or greatest English Carnation, has
a Root which is branched into several great, long,
and woody Arms or Parts, having many small Fibres
annexed to them, yet is very differently preferred in
Winter, for which reason it is not altogether so com-
mon as the other Carnations and Gilliflowers.
From this Root rises up a great thick Round Stalk,
divided into several Branches, somewhat thickly set
with Leaves, and at every Joint two or three large
Leaves, rather green than whitish, somewhat broader than
Clove-gilliflower Leaves, turning or waving two or
three times round; and in some other kinds of Car-
ations, they are plain, but bending their points down-
wards, and in some also of a dark reddish green
color, in others not so dark, but rather a whitish
green color: The Flowers stand at the tops of
the Stalks, in long, great, round, green Hooks, which
are divided into two points, out of which rise many
long and broad pointed Leaves, deeply jagged at the
ends, set in order, round and beautiful, making a
noble great double Flower, of a deep Carnation color,
almost red, spotted with many blithe spots and stripes,
more green, and some tints of an excellent, delightful
and plesant flower smell, not too quick, as many oth-
er kinds of this kind are, nor yet too dull, and with
two whitish crooked threads, like borage in the mid-
dle. This kind never bears many Flowers, but as it
is in growing so it is also in bearing, it is a
magnificent Flower, and shows a kind of stateliness;
for it will not endure to be often handled. This
description may serve for all the kinds of this kind.

VII. The other Kind of Carnation, has
a Root much like to the former, but something lef-
ter, having from it Stalks next the ground, thick
yet, but with smaller or narrower Leaves than the
in Gardens; but the Carnations and Gillyflowers, by reason of their tenderness, are usually Planted in Pots, that they may be housed, and so kept and preserved from the extreme cold of our Winters.

X. The Species. These Plants are so called not only from the Leaves and Flowers, but resinous in consistence, and are of heat or cold: Althaeus, Sambucus, Transectus, Cordial, Necrolock, Alternative, and Aliphilarmick.

X. The Specific and Peculiar Use of the Different Species. This is peculiar to Painting and Swouning Fits.

XII. The Infalplle Juice. It is highly Cordial, and may be diffolved in white Port Wine or Caraty, to make a Tincture of at pleasure, against Painting and Swouning Fits, Staphills at Heart, Malady of the Plague and Poison.

XIII. The Syrup Made with Water, is taught in our Pharmacopoeia Londinensis lib. 6. cap. 15. sect. 8, thus: Take Clove-gugflowers (the White being cut off) a pound and eight them all night in Spring Water two pounds : bring brasted, with double-dissolved white Sugar four pounds, make a Syrup (without boiling) only by melting the Sugar. This Syrup is temperate in Quality, strengthens the Heart, Stomach and Liver; it is Pecoral and Cordial, and may be mixt with other Cordial Liquors, against malignant Fears, and the Plague, as also against Painting, Swouning, and the like. Itrefreshes the Vital Spirits, cheereth the Heart, and refills Poultry.

XIV. The Syrup Made with Pors Wine or Court. It is made exactly as the Former, and has all the same Virtues only it is a greater and more famous Cordial, more powerful against Painting and Swouning, to comfort a languishing Stomach, as also to cheer the Heart and revive the Vital Powers.

XV. The Syrup Made with Vinegar. It is made exactly as that with Water, but containing the Vinegar instead of the Water, is opening, and refills Vapors which fly into the Seare, it fortifies the Stomach, comforts the Heart, cheereth the languishing and drooping Spirits; it helps Digestion, and prevents against all Diseases, proceeding from Choler or Blood of Blood, as Malign and Pestilential Fevers, and Poyers not Pestilential: it cools the Blood, refills Poultry, quenches Thirst, and is helpful against the Vertige. Dose of any of these three Syrups, an ounce at a time in any convenient Vehicle.

XVI. The Efficacy. It has all the Virtues of the Infalplle Juice and Syrup, it is good against Dyspepsie of the Head and Stomach, very Cordial, special good against Hoefick Fears, to hlep Flames and help fiach as fipt Blood: and so it cheers the Heart and revives the Spirits, so powerfully refills Melancholy. Dose of from two drams to four.

XVII. The Conveyance. It is Cordial, cheers the Heart and strengthens the Stomach, and is only eaten as a Swoment. It is good for old People, to eat in a morning falling.

XVIII. The Difflus Water. It is made by a very gentle heat in Baloons, is Cordial, and may be ufed as a Vehicle, to convey the Cordial Mediments in, besides which, it is of excellent Use to wash Fire Eyes withal, washing them therewith five or six times a day.

XIX. The Spirituous Vindiation. It is a great Preventive against all manner of Malign, Infections, and Pestilential Dificas, and ought to be used preventively, as first in the Morning falling, secondly about four in the Afternoon; thirdly at Bed-time. It more powerfully comforts the Stomach, cheers the Heart, and revives the Spirits, than any of the former Preparations. It may be prepared with common Spirit of Wine; and then it may be taken alone of it, from one Spoonful to two, according to the Age of the Person, or otherwise mixt with Wine, or some other Vehicle.

XX. The Acid Vindiation made with Vineger. It commonts the Stomach much, cheers the Heart, helps Digestion, hogs Vomiting, is good against spitting Blood, and strengthens the Retentive Faculty. It cuts rough Hegn, corrects the heat and malignity of Choler, helps Expectoration, and quenches Thirst in burning Fevers. It is an excellent thing to be given in the Guts of the Plague, and of all manner of Malign and Pestilential Dificas.
XI. The Decoction of the Herb in Red Port Wine. Being taken inwardly two or three ounces at a time, it is good to stop the Terms in Women, as also the Whiter, and to stop any inward Bleeding; it is good also to open Obstructions of the Reins, Ureters and Bladder, and to provoke Urine, and excels Stones, Gravel, Sand, and other Tarassous Matter.

X. The Liquid Juice. It has the same Virtues, but is seldom given inwardly; but outwardly applied, it stops all sorts of External Bleedings of Wounds, cleanses and heals Scabs and running Sores, Ulcers, Cancers, Fustula's, &c. by correcting the putrefaction, and drying up the miffm Humors which occasion them.

XI. The Decoction of the Flowers in Red Port Wine. It is good against all the Diffeses against which the Decoction of the Herb is good; but is with a more pleasant and delicate Medicine, and more powerful to stop the Terms in Women, and may be given three, four, or five ounces at a time, Morning and Evening. It is a peculiar opener of Obstructions in the Reins and Bladder: Used as a Gargle in the Mouth, it cleanses, dries up, and heals Cancers, running Sores, and Ulcers in the Throat, Mouth, and Gums; also great use made of it in all kinds of Ulcers, and the bitings of Serpents, or other Venemous Beasts.

XII. The Powder of the Flowers. It may be given to a dram in Red Port Wine, against all sorts of Fluxes, and Bloody-fluxes in Special, of the Belly, Reins, and Womb: outwardly applied to Sores and old Ulcers, it cleanses, drys and heals them. Inwardly given, it is good against the Plague, Malign and Pestiferal Diffeses, and the bitings of Serpents, or other Venemous Creatures. Outwardly applied to, or thrown upon Ulcerated Kibles, it effectually cleanses them, dries up the humides, and heals them, tho' the Ulcer has penetrated to the Bone.

XIII. The Decoction of the Seed in Wine. It helps such as are bit by Scorpions, &c. being inwardly taken to two or three ounces, and the place outwardly bathed therewith. It has also an effectual property to cure the itch, as also Scabious, and running Sores, and to correct the purrid Humors running to any Wound, Ulcer, or Fustula.

XIV. The Powder of the Seed. Being given from a dram to two drams, according to the age of the Person, and strength of the Constitution, it has been found to purge the Belly of Cholerick Humors, to expel Poison, and reftit the malignt force of the Plague; it is also of very good use in all sorts of running Sores, old Ulcers, inveterate Cancers, putrid and maligne Fustula's, and the like; for it reftitsthe purridity, cleanses and dries up the Moth, and heals beyond all imagination. Odena Musstan gives the Seed parched, and beaten to powder, to be drunk against the Yellow Jaundice.

CHAP. CXLII.

COCKS-HEAD.

I. THE Names. It is called in Greek, (by the Ancient Herbarist) Оυροφόρος, and is thought to be the Onobrychis or Dipotera, in Latin, Onobrycha, and Copae Gallinacea, in English, Cocks-head, Medick Kich, and Red Felching.

II. THE Kinds. Authors make many varieties hereof; Parkinson makes nine Kinds, but whereas they are not all Native of our Country, we shall only describe those which are natural to the place, and to be had with us, which are chiefly three, viz. I. Onobrycha vulgaris, Copae Gallinacea, Onobrycha Dolorem, Chiff, Talley, Glauca, fist Onobrycha Gasteri in hostis, Copae Gallinacea Belgarum Lobii; the latter for which is called by Bontonia, in Prodromus, Copae Gallinacae roman, Cock-head, the Common Kind, also Medick Felching, and by the French, Saint Vim: But this is not the Saint Vim so much talked of for the Improvement of the Land, as would be supposed from our Agriculture, but a kind of Onobrycha spicata, in Chap. 115, where we have shewed the excellent Uses thereof in Agriculture.

the Aparthecaries, Caius: In English, Cole, and Colewort.

II. The Kinds. There are two principal Kinds, viz. 1. The Headed Coleworts, which is our Common Cabbage, of which we have here enlarged Treated in Chap. 142: after which, 2. To the leaf, or open Colewort, of which there are several Species, viz. 1. The Garden Kinds, of which in this Chapter. 2. The Cole-Flower, of which in Cap. 144. 3. The Wild Kind, of which in Cap. 145. 4. The Sea Coleswort, of which in Cap. 146. Of the Garden Kind there are many Species, as 1. Brassica vulgaris fatia, Our common Garden Colewort. 2. Brassica fatia Crafo, Curled Garden Colewort. 3. Brassica Barbra, The common Red Colewort. 4. Brassica Frutala, The open Cabbage Colewort: Of all which

in their order.

III. The Descriptions. The first which is our common Garden Colewort, has a woody strong Root, with many Fibres or Strings, joins in it: From which Root rises up many broad, thick, fat Leaves, of a deep black-green color, through the middle of which Leaves runs in each a great Rib, which is thick and thick on the backside, with many smaller ribs or Branches rising from that middle Rib, of Reddish, Whitish, and Yellow colors. The Stalk grows out of the midst from among these Leaves, which spreads it self forth into several Branches, bearing at the top, small yellow Flowers: which Flowers being past, long Cods succeed, full of round Seed, like those of the Turnep, but smaller.

Colwort
Garden
Crisped

IV. The second, or Crisped Kind, has a Root somewhat thick, strong, and woody, filled with almost an innumerable company of Fibres, some greater, some smaller, some whitish, and some longer, like in number as it were to the houses of some lead; from which Root springs up one thick Stalk, bearing at top thereof a great thick head of crumpled Leaves: the Leaves are large, and of a white green color, and set with thick large white ribs: the middle of which is the red of the Leaves chiefly together, which are lesser than those next the ground, these lie open most part of the Summer, without any长春不老 to close; but towards the end of the Summer, being green to have a great many Leaves, it then seems as if it would shut up or close together: but standing a while at a flag, it on the contrary rather dilates and spreads itself abroad, looking something like a thick, hard, whitened Colewort, and is indeed nothing else.

VI. The Fourth Kind, has a Root somewhat thick, strong, and woody, filled with almost an innumerable company of Fibres, some greater, some smaller, some whitish, and some longer, like in number as it were to the houses of some lead; from which Root springs up one thick Stalk, bearing at top thereof a great thick head of crumpled Leaves: the Leaves are large, and of a white green color, and set with thick large white ribs: the middle of which is the red of the Leaves chiefly together, which are lesser than those next the ground, these lie open most part of the Summer, without any长春不老 to close; but towards the end of the Summer, being green to have a great many Leaves, it then seems as if it would shut up or close together, but standing a while at a flag, it on the contrary rather dilates and spreads itself abroad, looking something like a thick, hard, whitened Colewort, and is indeed nothing else.

VII. There are besides these, several other Species of edible Coleworts, some Curled, and wholly of a Green color, some of divers colors in one Plant, as White, Yellow, Red, Purple, or Crimson, so variously mixed as to cause admiration, the Leaves being curled on the edges like a Ruff, very beautiful to behold. 2. There is also another curv'd Colewort, of less beauty and respect, being but a little curl'd on the edges, whose Leaves are white, and edged with green: or green and edged with white. 3. There are two other sorts of Coleworts, one of a Popinjay green color: the other of a fine deep green, like unto the Savoys. 4. There is the Cole Rope, which is also a Colewort, which bears a white Head, or headed Stalk above the ground, as large as a reasonable Turnep, but longer, and from the top whereof springing out divers great Leaves, like unto other Coleworts, among which rise up divers Staple, which bear yellow Flowers, and Seed in
VIII. The Places. They all of them grow every where through England, Scotland and Ireland, in Gardens, being chiefly used up to supply the Markets, and for the use of the Kitchin.

IX. The Times. They all flower in July, and their Seed is ripe in the end of August.

X. The Qualities. They are temperate in regard to heat or cold, but are said to be drying in the first Degree, and of a binding Faculty: and yet the Broth of the first boiling, some Authors say, loosen the Body; the second Decoction (by they) is only affringent. They abound with a certain Nitrous or Salt Quality, whereby they mightily cleanse the Bowsels, whether in their Juice or Broth: but the Subtance of the Collory is of a drying and binding Faculty, because in boiling it looses its Saline Particles, and leaves them in the Decoction or Broth.

XI. The Specification. They are peculiar against Asthma, breathing Obstructed, and throoms of Breath, for being of a cleansing quality, by taking away the impurity of matter in the Lungs, and other Bowsels, they so open the Passages, as to leave the parts for respiration free and clear.

The Virtues.

XIII. The liquid Juice. Pliny says, that if it is mixed with Wine, and drop into the Ears, it is beneficial against Deafnes. Dioscorides says, that if it is mixed with Juice of Violets de juce and Nitre, that it will make the Body soluble. The Juice having some Nitre dissolved in it, and used as an Elixir, up the Nostrils, it purges the Head and Brain, of Cold, Mott, and Venorous Humors.

XIV. The Essence. Being mixed with Wine, and so drank, it helps such as are bitten by Vipers or Adders, or any other Venous Serpent. It is also good for those who have been Poisoned by eating Venous Mushrooms. Doze three or four ounces twice a day.

XV. The Syrup made of the Juice with Honey. It is good against Coughs, Colds, Hournfifs, shortness of Breath, and all sorts of Voife: and being often used, it causes enfe E rupture; heals the Lungs, and Firens of the Stomach, and is good for such as are entering into a Consumption. Doze two ounces two or three times a day, in Ten, Male, 57.

XVI. The Looch, or Eleuary. If it is made of the Pulp of the Stalks with Honey, it is good for such as are short winded, and are pufy, breath difficultly, and have a vehement Cough. You must take the middle fikk. Robin, boil them in Milk till they are feet, then take out their Pulp, and fo mix it with Honey to a Looch or Eleuary.

XVII. The Decoction. It encloses Milk in Nerves, and being drunk, strengthens the Nerves and Joints. And Gerhard, fays, that if those fores in the EYES called Coriromae, be washed therewith, it heals them, though they could be healed by no other means. The first Decoction loofens the Belly, but the second binds it: The fift is faid to provoke the Terms, and caufe Conception, but the fcond holds it. If the Decoction is made in Cock Broth, by boiling the Collory with the Cock, it will be a singular help for such as are troubled with Wind, and Grifling Pains in the Stomach and Belly. The fame Broth, is also very good for those who are troubled with Obftructions of the Liver and Spleen; and for fuch as have Stones, Gravel, Sand, or other Tumours in the Reins, Ures, or Bladder. Taken before meat, it is a very good thing to keep one from Surfeting, as also from Drunkenness, though they drink much Wine, by refaining and keeping down the Vapors, which otherwife would affcend up, and intoxicate the Brain; and this it will the more effectually do, if it is made plentifully, or gratefully, with Juice of Limes, Swedes and many Hands, Kaff, Logs, and Feet, (into which groft Humors are promoved or fallen) being bathed with Decoction of Collory Warming, cafes the Pain, diffolves the Humor, and takes away the Swelling. The Decoction (as also the Juice and Essence) cleanses, dries, and heals Stabines, old Ulcers, and fibby running Sores, being often washed therewith. And Golden says, it cleanses fo strongly, that it will even Cure the Lentero.

XVIII. The Collyrium. It is made of the Juice, Essence or Decoction, by diffolving Honey in it, three ounces of Honey to every Half. This being often dropped into the Eyes, it clears the light by removing any Cloudiness, Film, or Port: it is helpful againft Inflammations and Blood-flit, and it cures Coats and running Eyes.

XIX. The Cataplasm. Made of the Juice or Essence with Powder of Fennegreek, and applied, it cures the Pains of the Gout, and diffolves the Tumor: it alfo heals fikk running Sores, and old putrid Ulcers. If it is made of the Leaves beaten to a Pulp, it prevails against all Sorts of Inflammations, and hot Tumors. If it is made of the Herb or Juice, made into a Body with Barley Meal or Flower, and a little Common Salt, it is said to break Carbuncles, or at leaft some Sort of Tumors, which much resemble them. If it is made up into a Pufly,

\textbf{of COLE-FLOWER.}

\textbf{I. THE Names.} I cannot find that this Plant was ever known to the Greeks; for which reason it has no Greek name: or yet that the Ancient Romans had any knowledge thereof: but our Modern Authors call it in Latin, \textit{Brassica florida}, Coalis florida, Coalis flora, Brassica Cypria, in English, Cole Flowers, and Cole-Flowers.

\textbf{II. The Kinds.} It is a singular Plant, but is certainly one of the Kinds of Coleworts: and that Species, which Pliny lib. 19. cap. 8. calls \textit{Brassica Com-}

terena.

\textbf{III. The Description.} It has a Root spread out into several pretty thick Branches, which are full of \textit{fibres} or \textit{strings}, from which spring forth divers large Leaves, which are large, of a whitish green color, very like to Cabbage Leaves, slightly indented about the edges, yet smaller, narrower somewhat, and sharper pointed than those of Cabbage: in the midst of which Leaves, sometimes in the beginning of Au-

tumn, and sometimes sooner, there rise up a great white Head of white hard Flowers, closely thrift to-
gether, sometimes they are of a Milk, or Cream, or yellowish white color: these never open, or spread much with us, and are then called for the Table, the green Leaves being cut away close to the Head: in all the other parts, the Plant is like to the Cole-

\textbf{of COLEWORT Wild.}

\textbf{I. THE Names.} It is called in Greek, \textit{Kefqia \textit{Kefqia}}: In Latin, \textit{Brassica Sylvestris}: and in English, Wild Colewort.

\textbf{II. The Kinds.} It is a singular Plant, and the fe-

do Species of Coleworts, being the Wild Kind.

\textbf{III. The Description.} It has a root pretty thick, spread into some Branches, with several Fibers ad-

joining, white, hard, and somewhat woody, from which rise up several Leaves, and one principal Stalk. The Leaves are long and broad, not much

\textbf{worts. These Flowers have a much pleasanter taste, than either Coleworts or Cabbages of any kind, and therefore are the more Valuable as for Food.}
Salmon's Herbal. Lib. I.

IV. The Places. It grows in most parts of England, in open fields, as well as in Cornfields, meadows, on the seashore, and in the marshy places bordering on the sea. It is found in the marshy places near the sea, and in many places near to Colchester, and in other places by the sea side.

V. The Times. It flowers in the end of June, and all July, and the Seed is ripe towards the end of August.

VI. The Qualities, Specification, Preparations and Virtues, of Colewort, and the Sea Colewort, are the same with those of the Garden Colewort, except those various Preparations and Uses of them for Food. But in all the other respects there mentioned, this is the stronger, and more efficacious.

VII. Note 1: The Description of the Sea Colewort. (Some Authors say) doth by its biter Quality, and sharp Nitrous Particles, open the Belly, and purge the Body; but as Coleen thinks, not without some hurt or damage thereto, because it differs much from the Temperature of our Bodies, being hotter and drier than the Garden Kinds: For as all other

Wild
Chap. 147. English Herbs.

Wild Herbs are more potent or stronger in their Operations, so also this, for which reason it digests and cleanses more powerfully than the others do.

VIII. Note 2. The young Leaves boiled in Lyce of Porridge, (as Disparades says,) or in Fair Water (as it is most usual in our times) are eaten as other Coleworts are, by several poor People near the Sea, the bolting taking away much of the bitterness thereof.

IX. Note 3. The young Leaves, or their Juice, applied to Sores or Ulcers, cleanses and heals them, diffuses Tumours, or Swellings, and takes away inflammations.

C H A P. CXLVII.

OF COLTS-FOOT.

I. The Names. It is called in Greek, Λέπος, also Χαράκκαρ' τότον. In Latin, Tussilago, but by the Apothecaries, Taraxas, and Urgula Calabrina, or some Populus, (from its likeness to the Popular Leaves;) Ferrea, and Feraria Filius; of divers. Paolo Epipane, Allo Beckman, Chamastrae, (From the Popular Tree, called in Greek, Αλλο.) In English, Colts-foot, Pole-foot, and Hoe-fef foot; Gerard says, it may very well be called Cough Herb.

Coltsfoot in a flower:

II. The Kinds. Camariirius makes three sorts of Brasium, or Tussilago, viz. 1. The True, which we list in this Chapter. 2. The Perfoliate, of which we have treated before in Cap. i. 100. and the Calloa Palatina, or Marcia Marigold, which he calls Tussilago major, but is indeed no Colts-foot, and of which we shall treat in Cap. 11. Following. The true Colts-foot is either European or American, the Descriptions of both which we deliver here. The American is called Cotahta Americana.

III. The Descriptions. The English, or European Kind, has a Root small and white, spreading very much in the ground, so that where it once takes, the ground is very difficultly cleansed from it again; for any little piece or bit of it remains therein, it still from it spring forth afeeds. From this Root slender foliage stalks shoot up very early in the beginning of March or April, about a foot long, bearing at their tops small yellow flowers, which quickly fade away, and after they are past, Leaves broad and somewhat roundish come up, yet sometimes a little denuded about the edges, much softer, thicker, and greener than those of Butter Burt, with a little downy hairiness, over the upper side of the green Leaf, which may be rubbed away, and whith'ri' or neatly underneath the Leaf.

IV. The American has a Root which consists of a Bath of blackish Threads or Fibres, (which while the hardnese of the Winter, both the Stalks and Leaves perishing yearly,) but grows brownish at the end: from this Root rise many round Stalks about a foot and half high, and two broad, and somewhat round, but pointed Leaves, a little dented about the edges, at each Joint of them, the upper Leaves being smaller, and little or nothing dened: at the tops of the Stalks come forth several Branches with many pure white Flowers, being but small, and made of five Leaves opposite, rising out of each bush, which, being full, there succeeds small long Seeds, fleeing each to a little Dusen, which are carried away together with the Wind: The whole Plant has little or no Smell, neither Root, Leaf, nor Flower, whatsoever Commas say to the contrary.

V. The Places. It, viz. the first, usually grows in wet grounds, as also in dryer places: It is found likewise near unto Springs, and on the banks of Brooks and Rivers, in wet Puddens, by Ditch Edes, and in Ditches, and in other moist and watry places near unto the Sea, almost everywhere. The latter grows in America, in many places of Canada, New Eng-
Salmon's Herbal. Lib. I.

England, New York, New Jersey, Pennsylvania, Virginia, and Carolina, in which last place I have found it several times, travelling through moist, wet, and Morril places.

X. The Virtues. The first begins to Flower in the end of February, or beginning of March, and the Leaves appear about the middle or latter end of March, when the Flowers are all gone, and remain green all the Summer long; and for this cause it has been thought that Colas-foot had never been Flowers, as Pliny ib. 26. cap. 6. has hinted.

VII. The Qualities. They are cold and dry in the first Degree, Approptive, Altringen, Tranquill and Vulnerary, Peculiar, and Anslespetic.

VIII. The Specification. They are peculiar against Coughs, and Diseases of the Lungs.

IX. The Preparations. You may have therefrom,

The Virtues.

X. The Liquid Juice. Taken alone, or sweetened with Sugar or Honey, it is prevalent against Coughs, Cold, Wheezing, Hoarsth, and other Diftempers of the Lungs. Dose from one to three ounces, Morning and Night at Bed time, and at other times of the Day, if the Cough is vehement.

XI. The Essence. It has all the Virtues of the Juice, but more powerful; belted which it is, singularly good to cure Ulcers of the Lungs, and Stomach, as all the Bloody Flux, and Ulcers of the Bowels; it hots thin Rheums and Diftillations, and Carbohydrs, and helps in Contempstions. Dose from one ounce, two, three or three times a day, either alone, or mixed with the Diftilled Water.

XII. The Syrup. It cures Coughs, chiefly dry Coughs, but has an Influence against all Difter- pensions of the Breast and Lungs, being often taken, even by Bounteals, as also with a Liquorice Brick.

XIII. The Dose. If it is made of the green Leaves and Roots, it cures a Cough proceeding from a thin Rheum, and helps Healths, you may sweeten it with Sugar or Honey.

XIV. The Cataplasma of the green Leaves. If it is made alone, or with Honey, it is very good to abate hot Infammations, and Anxieties fire, and to cure other hot excitements of the Skin; and being applied, it is good to heal Ulcers, and other old and running Sores.

XV. The Dryed Leaves. Taken as Tobacco, they are good for thin Rheums, Diftillations and Coughs; to also the Root taken in like fort, as Disfesser and Golden layer: viz. the Fumes of it, taken (from burning Coles) into the Mouth two or a Fumet; as also the Fumes of the Leaves to taken (or if I suppose the Ancients knew nothing of Tobacco Pipes, that being a Modern invention;) they effeetually help such as are troubled with Thrushes of Breath, and draw their Breath thick and often. The Fumes also ripen and break Apothems of the Throat and Lungs, and that without any danger.

XVI. The Diftilled Water. Used simply of it fell, or mixed with Eider-flower and Nightshade, it is a singular remedy against all hot Agues, to drink two ounces at a time, and to have Cloths wet therein, and to be applied to the Head and Stomach. The same applied to hot Swellings, or any Infammation, does much good, and prevails against Burning and Swellings, and Anxieties fire. It is in particular good also to take away red Pimperles, Wheals, and other small eruptions of the Skin, which arise through heat; and is profitable against the Infammation of the Pile, and burning heat of the Perity Parts, cloths being wet therein, and applied.

XVII. The Tinder. It is made, as Matthewins says, of the Cotten or white Wool, which grows in some parts of the Root; this Cotten being cleaned from the Roots, and bound up hard in Linen Cloths, and boiled in Lea for a while, then adding some Salt pote to it, it is to be dried in the Sun. This, says Parkinson, is the best Tinder to take. Fine that can be, being thrust from a Flint.

Applied to molten Ucell, it dries up their Humidities.

C H A P. CXLVIII.

of COLUMBINE.

I. T H E Name. It is said to be called in Greek, καλυκνα, as Calecon thinks from Θεοπροφάλος, lib. 6. cap. 7. and yet some think the Greeks knew nothing at all of it: Delatampius upon Athenæum, calls it, ακολολο, ἄκολολο, τ. 6. H. 372. Ebinus Columbæ, in his Phytodesfins, to whom Calecon gives the greatest approbation, refers it to the Καλυκνα, Φυτογνωμος Διονυσί. In Latin, it is called, Aquileia, Aquila, Aquilegia, Aquilegia Rosae, Aquilegia Stellaris, Leonotomorum Gensferi, Herbe Léonis; and in English, Columbine.

many other of the Double sorts. These Double Kinds do give as good Seed as the Single kinds, which thing is not observed in many other Plants.

Columbine: double flow inverted.

IV. Double Columbine has a Root like the former, and differs not in Leaf or manner of growing from the Single, so that until they come to flower, they cannot be differed one from another, the only chief difference is, that this bears very thick and double Flowers, that is, many banded or crooked single Leaves set together, which Leaves are not so large as the Leaves of the single Flowers. The variety of colors in this Double Kind is as great or plentiful, or rather more than in the Single, for of these there are party-colored blues, and whites, and spotted variously, which are not in the Single Kind, as also a very deep Red, very thick and double, but a smaller Flower, and left plentiful in bearing, than

V. The third, or Double Inverted Columbine, is not to be differed either in Roots, Stalks, Leaves, or Seed from the former, but only in the Flowers, which makes the chief Division: these are as double as the former, but the Heads or Horns of these are turned inwards, and spread out in the middle of the Flowers together: neither is there that plentiful variety of colors in this Kind, which is in the former, there being never above three or four colors seen in this sort, yet White, Purpul, Rose, and a Dull, or dark overworm purpulish color. These double Flowers being past away, there come in their places small long Cods appear, four or five together, in which are contained small black, and glittering or shining Seed.

VI. The fourth, or Rose Columbine, in its Roots, Stalks, Leaves, and Flowers differs little or nothing from the former Columbines, the chief difference consists in the Flowers, which although they stand in the same manner generally upon their small Footstalks, but somewhat more sparingly than the others do, yet they have no heels or horns, either inward or outward, or very seldom, but stand sometimes with eight or ten small fists, plain Leaves, set in order one by one, as in a Compas, in a double row, and sometimes with four or five rows of them, every one directly before the other, like unto a small thick double Horned open, or a spread Marigold: but sometimes it happens, that some of these Flowers will have two or three of the left rows of Leaves, without any heels, and the rest which are inward, each of them with a piece of a small heel or horn about these, as the former have. The colors of these Flowers are almost as variable, and as variously mixt, as the former-double sorts. This also gives its Seed, which for the most part prefers its own kind in perfection.
VII. The sixth or Degenerate Columbine holds the proper form of a Columbine, being much like to the Double Rose kind, but that the outwardmost row of Leaves are larger than any of the rest inward, and its Flowers, either of a purplish green color, which is not altogether fit for to give good Seed like the former. This kind of Columbine might seem to some to be but a reduced Regeneration, and no true natural kind, happening by some cause of Transplanting, or otherwise by Art; but finding it to hold and keep its own proper Species, (being raised from its own Seed) and not voluntarily to change into other forms, I am obliged, I think, to conclude the contrary.

VIII. The fifth, or Spanish Tuffed Columbine, has a Root made of many long yellow Branches and Strings, which endow many Years, and increase much. These Plants (whether white or purple) have both one form in Roots, Stalks, Leaves, and Flowers, and therefore need but one Description: The Leaves are balm for color and form, so like to some Columbine Leaves (the larger and darker, yet more pure, and on larger Stalks) that they may easily deceive one, that does not con siderately observe them. For the Flowers are much more divided, and in smaller parts, and not so round at the ends. The Stalks are round, strong, and a yard high at least, branching out into two or three parts, with Stalks at their joints rough, and at the top thereover stand many Flowers, which are nothing but a number of Threads, made like into a small round Tuft, breaking out of a white Skin or Leaf, which inclose them, and which being unwound, appear like unto little Buttons. The color of these Threads or Tufts are whith, with yellow Tips on them, and somewhat purplish at bottom, having a strong, but no good or pleasant Smell. They abide in their Beauty (more especially if they grow in the fields, and not too hot in the Sun,) a great while, and then fall easy like short Down, or Threads: The Seed Vejels are three figures, containing small, big, and round Seed. The purple Tuffed Columbine differs only from the white, in that it is not full so high, nor so large, and that the color of the Tufts or Vejels is a bloddy purple, with yellow Tips, and is much more rare than the white.

IX. The seventh, or Virginian Columbine, has a Root long, with many Fibres thereof, but differs little from the common Figure for form, except in the following particulars. The Stalk (Cumulus makes to be a Dwarf, but) is as tall as our common English, and of a reddish color. The Leaves are smaller, and somewhat like to those of the Thaldrum, but with a paler green color. The Flowers are of a fair reddish color, and finge from the middle of them to the ends, but yellowish from the base to the bottom; the ends of several Leaves are not blunt, as in ours, but fent, rough, and pointed, within which brimed Leaves there are five other pointed, and of a reddish color also, their points bending downwards, having many small white Threads in the middle tips with yellow, after which come four pointed or brimmed Seed Vejels, containing within them black, thinning Seed.

X. The Plants. They all grow with us in our Gardens, as Garden Flowers; but Clarys, that the flat Flowers have been often found on some of the Wood Mountains in Germany. The seventh Kind is a Native of Virginia, and was brought to us from thence by John Tradescant.

XI. The Times. They most of them flower not until August, or the most part of June, and (as Gerard says) in July, their Seed ripening in the mean time. The Spaghata Virginia, or Virginian Kind, flowers somewhat earlier than any of the other Kinds, usually sooner by a Month.

XII. The Qualities. They are Temperate in respect of Heat or Coldness, Dryness or Moisture: Aperitive, Alterative, and Altingent, Heparitic, Nepitrick, and Hydropic, Alternal, Vomitive, and Lithomptic.

XIII. The Speculation. It facilitates the Deliverance of Women in Child-bed.

XIV. The Preparations. You may have, 1. A Liquid Juice from the Herb and Root. 2. An Efficacy from the same. 3. A Decoction in Wine. 4. A Potion. 5. A Powder of the Seed. 6. The Root of the Common Kinds. 7. The Root of the Tafted Kind.

The Virtues.

XV. The Liquid Juice. Mixed with Milk and Honey, it is good to heal sore Mouths: and taken four or six Spoonfulls at a time in White Port Wine, Morning and Night, it opens Obstructions of the Liver, and prevalent against the Jaundice.

XVI. The Efficacy. It has more peculiarly the Virtues of the Liquid Juice, besides it is of excellent use to heal old running Sores, and putrid Ulcers: and being taken for some time, it is an admirable thing against Obstructions of the Reins and Bladder.

XVII. The Devisition of the Herbs and Root in Wine. This being perfumed with some Grains of Ambergris, is good against those Swoonings, which the Greeks afe called

The Virtues.
Chap. 149. English Herbs.

by Some Savages, Of Froedolion (a Bane Soderer) and by
Scrophulariae, Lata, Radica et in English, Comfrey.

11. The Kinds. Authors make several sorts of
Comfrey, but the three following are only, or chief-
ly to be had in England, viz. 1. Symphytum major
vulgarum, Our Common Great Comfrey. 2. Symphy-
tum mitis flore purpureo, Our Great Comfrey with
purple flowers. 3. Symphytum Tuberose, Tuber-
ous Comfrey, or Comfrey with Knobbled Roots.

Comfrey with Purple Flowers.

V. The third kind, has a large Tuberous or Knob-
bbed Root, which Branches it self out into other Thick
and Tuberous parts, more Tuberous or Knobbled to-
wards their ends, with several Fibres adjoining, black
on the outside, and yellowish within, perforated
with six Vents, Gladiate or Clammy Faces as the
others, but not altogether so flamy: The Roots are
also as tender and easy to be broken, or more easy
than the others, and spread themselves under ground
in like manner. From this Root rise up a hairy,
crofted, or cornered Stalk, not so high as the former,
with smaller Leaves, and more thinly set thereon,

Comfrey with Tuberous Roots.
Herbal.

of the same form, and greenness, that thereby it may
of the first light be known to be a Comfrey, by any
who has well observed the Common Kind, but more
especially when the top Branches are in Flower,
which being placed after the same manner, and of
the hollow foliage, but smaller, are of a more
fiall yellowish color, whose Seed following is also like
the seed of the other Kinds. The Stalks and Leaves
Dye away, or perish every Year, as they do in
other herbs, the Roots standing and increasing in the Earth,
and forming many new Stalks and Leaves every Spring.
None make a better Species of this Tenedous
Kind, which if there is any fault thing, I am
apt to believe, arises only from the differing good-
ness of the Soil; a fat and rich Soil making or pro-
ducing a larger Plant than that can do which is poor
and lean.

VI. The Places. The two first grow by Ditches
and Water fides, and in divers low, fat, and moist
Fields, Orchards and Ground, for in fuch they
chiefly delight to grow: The third is found general-
ly through all England; The second but in
particular places: The third grows with us only in
Gardens, but is found Wild in Woods and moif
places in Altoria, Hungary, and Germany.

VII. The Times. They Flower in June and July,
and perfect their Seed in Auguft. There are feve-
ral of the Confedales, which have their different
times of flowering and fowing, as, 1. The
Symphium, or Confedale Fieres, of which Dioces-
iderides Speaks. 2. Confedale Sarafenica, Saracen Con-
found. 3. Confedale Media, Bugle, or Middle Con-
found. 4. Confedale minor, Prunella, or Self-seed.
5. Confedale Media, vel Bellis major Vulgaris, The
Great White Wild Dafie. 6. Confedale minor, vel
Althanna, Bellis minor Syneffrik, The Common Small
Field Dafie. But as these are all of them different
Plants, and not a Species of one and the fame Genus,
properly or any of the Comfrey, fo we fhall fay noth-
ing of them here, but to avoid Confufion treat of
them in their feparate and refpective Chapters, our
intention being in this Chapter, to treat of that Plant,
which we properly call Comfrey, and the Latin,
Symphium major, which is of feveral forms, as are before
described.

VIII. The Qualities. It is cold and dry in the
fifth Degree; Altering, Aeropy, Repellive and
Vulnery: Neurturic, Peculiar, and Arrhythmick.
Altering, Repellive, and Antiarrhythmick, and Analoprick.
IX. The Specification. It is of a Clamyphy
and Glowing Nature, and is peculiar againft Fuxes of
Blood, of what kind foever, whether internal or
external.

X. The Preparations. You may have therefrom,
1. A Juice of the Leaves and Roots. 2. An Ef-
fence of the Juice. 3. A Syrup of the Juice of the
Root. 4. A Decoction of the Roots. 5. A Powder of
the Root. 6. A Balm of the Root. 7. A Cata-
plasm of the Root. 8. A Diluted Water. 9. A
Black Asprenon Tenture.

The Virtues.

XI. The Juice of Leaves and Roots. Camper says,
that two ounces of it being drank at a time, does
much good in the Lethargy, and Dead Sleep: it is
drying and binding in a great measure, and is good
for fuch as fip Blood, bleed at Moufh, or make a
bloody Urine: yet it opens Oldforesions of the
Lungs, and caufes efie Ecfpefiation.

XII. The Effece. It has all the former Virtues, but
is much more efficacal to ftop any Flux of Blood,
in any part thereof. It prevents all in-
ward hurts, bruises and wounds, cleanses Ulcers
of the Lungs, drys and heals them; and being taken
Daily, Morning and Evening, it prevents againit Ca-
ths, and flops the defufion of Rheum from the
Head upon the Lungs, fluxes of Blood, or Humors
by the Belly, and the immediate or overflowing
of the Couries in Women: It fops also the over-
running of the Whites; and (when made
mixed and fyruped) it cures a Gonorrhoea, or Running of
the Keins in Men, coming from what caufe foever.
Dope two or three ounces in Red Port Wine.

XIII. The Syrup of the Juice of the Root. It has
the Virtues of the Effece, but caufes a better and
more cafe Efcpefiation out of the Lungs; it is good
againft Coughs and Cold, Wheezings, and other
like Dilempees of that Parts. It is foid to be
good for fuch as have broken Bones, because it ha-
ftens the breeding of the Cellus; and for the fame
Reafon, it is faid alfo to be good to cure Repruple
in Children. It is fo powerful to Confolidate or
Knot together, whatfever needs knitting, that if
the Roots be boiled with fhir cut into pieces, or
very deeply fifted, in a Pot, they will join them
felves again.

XIV. The Decoction in Wine or Water. It is
good againft inward Bruifes and Wounds, inward
bleeding, Spitting, Vomiting, or Fuffing Blood, as
A great Blood or Hepatick Flux, and fial indeed
all the Virtues of the Juice, Effece and Syrup,
(but not falt out so efficacal as they are) be it
Drunk to fix or eight ounces, Morning, Noon, and
Night. It is alfo good to clean and dry Wounds,
and external Wounds, Ulcers, and Running Sore.
they being varied therewith once or twice a day.

XV. The Powder of the Root. Being taken in-
wardly to one dram in a little of the Syrup, it fops
inward bleeding, heals Wounds in the Stomach and
Throat, as alfo Ulcers in the Lungs. If it is ap-
plied to green Wounds, as soon as the Wound is
made, it conframates, or unites the Lips thereof
together, and caufes it fpeedily to be healed: mixed
with the Syrup, and applyed to the Hemorrhoids or
Piles, it cools the Inflammation, and reproduces their
over much bleeding, and alays the heat of the
Parts adjacent, taking away, and eating all the
pain.

XVI. The Balm of the Juice of the Root. It is a
fingular Vulnery, and cures fimple green Wounds,
generally at one drefling. It is digestive, and clean-
ings, and dries up and heals running Sores, and old
Ulcers, in any part of the Body, but chieffly in tho
t Parts which are not depending, refilling Gonorrhoeas,
Morifications, 

XVII. The Cataplasm of the Root. If it be made
of the fame Root, beaten into a Maculage raw,
and then fpread upon Leather or Linnen Cloth, and
applied to parts painted with the Gout; it gives
prefumtions to the pain, and fo admiringly
french it, that the Difeafe never returns
any more from the old Caufe, and this I have fe-
ceral times proved. If it is made of the Root bol-
lid till it is fift in Water, and then beaten into a
Pulp, adding to it the Powder of the Root, enough
to bring it to the Confidence of a Cataplasm, and
it is prefently applied to any fimple Green Wound,
or Cut, it quickly heals it by confolidating, or con-
joining the lips thereof together: Apply it alfo upon
broken Bones, it facilitates and speeds the Cure,
by preventing a flux of Humors, inducing the Col-
us, and ftrengthening the Parts, and applied, is al-
fo very profitable againft Ruptures in Children.
It is alfo good to be ufed to Womans Bruifes, which
fwell and grow hard and bore by the abundance of
Milk flowing into them, which it does by a conver-
Singul Veft. It alfo cools the Inflammation, af-
bates the Swelling, and eases the Pain of the Piles,
as experience has fufficiently proved. It is alfo
very profitable againft moll and running Ulcers.

Gonorrhoeas, 

Salmon's HerbaL

Lib. I.
Chap. 150. **English Herbs.**

Gargenios, Sphacelus, and the like, in which cates it has been experienced, and found often helpful.

**XVII. The Diluted Water from the Leaves, Stalks, and Roots thin fluid.** It has the Virtues of the Juice and Efficacite, but very much weaker; yet Authors say, it is good for outward Wounds or Sores, whether in the Ritchy or nervous parts of the Body however; as also to take away the Fists of Agues, and allay the Thrums of the Humors; but this it the more effectually does, if it is mixed with equal parts of the Liquid Juice or Efficacite.

**XIX. The Acid Aquaeus Tincture.** Take Spring Water, a gallon: Oyl of Vitriol, or Oyl of Sulphur per Cent. Strew these oys, mix them: then put into it of the powder of the Root, six ounces: digest in a gentle Sand heat for a Month, shaking the glass three or four times a day: afterwards being filtered, decoct the clear Tincture for safe. Given inwardly in Wine, or any other proper Vehicle, it stops inward bleedings, and strengthens and restores the Tone of the Stomach: And mixed with Red Pean Wine, it makes a good Loten to cleanse dry, and heal any old Ulcer, or running Sore, and effectually destroys the Putridity (if any) therein.

**C H A P. CL.**

of **Consound Saracens.**

I. The Name. It was unknown to the Greeks, and therefore among them we have no name for it. The Latins call it Confinda (from Confindere, to Sticker, Codde, or Grow up.) *Confinda Saracenica* is a Son of the Lewis and Saracen in healing of Wounds: *Herba fortis* from its strong Smell and Tafte: *ALD Solidago, and Herba Vulturaria* in English, it is called Saracens Confound, almo Saracens Wound-Wort.

II. The Kinds. Authors make four Kinds thereof, viz, 1. Solidago Saracenicca vera falicis folis, Confinda Saracenicca vera, The true Saracens Confound on Wound-Wort. 2. Solidago vel Confinda Saracenicca major Laudeunan, The greater Saracens Confound, or Wound-Wort. 3. Solidago vel Confinda Saracenicca vel Germanica Silipulca, Coddled Saracens, or German Confound, or Wound-Wort. 4. Solidago vel Confinda Saracenicca vel Germanica altera, Confinda Terris, Tragi, Herba Vulturaria Tragi, Tragi his third Saracens Confound, or second German, which he also calls Wound-Wort; Thefe Plants the Germans generally call Vulturaria Turricca, Turkisch Wound-Wort.

III. The Descriptions. The taff (which is the True Saracens Confound) has a Root compofed of many different _strings_, and growing together and growing from a Head, which perishes not in Winter, but continue, though the Stalks fade and die away, without as much as a Leaf appearing in that Season: From this Root proceed several long and narrow green Leaves, spriting about the edges, like to those of the Almond or Peach Tree, or Willow Leaves, but not of such a whitish green color: From amidst these Leaves rises up a Stalk or Stalks, very high, growing sometimes to a Man's height, which are of a brownish, or brownish green color, and hollow, having many long and narrow green Leaves (as before described) set thereon. As the tops of the Stalks grew many pale yellow Star-like Flowers, standing in green Heads, which when they are fallen, and the Seed ripe (which is of a somewhat long, small, and yelarish color, and wrinkled in Down) is carried away with the Wind. The Root and whole Plant is of a strong and unsharp Smell and Taste.

IV. The second, or Greater Saracens Confound, has a Root compofed of a great Bath of white Fibres or Threads, growing very deep and strongly in the ground, and shooting forth springs on all sides, which produce new Plants, encressing in a little time, and ever-running a great quantity of ground. From this Root springs forth a head of Leaves, which is somewhat brown at the first flowing out of the ground, (and so also is the head of the Root before the Spring,) which is of a bitter Taste, and binding withal: This Plant differs not much from the former, and therefore from amidst this head of Leaves, there rise up sprightly, hard, round hollow Stalks, as high as the former, with many dark green Leaves at the first, fe (as above) at the head of the Root, which afterwards rise up with the Stalks, and are set there without any order, somewhat larger than the others, and a little dentred about the edges. The Flowers are much greater than those of the first Kind, more in number, and with yellower long Leaves, Star fashion, standing in green heads many together: Wherein, after they are past, is contained the Seed, which with the Down thereof, flies away with the Wind, in the same manner as the former does.

V. The third, or Coddled Kind, has a Root which in time grows be very great, even to the height of a Man's Arm, and runs very deep into the ground (as those who are acquainted with the Plant well know): It is of a strong unpleasant Smell and Taste, stronger than Credes, and very like unto that of Elecam, shining many Years, but the Stalks perish Annualiy. Springing forth sprigs from the same Root every Spring. These Stalks thus Annualiy rising up, are great, round and woody, and in height equal to any of the former, or rather (when
they have attained to their height) higher, but are so weak, by reason of the length and weight of the Leaves, that they cannot stand upright, but fall down upon the ground, bearing many dark green Leaves thereon, long and narrow like to the fluff, with a white rib in the middle, and jagt gently, or curved about the edges. At the tops of the Branches or Stalks, come forth many yellowish Flowers, but smaller than those of the other kinds, which being pap away, there come forth very small and long round Dark Pots or Cells, as small and long as those of Sophia Chirurgorum, or Flixweed, which contain within them small brownish Seed, of a hot and quick, fiery and unfruitful Taste, as the whole Herb is left, but much more the Root.

VI. The fourth, or Tragus his German Confound, but a Root which creeps in the ground, and flows up Branches round about it, which are somewhat like both in Seeds and Leaves unto the middle kind of Nep or Cauim, with long Leaves, and white as they are. The Flowers come forth at the tops of the Stalks, many together, upon small, round, green heads, very united with some leafy, being fatal, and yellow. After that they are pap, and the Heads, with the Seed, are ripe, they open themselves, and with the Dew in them, the Seed is carried away with the Wind, after the manner of the fly.

VII. The Flowers. Those do all grow in mold and wet grounds, by Wood sides, and sometimes in the moist places of shady groves, as also by Water sides. The first of these has been found growing in Shropshire, in the Hedge, by the way as one goes from Daviden in Cherberry Parishes, to Garthdon. Gerard also says, that it grows by a Wood, as you go from Great Dumme in Essex, unto Clare in the same County.

VIII. The Times. They Flower in July, and the Seed of the two first is soon after ripe and carried away with the Wind. The third has not its Pods and Seed ripe until the end of August, or beginning of September.

IX. The Qualities. Saracens Confound, (under which singular name we comprehend all the kinds,) is temperate in respect to heat or cold, but dry in the third Degree; Astringent, Amody, Incarnative, and Vulnerary: It is Neutricht, Arthritic, Alterative and Analeptic.

X. The Specification. It is not inferior to any of the Wound-Herbs whatsoever, being inwardly given, and outwardly applied in suitable Preparations.

The Virtues.

XII. The liquid Juice. It cures internal Ulcers of the Lungs: I happened it was with the juice thereof, that Gerard (as he says) cured one Cartwright, a Gentleman of Gray-Iars, who was grievously wounded into the Lungs, and that in a short time: In this case, it will be the best way to make it into a Syrup with Honey. It cleanses, dries, and heals old Ulcers, and foul running Sorets, and Conflagrates Wounds by washing them.

XIII. The Essence. It has all the Virtues of the liquid Juice excited, and is an excellent thing to give inward, for the cure of those who have lain long languishing, and old, running Filthful's, ill-natured Ulcers, and other fustum and rebellious Sorets, washing them also outwardly therewith, or injecting it with a Syringe. However the application of it to Green Wounds is a matter beyond all expectations: so readily taken, it opens Obliterations of both Liver and Spleen, and is profitable for the cure of the Yellow Jaundice.

XIV. The Decoction of the Leaves in Water or Wine. It removes the Vitues of the former, but in a much lower Degree; and being made in Water, it is said to cure Agues or Fevers, even of a long continuance: Made with Wine, it opens Obliterations of the Gall Bladder, as also of the Liver and Spleen, and therefore is said to be prevalent against the Drope in the beginning thereof; and heals all inward Ulcers of the Reins, Uterus, or Bladder, or else where: It cures also inward Wounds and Bruises.

XV. The Garbagium. Take the Decoction in Water a pint: of the Decoction in Water half a pint: At the first Pauser a dram: mix and digest: then add half three new founers: distill, and jufi boil them up together. It is excellent to heal a sore Mouth or Throat, by gargling therewith; and to make it, with some wine, decoct in the Privy Parts of Man or Woman: and to inject into Fiftula's with a proper Syringe.

XVI. The Oil made with Old Olive, &c. It is excellent against burns, burnsings, and is proper against Pains and Aches in any part of the Body, arising from Cold; as also to anoint Nerves which are inflamed, or Johns which are weakeen, by any extraordinary force, or by being put out of Joint. It is good also against dry Scails or Scurf, to bring it off, and clear the Skin.

XVII. The Ointment. It heals green Wounds admirably digests, cleanses, incarnates and dries running Sores, and old Ulcers, and is prevalent against flatulencies of the Bourses, inducing the Calles, and strengthening the part affected. It is good (being mixed with a little Red Perpetrature) against General Ulcers in the Privy Parts of Man or Woman, cleansing them out of their putridity, and quickly afterwards healing them up.

XVIII. The Balsam. It cures simple green Wounds at the first Intention. But if they be compossed with Contusion, Flatulencies of the Bone, &c. It admirably digests them by a speedy maturation, then cleanses, and incarnates, afterwards dries and heals them: The same thing it does old running Sores, putrid Ulcers, and Fiftula's, and is much used open and then duly applied according to Art. I have seen very few things more prevalent against Sores and Ulcers of the King's Evil, which after a singular manner refits the malignity of the Disease, the Patients also taking the Juice or Essence thereof inwardly.

XIX. The Cataplasm. It ripens Phlegmons or inflammations, as also other Tumours which Nature designs to have brought to Maturation, and to break them. Applied, it gives light to Pains of the Gout, diffuseth Simple and Recent Contusions, strengthens Weak Parts, and cleanses Ulcers in any Part, be they never to foul or bleeding.

XX. The Distilled Water. Whether it is Distilled from the green Herb, or the Liquid Juice, or the Essence, it is excellent to heal any green Wound, or old Sore or Ulcer whatever, cleansing, drying, and healing them as Nature requires: but yet after all, the Juice or Essence are much more effectual for the same purposes.

XXI. The Spirit. It is made by infusing the Herb forty eight Hours in Wine, and then drawing it off in a gentle Balse: It is singular good to heal inward Ulcers of the Poins, Liver, Stomach, Bladder, inward Wounds and Bruises, and to refil the Diffa-
Chap. 151. English Herbs.

Dicrasie of the Liver and Spleen: It is good also
to ease growings in the Stomach, Pains and Tor-
ments in the Bowels, to expel Wind, and ease the
Pains of the Mother. Dose are four spoonfuls in a glass
of Wine Morning and Night.

CHAP. CLI.

of CONSOUND Daisy.

THE Name. was unknown to the Greeks; the
Latins call it, Confolida media, Odorata
Brutis Brunelfi, and Bupthalmus, Bellis major
Tabernamentum: but by all other Authors, Bellis
major, and Bellis major Vulgaris, five Syt序ges: in
English it is called Daisy or Middle Confound, Or
Eye, the Great White Daisy, and Murder-wort.

II. The Kinds. It is a Species of the Daisy, be-
ing the first and great Kind of White Field Daisy:
and is twofold: 1. Consolida media Anglica, Conso-
ilda media Vulgaris, Bellis major vulgaris Angli-
ca, The English Middle Confound, or English
Great Field Daisy. 2. Consolida media, vel Bellis
major Americana vel Virginiana, The American or
Virginia Middle Confound, or Great Field Dai-
sy. 3. Consolida media, or Bugle, which fite in
Cap. 92. aforesaid.

III. The Description. The soft or English Kind, has a Root which is only a Ball of White Strings,
which while many Years, with the Leaves running
forth every Spring afsi: From this Root come forth
many long, narrow, and round painted Leaves next
to the ground, pretty deeply cut in on both sides, mat-
ing it look almost like the drafclen of some sorts of
Oak, Leaves, or rather like those of Grounds. From
among these Leaves come forth the Stalks.

which grow to be about a foot and half high, main-
driven like Leaves thereof, but smaller, and lower
divided than the lower. At the top of the Stalks
and Branches grow large Flowers, each upon several
Fetalorkes, confluting of many white and narrow
Leaves, as a Pale, or Ovetber, about the yellow
Thums in the middle, like those of Mayweeds, hav-
ing no Smell at all: The Seed is square, long,
and is blown away with the Wind. Of this Kind
there is one which bears double Flowers, differing
from the former in nothing else.

IV. The second, or Virginian Kind, has a Root
full of Fibres not much unlike to the former, from
which Root rise up Stalks higher and greater than
those before defcribed: The Leaves also are larger,
and broader towards the ends, but larger and smal-
ler at the bottom, destitute likewise about the Edges,
fluctuating forth several Branchers, at the tops of all
which they bear many white Flowers, as if were in
an Umbel, yet not so great, nor the white Leaves so
large as the former, but smaller, and more in num-
er, with a greenish yellow in the middle; and some
a little larger than others, and succeeded with Seed
somewhat smaller than the former.

Middle Confound or Bugle.

V. The Placer. The fift grows every where by
Hedge sides in Meadows, and in the Borders of
Fields, and other waste Grounds. The second grows
in Virginia, from whence it was firit brought to us
here.

VI. The Timer. It flowers in May and June,
and the Seed is ripe in some short time after.

VII. The Qualities. This Confound, or Great
Daisy, is cold in the end of the fift Degree, and
dry in the fenth Degree: It is Anodym, Valunary,
Neuroni, Arthritick, and Alterative.

VIII. The Specification. It is a famous thing for
the immediate cure of Wounds in any part.

IX. The Preparations. You may have theretofor,
4. A V occultion in Wine or Water. 5. A Lejion or
Gargarism. 6. An Ointment or Beefum. 7. A Gre-
tepholian. 8. A Difhilled Water.

See Cap. 92.
The Virtues.

X. The liquid Juice. It much stimulates the heat of Choler, refreshes the Liver, and other Inward Parts, and Conforts Wounds, whether inward or outward, after an admirable manner. It is good for the Wounds of the Thorax or Back, being taken two or three, or four ounces at a time, either alone, or mixed with a Glafs of Wine, Morning and Evening. Outwardly it also Conforts Wounds, cleanses old running Sores and Ulcers, and drys and heals them: Drop into Eye and running Eyes, it cleanses, strengthens, and heals them.

XI. The Essence. It has all the Virtues of the Juice, and is indeed more effectual, outwardly applied, it heals Sores in the Privy Parts, gives cinch in Pains of the Gout, difeafes Tumors, and dif- peppers Kereds in the Eyes, and helps bruises and hurts which come by Falls or Blows. Inwardly taken, it induces the cure of Wounds, Ulcers and Flluda's, whether inward or outward, and hifters the Callus breeding, in fractures of the Bones: for with reason alfo it is made to be good against Ruptures, and other inward Breaches of any Vejfels within the Body. Dole two or three ounces Morning and Night.

XII. The Syrup. It has the Virtues of the Juice and Essence, and is better to be given to Children in Ruptures because of its pleafantness. And if it is made with Honey, it is more effectual in Wounds and Ulcers than the Beef and Langes, or any other Bawl: It thickens Rheum, and is good againft Coughs, Colds, Wheezings, or any Obftipation of the Pififer.

XIII. The Decoction in Wine or Water. It helps to cure Wounds of the Thorax, and may be used Diectly in all the Ciles for which the Juice, Essence or Syrup are commended. It fomewhat ref- ferves the inward Parts, removes the Difcharge of the Blood and Humors, and as a moft admirable Veflamay induces the healing of Wounds and Ulcers. If there is any Infammation in or about the part afflicted, or if a Fever is prefent, the Decoction is best to be made with Water, but otherwife with Wine. It is of good ufe to waft the Wound, (large of Wine) or cleanse foul Ulcers of Ffihula's, by infhiring it with a Sprong, or otherwife, as often as they are dreft, by which they are daily cleansed and kept clean, and if hollow, incurfed, by what means the healing speedily follows. If it is made with Wine, with the Addition of a third part of Agrimony and Angelica, and the parts af- flicted with the Fallie or Scitania, be daily, Morning and Night, fomewhile with very warm for half an hour, or thereabouts. It gives great ease and relief.

XIV. The Lotion. Take of the Decoction in Wine eight ounces, of the Essence four ounces: Atom it in five poudre three drams: Honey of Redberries four ounces: wine and disjefor. It heals and cures all Wounds, Ulcers, Sores and Pultudes of the Mouth, Gums or Thong, as alfo of the Scarren Parts of Man or Woman, if duly wafhed therewith. Drop into the Eyes, it cles the fight, taking away, Clouds, Films, Infammations, Fux of Humors, &c.

XV. The Ointment of Balfom. They do wonder- fully help all Wounds which have an Infammation about them, or have a Flux of sharp and moft Hu- mors upon them, by which they are kept long from healing. If in a simple gout, Wound the Balfom many times cured at the first Intention; and other de- generated Sores it digests, cleanses, incubates (if fiiff is wanting) and quickly heals them, and this although in the Johns, whether of the Arms or Legs.

XVI. The Cataplasm. It is excellent to diffefts Contusions or Tumors coming upon fimple Brui- ftes, if applied upon the Spot. Applied to the Te- nacles, or to any other part which is Swelled, and Infammated, it hales the Flux, difeafes the Humors, and refolves it: Applied alfo immediately to a fimple green Wound, it prevents Infammation, cond- gbition the Limbs, and heals it, and this more efactly if it is made of the raw green Herb. And so made and applied, it is very effectual to enfe the pains of the Gout, difeafes the Tumor, and strengthen the Part: but whether it is altogether ef- fefts towards the Carapath of Comely Roofs, I will not presume to fay.

XVII. The Diluted Water. It has the Virtues of the Juice and Essence, but much less effectual. Drop into the Eyes, it always an Infammation there, and if Powder of White Sugar Candy, or clarified Hovey beaded, a ounce, to vi. ounces of the Water, it makes a Cumbly which cures dimly, clearly, forc, and running Eyes, being often droped into them.

C H A P. CIII.

Of CORAL WORT.

I. THE Names. Schoforides nor Plyg, nor any other of the Liners, Writers, keep any thing of this Plant, fo far as I can learn, but it seems to be purely an invention of the Moderns. The Latine (from the Form and Color of the Roots) call it Corallina, Dentaria, Dentillaria, Dentilaria or Dentaria Corallide Rubea, Alba- frutes Lobelia, Viola Dentaria Dodomin, (from the Roots and Flowers, being like unto Stock-Gill- Flowers:): by Gfensor, in Horia, Sanctas obla, Path- monaria, Smocraula montana (from its Virtues) but Columna takes it to be the Ceratia Fimius, because it has all the Virtues which Plyg affcribes unto his Ceratia, but this is doubtful. Dalchampis in Long- donec afo it to be an Aconitum, but this was wholly Error. In Engllsh it is called Coralwort, Toothwort, and Toothwort.

II. The Kinds. Matthiues places this between Symphysis and Confolfoe, it being wholly of their Natura and Qualities. Parkinson makes few Kinds thereof, but other Authors more; but we shall only discourse of three which are to be had with us, either Wild in our Fields and Woods, or nurtured up in our Gardens, and they are, 1. Dentaria Bul- bifer, vel Bacifera. Bolled, or Bentybearing Co- ralwort. 2. Dentaria unin, or minima, Athabif- rer, Small Coralwort. 3. Dentaria Pentaphyllos, Cinkflfl Coralwort. 4. Dentaria Pentaphyllos al- ter, The second Cinkflfl Coralwort. They are ge- neraUy called Dentaria: and most of them from the number of their Leaves, as, Triphylos, Pen- taphyllos: and Heterophyllos: but the Triphylos or Triphylos Pheblos, and the Heterophyllos, are franglages in our CountrY.

III. The Descriptions. The iift of these has a Root very white, smooth, and finning, made of divers Kinds together, not being downward; but lying along, and encroaching under the upper cuff of the Earth, having very few fibres there- at, its ruffle is somewhat bitter, but and sharp, like the Radish, as all the rest of the Kinds are. From this Root flows forth out two Winged Leaves, upon long brownish foot-stalks, which in their rising out of the ground, are, as it were, doubled, or folded downward, and then open themselves, most commonly, this
Chap. 152. English Herbs.

into seven Leaves; and sometimes into but five each of which is something long, dented about the edges and pointed, of a sad green color, and set on both sides of the middle Rib, one against another. The Stalk, which beneath Flowers rises up in the same manner with the Leaves, and in bare or naked of Leaves, to the middle thereof, where it flows forth a Leaf, and so one or two more up higher, each confiding but of five Leaves, and sometimes but of three, having also the uppermost fingle, at each whereof comes forth a small round Ball, eleven, or as it were, divided into several parts or coves, of a sad purple yellow color, which being ripe, and put into the ground will grow to be a Root, and bear Leaves, like the Bulbs of a red Buffed Lilly, about which, at the very top, stand four or five Flowers in long Stalks, upon short Booths, opening into four several Leaves, of a purplish color, and very like unto the Flowers of Stock-gilliflower, or Damas Violets. These being past away, small long horns, or Cods, painted at the ends come forth, in which Pods or Cods have such-like Seed as are in the Cods of Damas Violets, which as soon as it is ripe, the Cods open, and the Seed falls out: The Leaves, and indeed the whole Plant, is of a bitterish, but sharp, Radish-like Taste.

Bulbed Coral wort

W. The second, or Small Coralwort, has a Root small, and somewhat long, composed as it were, of many small, very shining, white thick foliages, growing upwards, and having many white Fibres at the head of them, of a little face, as bitter, sharp and aromatic Taste. From this Root spring forth three or four slender pale green Stalks of Leaves somewhat divided on their edges, not half a foot high, and not of half that height. Some plants, very like unto those of the balde Root, cut smaller, and of a paler shining green color, with leaves among which rise up, one or two small Stalks, about two such like Leaves thereon, but smaller, and a little above them, a small round greenish yellow head, which spreads not into Leaves, but into four or five miffle heads of Threads, and so abides a while, (being on other Herbs) which pafs away leaving in their room many small kernelly Seed. The Leaves have a bitter sweet scent, somewhat like unto the Mushed Cranes Bill, yet more sweet when it grows Wild in its natural places, then when it is transported out of them into Gardens. This Plant is referred by many unto the Ramuncul or Crowfoot, to which it has but a small resemblance, and ought rather to be inserted in this place, for the likeness of its Root false.

Small Corall wort

V. The third Kind, which is the first Chinefull Coralwort, has a Root which is greater than the first, and made as it were into joints, not so white as that is, but with longer Fibres coming from between the Joints. From this Root rise one or two Leaves upon
Salmon's Herbal. Lib. I.

upon long twofold, consisting of five Parts, or Leaves, each of them somewhat like the first, and destined along the edges, but they are longer, rougher and harder in feeling, and more closely set together, rising for the most part from one joint, like as the Caul is in the Cabbage; upon the Stalks as are some fuch as like Leaves set one above another, at the top four or five such like flowers, but somewhat larger, of a purplish color, something deeper than the Jaffir, which turn into such like Pales, with the like Seeds in them, but has no Bulbs on the Stalks.

VI. The fourth, or, second Cinkfold Kind of Coriandrum, but a Root very like the first, consisting of many round Cylindric Knotts, but more in number, set together by pieces, with divers long Fibres growing out of it: from this Root shoots forth a lower and smaller Stalk than the former, being not above a foot high, nor four Leaves set thereon; as also there is some of those very like the leaf, but narrower, more fomath and gentle, and also of a paler green color: the Flowers stand at the top, like unto the Cabbage, and are of a purplish color, after which come the like Pales with Seed in them, as in the first.

VII. The Plants. The leaf and second are found wild in England, the first at Meigfield in Saffier, in a Wood called Highcreed, and in another Wood there alias, called Foot-holes, as also in divers Thoow and dark Mountains, or Hills: the two last are only made up with us in Gardens.

VIII. The Times. They flower about the middle of April, and beginning or middle of May, and the Seed ripeth in August, after which they quickly wither and perish, the Roots abiding late all the Winter.

IX. The Qualities. They seem to be Temperate in respect of heat or cold, but are drying in the first Degree. They cleanse, alluring, dry, bind, and strengthen.

X. The Specification. They are dedicated to the curing of Wounds.

XI. The Preparations. You may make therefrom,

The Virtues.

XII. The liquor Juice. It strengthens the Bowels, and makes them able to perform their Offices, provokes Urine, and is said to expel the Stone and gravel, being drank, morning and evening, from three once to five, in a Glass of Port Wine.

XIII. The Essence. It has the former Virtues, besides which it is said to cure any inward Wounds, especially those Wounds which have pierced into the hollows of the Throat. It is also good to cleanse the Gripping Pains of the Bowels, and Sides, being taken to four or five ounces in a glass of Red Port Wine, or old Mahaga.

XIV. The Decotion in Wines. It has the former Virtues, but much weaker, and is good against Lacks or Fluxes which proceed from hot and choleric Humors: you may give it to fix or stop oozes, morning and evening, for many Days together.

XV. The Syrup. It is made of the Juice or Essence, and is proper to be given to Children which have Ruptures, or are troubled with Gripings, Vomiting, or other Distempers of the Bowels.

XVI. The Powder of the Root. It has the Virtues of the Juice and Essence, and heals Wounds of the Breast and Lungs, being given to a dram in Red Wine for some considerable time. It is also profitable against Bittlements, being given in the Syrup at once.

XVII. The Balsam. It is good to be applied to green Wounds, to it quickly confederate and heal them, it also digests, cleanses, stomates, easts and heals old, running, filthy and hollow Ulcers; facilitating the cure after an admittable manner.

CHAP. CLIII.  
OF CORIANDER.

I. The Name. It is called in Greek, Κοριαντρος,  

from Κοριαντρος, the Wulf-Loue, which we call Bagger, for that Coriander in its froot, very much resembles theirthing Smell when they are killed: in Latine, Coriandrum, but mostly in the Shops Coriandrum in Arabic, Coriander, and Elsewhere in English, Coriander, 

II. The Kinds. There are but two sorts of it which are found with us, viz. 1. Coriandrum vulgar, The common Coriander. 2. Coriander minus odorum. The latter sweet Coriander. And by the same Coriander these Plants are known in almost all Nations.

Coriander.

III. The Descriptions. The first has a small Root, which perishes every Year after Seed time: from this Roots spring up Leaves which are something broad, almost like unto caraway or Chervil; but after the Stalk or Stalks a few forth, which are three or four feet high, being full grown, the Leaves then are smaller and finer, every one other than, up to the top, being of a short, green color, and very much more like to the Leaves of Coriander, or Cumin, but a great deal smaller, tenderer, and more jagged. The Flowers are white, and grow in small bushy Uppers, like white Dill, which being pulled away, there comes forth round shewed hollow Seed, of a whitish yellow color, when it is ripe. The whole Plant, Seed and all, while it is green and growing, but

has a strong and hortifonn Smell, scarcely to be endured, but when the Seed is full ripe and dry, it is of a very good Scent, and of an agreeable Tiffue.

Small Coriander

IV. The second has Roots and Stalks almost like the former; but the Leaves, the lower as well as the higher, are all finely cut in, and jagged; the Stalks are much longer, not above half a foot high, (see Parkinson) and lying almost on the ground; the Flowers on its Tops are white, and the Seed round as the other, but fuller and larger, and two always joined together.

V. The Places. They are only Sown in Gardens now, as in old time. In dry lyes, they are not found Wild; nor are their natural places known.

VI. The Times. They flower in July, and their Seed is ripe in August.

VII. The Qualities. The green Leaves are said to be Cold and Dry. The dried Seed is Hot and Dry, in the end of the second Degree, or beginning of the third. It is Aperitive, Analys, Constringitive, Digestive, Antismatic, and Alterative.

VIII. The Specification. It heals Worming, and helps Digestion.

The Virtues.

X. The Juice of the Green Herb. Authors say, it is of a cold Quality, and that being drunk, affords but half an ounce, it kills them that take it. But outwardly applied, it dissolves Knots and Kernels, and difcusses other hard Tumors, being abfurdly used.

XI. The Essence of the same. It has the Virtue of the Juice, and being applied by Rags ditp thence, it is said to cure Antimonies lury, and other hot Tumors.

XII. The Ointment or Balsam of the same. It is made with Ceruf, Litharge, Vinegar, and Oil of Rofes. It is commanded against an Erysipelas, running and cutting Sores, Wheals, Puffes, Carbuncles, and Botches, rising in the Skin or Head; it cools the Inflammation, and takes away alfo the Swelling of the Cods.

XIII. The Copulifer of the Green Herb made with Barley Meal, or Barley Breacl. It has the Virtues of the Ointment, but is more powerful to allay Inflammations, and difeases hot Tumors or Swellings. It is also good to difsolve or difeases Wens, flabby Tumors, and prominences of the King's-Evil, being duly applied.

XIV. The Confisa of the Seed. Gerard says, they prevail much against the Gout, being drunk upon a lifting Stomach, before Dinner, and also after Dinner without drinking after the same for three or four hours; and they have yet a greater power over that Distemper, if they be eaten in the same manner after Supper.

XV. The Powder of the Seed. If it is taken falling to a dram in a Glass of Generous Wine, it strengthens the Stomach, caufls an Appetite, and makes a good Digestion, deteplles Fumes and Vapours rising from the Stomach,혈, and also helps the Head. It stops Coughs, helps the noise in the Ears, and difficases that Tumor in the Throat, vulgarly called the Quinsey.

XVI. The Spirituous Tincture of the Seed. It is a most singular Stomachick, strengthens the Ventricle, stops Vomiting, helps Digestion, and caues the most inveterate Pains of that Bowel: and is indeed a most excellent thing against the Gripings of the Guts.

XVII. The Acid Tincture. This is yet a more excellent Stomachick than the former, where there is a facility or weakness of the Stomach, and the Tone thereof seems to be depraved or undone, and the Aciditie thereof do diminifh, as that the Patient wants an Appetite, and cannot at all digest their Food; but that it comes up again undigifhed, with Vomitting, manifold Reftifings, and verti- ment Sickness thereof, being taken in Red or White Port Wine, or in a generous Canary, to a pleasing Acidity, it refhores the Tone of the Stomach, and kills Worms in the Body.

XVIII. The Oily Tincture. If it is daily taken, vs. Morning and Night, in any generous Vehicule, from twenty drops to forty, it cures the Colics, and Gaping of the Guts, and mightily lifts up Ver-

num. It prevails also against the bitings of Serpens, especially of that called Amphicthion, the place bitten being also anointed therewith. And as it is conformable to the Stomach and Bowels, by its healing and drying property, and prevails against a Paralylys, or Poffic, so also it is eminently good against that Distempe by anointing the whole length of the Back therewith, as also the parts afflicted, twice a day before a fire, and rubbing it very well in for a long time: And by outward application in like manner, it prevails againit Cums, Corvolivis, Gouns, and the Scutia, and all cold and moist Diseases happening in what part of the Body forever.

XIX. The Saline Tincture. It opens Obliterations of the Reins, Urines, and Bladder, provokes Urine, and causes an Evacuation of Sand, Gravel, and Tumorous Matter out of those parts. Dole to one dram, or more, in a Glass of generous White Port Wine.
XX. The Spirit. It is very comfortable to the Stomach, and excelling Cordial; by hearing and refreshing of it, and taking away the cold and moist Temperature thereof, which is the groundwork and foundation of Catarrh and Rheumatism; it helps Digestion, repels the Vapours, which adhered thence up into the Head, and forcibly refills the Tortures of the Colick, proceeding from Cold, Wind, and the like; and being moderately used, it lifts up Vesey by an encruce of Blood and Seed, and by a gentle warming. And, as it were, vivifying the same. Do's one spoonful, or more, in the Morning fasting, a little after Dinner, and at Bed time, either alone, or in a Glass of Canary.

XXI. The Oil by Distillation. Being taken inwardly from ten to fifteen or twenty drops, and in some very cold and moist Confectioners to thirty or forty drops, first drop down, and mix well with White Sugar, and then mixed well with a glass of Wine, and fo taken, it is a famous thing against the Pulsico, Cramps and Convulsions, whatever is Old or Young, and the Gout in the Stomach; opening all those parts which are afflicted with those Diseases; externally, Morning and Night, and rubbing or oathing it well in, it effectually opens the Urinary Passages, and powerfully lifts up to Conition, by encouraging Seed, making it Spirituous, and strengthening the parts of Generation.

XXII. An Observation. The Arabian Physicians, and others of the Ancients, tell us how we should correct Coroander Seed before we use it, viz., by steeping it all Night in Vinegar, and then drying it again, thereby to take away (as they think) its Venome Qualities. But this Label seems to dispute, and that truly with very good reason, because no such thing can be extricated from it, for after it is ripe, if it is suffered to dry of it itself, or in the Sun, all those pretended Obnoxious Qualities will vanish away of their own accord, and need it any other Preparation when it is made into Confiters, and is so far from being hurtful to the Stomach, and Bowels (as some Authors have affirmed) that on the contrary, it has been found by great Experience to be an excellent Stomachick, exceeding many others; and this even Country People have found by the use of it, without any Preparation at all: for being only Dry, it has a warming Faculty, and a Sweet, and no Noifome Smell or Taffe, that being contain'd only in its Humilities whilet it is Green, and not in the Seed when only dried.

CHAP. CLIV.

I. THE Name. It is called in Greek, Υάνινα, and in Latin, Gladiolus, and of some English (as it were the Sword Flag;) of some Gladiolus Secotis, Victorialis femina Cord, and Victorialis Rotunda: in English, Corn-Flag.

III. The Descriptions. The first has a Root which is somewhat great, round, flat and hard, looking as if it was nerved, having another shore upon one under it, which when it has been bearing, and the Stalk dry, that the Root may be taken up, flicks close to the bottom, but may be easily taken away, being commonly a number of small Roots encircled about it, the shaft of which will quickly grow, so that if it is suffered any long time in a Garden, it will even shoot it up. From this Root, three or four broad, long, and still green Leaves rise up, one, as it were, rising.
Chap. CLV.

OF CORN-SALLET, OR,

LAMBS-LETTICE.

I. THE Name. It may be called in Greek, 4νπενειος; in Latin, Lacteis Aginae, and Old Album Dodecan: in English, Cor-n-sallet, or Lambs-Lettice.

II. The Kinde. It is not a Kin to the Lettice, though called by that name, which I suppose was, because it is eaten for a Sallet, as the Lettice is. And is a singular Plant by it fell.

III. The Description. It has a Root consisting of many small and long Fibres, from whence spring up many slender, round, weak Stalks, tender, as it were, upon the ground, about a foot high, if it growes in good and fertile ground, otherwise but a hand or
Salmons. Of Costmary.

I. The Name. It seems not to have any Greek Name; but the Latins call it Co-
finnorum major: some call it Balfanius major, Mentha Græca, Mentha Roma-
sa, Mentha Caryophyllea major, Mentha Sanguinea; by Gaffier, in Hor-
ti Flora: by Celsopinianus, Herba Aericm, and Layfaletts by others: In English, Costmary, or Al-
cast.

II. The Kinds. Of the Cofinnorum, there are two Kinds, viz. 1. The Greater, which is Costmary, of which in this Chapter. 2. The Lesser, which is Maulden, of which in its place, in some one of the following Chapters of this Book: Many Au-
thors join these two Plants together in one Chap-
ter, making them as two Species under one Genus; But in my Opinion, notwithstanding the Unity or Sumenee of the Latin Name, they are truly two differ-
ning Herbs.

III. The Description. Costmary has a Root which is somewhat hard, and very full of Sertings, which when being divided with the Heads of Leaves, may be re-
pealed in the Spring time for use. From this Root spring forth many broad and long pale green Leaves, dented, or cut a little about the Edges, ever-
rever, standing upon a long stalk; among which rise up many round green Stalks, with such like Leaves thereon, but longer up towards the top, where it spreads into three, four, or more Branches, every one bearing an Umble or feely Taft of gold yellow

Flowers: somewhat like unto Tulip Flowers, but lesser, which afterwards are the Heads which con-
tain the Seed, which is small, flat, and long: These Flowers being gathered before they be ripe, keep
their color and beauty a pretty while without With-
tering; and the whole Plant is of a very pleasant
Smell and Tafle, and very agreeable with the Sto-
marth.

IV. The Places. This Herb grows Wild in Corn-
Fields: (whence the Name,) but since it has grown into use amongst us for Saturing, it is also Tawm
in Gardens for a Salter Herb.

V. The Times. It is Round Green all Winter and
Summer; and runs up to Flower and Seed in March, April, and May.

VI. The Qualities. It is Temperate in respect of
heat or cold; and moif in the Fifth Degree. It is
Emollient, Hepatick, Alternative, and Gaftrope-
nick.

VII. As to the Specification, Preparation, Vurta-
s and Ufe of this Herb, Authors have been silent.
It is doubled an innocent Plant, and pleafant to be eaten: for which reafon it is used as a Winter
Salter, at leffe wife very early in the Spring; for
which purpofe it is defried up to the Table as
Garden Lettees are, with Salt, Vinegar, and Oil,
and sometimes with Sugar, as the Later biff likes.

CHAP. CLVI.

OF COSTMARY.

IV. The Places. It grows almost evety where in
Gardens, and is much used with us for the fresh
Smell of its Flowers and Leaves. But in Italy
it has been found to grow naturally Wild in rough
and untlled places, especially in the Duke of Ta-
fero's Dominions.

V. The Times. It flowers in June and July, and
the Seed is ripe some time after.

VI. The Qualities. It is hot and dry in the end of
the second Degree. It is Aperitive, Allofiorre, Carminative, Digestive, Diflufive, Diuretic, Tra-
umatic or Vulnary; it is also Cephalick, Neuro-
tick, Stonick, Cordial, Nephrick, and Hyfle-
tick; Alexipharmick, and Analeptic.

VII. The Specification. It is singular in curing all
sorts of Green Wounds.

VIII. The Preparations. You may prepare there-
from, 1. A Liqueur Juice. 2. An Infusio. 3. An
Infusion or Decotion. 4. A Powder. 5. An Oil
by Infusion. 6. An Ointment. 7. A Balsam. 8. A
Cephalick. 9. A Spirituosum. 10. A Spiritu-
ous Tincture. 11. An Oily Tincture. 12. A Saline
Pottage or Powders. 16. An Elixir. 17. A
Fixed Salt.

The Virtues.

IX. The liquid Juice of the Herb. It proceeds
Urine mightily, by opening Obstructions of the Urinary Paris; and by injection takes away the
 hutref of the Wound, if it be not Cancerous: It
gently evacuates Choler and Flage.
that which is thick and gross, cuts and divides that which is rough and glutinous, cleanses that which is foul. Mutes, Corrosion or Purification, diffolves without Attrition, opens Obstructions, and removes, and kills Worms in Children, inflames the Stomach and Liver, and all the other Viscera, and it is taken from two ounces to four, or six, in clarified Whey, it operates more effectually to all the aforesaid intentions than it is being also duly given in Morning and Evening, as also about two or three hours before the coming of a Quartatory, it is very powerful in respecting it, and for the most part produces its effect on the heart.

X. The Efierce. It has all the Virtues of the Liquid Juice, and indeed more powerful to all the intentions, besides which, it is an excellent thing to be used Diuretically by all those who have com- plicated Wounds, running Sores, old and putrid Ulcers, infefted Fisticula's, or have a Cachexia, or are inclinable to the Green-fiennes, in which latde cafe, it does as much as most Vegetable can do. It may be given either alone of it, or mixt with a glaft of White Port Wine, from one ounce to fix, every Morning lasting, and last every Night at Bed time. Thus taken, it is also very profitable against the Gout,provided it be taken hot, dry up, and conforme all thin diffiliations, which are apt to fall upon the Lungs, and helps to digest raw Humors. It is a truly beneficial thing to the Bowsels, and it makes the bowels of all persons which are affected, rubbing and chastening it in. It cures the Nerves, being Prick'd or Wounded, immediately eating the Pain, and abating the Tumor, and in a short time after heals the Wounds. If it is taken inwardly from twelve to twenty or thirty drops, in any Homogeneous Vehicle, it cures cold and moist Diffumpers of the Head, Breast and Lungs, and prevails against the Head-sach, Megrim, Vertigo, Carps, Lethargy, Apoplexy, Falling-lickens, Palpes of the Head and Tongue, and other Diffumpers of like kind. It also opens the Humor of the Reins and Womb, and is prevalent against Vapors, and Fists of the Mother.

X. The Suiusus. Given to one draught, or more, in a Glaffe of White Port Wine, Morning and Evening, it cleanly openeth the Urethra Passages, and powerfully provokes Urine, expelling all preternatural, or Tartarous Matter out of the Reins, Urethra, and Bladder, and is very prevalent against a Sarcina, or Angina, which is a Dropit in the feby parts of the whole Body.

XX. The Spirit. It is Cordial, and rectifies Pois- on, and is prevalent against Fainting and Swooning Fits, Vapors, and Fists of the Mother; it restores the malignity of the Plague or Pestilence, and the contagion of the Spotted Fever, or other infectious Diffumpers; it is good also against the Venom of Ser- pents, as of the Viper, Rattles, Snakes, the venom of that kind, the poison of Mad-Dogs, for which there are but few better remedies. It is a singular thing against Vomiting, and Lickens at Heart, by reviving the Spirits, and strengthening the Parts.

XXI. The Djighted Oil. Taken inwardly in any proper Vehicle (being first drops into White Sugar) it comovers the Head, Brain, and Nerves, dries up cold and moist Humors, and is helpful against all those Diffumpers which are caused by them, in any of the Parts aforesaid. It cures Palpee, inwardly taken and outwardly applied, so to all Diffumpers, happening in what part of the Body.
Chap. CLVII.

Of Cowslips.

I. The Name. Some doubt whether the Greeks knew this Plant at all, or, however, later Authors have called it [Names]. 1. In Latin, Paralis, Herba Paralis, Herba Paralytica, Althaeo Difforbusta, according to Fabricius, Praetorius, Arbitaria, Herba Arthritis, Dodecatheon, Primula veris major; 2. in English, Cowslips, Oxlips, and Pagets.

II. The Sorts. There are several sorts hereof, as, 1. Paralis vulgaris, or small, or Sessile Cowslips, the Common Field Cowslip. 2. Paralis altaeris odatora, or tall or tall Cowslip, one in another. 3. Paralis altaeris, the tall Cowslip, one within another. 4. Paralis altaeris, the tall Cowslip, one within another. 5. Paralis altaeris, the tall Cowslip, one within another. 6. Paralis altaeris, the tall Cowslip, one within another. 7. Paralis altaeris, the tall Cowslip, one within another. 8. Paralis altaeris, the tall Cowslip, one within another. 9. Paralis altaeris, the tall Cowslip, one within another. 10. Paralis altaeris, the tall Cowslip, one within another. 11. Paralis altaeris, the tall Cowslip, one within another. 12. Paralis altaeris, the tall Cowslip, one within another. 13. Paralis altaeris, the tall Cowslip, one within another. 14. Paralis altaeris, the tall Cowslip, one within another. 15. Paralis altaeris, the tall Cowslip, one within another. 16. Paralis altaeris, the tall Cowslip, one within another. 17. Paralis altaeris, the tall Cowslip, one within another. 18. Paralis altaeris, the tall Cowslip, one within another. 19. Paralis altaeris, the tall Cowslip, one within another. 20. Paralis altaeris, the tall Cowslip, one within another. 21. Paralis altaeris, the tall Cowslip, one within another. 22. Paralis altaeris, the tall Cowslip, one within another.

IV. Their Description. The first, or Common Cowslip, has Buds like to the Primrose, with many Fibres annexed to the greater Root, from which spring up several green Leaves, very like unto the Wild Primrose, but shorter, rounder, stiffer, rougher, more crumpled about the edges, and of a lighter green color, every one standing upon its Stalk, of an Inch or two long. From among these Leaves rise up divers round naked Stalks of a whitish color, a foot or more or less, bearing, in the upper part, several yellow Bowers, growing out of a long stalk, upon a short footstalk, with spots of a deeper yellow at the bottom of each Leaf, and smelling very sweeter.
V. The second, which is the Primrose Cowslip, or many flowered, has a Root like the former, from which springs forth Leaves, which are larger than the Common Field Cowslip, and of a dark yellowish green color; from the midst of which spring up several Stalks like the others, all of which, at the tops of which are the Flowers, which are unseveral, and grouping together, in Hanks like the former, sometimes to the number of thirty in one Head, at the top of one Stalk, and sometimes more, every one of them bearing a longer Blossom than the Common Cowslip, which is requisite by reason of their great number: they are of a pale yellowish color, almost like those of the Field Primrose, with yellow spots at the bottom of the Leaves, as the Common Kind have, and of a sweet Smell.

VI. The third, or Single Green Cowslip, has a Root like the first, with many fibres annexed, and from which rises is but little difference either in its Root, or Leaf; the chief difference in this Kind being, that the Leaves are somewhat greater; the Flowers being in all respects like in form to the first Field Cowslip, but somewhat larger, and of the same color with the yellowish green Hanks, or rather a little yellower, and of very little Smell; in any other thing there is no difference, but that it is much longer in Flower, before it fades, especially if it grows out of the Sun.

VII. The fourth, or Carved Cowslip, differs chiefly in the Flowers, which are folded or crumpled at the edges, the Hanks of the Flowers being larger than of any of the former, the Leaves more slender, and in the middle, as it were Ribs, and crumpled on the sides of the Hanks.

VIII. The fifth, or Double Cowslip, one in another, which some call hoof in hoof, has each Single Flower growing out of another, which makes the same Double, for which reason Penca calls it Gemini, for that the Flowers are brought forth like Twins; The Smell is the same with the common Field Cowslip, but something stronger.

IX. The Earth, or Single Oxlip, is a kind of Cowslip, which has Roots, and Leaves, and Stalks like the first kind, but somewhat smaller; the Flowers are yellow like the first Cowslip, and smaller; standing many upon a Stalk, but bare or naked, without any Hanks to contain them, and having no other thing different from the Common, or Field Cowslip.

X. The seventh, or Double Oxlip, called, Hoof in Hoof, is almost like the former Double Cowslip, or Hoof in Hoof, having its single Flowers one within another, fearing that this has no Hanks to contain them, no more than the former Oxlips, but stands bare or naked, and of the very same bigness each of them, and of the same deep yellow color with it, and with a little Smell as the Single. There is another of this Species whose Leaves are somewhat larger, as also the Flowers, but of a paler yellow color.

XI. The eighth, or Oxlip with Jagg'd Leaves, differs not from the first Single Oxlip in the smallness of the green Leaves, but in the Flower, which standing many of them together on a reasonable height, all of the same height, and some open, and lay abroad themselves, but appear only, as having been under a green Hanks under each Flower, which is divided into several small long pieces.

XII. The ninth, or Foxglove Cowslip, differs not much in Leaves from the former Cowslip, but bear at the top of the Stalk a Tuft or Bush of small, long, green Leaves, with some yellow Leaves, as it were pieces of Flowers broken, and standing among the green Leaves. And sometimes some Stalks among the first green Leaves at the Top (which are a little larger than when it has but broken pieces of Flowers) do carry whole Flowers in Hanks like the Single Kind.

XIII. The tenth, or Double Garden Cowslip, has smaller and darker green Leaves, than the first Single Field Kind has, and longer Foxtails, horizontal, on which the Leaves do stand; it bears several Flowers upon a Stalk, but not so many as in the Single Kind, every one of which is of a much deeper and fairer yellow color than any of the former, standing not much above the bristles of the Hanks which hold them, consisting each of a few or three rows of Leaves, set round together, which makes it very thick and double, of a pretty pleasant sweet Smell, but not Head.

XIV. The eleventh, or Double green Cowslip, is so like to the single green kind, before described, that until it is near flowering, it can hardly be distinguished from the Single Kind; but when it is in flower, it has large Double Flowers, of the same yellowish green color, with the Single Green, and more laid open or spreading than the Flowers of the former Double Cowslip.

XV. The twelfth, or Double Green Feathered Cowslip has but little difference in the Leaves from the Double Green fully described, but that they are not of so dark a Green. The principal difference consists in the Flowers, which are many, standing together at the tops of the Stalks, but for differing from all others of these kinds, for every Flower standing upon its own Stalk, is composed of many very small and narrow Leaves, without any Hanks to contain them, but spreading open like a little Rose, (whereof came the name of Rosa Cowslip) of a pale yellowish green color, and without any Smell at all, abiding in Flower (especially if a flaxen in a flaxen place out of the Sun) about two Months, smelling in perfect beauty, as in the first Week.

XVI. The Places. All these Kinds have been found growing Wild in England, and from their natural places of growth, they have been transplanted into our Gardens, where they abide, and being in a richer Mould, grow larger and Eater than in their natural places.

XVII. The Times. They all Flower in the Spring of the Year, some earlier, and some later, according as they are defended from Cold and Frost, and as the mildness of the Season will permit. They Flower at the latter end of April and in May, (later than the Primroses do:) and the Single and Double green Cowslip the latest, and continue flowering a pretty while after all the rest.

XVIII. The Qualities. They are all hot and dry in the fifth Degree, They are APERTIVE, to Attenuate, are Digestive, Diffusive, Excretive, Traumatick or Vulnicrur, Cephalick, Nautrick and Amenick.

XIX. The Specification. They are singular for the cure of Palsies and Gout.

The Virtues.
Salmon's Herbal. Lib. 1.

Pains in the Back and Bladder, and opens the passages of the Urine, causing a free and easy

XXI. The Effect. It has the former Virtues, and as it is an admirable Neurotick, so it helps all

infirmities of the Head, Brain, and Nerves, coming of Cold, Wind, or moist Humors, as the Vertigo,

Palsy, or Night mare, Life Agitations or Whim-

Sies, Paralyse, Unfeft, or Falling-Sickness, Palpae,

Convulsions, Cramps, and other Pains of the Nerves

and Joints. Dole three ounces or more to a Glass

of Wine, Morning and Night, lasting also twice

a Day very well, the parts affected with the

same.

XXII. The Wine of the Flowers. It is Cordial

and Confortative, retires the Spirits, and is con-

ducive to all the purposes abovementioned: The

Patient may drink a Glass of it half an hour before

Dinner, or any other time of eating.

XXIV. A Freedom of the Leanes. It is a small

kind of an Elixir, being sniffed up the Nostrils,

and so purges the Head, but yet very gently. Be-

ing drawn upon old running Sore of Ulcers, it

cleans, dries, and heals them, and raises away the

sharpness of Humors, or inflammation therein, if present: it may be drawn on dry, or

mixed with Unguentum Nicotianum, and so ap-

plied.

XXV. The Ointment. It is made of the Flowers,

either by Infusion, or a boiling to Criples, and

a treble repetition of the same, it is sold by

Authors to take away spots and wrinkles of the

Skin, Sun-burnings, and Freckles, adding Beauty,

and heightening the Complexion. If the Ointment

is made of the Leaves, it is an excellent thing to

heal simple Green Wounds, clean Ulcers, dry

up, and heal inveterate running Sores, &c.

XXVI. The Cataplasm. Applied upon the spot,

it destroys simple Corruptions, and prevails against

the Gout in the Hand or Foot, by comforting and

strengthening the Nerves, and eating their pain, be-

ing often repeated as need requires.

XXVII. The Distilled Water of the whole Plant.

It is eell as a Vehicle for other Cephalick and Neu-

rotic Preparations: In the mean Season it is sold
to be Cephalick, and therewith the Face and Skin

may be washed every Morning after the Ointment

is rubbed out.

XXVIII. The Spiritual Tincture. It has all the

Virtues of the Efficacy, and is much more Cordial,

and therefore better against Palpitations and Sweating

Fits, fickness at Heart, and other Diempers in

which the Vitals are concerned. Dole half a spoon-

ful or more in a Glass of Generous Wine.

XXIX. The Oily Tincture. It is peculiar against

the Palp and Gout, as also Convulsions, Cramps,

Punctures of the Nerves, &c. in all which cases, it

has neatly any equal: In Palls anoint with it

Morning and Evening, all along the Back-bone, from

the Verbre of the Neck, almost to the Anus, as

also the Parts affected, rubbing it very well in; in

Gouts, (from a cold Cause) Convulsions, Cramps,

Punctures, &c. you may only anoint the parts af-

fected, but in Convulsions, it will be good also to

take it inwardly; in some Neurotic Vehicles

Morning and Night, from fifteen drops to thirty or

forty, as the Exaggery may require.

XXX. The Saline Tincture. If it is daily taken

twice a day, from half a dram to one dram, in a

good Glass of White Port Wine or Canary, it

promotes the open Obstructions of the Urinary parts,

and eases pains in the Reins, Ulcers and Bladder,

and if any Sand, Gravel, Small Stones, or Par-

tious Mischance be lodged in those parts, it cleans

ethem thereof, and expels it.

XXXI. The Fixed Salt. It is Neurotick and

Diuretick, peculiarly dedicated to the Head, Brain,

Nerves, Reins and Bladder. It is good against the

Insanity, and curries it off as a Neuropath Vir-

temper by Urine, being given to half a dram in

White Port Wine.

XXXII. The Balsam. It is an admirable Volu-

mury, curing simple Green Wounds at the first in-

cision: If they be compos'd, it digests them, or

brings them to maturation, refills putrefaction,

cleans, incures, dries and heals them in a very

short time. If it is mixt with equal parts of

Unguentum Nicotianum, it performs all these things

the more admirably, and is a Medicament which every

good Country man ought to keep always in his

House.

CHAP. CLVIII.

of COWSLIP Spotted.

I

T H E N a me. It does not appear that this

Plant was known to the Greeks, yet some,
as accounting it among the Kinds of Conflury, have
called it Symphytum maculofum: It is called in Latine, Palmo-

nature, (and yet it is no Species of the Lang-

\nae, as we shall, God willing, hereafter shew:) also, Symphytum maculofum: and in English, Jeru-

alem Conflury, and Spotted Cowflip. (and yet it is

not of the Species of Cowflips:) also Sage of Je-

rusalem, Sage of Bethlehem, Spotted Languror, and

Spotted Conflury.

Spotted Jerusalem Conflipy.

II. The Kinds. Authors make these Species or

Kinds of this Plant, viz. 1. Pulmonaria maculofa

niculofa, Common Spotted Jerusalem Cowflip.

2 Pulmo-
CHAP. CLIX.

OF CRANES-BILL Garden.

The Name. It is called in Greek, Ἀφρόν, in Latin Geranium, allo Granaul, Roftrum Graus, or Granuus, Rostrum Graecos, (from the form of the Seed Veilis:) in English, Storks-bill, and Cranes-bill.

The Kinds. There are many Kinds of this Plant, as: 1. Carpinus, Geranium Hortensae, Garden Cranes-bill, of which in this Chapter. 2. Geranium Media, Stalked Cranes-bill, of which in Chap. 160. 3. Geranium Exalbris, Cowfoot Cranes-bill, of which in Chap. 161. 4. Geranium argente, Field Cranes-bill, of which in Chap. 162. 5. Geranium Californiaste, Deerfoot, of which in Chap. 6. Geranium Robertianum, Herb Robert, of which in Chap. following.

The Plants. All these grow naturally in the Woods of Germany, in divers places: Parkington says, that the fifth Kind is found in England. John- son upon Gerard says, that the second Palmaris fojii Eichf. was found by Mr. John Gooder, growing in a Wood by Holbury Haufe in the New Forest in Hampshire. Their natural place is in moisty and thatowy Woods, but with us they are for the most part rare'd up in Gardens.

The Times. They Flower generally very early in the Year, for the most part in March, and in the beginning of April.

The Quality, Spicification, Virtues and Uses, are much like those of Confrey, in Chap. 149. after going, to which you are referred, but doubtless as these have not such a Volatility, as our common Confrey has, so in many cases they may not be so useful, but as these are more dainty and binding than Confrey, so also in some other cases, they may exceed Confrey. And whereas in Confrey the Root is chiefly used, in these Plants, the Leaves are to be crafted to a farthing.

IX. An Observation. The Round Fruits or Fusses of the Leaves, or whole Plant, have been found by large Experience to be singularly good for the Cure of Ulcerated Lungs, which are full of corrected and rotten Matter: and it has been found to be a Cure for those who spit Blood. Dose two, three, or four ounces in a Glass of pure Red Port Wine.

But the greatest Use which our Country People make of it, is for a Pot Herb.
This page contains text from Salmon's Herbal, which describes various plants. The text includes descriptive information about their appearance, growth patterns, and distinguishing features. The page features descriptions of the Tuberous Cranefoot, Bloody Cranes-bill, and Striped Cranefoot, among others. The text is written in a historical botanical style, focusing on the plant's physical characteristics and their uses or象征意义.

The text is structured into paragraphs, each describing a different aspect of the plants. The descriptions are detailed, covering the plants' appearance, growth habits, and any notable features such as flowers, leaves, and root structures.

The page also includes small illustrations or diagrams, which are typical in historical herbal books, to help visualize the plants being described.
Chap. 160. **English Herbs.** 229

on the surface, and whitish within, which abides, and persists not, but flows forth some new green Leaves, which abide all the Winter, although those which turn red, do fall away. From this Root divers Leaves afford, which spread themselves upon the ground, very much cut in or divided into many parts, and each of them again split or cut into two or three pieces, growing upon slender long Footstalks, of a fair green color all the Spring, and Summer, but reddish in Autumn. From among these Leaves spring up several tender and weak Stalks, before at every joint (which is something reddish) with two Leaves for the most part, like unto the lower. The Flowers grow feveral on the Tops of the Stalks, but are not together, in Bunches or Branchet, as in all the other kinds of Cranes-bills; every Flower being as large as a Single Rose Camphon Flower, consisting of five large Leaves, of a deeper red color than in any other Cranes-bill at the first opening, but changing more whitish afterwards: when the Flower is half grown, there does arise such like Beaks, or Heads of Seed, as are produced in the other kinds, but they seem to be smaller.

VIII. **The Places.** All these grow Wild in Foreign places, but are only nurs'd up with us in Garden. Matthiolus says, that the first grows very plentifully in Dalmatia and Illyria; and Campanarian, Chlopian, and others say, that the root grows in Germany, Bohemia, Anftria, &c.

IX. **The Time.** All these Cranes-bills do flower for the most part, in April, May, and June; but the Variable or strip'd Cran'es-bill Flowers usually later than any of the rest.

X. **The Qualities.** Specification, Preparation, Virtues and Ufes, of all the Cran'es-bills, being one and the same, we shall forbear the declairing thereof in this place, as also in some of the following Chapters, till such time as we have fully described all such kinds as are to be found growing in our Country; and therefore I refer you to Chap. 166, where we shall (God willing) discourse the fame at large, and to full satisfaction.

---

CHAP. CLX.

Of CRANES-BILL Musked.

I. **The Names.** It is called in Greek, Μυκητια, in Latin Geranium Mochutatum, and in German Geranium Mozkhatum, Ruftram, Creticum, Myrrhida Plant, and Arab Pofloris, and in English, Musked Cran'es-bill, or Stark-bill, of the Vulgar, Much, Moskhatum, and Herb-Musk.

II. **The Kinds.** We have four feveral sorts of this Plant, viz. 1. Geranium Mochutatum Vulgar, or Herkofce, Herba Mochhoe, the Common, or Garden Musked Cran'es-bill, or Herb Musk. 2. Geranium Mochutatum imudorum, Musked Cran'es-bill without flinch, being only called Musked from its form. 3. Geranium Apulum odorum, altemtor, in ruins folio Cercandii, Italian Musked Cran'es-bill. 4. Geranium Criticum, Cudy Cran'es-bill.

III. **The Descriptions.** The left, or Musked Cran'es-bill, has a Root somewhat long, with divers Fibres thereof, from whence springing several long tender Leaves, of a dark green color, (and sometimes of an Ash green color, or somewhat whitish by reason of having which are oblong, lying upon the ground, and cut or divided into many Ports or Leaves, and each of them cut in or spint on the edges, among which rise up two tender Stalks, force able to climb upward, about a foot, more or left high, with some fuch like Leaves growing upon them, as you find before, but smaller the better they grow on the Stalks, and the lower cut in on the edges on the Tops; also among the upper Leaves sometimes, several very small Red or Crimson Flowers grow, after which very small and long Buds or Bills come forth, with Seed at the bottom, as all the rest of the Cran'es-bills have, which ruises it feall, as small of them do. The whole Plant, and every part thereof above ground, has a very fine and pleasing ftr of smell, very much resembling that of Musk, whence came the name.

---

Musked Cran'es-bill

Musked kind With Oast Smell.
Salmons and or found Geranium Candy hen the wherein it accounted from lying the Ge- of Latin, Prepara- Geranium and I this the thefe us The of which the Lies, unto ft each kinds wards Stalks, ed Pointel The in brought grows Cranes-bill, tions with following. Herb Drinks, and V. and Root Flora in the lower Leaves of Comander or Petherlow, but with rounder dots, the Stalks are Jointed and Knotted, with two fuch fach Leaves at them, but more finely jagged: at the tops of the Stalks and Branch- er the Stalks are grooved, fraught with pale purple color, each boreing in a green burry Hutt, wherein afterwards fhould the heads of Seed, very like to the other kinds, grow below, and wide above. The whole Plant above ground is of a Pefling Sweet Muff, likes the fift of thife, and of which it is a Species.

VI. The fourth, or Candy Cranes-bill, has a Root which is long and white, with fome fubtle admi- ni to it, and perifhes when it has perfected its Seed: from this Root springing feveral long and tender Stalks, fift and fift of Twize, upon which grow fe- veral broad and long fringed Leaves, not much un- like to the fift Musked Cranes-bill, cut in, or match- ed on the edges. Thofe Stalks fhread themfelves into many branches, more effentially towards the Top, on the Tops of which grow many Flowers made of five Leaves fpaced, of a reafonable bignefs, and of a fair Blew, or Watchet color, with a purplife Portion in the middle, which being paff, beak-like heads fowin, as in the other Cranes-bills, but grea- ter, and containing larger, greater, and sharper pointed Seed, able to pierce the skin. This Plant fhings up many times of its own Sowing, if the Winter is not too fharf, otherwise being Annual, it mufl be Sown in the Spring of the Year.

VII. The Places. The two fift grow Wild (fays Paffage) in many places of this Land, as well in Meadows as wafli Grounds. But the fift is now nurified up in Gardens for its pleafant Swee Smell. The fecond is fownd fometimes upon Heaths, and dry Cafually places, but much smaller than when it grows in better or richer Ground. The third was brought to us out of Italy, and the fourth out of England we arc only nur’d up in Gar- dens, where they grow very well.

VIII. The Times. They flower in June and July, and the Seed ripens not long after: the Candy Cranes-bill, Gerard fays, fower’d with him for the moft part in May.

IX. As for the Qualities, Specification, Prepara- tions and Vertues (thefe being of the fame nature with the Wouind Herb) fee them in Chap. 162 following. Thefe here are accounted excellent Wound Herbs, and equal to Dover-foot: The Cre- nick or Candy Cranes-bill being used in Wound Drinks, does far excell (as Gerard fays) any of the Cranes-bills, and is equal with any other Wound Herb whatfever for the fame purpofe.

Chapter CLXI.

Of CRANES-BILL - Crowfoot.

I. The Names. It is called in Greek, Tejorium beuronum: in Latin, Geranium Batrachi- oides, Granus Dei Fuchfii, Ranunculus curatus: and in English, Crowfoot Cranes-bill.

III. The Descriptions. The fift, or Blew Crowfoot Cranes-bill, has a Root which is compofed of many reddifh fringes, spreading in the Ground, from a head made of direft red heads, which be of fizes: above ground, from this Root springing forth many large Leaves, cut into five or six parts or fivifhes, even to the bottom, and jagged edges on the edges, fow upon very long tender Footstalks, very like to the Leaves of the Field Crowfoot: from among which Leaves fpringing up great ftones, fomevifhes reddifh, fow with Leaves like to the fift Garden kind: The Stalks towards their Tops fhread them- felves into many Branches, on which grow ferveral Flowers, made of five Leaves fpaced, as large as any of the Field Crowfoot, round pointed, and of a fair Blew, or Watchet color, which being paff, beak-like heads and bills do follow, as are found in other Cranes-bills.

IV. The second, or White Flowered Crowfoot Cranes-bill, is in Leaves, Stalks, Branches, Flowers, Magnitude, Form, and manner of growing, alike with
like to the former, excepting in two particulars, viz. 1. In the Roots, which has not such red heads as the former Blew blowered bar. 2. In the Flowers, the former being Blew, whereas the Flowers in this are wholly White, and fully as large as the last.

V. The third, or Purple Crowfoot or Grasses-Bills, has a Root which is composed of a great Tuf of Spires, joined to a Tuberos or Knobby Head, from whence many Leaves spring forth, set upon long Foot-stalks, somewhat like unto the other; yet not so broad, but more divided or cut, viz. into seven, or more fifte, even to the middle, each of which is cut in on the edges, more deeply than the former.

The Stalks are a little Knobby or Ganty at the Heads, set and long drawn unto the lower, and bearing a great Tuf of Bars at the Tops of the Branches, which bud and put out into fair large Flowers, made of five purple Leaves, which do something resemble the Flowers in some one, before it be too full blown, each whereof has a reddish Pointed in the middle, and many small threads confiding of it. (ten in number) at Gertrud's sale. This Umbel or Tuft of Bars, does flower by Degrees, and not all at once, and every Flower shivers open but a little more than one day, and then finds its Leaves, so that day yearly yields fresh Flowers, which because they are so many, are a long time before they are all blown and spent. The Flowers being pale, small Beak or Bill Heads come forth, like unto the other Cranes-bills, with small tufting Seed.

VI. The fourth, or Dark Red Crowfoot Cranes-bills, has a Root with great reddish heads above, with many long Spires and fibres depending from it, from this Root springing several broad spread, left, and somewhat hairy Leaves, growing upon long Foot-stalks, cut into two, or sixteen deep gales or divisions, each with a blackish spot at the bottom of every one of them, and dented also about their edges. The Stalk rises up about two feet high, spotted with many red edges, and is strong, somewhat hairy, and spread forth into three or four Branches, with such like Leaves on them, but leffer, and at their Tops, tworthree or four Flowers spars, each of them consisting of seven Leaves, cut in at the edges, which is a mode differing from all other Cranes-bills of a deep red color, almost blackish, and in the middle a long Stipe or Pointed, with many hairy threads about it. The Flowers being pale, there follows brown pointed Seed, like to the other Cranes-bills.

VII. The fifth, or Party-colored Crowfoot Cranes-bills, is in its Roots, Stalks, Leaves, Flowers, Seed, Margins, Form, and manner of growing, so like to the first described in this Chapter, that until it is perfectly in Flower, this cannot be known from that: but when it is blown out, the Flowers are found to be very differently striped and spotted, and sometim difered, the one half of every Leaf being white, and the other half blew, sometimes with greater or lesser spots of blew in the white Leaf, very variable, and more in some years than in others, so that it would be a very difficult matter to express all the varieties which may be observed, at the same and differing times, in the blown Flowers.

VIII. The sixth, or Long Rooted Crowfoot Cranes-bill, has a Root very long and great, with small fibres adjoining thereto, of a reddish colour without, and abiding all the Winter; from this Root springing several Spread, (somewhat Foot-stalks) flowers of that large, but yet less than those of the other Crowfoot Cranes-bills, otherwise very like, from among these Leaves rise up several Stalks, bearing false Flowers, of a more excellent red color than those of the Tuberous Cranes-bill, and of a lighter red than those of the third Kind be-

Chap. 161. English Herbs. 231

of CRANES-BILL Field.

I. The Name. It is called in Greek, Geranion aggrostis; in Latin, Geranium argenteum: and in English, Field Cranes-bill.

Field Cranes-bill, small.

II. The Kinds. The Field Cranes-bill is manifold, but those which we design under that Name, are 1. Geranium argenteum, Geranium Hair-footed, Field, or Violet colored Cranes-bill. 2. Geranium Centaury, false imodorus, Field Cranes-bill without Smell; of this we have discoursed in Chap. 160. Sect. 4. a. Geranium Octium, Dowd-bills. 3. Gerani-
The Virtues.  

IX. The liquid Juice. It is said to be good against Fluxes of the Bowels, whether Diarrhoea, Dysenteria, Ileenteria, or Hepatica Flus, healing them, and a remedy for those Gripe or Pains, it proves good against Hyperbick Flus, and is good against Sand, gravel, and Stone in Knees and Bladder. Dofe four ounces, or more, either alone, or in Wine, Morning and Night.

10. The Effence. It has all the former Virtues, and more powerful to all the same Intentions, besides which, it is a famous thing to Stop the over flowing of the Terms in Women, and to confol date Ruptures, whether in old or young. It is good against Fits, and the extrem Tumours of the Colic, as also to heal Wounds, whether inward or outward, curing Spriting, Vomiting, or Biting Blood, dissolves congealed Blood, whether in the Stomach, Bowels, or Knees, and expels it, and is a singular thing to be taken as a Wound drink, for those who have any Wounds, running Sores, old Ulcers, or Fistula's, to induce them to a speedy healing. Dofe three ounces, Morning, Noon, and Night in a Glass of Red Port Wine.

11. The Syrup. It has all the former Virtues (being made either of the Juice or Effence) but is more to the weaker by the Sugar which it adds to it. Moreover it is more fit for Children, and to wash the Stomach, and may be given to them against Ruptures.

XII. The Deed. It has the Virtues of the Juice and Effence, but very much weaker, and may be given to those to be reduced to take them. However you make thereof an exceeding good Wound, drinks to all the purposes aforesaid mentioned. Being injected into Fistula's, or running Sores, or running Ulcers, or runneth otherwise, it perfectly cleanses and heals them, and also conglutinates the Lips of Green Wounds.

XIII. The Powder. It is good against Ruptures, or Burtings, given to one dram, in some proper Vehicles; outwardly applied upon old running Sores or Ulcers, it cleanses, dries and heals them, and is good to stop Breeding in Wounds, and to conglutinate their Lips.

XIV. The Balsam. It is a singular Vanculary, and cures simple Wounds at the first intention: it digests, cleanses, indurates, and dries old running Sores, and reduceth Ulcers, and by strengthening the Part, brings on the healing after an admirable manner: applied in the Gout, it gives eafe, and by continuing its use, it cures it in a short time.

XV. The Catalpa. Being applied to simple Contusions, it diffuses, prevents Pain and Inflammation, and cures them: it conglutinates simple Green Wounds, and gives eafe in the Gout, as also in all other Pains of the Joints, nerves, or Tendons, coming from blows, strains, or the like.

CHAP. CLXIII.

OF CRESS Garden.

T HE Names. This Plant is called in Greek, Alphiias, or the allyas, Cardamum quad cari datus factus, vel quad Var foestus, guia in focipe Cardamae pantarum color : And of this Herb, the Greeks had this Proverb, cerves, Ede Nafurr tim, propereas good Naffurio in foie Credchani ani venum egerunt excitndt. In Arabick, Nerif, vel Naf alfjel : in Latin, Naffurium, a vncn torments, as Phef fith : And in English, Cress.

III. Of the Garden Kind, Naphrus flaves, there are these following, viz. 1. Naffurium Sativa, vulgaris, The common Garden Cress. 2. Naffurium Hortefc Latifolium, and Naffurium Laffi tim Hifpanicum, Broad Leaf Garden Cress. 3. Naffurium Hortefc Crifpum Latifolium, and Angijsfolium, Curled Cress, with Broader and Narrower Leaves. 4. Naffurium unguis, Siam minimun, Siam Naffurio Seltrifia folia. Noli me tangere, The impatient Cress, being called a Cress, more from the form of its Leaf, than any thing else.

IV. The Decriptions. The fift has a long Root with some Yoles adtoyn in it, which perishes every Year after the ripening of the Seed, or upon the approach of Winter. In it is a few true rootlets, or the Stalks grown up half a yard, or two feet high, having many small, tender, white, broad, indicated, or corn Leaves set thereon, growing together upon a middle rib next the ground, but
but those which grow higher upon the stalks are smaller and longer: The leaves in general are so like to those of Garden Chervil, or Sweet Cicely, that it must be a very shrewd eye which can distinguish them; and whilst young, are scarcely to be distinguished but by the taste. The tops of the stalks are replenished with white flowers, which turn into flat pods or pouches, not much unlike to shepherd's purse, in which is contained flat reddish seed; the smell of both leaves and seed is strong and spicy, and their taste is hot, sharp, and biting, almost like pepper, for which reason some call it pepper-wort.

Garden Cress

V. The second, or broad leaf'd garden cress, has a root which is small and broad, perishing every year, and therefore must be annually sown in the spring, and for this reason also, because after it is sown, it springs up quickly, and will not endure the cold of winter. Its first leaves are small like Bafil, among which rises up a stalk about half a yard high, set with larger leaves therein, without any division, but finely dent'd about the edges, and pointed at the ends, every one standing upon a long footstalk, branched from the middle to the top, with longer and narrower leaves, like to the top leaves of garden cress; from whence break forth many white flowers set in flowers, one above another, after which come pouches or purfes containing brownish seed like to the other cresses, but much more bitter, and yet not all out so fiery or sharp.

VI. The third, or curled cress, has a root like to the former, which grows deep into the earth, and perishes every year after seed time, as the other does. It grows like the first, or common garden cress, and differs therefrom only in the leaves, which are of two sorts; the one with broad leaves, cut, and roundly dent'd, and car'd about the edges, every one by itself, on a long stalk. The other, consisting of many smaller leaves, set one against another upon a middle rib, each part of which is in the same manner cut in, and car'd about, as the other. The flowers are white, like the common garden kind, and the reddish seed also like the same in form and magnitude.

VII. The fourth, or impetuous cress, has a small root spreading forth it self into many branches, from whence arise many winged leaves, not much unlike to the smaller sain, which spread themselves at first upon the ground, not much more an inch or two long, which do abide from autumn, when it springs up, all the winter long. In the spring of the year, they grow somewhat bigger, and the said leaves are a little dent'd about the edges, the bottom of the leaf being for the most part the bigger.

From among these leaves rises up a slender stalk, about a foot and half high, which is divided into several branches, from the middle thereof to the top. On the extremities or tops of all which branches grow many very small white flowers, which being cast away, as many slender long pointed pods follow, in which is contained yellowish seed; when these seeds are ripe, they are so impatient of being touched, and the seed is so hard to be gathered, that the pod breaks itself, even of its own accord, upon the least touch of the hand, or any thing else, and to the seed flies away, not being then possible to be gathered: This seed has little or no heat in it.

VIII. An observation. It is indeed the nature of this impetuous cress, that if you but touch the cress when the seed is ripe, though you do it never so gently, yet will the cress fly all away with a great violence, not suffering it self to be touched, from whence came the name, Not me tangere, and Nasturtium Impatien 

IX. The place. These plants are all of them suited up with us in gardens. the fifth matters not what soil it grows in, for it thins any ground, especially if it is well watered: The second came
Salmon’s Herbal. Lib. 1.

Herbal

Spleen. It grows well with us in England, as does also the third. The fourth, although found about both, and other Parts of our Land, which, says he, is now kept in divers of our London gardens, in some of which I have seen it grow.

Spleen. They may be Sown at any time of the Year, unless it be in Winter. They quickly spring up, after Sown, flower in April and May, and the Seed is ripe in June, or not long after their flowering time, after which they die every Year, and recover themselves, i.e. spring up again of the same or fallen Seed.

The Virtues.

XIV. The Herb. Eaten as a Sallet with other Salad Herbs, as Lettuce, &c. it warms, comforts and pleases the Stomach: bruised and applied, it takes away Spots and Marks, eases the Pains of the Liver and Sciatica, and draws forth broken Bones, Thorns and Splinters; and parts a Stop to the Corrod ing of purrid and creeping Ulcers; held or chewed in the Mouth, it cures the Tooth-ach.

XV. The Herb. Uttered as an Elixir, it purges the Head and Brain of cold and vicious Humors, thereby eating all kinds of Head-aches proceeding therefrom, and for the same Reason prevails against Toothache, Leances, Appendicitis, Epilepsies, Vertigo’s, Cans, Convulsions, and all other like Disea ses affilling those Parts. Given from half an ounce to two ounces, in a Glass of Genial Wine, it powerfully acts to the Blood and viscous Humors:

XXVII. The Acid Tincture. It wonderfully strengthens the Snowdrop Heart in S. M., as well to preserve from the Contagion and Infection of the Plague or Pestilence, as to cure the same, for which it is an approved thing. It cures the Scoury in cold, and also in the Summer: it is diuretically used, and removes all the Symptoms of that troublesome Disease. Dose from 30 to 40, 60, or more Drops in Ale, Wine or other Vehicle, according to the Quantity the Patient drinks at a time.

XVIII. The Acid Tincture. It cures the Palsey, being anointed well Morning and Evening upon the Backbone, and Parts affected. But that Part of the Spleen Disease is to be chiefly bathed therewith, from whence the Nerves proceed, which replenish the Parts afflicted with that Disease. It is also good a gainst Cramps, Convulsions and Guts arising from a cold Caution, and gives ease in the most intolerable Pains of the Back, as also of the Reins, being outwardly applied therewith, and inwardly given from 1 to 30 Drops, Morning and Evening in any Nephritic or Urinary Vehicle.

XX. The Saline Tincture. It powerfully opens Obstructions of the Worm, Reins, Ureters and Bladder, promotes the Secretion of Morbidthick Humors by Urine, and provoking Urine. It expels Blood, Gravel, Stones, and Tauris and other Matter out of the Mus of Blood, and cleanses all the Urinary Parts from the same. Dose from 40 to 60 Drops in Wine.

XXI. The Spirit. How it is to be made, we have shown at large in the Second Edition of our Pharmacopæa Galenæ, lib. 3. cap. 3. fol. 67. This Spirit thus prepared, is very full and volatile, an admirable Antiscorbutick, and powerfully assill all Diseas arising from vicious Humors, and other Tauris Humors: it thins and raises the Blood, provokes Urine and the Terms, and cleanses the Womb. And as it is famous against the Scoury, so it is excellent against the Dropsy, Jaundice, Stone and Gout: it is a good Nephritic, and cures most Disea ses of the Reins, expels Sand, Gravel and Slime, and prevail against the Colic, and Violent Disea ses of the Bowels. It is said to be good also against the Confinement of a Kidney in Virgins, because it powerfully opens Obstructions, and purifies the Blood, for which Reason it is regularly good against the Kings-Evil: it warms the Inflammation of Generation, provokes Urine, and the Terms, and expels all Chills. The Dose of this Spirit is from 20 drops to a dram, in some proper Vehicle. The distilled Water of Spleen, which is made after the Dilution of the Spirit, by distilling a Spirit of 66’s, will be much stronger and better than that which is made the vulgar way, it being impregnated with much of the Effluent Salt, liquoriset by Fermentation, which yet remains behind, and does impregnate the Water. This Water may be given from one ounce to six, its Virtues being the same with the Spirit, but much weaker in its Operation.

XXII. The Coprophoia. It is good against the Gout and Sciatica, as also itching Humors and E rup tions in the Skin. It draws forth Thorns, Splinters and other things gotten into the Flesh. It is used to wash the Eyes, and applied to the Face, and affords of它seven against the Kings-Evil, whether in the Throat or any other Part: If made with Hogs Lard, it cures cuts, running and Rabby Heads, tapers Plague Sores, and臥闃an, and expels all Rats, and Felons on the Fingers ends, and takes away the De formity of the Nails.

XXIII. The Sawd. If it is chowed in the Mouth, it cleans, caused, for hanging, and helps the Throat (and so also does the Herb) it also helps the Palate of the Tongue, provokes Sneezing, and is good against...
CHAP. CLXIV.

CRESS Indian.

THE Name. It is called in Greek, Κρέσσων 

in Latin, *Crescens* Indicus, *Flos 

in English, *Indian Cress*, 

or *Yellow Lark's-beads*, from the Form of the 

II. The Kinds. It is a singular Plant of the kind, 

and by its Taffe declares it to be one of the 

crassulins. Some do account it amongst the 

Cemstrs or Cemstrils, the Cmmbers or Cmmbers, 

but any of these it cannot be, because it has 

not Cmmbers, nor does it wind it wind about anything, 

but by reason of the number of its Branches which 

run one within another, it may seem to climp-up a 

Pol, or the like, which yet it does but only close, 

as having something whereon to rest or lean its 

Branches. But *Parkinson* fancied two 

kinds, viz. the *Round Leaved*, (which is the Com- 

mon) and the *Cornered Leaved*.

III. The Description. This fair and noble Plant 

has Roots which are small, and spreading under 

Ground, which persh with the least Froats, and shall 

be from ofrest every Year : from this Root arise ma-

ny long trailing Branches, united one within anoth-

er very confusedly, yet it does not wind itself 

with any Cmbers, or any other Prop, but if you would have it this close the better, you shall 

take it, if it will it will be upon the Ground,) four 
or five feet in length at the head, for which Reason 
it takes up a great deal of Ground. The Leaves are 

smooth, green, and as round as the Pennywort which 
grows on the Ground, without any Cut or Incision 
in any part, the foot Stalks of which Stand in the 
middle of each Leaf, and grow forth at every joint 
of the Stalk, where they are a little reddish, and 

bowed or bunched out: the Flowers are of an ex-
cellent Goldyellow color, and grow all along the 

Stalks, almost at every Joint, with the Leaves, up 
on pretty long foot Stalks, which are composed of free 

Leaves of these, not hollow or gaping, but standing 

open, each Leaf apart by it self, two of them, which 

are larger and longer than the others, stand above, 

and the other two, which are lower, stand below, 

which are a little jagged or bearded on both sides, 

and the fifth lowest. In the middle of each of the three 

lower Leaves, (yet sometimes it is but in two of 

them) there is a little long Spot or Streak, of an ad-

mirable Grmphon color, (whence the Name *Flos San-

guineus*;) and the Blossom has a long Heel or Spur 

behind it, hanging down, (from which and the Color, 
came the Name of Yellow Larks-beeds;) the whole 

Blossom has a great Beauty, and *Sweetnesses* withal, 

very pleasing, which being placed in the middle of some 

Carnation s or Clove-gillyflowers, (which are both in 

flower at the same time) make a noble Nofiggey, both 

for Sight and Smell. When the Blossoms are paf-

some the Seed, which are rough or uneven, round, 
greenish, yellow Heads, sometimess one, and some-
times two or three standing together upon one Stalk, 

here or there, without of themselves, without any Heat, 

containing a white pulp Kernel.

IV. The second, or *Cornered Leaved kind*, in its 

Root, Stalks, Branches and Blossoms differs little or 

nothing from the former: the chief Difference is in 

the Leaves, for as in the former they are round, and 

are fitted upon a long foot Stalk, and smooth, nearly 
in the Center or Middle of each Leaf, and bunched 
out, in this, they are broad, and seven, eight or 
zeven cornered, of the same Smelings and Color, 
harsh pointed at their tops, and growing one and the 

foot Stalk, which is joined to the Leaf at the lower 

part.
part thereof. The Flowers are dark-stained, like the other, and in the whole, differs nothing from it in its Manner, and form of growing. Parkinson seems to say it was taken from the Life, which tho' it has not been seen here with us in England since, yet that binders not (just be) the Terrap of the thing. When I was in the West Indies, in my Travels up and down, I saw it several times.

V. The Places. This goodly and beautiful Plant was first found in the West Indies, and brought thence into Spain by Monsard, from whence it was afterwards conveyed into France, Flanders and England. It grows now familiarly in most of our Gardens, where it flourishes, and is become as it were a natural inhabitant. It need not be planted or sown in both of Horset-dung, or the like, for the natural Ground will be sufficient, so that it is but a little defended from those Frosts in the Spring of the Year, which are apt to nip it whilst it tender, or newly sprung up.

VI. The Years. It may be sown in March or April, and grown, which, when it is young, and has gotten three Leaves, must be taken up, and carefully replanted abroad, in the hottest place of the Garden, and in the most and fairest Mould. It flowers sometimes in June, but usually in July, if it is well defended, and in good Ground, and so continues flowering till the cold Frosts and Weather in the latter end of October, does check it, and pull a Drop to its Luxuriant Nature, the Seed growing continually ripe in the mean Season, which after it is ripe, soon falls down on the Ground, whence for the most part the Bell is gathered.

VII. The Qualities, Specification, Preparations and Virtues, are exactly the same with those of Garden Cresses in the former Chapter, to which I refer you; so that no more need be spoken of them here, except that the same Preparations of this Plant, as they are stronger, so they are more Effectual.

C H A P. CLXV.
Of C R E S S Meadow.

I. T H E Name. It is called in Greek, Κοχυρις, in Latin, Capiiculn, Naffurtium Pratense, Sifymbrium alternum Disporidors, and Cardamine: and in English, Meadow Cress, or Cuckow-flower: in some Countries it is called, as Gerard says, Ladies Smocks.

II. The Kind. They are either Single or Double: the Single we shall treat of in this Chapter, the Double in the next following. Of the Single, so many as grow with us in England, there are three Varieties, viz. 1. Naffurtium pratense major Trigo & Geofori, Cardamine latifolia, Naffurtium argente Ecchis, & Syphorch Lancre, Lepidsium minus Car- di, Iris Culci Eundem & Bramefli, the Great or Broad-leaved Cress, or Cuckow-flower, 2. Carda- mine ultera minor, Sifymbrium Cardamine Lusae & Langadansis, Sifymbrium aquaticum alternum Mut- thiois & Lepismontis, Heberis Ecchis, Heris Tha- li, Cardamine longa, Lapiens & Cfi, Aegopoaqua- tium, fave Cardamontis Naffurtii folis, Naffurtium pratense magno flore botritis, the Small Cuckow-flower. 2. Cardamine ultera pars flore, The Small

Great Cuckow-flower:
VII. The Times. They flower somewhat early in the Spring about April and May, at Earleist, and continue with the lower Leaves all the Winter.

Small. Cuckow Flower

VIII. The Qualities, Specification, Preparations and Virtues are the same with Garden Cress in Chap. 163; going on, to which you are referred.

CHAP. CLXVI.

Of CRESS Meadow, or, Cuckow-Flower, Double.

I. THE Names. This is called in Latin, Cardamine hore plena, (that it was known to the Greeks, I cannot learn) and in English, Double Meadow Cress, and Double Cuckow-Flower.

II. The Kinds. Taken as Garden Flowers, there are two of them, viz. 1. Cardamine hore plena, being the double kind of that Plant, which growing Wild abroad, is called, Cardamine altera, and Sulphurium alterum Desfertatis, allo Epicurian, but this Name is more usually given to the Wild fea thered Compin, both single and double; in English we call it Double-flowered Cuckow-flower, or Ladies Smock. 2. Cardamine triflota, Trefoil Meadow Cress, or Cuckow-flower, this is not truly a double-flowered Plant, but rather a Plant very full of Flow- ers, which at first sight makes it look as if it was double-flowered. These two being the fairest of all the Meadow Cresses or Cuckow-flowers, and for their Bonny being brought into Gardens, we thought bess to place them both in one Chapter.

All the Descriptions. The first double-flowered, but a Root which creeps under Ground, sending forth many small white Fibres or Strings, and shoots up in flowers places: from this Root spring forth several angled Leaves, tough and tender, lying on the Ground, very like to the Garden Cress kind, from among which rises up a round green Stalk, set bare, and there with the like Leaves that grow below, the top whereof has a few Branches, on which stand several Flowers, every one of them upon a small foot Stalk, consisting of many small oblong round Leaves, a little daft over with a blue Bleach, set round together, which make a double Flower.

IV. The second, or Trefoil Cuckow-flower, has a Root, composed of few several oblong Fibres, from the Heads whereof run forth small Strings, of a dark purple color, by which it encreases; from this Root spring forth several dark, round, green Leaves, a little uneven about the edges, and always three set together on a blackish short foot-Stalk, among which rise up small, round, blackish Stalks, six or seven inches high, with three small Leaves at the joints where they branch forth, from the tops of which grow many Flowers, consisting of four Leaves apiece, of a white, or very pale bluish color. The Flowers being pure white, thick and long Peduncle forth, in which is contained small round Seed.

V. The Platers. The first generally grows with us in Gardens, but is also found Wild in divers parts of England, as near Altrincham, about eight Miles from London, and in Lancashire. In several places: the other was brought to us at first from beyond Sea, and is here only musty up in Gardens.

VI. The Times. They flower usually in the end of April or May, but the latter of them commonly flowers before the former.

VII. The Qualities, Specification, Preparations, and Virtues, are the same with those of Garden Cress in Chap. 163, or with those of Water Cress, to which you are referred.

CHAP. CLXVII.

Of CRESS Wild.

I. THE Names. It is called in Greek, Ἀγάλλις (Agallis) in Latin, Nasturtium aggrega, Violaceum Syphyrra: in English, Wild Cress.

III. The Descriptions. The first of these has a long Root, which continues after a little time, from whence spring forth many small, round and hard Stalks, with several small, round and narrow Leaves growing thereon without Order, branched from the middle upward into many parts, at the tops of which come forth a great number of small white Flowers, (but some have been found with yellow Flowers, tho' not often) one standing above another, Spire fashion, after which appear Hooks, containing small Seeds.

IV. The second, or Carolinian Wild Cress, has a long and slender Root, with many Fibres proceeding from it, which also perishes every Year, from which Root grows up a round, given and hairy Stalk, about a foot high or more, and if it grows in rich or fértil Ground, sometimes about a foot and half high, sometimes but one Stalk grows up, and sometimes more, which Stalk or several Stalks send out branches from the very Ground, at every Joint above; the long winged Leaves, very much divided, like unto the

Common
Common Garden Cress, but yet more finely cut or divided, and sharp and tayle, like Cressets. The flowers are many, and of a pale yellowish color, standing in long Spikes at the tops, which being frayed away, small, sharp Pouches appear, divided into two parts, which stand not upright, but hang downwards, in which is contained several redish Seeds, like unto Cress Seed.

Stone Cress.

V. The third, or Rock Cress, has a small and thready perishing Root, from whence rise up several Leaves upon long foot-shafts, which Leaves are jagged and cut about the edges, much like to Oak Leaves, or rather the Leaves of Shepherds-parsley: from a midst these Leaves rise up several Stalks, with small jagged Leaves growing therein, one only at a place, without any foot-shaft, and not being above one, two or three in number, to the top of each Stalk: on which tops frayed Heads of Flowers very thick set, which are small, and of a white color, like those of the Garden Cress. The Seed is contained in small Pouches or Seed-yellets, which are flat, like to Tulipt, or Tracle-Muulrid.

VI. The fourth. The fifth grows Wild in the Fields, by Highways, and Hedge-sides, and among Rubbish, and in many other places. The second grows plentifully in many places, Wild in the Fields which have been formerly Manured, and afterwards lay as Fallow or Waste: I found a great quantity of it in Capt. Athol's Plantation up Wando River, not above four or five Miles from Charles Town in Carolina. It grows also very plentifully in the Kingdom of Valencia in Spain, (from whence it was brought to us in England) for which Reason it is called also Naffurium Synagroeborlum. The third has been found growing in Shropshire, in the Fields of Hork, in the Parish of Edgine, and in the Grounds formerly belonging to one Richard Herbert, and there in great plenty, also on the farther side of Black-heath, by the Highway side, leading from Greameb to Laffon.

VII. The flower later than some of the former Cressets, viz. in June and July, and the Seed ripens not long after.

VIII. The Qualities, Specification, Preparations and Virtues, are the same with Garden Cresset in Chap. 162. foregoing, and to them you are referred.

Salmon's Herbal. Lib. I.
Chap. 169. English Herbs.

manner, as they grow in height, and stand on the Stalks without any great Order. The Flowers grow as the tops of the Branches in flaked Heads, which with their Seed, are very like the former, the Seed of this Thistle as hot, sharp and biring, as the Seed of the other.

V. The Places. They grow by the Way sides in rough and unimpeared, and by the sides of old Walls, and ditch-like; they have been found in Corn-fields about Southfleet, near to Gravesend in Kent.

VI. The Times. They flower according as they are early or late in the Fields; but for the most part in June and July, and their Seed is ripe not long after.

VII. The Quality, Specification, Preparations, Fortuna and Ufes, are in the main the same with tho' of Garden Cress in Chap. 163, a foregoing. But more especially these are said to be Specchicks in curing the Sciatica and Gout in any Part.

VIII. Observation. A Cataplasme made of the green Leaves, but especially of the Roots, either alone or mixed with old Hogs Lard, and applied to the place pained with the Sciatica, letting it to lye on for four or five Hours in Men, and two Hours in Women, is said by Galen from Democritus, to cure the Diaphse, and not only this Diaphse in the Hips or Hucklebone, but all the Gout, and all other Pains and Aches in the Joints, whether of Hands, Knees or Feet. Likewise all other inveterate Grieues of the Head, or other Parts of the Body difficult to be cured, as vehement and long continued Catarrhs, universal Rheumatickes, &c. he also says, that Democritus cured hardly all those Diaphses, to which Simp, Thoppe and Thufpe are applied. Pityre cites the same method and manner of Application, and says farther, that if any part of the Grieue remaineth, that the same Medicine after twenty days is to be applied again. And applied to the Shin, it takes away the Blemishes thereof, as Freckles, Lentillis, Scars, Scabs, Scurf, Leprosy, &c. it is true, that it cleanseth or blusters the Part, but that is to be healed with a Balm made of Oil and Wax, with the Addition of a little Strachburgh Turpentine. After the Application of the Cataplasme in the Sciatica, Flarse, says, is to be bath'd with warm Water; or, as Parkinson says, with warm Wine and Oil mixed together; and then wrapped up with Wool or Skins, or a Lamb-skin may be applied thereto. It is also eaten broke open from the Creature. Disforbid and Pityre say, that if the Root is hung about the Neck, or tyed to the Arm, it will give ease in the Tooth-ach.

CHAP. CLXIX.

Of CRESS Winter.

I. THE Name. It is thought to be that Plant which the Greeks (as Disforid) call Κρέςσε, (the it is pronounced in the Text, which I hold to be alike in Turpin, B also Bausanis and Bysana, the Novoco or Wind Turnep, to which latter, this our Winter Cress is denoting a kin;) in Latin is called Naurprünum Herba, or Cress, Naurprünum Barbarea, Barbarea, Scallbarbe Herba, Scope Regia Anguillara, Sideritis Latifolia, Eruca, Eruca quinque genista Trips, and in English Winter Cress.

II. The Kinde. They are threefold, 1. Barbarea Vulgaris, Barbarea, five Erucatula lens, Norfullum, Palusse Cafferi, Eruca Vulgaris, Leander, (it is called alo by all the Names in the former Section,) Common Winter Cress. 2. Barbarea florae pleno, five Eruca lutes Bunchi, Double-flow néred Winter Cress. 3. Barbarea minor, Herba folefulis Alberti, Cressiflora, Small Winter Cress, or Winter Rocket.

III. The Greatness. The plant is greater after the perfellng of its Seed, from which rising up several Leaves indifferently large, and of a salt green color, lying upon the Ground, and torn or eaten into several parts, something like unto Rocket or Turnep; Leaves, but nothing like to Cress, which have smaller pieces next the bottom, and broad at the ends, which do abode all Winter. But it is rising up in Autumn, when it is used to be eaten either green or flowered from among these Leaves rise up divers small round Stalks, which spread themselves into many Branches, bearing in a welldone manner many small yellow Flowers, each having four Leaves apiece, which being past, small long Pods come forth, containing small reddish Seed within them.

IV. The second, or double-flowered, is a Root like the former, which perishes not in Winter, but abides many Years: the Stalks are bigger than the former, and creased within. The Leaves are shorter, and are about an inch in length, cut in on the edges in the same manner as the others are. The Flowers are yellow, like the former single, but something larger, and double within, which makes the greatest part of the difference.

V. The third, or Small Winter Cress, has a Root like the last, and perishing as it is, from which spring forth blackish green Leaves, somewhat jagged or torn in on the sides, resembling Moth-mullein: the Stalks and Leaves both are less than the last, but grows so high. The Flowers are yellow alfo.
Salmon's Herbal.

Lib. I.

CHAP. CLXX.

Of CRESS Water.

1. The Name. It is called in Greek,  Κρέκσα Λατεία, in Latin, Nauflurtium aquatilium, and in English, Water-Cress.

II. The Kind. There are four several sorts of this Plant, viz. 1. Nauflurtium aquatilium vulgaris, which is generally taken to be the Sifymbrium aquaticum 

Dioscoridis, and by Celspinus and Thebanoponemum, it is called Sifymbrium aquaticum; by Cordco, Grefter and Thorow, Sifymbrium aquaticum, by Fachter and Lugandertui, Sifymbrium Cardamome. The Common or Vulgar Water-Cress. The second is called, Nauflurtium aquaticum roundifolium major, Sifymbrium aquaticum Matthioli, Sifymbrium aquaticum Species fecundae Thelii, Nauflurtium aquaticum obtusum, & aquaticum omarum Baubuli. The Greater round-leaved Water-Cress. 3. Nauflurtium Aquaticum roundifolium minus, Sifymbrium Aquaticum minus Matthioli, The Lesser round-leaved Water-Cresses. 4. Nauflurtium Aquaticum erectilum folio singulario Baubuli, Siam vulgaris Matthioli, Siam Matthioli, Siam vulgaris Leblati, Siam Lugandertui, Matthiolus his Water-Cress, or the Italian Water-Cress.

III. The Llciations. The first has a long Root, which is filled with nothing but Knots or Bunches of white Fibres or Threads, from whence spring forth many meats, hollow, sappy Stalks or Branches, trailing upon the Water and gravely Earth where it grows, taking hold in several places as it creeps, by which means it spreads it self very much, shooting forth Fibres at the Joints. As the Stalks grow upwards, they are filled with long winged Leaves, holding many small Leaves, set upon a middle Rib, one against another, excepting the point Leaf, which stands by its self, as does that of the Alb-tree. The upper

Water Cresses
Chap. 170. English Herbs.

upper face of the whole Plant is of a brown green color, and the Leaves are green underneath, which, few Gerard, is the perfect mark to know the Physic- cal kind from the others. The Flowers are many and white, standing on long Foot-Stalks at the top of the Branches; which being past away, are succeeded by a like number of small long Pods, like Horns, which contain within them small yellow Seed. The whole Plant abides green in the Winter, and takes sharp and bring, somewhat like to other Clefts.

Water-Cresses round the Great.

Water-Cresses round the Great.

the joints from whence rise one or more Stalks, which are hollow, weak and soft, with a great number of long winged Leaves, which are made up of several broad, happy, and almost round Leaves, of a reddish brown green color on the top, and green underneat: when it runs up into Stalk, the higher Leaves are longer and more pointed, yet round pointed without. The Flowers grow at the tops of the Branches, like the former, nor- dthe Pods and Seed differ much therewith from Parkin- says, that it is so extremely bit, that it cannot be eaten till it is boiled in Water, and shifted again: I have seen it grown several times, and have gathered it, but never could find that bitter Toffe in it, but only a very sharp being Toffe, like other Clefts; Matthiolus says, Naturitious fimile quiddam gudii præterit.

V. The third, or lesser round kind, has a white fibrous Root, from whence spring forth a great number of long winged Leaves, very like to those, in their Substance and Form, being fat, broad and roundish like them, but very much lisi: from amidst these Leaves spring forth several long Stalks, when run up to Seed, which are almost naked, save that here and there they have a single winged Leaf, cut into fine long slender parts, almost to the middle Ribs. The Stalks at their tops, abound with a great number of little Branches, filled with small fine sub- ticel Fowers, which in the very tops of all, appear exceeding small and diminutive, so as they are not easy to be seen at ander.

VI. The fourth, or Italian kind, has a long Root, which creeps not so much as any of the former, nor in so full of Fibres: the Leaves grow many on a winged Stalk, and differ not much from the first, sav- that the Stalk is crested, and the Leaves are denuded or frignt in a little round the edges, Being in shape between the Garden-Cress and Chicon-ower, the Stalks are crested, and divided into many Branch- es: the Flowers are white, which being past away, are succeeded by Ceds, like the Ordinary or Common Water-Cress, and with the Seed. The Toffe of both Herb and Seed is more mild and pleasant than that of the other Water-Clefts.

VII. The Place. They all grow for the most part in small running Waters; and sometimes in small Rivulets of running Water: but the last is sometimes found growing in Gardens.

VIII. The Time. They spring and grow green in March and April. That Water-Cress which is eaten in Sallets, is best in March and April: they grow wild all the Summer, and flow in June and July, their Seed ripening in August.

IX. The Qualities. They are hot and dry in the third degree: are Diuretic, Cephalick, Nervotick, Somanicket, Hydropick, Nephtick, Alekthamick and Antifcorbick.

X. The Specification. They are peculiar against the Scurvy in a cold Habit of Body.

The Virtues.

XII. The Sallet. It is made of the green Herb, gathered in March and April, pickt and washed clean, and dressed up with Salt, Vinegar and Oil, or Sugar, and so eaten raw: it is generally eaten in the Spring time, to clear and purify the Blood, sweeten the Juices of the Body, and cure the Scurvy.

XIII. The liquid Juice. It is more powerful than that of Brooklime against the Scurvy in a cold

Habit.
Salmon's Herbal. Lib. I.

I. The Notice. This Plant, as it was unknown to the ancient Greeks, so it has no Greek Name retaining to it; but it is called in Latin, Crucis, Cruciat, and Crucifer, from the Situation of the Leaves. Thistle calls it Crucis herbaria, and Label, Crucis minor, to distinguish it from Orient-Cruci, or Cruce. Larpent calls it Affernum versus, for its primus est Grinnia Crucis, Backian calls it Crucis herbaria, in English, Crosswort, or Crosswort, and Golden Crosswort.

II. The Kinds. Authors make four kinds thereof: as, the Crucis vulgaris, our Common Crosswort; Crucis minor, Smal Crosswort; or Crucis minor, Small Mountain Crosswort; and Crucis minor, Small. The Watt Crosswort; but as there is one but one, and that is the plant of a thorn, which grows in England, so we have the Pains only to describe it here.

III. The Description. It has a Root which is very firm and full of Fibers, which raising hold of the Earth, forces with the Branches over a great deal
of Ground, which perishes not in the Winter, the Leaves die away every Year, and Spring again thereof. From this root springing up fquare burry brown Stalks, something more than a foot high, having four or five small, broad and pointed burry, yet ferny, not ragged, yellow green Leaves, growing at every Joint, each against other crops-safe, from whence proceeds the Name. Towards the tops of the Stalks, at the Joints with the Leaves, in three or four rocc upwards, stand small, pale, yellow Flowers, after which come small, blackish, round Seed, four to the most part contained in every Herb.

IV. The Place. It grows in many moif Grounds, as well Meadows as other wild and unfettled places about London: in the Church-yard at Hambleden, near London: at Wye in Kent: at Rand, near Ringmore in Saffox, along the High-way; and in a Flower adjoining the Church-yard at Hambleden by the Mill: also in a Lane or High-way beyond Charlton: a small Village near Greenwich, and in several other places.

V. The Time. It flowers for the moft part from May all the Summer long, in one place or other, as it grows more or less in the Sun, and the Seed ripens from after.

VI. The Quality. It is temperate in respect of Heat or Cold; and dry in the second degree. It is singularly Affrangent; and admirably Traumatick or Vulgarick.

VII. The Specification. It is dedicated to the Cure of green Wounds, Ulcers and Ruptures.

The Virtue. IX. The Liquid Juice. Taken to 2 or 3 ounces in Red Port Wine, or Wine mixed with Water, it helps the bleedings of inward Wounds, and confolates and heals them: applied also outward to green Wounds, it does the fame, for by cloathing the Lips of Wounds quickly together, the Cure soon after succeeds.

X. The Essence. It has the Virtues of the Juice, but more powerful for the fame Intention: Calomelum Testa lets it helpes to expellate Flegm out of the Throat, and is good against the Obflurations of the Lungs or Stomach: as also other Obfcurations in the Meferick Veins, Latacles, and other Vifoms. Dofe 2 or 3 ounces in Wine, or Water.

XI. The Decoction. It has the fame Virtues with the Juice and Essence, but not fall out of the Body: nevertheless, (the Decoction being made in Wine, or in Water with Wine added to it) it is often given as a Wound-drink, in which way of Exhibition it is very efficacious: and mixed with Spirit of Wine, it is good to cleanse old running Sores, and purifie Ulcers, cleaning the fame, and inducing them to a speedy healing. It cures also Ruptures.

XII. The Pouder. It is made of the dry'd Leaves Taken to a dram Morning and Evening, it is good to stop any inward Bleeding, fifting of Blood, or Blood of Blood, or bloody-flux: the fame it does alfo being applied to any bleeding Wound. It alfo dries up Moifture in Ulcers, and stops the Flux of any running Sore, being applied after washing the fame with the Juice, Essence or Decoction of the fame Plant before specified.

XIII. The Ointment or Balsam. They cleanfe, and are admirably drying and healing; give Eftc. where the Pain is extravagant, alay the Infammation, breed Fleshs where it is wanting, dry up the Moifture, and produce the Clearneffe in a very short time.

XIV. The Caraphis. Made of the green Herb with the Pouder of the dryed Herb, and applide, it stops the Bleeding in Wounds, over the Head, or other Afflux of Humors, and to by confluence Pain and Infammation. Applied to simple Contusions, it difflufes them, and quickly refores the Part to its former State of Health.

XV. The Spirituouf Tincture. It heals inward Wounds, and stops inward Bleedings, refores the Tone of the Bowels being hurt, is good against Ruptures, bloody-fluxes, Diarrhea, Lungs, or the Hepatick-flux, and has indeed all the Virtues of the Juice and Essence. Dofe 1 or 2 ounces in Wine, or any other in Vehicle.

XVI. The Acid Tincture. It is good to expellate tough and viscous Humors, opens Obfcurations of the Vifoms, strengthnes the Stomach, and helps a decayed Appetite: it may be taken inwardly in Wine to a grateful Acidity every day, two, three or four times a day: if mixed with Water to a Gravy-flushes, and a little delphic with Syrop of Cau- giufifows, it alteres the Heat of Fevers, allays Infammations of the Lungs, quenches Thrift, and reprefves Vapors, being taken as ordinarie Drink.

XVII. The Oil Tincture. It is eminently good against Pains of the Nerves, heals nervous Wounds, gives cafe in the Gout the never to extream, and in a short time cures it; it fhinnes the Joints, and is singularly good againft Convul- sions and Palfies, being duly anointed upon the Parts affected.

CHAP. CLXXII.

OF CROWFOOT Meadow.

THE Name. It is called in Greek, Baphetos, (Frog-swort:) in Latin, Renunculux, alfo Pes Corvi, and Pes Corvius: in English, Crowfoot, King Cole, and Cold Caps, and Bitter-fowers.

1 2 12

11 2
Salmon's Herbal.

II. The kinds. Authors are in a Wood about this plant, and make so many general kinds thereof, that it is difficult to reduce each Species to its proper Class. However, since we intend only to treat of them which grow in England, (setting aside the Rumanated Montani, which were never known to grow with us in our Country) and that we may be intelligible to the Vulgar, we shall divide them into the five following Classes, viz. 1. Barley-colored, 2. Tuberous, 3. Knobbed, 4. Flaxen, 5. Globe. Of these, the noblest is the last, which is the Garden which is the Chrysanthemum, and the noblest of those which are in the following Classes. 1. Barley-colored. 2. Tuberous, 3. Knobbed, 4. Flaxen, 5. Globe.

Common Meadow Crowfoot.

V. The second, or sweet kind, has a Root consisting of many white Fibres, as the former, from whence rises several great, broad, dark, green Leaves, spread upon the Ground, a little hairy, and in the edges to five Divisions, and a little denting about, especially at the ends, and of a pater yellowish green, on the under-side, of a sweet and not unpleasant Toffee, for I call it Sweet Crowfoot, not because it smells sweet, but because it has no sharp, biting or nauseating Toffee, as most of the other Crowfoots have, being so sweet, soft and pleasant, that the People in many places do frequent it when they are young, with other Herbs, to eat them after the manner of a boiled Sallet. From these Leaves rise several hairy Stalks, a foot or foot and half high, with some Leaves upon them more divided, and cut into smaller and narrower parts than those which are lower. At the tops of these Stalks and Branches hand many fair Golden yellow colored Flowers, such yellow Thrums in their middle, so very like to the former Common Meadow Crowfoot, that they are of them, being as much as any other Plants, and Seed following them are also like the other before described. Of this kind there is one also with double Flowers.

VI. The third, or creeping kind, has a white and thread Reel, from whence spring forth several Leaves, which are divided into many parts, commonly into three, sometimes into five, cut here and there in the edges, as if they were fringed, of a deep green color, upon which are found divers yellow Spots. From among these Leaves spring up the Stalks, which are round...
broad, dark green Leaves near the Ground, standing upon long Foot-stalks, which Leaves are deeply cut as jagged into five, six or seven pieces, and besides some in or demarcated on the edge, among which rises up a S-thall, divided towards the top into four Branches; on the stalks are set fuch-like Leaves as are below, but smaller. On the tops of the stalks and Branches grow several large fair yellow Blossoms, consisting of five Leaves opposite, or rather of eleven Leaves for the most part, set or placed in three rows, and always folded towards, or sowed up together like a round Ball or Globe, like a clofe Flower never blossoming, (from whence came the Name:) they have many yellow Threads in the middle, standing round about a green rough Head, which in some grows to be full of small Knobs, wherein is contained small black Seed.

IX. The Placer. They all grow in Fields and Meadows, or Pature-Grounds, thro' all England, especially the four fift Kinds. The fifth kind grows wild in most places of Lancashire and Yorkshire, and other bordering Shires in the Northern parts of this Kingdom, almost in every Meadow, but has not been yet found wild in any of the Southern or Western parts of England.

X. The Time. They flower in May and June, and the Seed is ripe in July and August.

XI. The Qualities, Specification, Preparations, Virtues and Uses, see in Chap. 176. following, where they will be handled at large.
The Kind. It is a singular Plant, and is called by Lobe in his Index, Ranunculus arroriam, and is the same with Ranunculus avensis Gefferi, Ranunculus arvensis echinatus Bauhini, Ranunculus fogetalis Cordi; Ranunculus Syvofi tragi Virgi- 
fus & Labezii in Observationibus, Fallow-field Crowfoot.

III. The Description. It has a small white foot, from above finely forth some deeply puffed leaves upon long-stalks, but smaller than any of the former, and divided into many narrow parts, of an over-green color; they are fat and thick, much puffed, and something resembling in some Gerard) the Leaves of Sumpire, but not near so green. From among these leaves rises up a stalk about a foot or more high, which towards the top is divided into other branches, the leaves on the higher part of the stalk are more puffed or divided than those which are lower. The flowers grow at the top of the branches, which are consisting of five small leaves, all green or faint yellow color, which being puffed away, there come Cynthia of rough and sharp-pointed seeds, as it were in heads, many together.

V. The Places. It is found chiefly in Ploughed Lands and Fallow Fields in many parts of England, the Latin is called in Ranunculus arroriam, because it is commonly found in Fallow Fields, where Corn has lately been sown, and so may be called Corn Crowfoot.

VI. The Times. It flowers in May and June, the seed ripening in the mean while in August and September.

VII. The Qualities, Specification, Preparations and Virtues thereof are the same with the Common Mead Crowfoot, which may be found at large in Chap. 176. Following.

246 Salmon's Herbal. Lib. I.

Of CROWFOOT Wood.

I. The Name. It is called in Greek, Barbebo, in Latin, Ranunculus Nemorius; and in English, Wood Crowfoot.

II. The Kinds. 1. Ranunculus nemorius albus simplex, Ranunculus Plagiocephal Coper, Ranunculus Syvofi Tragi. White single Crowfoot. 2. Ranunculus nemorius albus minor, Ranunculus nemorius Anemone, yellow Crowfoot. 3. Ranunculus nemorius flore minor Bauhini. The leaf or leaff white Wood Crowfoot. 4. Ranunculus nemorius flore Canes, flore purpureo. The single blath and purple Wood Crowfoot. 5. Ranunculus nemorius albus major. The yellow Wood Crowfoot. 6. Ranunculus albus major. The leaff white Mountain Crowfoot. 7. Ranunculus Virginiensis et Virginianus, White Virginia Crowfoot. 8. Ranunculus Americus, Sweet Wood Crowfoot. 9. Ranunculus montanus albus minor simplex, Ranunculus Alpinus albus. The leaff white Alpine Crowfoot. III. The Description. The leaf or White single Crowfoot has a root commonly of the bigness of a Withen Strode, not growing right down, but creeping at length, having the upper root of the Earth, spreading into several small knobs, like Branches or Arms, of a dark brown color on the outside, and white within, of a sharp being leaff, infuming the Month. From this arises up two or three stalks, about an Hand breadth high or more, about the middle whereof come forth usually three Stalks of Leaves, each being something broad, hard, and cut in on the edges into three parts, of a flat green color, and dented also: the Stalks rising to a certain height, bearing at the top one single flower, hanging down the Head for the most part, consisting of six Leaves, somewhat broad, and almost round-pointed, of a light blueish color on the outside, before it is blown open, but white afterwards, and more white on the inside, having a few white Threads in the middle, tisp white, standing about a green Head, which growing ripe in length of time, as something like the other Heads of Crowfoot, composed of many small Seeds compounded together.

Single white wood Crowfoot.
thing brownes, and its Flower of a pale purplish blood color, (from whence it is called Kamemusus nemorosus, more purpureus caeruleus,) as was a pale Violet Flower, without any great Smell. These three, as all the kinds the Italians call Wild Ginger, either because the Roots of them all are very floribund, and bring up many flowers, like Ginger, or because their Roots do grow a little spreading into several Arms or Tuberosities, like to Ginger.

VI. The fourth, or yellow kind, has Roots very like to the first described in this Chap. from whence spring forth yellowish Stalks of Leaves, and growing in the same manner, but the Leaves are not so broad, nor so hard in huding, and are more deeply cut into more long and narrower parts, each also dented about the edges, especially about the ends of the Leaves, which are of a darker green color. From between these Stalks of Leaves grow forth sometimes but one, and sometimes two or three Stalks, at the top of each of which grows one flower, something smaller than the former, confining generally of six or seven, and sometimes of eight Leaves, which are of a fair pale yellow color, with many small Threads or the middle, which being past away, there succeed like Heads of Seed, in the same. These Flowers have the least Smell of them all. And unto this kind belongs that sort of Anemones (but rather Crowfoots) which Doxamone calls Trifolia, having the Leaves parted into three, five about the edges, and which bears a one

Golden haired Crow foot

on the Stalk, are full more divided than the former.

The Flowers are small, and of a fair plain Gold-yellow color, standing at the tops of the Stalks, like unto the Common kinds of Crowfoots. After the Flowers are past away, come the rough Heads, like a small Starworts, in the manner of other Crowfoots have, in which Heads are contained the Seed, many siks together.

VIII. The fifth, or letfer single white Mountain Crowfoots, has Roots greater than any of the hundred of Crowfoots, from which Root spring forth four, large, soft-spread Leaves, (standing upon a long foot-stalk,) which are cut into fine Disheets, and somewhat dented about the edges, green on the upper side, and paler underneath, having many Veins running through the Leaves; these Leaves are like those of the Common Crowfoots, but greater, of a deep green color, much like to those of the yellow Acorn, called Acomnut lum Ponticum: it has great fat Stalks, about two feet or more high, spread into many Branches, at the tops of which come forth white Flowers, consisting of few Leaves spire, with many small yellow Threads in the middle, smelling like the Flowers of May or Haw-Thorn, but more plesant, after which comes the Seed, which is contained in Heads, like to the other Crowfoots.

IX. The aterleaf (or Virginia Crowfoot, has a reedish, thick, tuberous Root, with some fmall fibres springing from it: from which shoot forth three or four fomewhat large, broad, caldbrighty green Leaves, upon long foot-stalks, rent or torn at the edges for the most part, among which rises up a flinder, round, naked Stalk, fixed, fixed or more inches high, bearing one white clover at the top, made of five or six outside small, narrow and pointed Leaves, with a few yellowish Threads in the middle, set a greenish Head, which in time grows to be a long fender staff, in which is contained round whitef Seed.

X. The Flaxen. They are almost all found growing in Woods, Groves and Orchards in most places of this Land. The fourth is found as well by Breeks, fide, which pass by Meadows, as in Woods, and by Hedge-fence. This is called Rhinocilus Alpinus, because that which first found it, met with it upon the Alpine Mountains; however, since it has been found to grow plentifully Wild in England, especially in Hampden Hill, from whence it has been transplanted into Garden. The seventh bears in its Name the place of its Growth, but it has been found in many other parts of England.

XI. The Ram. They flower pretty early in the Spring, sometimes in March, but for the most part in April, and sometimes in May; and the Seed is ripe in June, July and August.

XII. The Fluid, Specification, Preparation, Virtue, and Use, see in Chap. 176. their being of the same Nature with those others, where you may have them at large.
the Crowfoot, yet they have nothing of the Form, and we think that nothing more than the Tail ought to conclude the several Species, otherwise Ginger may as well be admitted into the Eme Stock, which I am sure no Herbist will ever grant: for this Reason we refer you for the three aforesaid kinds of Plants to their proper places, which you will find in some of the following Chapters of this Book.

III. The Water Crowfoot then, which is but treated of in this Chapter, are four: 1. Ranunculus aquaticus vulgaris major, Ranunculus aquaticus Hepatica folio Lobatis; Ranunculus aquaticus Diomed; Hepatica aquatia Lagunenfis. 2. Ranunculus folio rosando & capillus Baebi, The Common greater Water Crowfoot. 3. Ranunculus aquaticus Communis minor, Ranunculus Hederata folio aquaticus. The lesser Water Crowfoot. 4. Ranunculus palustris Sardinius levis, Strumos, & Apium Firmum, by some Apium Riffair, Herba Sardini Comandoni, (who says, when he was taken Prisoner by Pyrates, and carried into Sardinius, he saw this Herb growing plentifully there.) Apium aquatium Tragi, Apium Cordis. Scleratae Apusae, Ranunculus palustris Cordis in Historia Lugunenfis, Thulsi, &c. Ranunculus palustris Apis folio lavo Baebi, Ranunculus palustris restando folio Lobati; Smooth-leaved marsh Crowfoot. 5. Ranunculus palustris Sardinius lagunensis, Ranunculus Sardinius versus Dioscoridis; Ranunculus Sardinius Ancilarsia, Apium Sylvestris, Ranunculus palustris Apis folio longanumus Baebi; Ranunculus palustris secundus Matthioli, Cordis in Historia, The true Sardinian Marsh Crowfoot.

V. The second, or Small Water Crowfoot, with Alchoof or Ground-ivy Leaves, but a great number of fibrous Roots, from whence some long, fìnder, trailing Branches or Stalks, shooting forth at almost all the Joints under Water many other fibrous Roots, by which it spreads and very much increases at Felt, from the several Joints, as well under as above the Water, spring forth several small roundish, indented Leaves, not much unlike to those of Alchoof, standing each upon a pretty long foot-stalk: from some of the Joints with the Leaves, and at the tops of the Stalks, come forth pulfûl Flowers, having six pointed Leaves apice, which being past, many, near roundish Heads of Seed after them.

VI. The third, or Smooth-leaved Marsh Crowfoot, but for a Root a Bath of small white Fibres, from whence float forth several Leaves upon long foot-stalks, rather than those growing higher upon the Stalk, and not so deep cut as, but dented about the edges: from among these Leaves float forth a round bottomed Stalk, near a foot and half high, spreading it self forth into several Branches, the lower Leaves whereof are more round than those above, and are divided into three parts, which are the first and lowest, where into five Divisions, and each of them divided about the edges, somewhat like unto Coriander Leaves, smooth, and of a pale green color; but those up higher on the Stalk and branches are still more and more divided, so that some of the highest have no Division or East in them. All the tops stand small yellow Flowers, but Coriander has: he hath observed some to bear parplefish: which being past away, there come in their places small, long, round Heads, of many crooked Seeds for together, as in some other Plants is to be seen: the whole Plant is as hot, sharp, biting, and as excruciating as any of the other kinds, whether of the Lard or Water.

VII. The fourth, or True Sardinian Marsh Crowfoot, has a Root consisting of a Bunch of white Strings, from which spring forth several large winged Leaves, upon foot-stalks of a moderate length, divided into several parts, and dented about the edges: from among which spring up one or more Stalks, spreading themselves out into divers Branches, on which grow Leaves, some winged, and some single Leaves.
Chap. 176. English Herbs. 249.

Leaves not mingled, more divided than the former kind, and so much nutty, as if there was a small soft Coton upon them; at the tops of the Branches and Stalks come forth the buds of flowers, consisting of fine broad-paintèd Leaves above, each Leaf being on its end hollowed in a little, which being past by a way, there succeed Heads of Seed, much like to the former.

VIII. The Places. These all grow in moifft, wet and marsh Grounds, and sometimes by the sides of Waters, Ponds and Ditches; and in plain places. The firft is common in many places of this Kingdom: the second is more rare to be met with: the third and fourth are often found, but not altogether to frequent to be seen as the first.

IX. The Times. They all flower in May and June, and their Seed is ripe some time after.

X. The Qualities. Specification, Preparations, Virtues and Uses, fee in the following Chapter, thofe being of the fame Name and Temperature with the former and thole following.

CHAP. CLXXVI.

Of CROWFOOT Garden.

I. The Name. It is called in Greek, Baraganthus, in Latin, Ranunculus montanus; in English, Garden or Manured Cereus.

II. The Kinds. Of the Ranunculus which flowres now rofl their Gardens withal, there is fuch a great number of them, that it would not be eafy to name them all, much lefs to defcribe them; a great part of them being originally Exotic or Foreigners, but being brought to us, and profligating well by a Cultivating in our Gardens, they were made free Denizens, (as it were) and fo length became Natives of our Soil. The chief of thofe which we fhall take notice of in this Work, are the eighteen following.

IV. The Defcription. The firft, or Great fingle white Mountain Cereus, has a Root compofed of many long, thick, whitish Strings, running out from a thick Head. From this Root spring forth large and green Leaves, divided into three parts, and sometimes into five fpecial Divifions. From the lower parts of these Leaves are detaind about the edges, somewhat re-sembling the Leaves of Globe Cereus, but larger. The Stalk is two feet and half high, having three small Leaves, fett at the front of the Stalk, whereof two are divided into Flowers, which stand four or five together upon long foot-flifts, made of four white Leaves apiece, very fweet in Smell, with some yellow Threads in the middle, enclofling a green Seed, which, with the Seed, is very like to other Cereus of the Wild kind. There is one of this kind which is alfo fower.

V. The second, or Low double white Mountain Cereus, has a Root compofed of many white Strings, from whence proceed three or four broad thick Leaves, almost round, and pretty deeply cut in the edges, of a fine green and flowing color on the upper fide, but not fo green underneath; and which ripes up a fmall foot Stalk, bearing one Snow-white flower on the top, pretty large, and a little double as it were, with two rows of Leaves, with fome yellow Threads in the middle, standing about a green Head, which in time grows to be like a fmall green Strawberry, and full of Seed. There is alfo a fingle sort of this kind, having only one white fnower on the top of each Branch, which is fower, and confifts only of fome round-pointed Leaves, being in all things else like the other.

VI. The third, or Double white Cereus, is of the fame kind with the firft, but fower, its Roots, Stalks and Leaves being alike in all repects: the chief Difference is in the whites, which in this Plant are very thick and double. The Leaves are fair, cut into five Difjions, and very little dented about the edges, green on the upper fide, and pale under-neath, having many Venus running thro' Jbe Leaves: the Ska is grows not very high, not much above a foot and half in height, which is fpread into many Branches, whose tops are reafonably fivered with double white Flowers, as afperfion.

VII. The fourth, or Double yellow Field Cereus, has a Root running and creeping under the Ground, like the finge does, from whence proceeds its Leaves and Stalks, in which there is but little difference from the fingle Wild kind, which grows in every Meadow, being fpread into four or five parts, and intented about the edges, but they are something fmalier, and a bit fherer green. The Flowers fpread on the many Branches, much di-vided or separated, being not very great, but very thick and dowe.

VIII. The fifth, or Great English Garden double yellow Cereus, called alfo Batchelors-buttons, has a Root round, like unto a small white Trump, with several Fibres adjoining to it: from which arife maf-ry great black, green Leaves, jagged and cut into three Difjions, each to the middle Rib; from among fome Leaves spring up the Stalks, which fpread themfelves out into feveral Branches, and which have fome smaller Leaves on them, and fohe which are next under the Branches, are long and narrow, the higher up, the longer and narrower. The Flowers are of a greenly yellow color, very thick, with about of Leaves; in the middle of which ripes up a fmall Stalk, bearing anther double Flower, like to the o- ther out of which it grows, but smaller, which being paff'd away, there comes a round, though head of Seed, much like to the other Cereus.

IX. The firft, or Double-rowelled Graslike Cereus, has a Root compofed of many thick, long, and round,
round, whose Strings, from whence proceed long and narrow Leaves, furnished like unto Grass, or rather like to the Leaves of single Gillflowers or Pinks, being slender and sharp-pointed, a little bottom, and of a yellowish green color. From among these Leaves springing up several finer Stalks, bearing at the top each one small yellow Flower, which is double, and consists of two rows of Leaves, with four Threads in the middle. There is also a singlesort of this Species, the Flower being small, and consisting of five yellow Leaves, with yellow Threads in the middle, like to other Crowfoots.

X. The seventh, or Broad-leaved Candy Crowfoot, has a Root somewhat like that of the Afiom Crowfoot, or composed of a number of tough Roots, like those of the yellow Alpholid: it has the greatest and broadest Leaves of all the Crowfoots, being almost round, and without any great Driftions, dintro a little about the edges here and there, as large or larger than the Palm of one's Hand, of a light green color, yet some of the Leaves are here and there deeply divided. Among these Leaves rises up a flower very high when it bears first flowers, but afterwards as the Flowers do open themselves, it grows to be about a foot and half high, having some Leaves on it deeply cut in and divided. The Stalk is also thick, round and stiff, and Roots it fell forth into two or three Branches, at the setting on of which grow several Leaves, a little dished about their ends. These Branches bear many fair yellow Flowers, consisting of five round-pointed Leaves above, standing each a little distance from other, so that the green points of the Cyps there themselves between them, and having yellow Threads in the middle, but become somewhat whitish when the Flowers have first blown a little time.

XI. The eighth, or White Candy Crowfoot, has a Root consisting of many small Grains or Kernels, of a dark or darkly greenish color, set together, and its Leaves are very like to the Leaves of the Red Afiom Crowfoot, being somewhat broad and inclined about the edges, some of the Leaves being cut in or softly, making thereby as it were three Driftions, of a pale green color, with many white Spots in them. The Stalk rises up a foot high, with some Leaves on it, bearing more divided than the lower, and divided at the top into two, and sometimes into three Branches, each of them bearing a fair Snow-white Flower, something large, included at first in a brownish green or pale Cup of Leaves, which afterwards stand under the Flowers, consisting of five white, large round-pointed Leaves, having in their middle many blackish purple Threads, encompassing a single, long green Head, composed of many Stalks, or chaffy white Heads when they are ripe. They yield Seed, but it is unpouched, as yielding no new Plant. Some of this kind have their Flowers purplish-pale, some again have their Flowers with Veins of the same purple, and some of them are edged with a bright red color, not differing in any other particular.

XII. The ninth, or Single red Afiom Crowfoot, has a Root made of many Grains or Small Kernels set together, and elating at the Head, but spreading it self, if it likes the Ground, under the upper Craft of the Earth, into many Roots, springing from long Strings which run from the middle of the small Head of Grains, as well as from the Head itself. The lower Leaves are always whole, without Driftions, being only somewhat deeply indented about the edges, but the others which rise after them, are more cut in, sometimes into three, and sometimes into four Driftions, and mixed also about the edges. The Stalk rises up with the first, and any of the former, and has on two or three smaller Leaves, more cut in and divided than those before, at the top whereof stands one large Flower, consisting of six Leaves, every one of them being narrower at the bottom than at the top, and not the least resembling one to another, but with a certain distance between, of a darkly yellowish red color on the outside, and of a deep red in the inside, the middle being set with many Threads of a dark purple color, being sometimes stiffly or softly and very profitable for fasting, as in springing again.

XIII. The tenth, or Large single red Afiom Crowfoot, has a Root much like the former, its Leaves are broader and greater. The Stalk is much of the same height as the other, and branching out, with like Leaves thereupon: the Flower is also larger, and the Leaves thereof broader, being sometimes eight in a Flower, standing round and close one to another, of a deep red color, which makes it look the fairer, and have the more excellent show: in all other respects it is the like to the last.

XIV. The eleventh, or Single red Bipt Afiom Crowfoot, has a Root, Stalk and Leaf very like to the two last foregoing, and in the manner of growing, differing chiefly in the Flower, which being red, has the two foregoing, but yet some yellow Stripes or Veins throug every Leaf: these Stripes are sometimes few and little, and sometimes so much that it seems to be partly colored red and yellow. It is a very tender Plant, and apt to perish, unless carefully looked after.

XV. The twelfth, or Single yellow Bipt Afiom Crowfoot, has a Root not much unlike to any of the three last described, but the Leaves are very different, being very much divided. The Flower is large, of a fair pale green yellow color, consisting of six and seven, and sometimes of eight or nine round Leaves, the tips of which have reddish Spots upon them, and the edges also sometimes, with dark purplish Thorns in the middle as the other. It has been observed, that none of the kinds of Crowfoot with these kernelsly Roots, ever bear so good Seed, which being small, will furnish up and grow in England, so that with them they can only be propagated from their Roots, by a careful and skilful looking after.

XVI. The thirteenth, or Double red Afiom Crowfoot, has a Root so like to the Single red kind, as fol. 213 above, that none can perceive any difference between them, for also it is the same in its Stalk and Leaves, that the difference or kinds are never. As known till the Buds of the Flowers do appear, which after it is any thing forward, may be perceived to be greater and fuller than the Buds of the single kind. This double form bears more commonly but one large double Flower on the tops of the Stalks, composed of many Leaves set close together in three or four rows, of an admirable Crimson color, declining to Scarlet, the outer Leaves being larger than the inner, and instead of Thorns, it has many small Leaves set together. It has also six small, narrow, green Leaves on the backside of the Flower, where the boot begins to it.

XVII. The fourteenth, or Double buttoned red Afiom Crowfoot, has Roots, Stalks, Leaves and Flowers so like the former, that before the time of flowering they are not to be distinguished one from another. The Flower is of the same Color and Duplicity, but herein they differ, that this has another double Flower growing upon a Post-flaithe yellowing out of the middle of the Half Flower, of the same color, but much smaller, which Gerard thinks doth happen by reason of the Strength of the Root, and Girdle yap the Soil where it is planted. It is a noble Flower, and of great delicacy, and grows in the same kind Garden.

XVIII. The fifteenth, or Greater Columbus-leaved Crowfoot, has a Root made of a stuff of white fibers or
Chap. 176. English Herbs.

XXII. The Places. The Names of most of these Plants flow where they originally came however, by Transplantation, they are now Natives of our own Land, being all of them found in some of our Gardens, or other districts of our Sallies, where they flourish admirably well.

XXIII. The Timers. The Broad-leaved Candy Crodfoot flower more early, viz. in March or April; the others flower from April to the end of June, and the Sod is ripe in July and August.

XXIV. The Qualities. The bot, biting and excruciating kinds, (which are those only which Virtues we design to give you in this place) are hot and dry in the fourth Degree, and congealing.

XXV. The Specifick. They are peculiar for curing the Scrofula or Kings-Evil.

XXVI. The Preparations. You may have thereof, 1. A liquid Juice of the Roots or Leaves. 2. An Effence. 3. A Powder of the Roots, Flowers or Leaves. 4. A Cataplasme of the Sallies. 5. A Solution. 6. An Ointment. 7. A distilled Water. 8. A distill'd Water upon the Flowers, sowe for the Leaves, but they may be all taken and used promiscuously, according to the Intentions; but none of them be used inwardly, being but little better than Poison, by reason of their excruciating Property; none especially the Ulterian Crodfoot, which some call Apium Sydneysre, and some Apium Bisus, but is not the true Ulterian Bisus, of which we speak in its proper place. But as to this Ulterian or Laughing Crodfoot, if it is taken inwardly, it is said to cause the Peron to see false Sights, and to kill them Laughing: without doubt, it hurts the Sentences and Understanding, and rather causes Crimes, Corruptions and Wicked notions or Drawings of the Mouth and Jaws away, seeming to the Souldiers by as if the Patient Laughted, and dying in this Condition, to dye Laughing, whereas it was no Laughing, nor was the Plenty in any Condition to Laugh, but rather it was a violent Convulsion of the Nerves, causing the Man or Woman to die with great Torment.

The Virtue.

XXVII. The liquid Juice. It is sharp and biting, good to batter, or turbine tho' Parts of the Skin which are affected with Scrofula, Ulcer, Mopeh, Pox, Pimples, Spots, Yellowness, Roughnefs, &c. The Skirn is fift to be washed with warm Water very well, to loofen and open the Pores thereof, then being wiped dry, to be immediately bathed with this Juice, which is to be done twice a day. It is good alio to dry away Scalls and Itch.

XXVIII. The Effence. It is powerful to all the Intentions aforesaid, but more drying. It is good to waffe away and confume Warts, Coms, hard Scalls of the Skin, Ruggednefs of the Nails, and other like Deformities of the Cutis. The Head being washed with it, it kills Worms at the Roots of the Hair, which eat the fame and cause it to fall off. Neither Juice nor Effence, by reason of their Violence, are ever used inwardly.

XXIX. The Powder. It is burning and drying, and is good to be burned into old, running and purulent Sores, and Ulcers which have Worms in them. Smelt up the Noftills, it purges the Head and Brain by Sweating. It is three or three Small Branches, heating every one of them a Small Leaf at the foot thereof, and a reasonable large Flower at the Head, (without any Small) compofit of five white round-pointed Leaves, with many yellowish Threads in the middle, which growing ripe, has many Seeds fet together, like to drows and other kinds of Crow-foot.

Soil.

Crown Imperial.
Hollownes; and thus springing up, rises up to be three or four feet high, being great, round, and of a purplish color at the bottom, but green above, being from thence to the middle thereof, with many long and broad green Leaves, very like to the Leaves of our Common white Lilly, but something shorter and narrower, confusedly without Order, and from the middle upwards it is bare or nothing without Leaves, for a certain space; and then it bears four or six or ten Flowers, more or less, according to the Age of the Root, and the Fertility of the Earth where it grows. The Buds at the first appearing are whitem, standing upright among a Bush or Tuft of green Leaves, smaller than those below, and standing above the Flowers, after a while they turn themselves, and hang downwards, every one upon its own Foot-stil, round about the great Stem or Stalk, sometimes of an even depth, and sometimes again one lower or higher than another, which Flowers are almost in Knew like to those of an ordinary Lilly, but somewhat less and elder, consisting of six Leaves, of an Orange color, fringed with purplish Lining and Vessels, which add a great Grace and Beauty to the Flowers. At the bottom of the Flowers next unto the Stalk, every Leaf thereof has on the outside a certain Bunch or Em- brance sticking forth, of a dark purplish color, and on the inside there are many hollow places, certain clear drops of Water, like unto Pearls, of a very sweet Taste, almost like to Sugar or Honey. In the midst of each Flower is a long white Stile or Tooth, forked or divided at the end, and six white Clovers with yellowish Thorns, standing also about it; after the Flowers are past, fox-figarette Suc- cedils appear, standing upright, stung as it were, or rooted on the edges, yet seeming but three-squared, because each couple of those united edges are joined closer together. In these Pods or Succedils are contained broad, flat and this Seeds, of a pale brownish co- lor, like unto other Lilies, but much greater and thicker affine. The Stalk of this Plant does sometime great flat, two, three or four Fingers broad, and then bears many more Flowers, but then generally they are smaller than when it bears round Stalks. Sometimes it happens that the Stalk is divided at the top, carrying two or three Tufts of green Leaves, without any Flowers on them; and sometimes likewise it bears two or three Heads or Crowns of Flowers, as we have before hinted at &c. above upon one Stalk, this is not often seen, but when it happens, it is very accidental. The whole Plant, and every part thereof, Roots, Leaves and Flowers do fulfill somewhat manner, much like to the Scents of a Fox, which, if at- ny do but come near it, they cannot escape but fasci- 

VIII. Objects 2. As in the bottom of each of these Bells, there is placed six drops of most pure clear thinning Water, sweet in Taste, like to Sugar, resembling in Taste our Oriental Pearls, these drops, if you take them away, new and fresh drops will immediately come in their places again. But if they may be suffused to continue the Flower, they will never fall away, no, tho' you strike the Plant till it is broken.

**Chap. CLXVIII.**

**Of CUCUMBER Garden.**

**Garden Cucumbers.**

III. The Descriptions. The first has a Root which is long and white, with divers fibres adhering to it, from whence spring forth many warton rough green branches, lying on the Ground, all along adventitious great several Leaves, which are rough, broad, une- ven on the edges, and pointed at the ends, with long crooked twining Tendrels or Shyfars, coming forth at the same Time with the Leaf, but on the other side thereof. Between the Stalks and the Leaves, at the joint, come forth Flowers severally, each standing on a short foot-sial, opening it self into two Leaves, of a yellowish color; at the bottom of which grow

VII. Objects 1. To obtain the true color of the Flowers of this noble Plant: Take Sap-berrisies, and let them in shape in a proportional quantity of fair Water for two hours; and mix a little Saffron in that Infusion, and it will give the perfect color, to limn or illuminate the Flower withal.
Salmon's Herbal. Lib. I.

the fruit, long, and green at first, but when it is through ripe, a little yellowish, having many Fières and uneven Branches out all the whole length of it, with long yellowish white Salt Seed, lying dispers'd as it were, and very regularly thro' the whole Substance. The inward Pulp or Substance is clear or through Nourishing, which together with the Seed is eaten a little before they be fully ripe: of this Cucumber there is one, which is of an equal bigness in the holy thereof, and the longer, of an unequal bigness at both ends, and a very long one, which is near a foot in length: there is also the early kind, called the French kind, which are the north of all, and the Danish kind, which bears but small Fruit, growing on short Branches or Running, of which kind the Cucumber we usually Pickle are.

W. The second, or Long Serpentine Cucumber, has a Stem much like the former, bearing long trailing Branches, a few and Leaves, (the foliage) much like the former. The Fruit, says Gerard, is very long, (and somewhat round,) like a Serpent or Snake, which (say's he) were at first made by Art and Musing, and were afterwards so brought forth by Nature: for at first, when the Fruit was small and little, it was put into some hollow Canes, or other like things, for the sake of purpose, in which the Cucumber did grow, and that in length according as the Canes it was enclosed in would permit it. It grows long by reason of the narrow Holdings, in which it was enclosed, which being filled up, it increased in length.

The Seeds of this kind of Cucumber being small, bring forth not so much as it were before this Application of Art, but such as are which Art has framed, which now of their own Growth are long, and often-times very crookedly turned, whence came the Name of Serpentine, or Long Cucumber.

V. The third, or Pear-like fashioned Cucumber, has a Pear or threaded Root, from whence come many trailing Branches, lying flat upon the Ground, rough and prickly, whereby do stand at each fruit, one rough Leaf, sharp-pointed, and of an over-corn green color: among which some come forth lodging Tender, and also slender Stem-stalks, on which do grow yellow Star-like Flowers: the Fruit is at first green and length, which coming to its bigness, forms it full much like a Pear, greenish on one side, and of a yellowish green on the other, and is much about the largeness of a great Walnut: the Seed is long, flat, and more yellowish, like the other.

VI. The fourth, or Spanish kind, (which were brought out of Spain first to Strasburg, and thence to us,) is a rare and beautiful Cucumber: it has a round Root, from whence come forth rough and bony trailing Branches, set with very large rough Leaves, sharp-pointed, in form like unto the Leaves of the great Burch-dock, but more eat in or divided: among which at the joints come forth upon tender Stem-stalks, fair, naked yellow Flowers; which being poll, the Fruit comes in its place a foot in length, green on the side towards the Ground, and yellow in the Sunny part, broken with many Spots and Lines of divers colors, whose Pulp or Meat is hard and soft, just like that of our Melon or Pumis.

VII. The Places. These Cucumbers all grow in Gardens, not only in England, but in most parts of the World, especially in all the more Southern Countries, where the Heat of the Sun makes them grow and fruitful admirably well.

VIII. The Times. They are planted in April, and are fit for eating in June, July and August: and the Seed is fully ripe about the latter end of the present summer.

IX. An Observation about Planting them. About the middle of April, or something sooner, (If the Weather be warm,) you must make a Bed or Bank of hot and new Horse-manure taken from the Stable, and not from the Dung-hill, of an Ell in breadth, and two feet and half in depth, of what length you please, accordingly as it may hold the quantity or number of the Seeds you intend to use: this Bank you shall cover with Hoops or long slender Sticks, to bent and bowed, that you may cover the whole Bank or Bed with Mars or some other warm Covering, Straw, or the like, to keep it from the Injury of cold frosty Nights, that the Seeds which are planted or sown, may not be night: than shall you cover your Bed over with the half and halfed Earth, finely sifted through a Wide Sieve, that it may be half a foot thick, in which you shall set or sow your Seed: this being done, cast your Straw or other Coverture over the same, and let it rest without looking upon it, or taking away of your Covering, for the space of seven or eight days at least, for commonly in that space of time they thrust themselves through the Earth. Then must you cast them upon, in the hottest time of the day, some Water which has stood in the Houte or the Sun a day before, or Water of which the Cold is just taken off, for otherwise, if the Water cast upon them is just taken forth out of the Pump or Well, it will so cool and chill them, being brought forth and nourished in such a hot place, that presently, even in one day, you will break them through, for your Plants will not only be killed, but your Bank also will be chill'd and looke its Heat.

X. Observ. 3. This is also to be noted, That the young Plants must every day when the Sun shines warm, be opened and exposed to its Beams, and at Evening every Night they must be covered a again: this must be done from time to time, till the Plants have four or six Leaves apiece, and that the Danger of the cold Nights and tipping Seacon is past then they must be replanted with a great deal of Care, taking each Plant up with the Earth sticking to its Root, and they must be placed as near as may be in the most Fruitful and fit Soil, and in that part of the Garden which is most sheltered from Cold and piercing Winds, and where the Sun shines warmed. Now, you must also observe, That upon this Replantation, you must cover them with force this Mats or Wiffes of Straw, prpped up with forked Sticks or some flesh-like thing, and this thing is to be done every Night, to keep them from the Cold of the Night, and sometimes in the Day-time, to keep them from the too great Heat of the Sun, otherwise, the you have brought your Work thus far on, all your Labor may be lost: for they cannot, whilst they be young and newly planted, endure either over-much Cold or over-much Heat, till they be well rooted and fixed in this their new Habitation.

XI. Observ. 3. Sometimes it falls out that some Seeds are more forward than the rest, and therefore do commonly rise up very nimbly, with long Necks, not much unlike to the Stalk of a small Mushroom of a Night old. This raised Stalk you must cover with the like fine Earth, even up to the green Leaves: you must also have that regard to your hot Bank, fo to place it, that by its Situation it may be defended from the North, North-East and East Winds. If these Influences be carefully observed, you may need not fear to complain that your Seeds were not good, nor your Clime too cold or temperate, by reason of which you should be frustrated inearing or Fruit; but if your Seed is hard, plump, firm and good, it will certainly prove fruitful, tho' in the most Northern parts of Scotland.

XII. The
The Virtues.

XV. The liquid Juice. It is expelld from the Cucumbers, either ripe, or almost ripe, or unripe, as they are most in to be eaten. It opens, is cold and cleansing, provokes Urine, and opens the Obstructions of the Liver, Lung, Heart, and Reins, and takes away inflammations of the Parts. It helps Heat, and Sharpness and Scalding of Urine. Do as from 1 to 3 ounces twice a day. Outwardly applied, it makes the Skin yellowish in the day and fine for some considerable time, it perfectly cures the Scoury in a hot Habit of Body.

XVI. The Efficacy. It has all the Virtues of the former, but most of all of that which Refresheth the Body, and this may be taken by it, from 1 to 3 ounces or more, whereas the other ought to be taken mixed with Ale or White Port Wine. It is an excellent Stomachic, very much pleasing and gratifying the Villera, if inflamed or over-heated.

XVII. The green or unripe Fruit. It is first pared, then flined thin, after which it is seasoned with Pepper, Salt, Vinegar and Oil, an Onion or two being also thin flined and shred, and put there to. It is grateful to the Stomach above all other Sallots, as it cools the Heat thereof, as also the Inflammation of the Lungs and other Villera. It cures the Scoury in a cold Habit of Body, nor is there a great Antifcorbutick in the World, and may be freely eaten two or three times a day, and in large quantities too, without any danger or hurt to the Stomach and Body, the former ignorant People may affirm the contrary. God and Nature has replenished all the Regions and Countries of the World with them in a very simple manner; and it is the same, or nearly the same, as the Precaution of Life in all the fultry hot Parts of the Earth, and a singular Preventive of Difcalces, especially of all such as proceed from Inflammation, violent Scars and Fevers, of what kind soever. It was not without some Reason that the Children of Israel left them in the Wilderness: Num. 11:5. We remember (said they) the fishes which we did eat in Egypt freely, the Cucumbers, and the melons, and the leeks, and the onions, and the garlic. And by this it appears also, that Egypt was very well floved with them.

XVIII. The Pickles. Take the Fruit, cut it in pieces, and chop it as Herbs to the Pot, and boil the Name in a small Pippin (or stew-pan) with a piece of Mutton, (Bird, Veal, Lamb, or other Flesh,) adding in the boiling the Flower of Onions, and give it the Confitence of Pottage: Gerard. This may be made lofty with a little Salt, and if you please you may also add to it the Juice of an Orange, to make it grateful, of which you may eat from half a pint to a pint, or a good Porter full every Morning to Breakfaft, as much at Dinner, and the Same again at Supper. Eaten in the manner for the Space of three Weeks together, without Intemperance, it will perfectly cure all manner of Pults, and copper or red Faces, red and fiery flaming Noles, (tho‘ as red as red Roses) tho‘ the Skin is filled with Pimpls, Rubies, Scarfs, Mops, Arse, Spots, Herpes, Tawtis, Ringworms, and other like Breakings out.

XIX. The Lotion or Water. To strong White Wine Vinegar a quart, Juice of cucumbers a pint, Oriceation in fine flour or powder, Flowers of Sugar, or Sulphur in fine powder, of each a quarter. Coward in fine powder half an ounce, beaten with four blanched Almonds, Juice of eight score Lemons, eight Oct-apples cut three the middle: put all these into a strong double Glass, shake them together very freely, and set it in the Sun or an equivalent Sun heat for 12 or 14 days. This does not only help red and fiery Faces, but also takes away Pimpls, Rubies, Freckles, Lentils, yellow Spots, Scars, Morphean Herps, Erysips, tumors, ringworms, Sun-burning, Tawtis, and all the other Deformities of the Face and Skin. The Face or Skin ought first to be washed pure and clean with fair warm Water, to open the pores thereof, and then to be dried with a Cloth; and then as soon as this is done, the Water is to be used and laid on, and so to be suffered to dry in of it itself, without wiping away. It is to be used Morning and Night, and always during the whole time of eating the above prescrib’d Pottage.

XX. The distilled Water. It is good to cool the hot Dilhemper of the Liver and Blood, to quench thirst, cool the Heat of Revers, and take away the Drynes and Roughness of the Tongue. It is good against the Heat of the Reins, as also the Sharpness, Scalding and Stoppage of Urine. Outwardly used, it cools Inflammations, helps Blood-throb and Redness of the Eyes, clears, cools and soothes the Skin, and is good against most Deformities thereof, being often applied thereto.

XXI. The Seed made into an Emulsion with the distilled Water. It wonderfully cools the Heat of the Reins, and takes away the Scalding and Sharpness of Urine, and that Pain which is caused by the Application of Camphor and other GREAT ENGLISH HERBS 255
Salmon's Herbal. Lib. I.

256

of Cucumber Wild.

I. THE Names. It is called in Greek, Ἀβάκος; in Latin, Cucumber & Cucumber agreeable, and to the Shops, Aj OUTER, Cucumis Sylvestris, Matthiolus, Trogy, Pedesna, also by some, Noli me tangere, (because of the spirit of them, if rudely handled, when ripe); in English, Wild Cucumber, Sprouting Cucumber, and Touch me not.

II. The Kinds. It is a Species of Cucumbers, the Wild kind, but a singular Plant of the kind.

III. The Infusitwe Juice, is the Juice of the Fruit, or rather a Liquefied Chyle, which being dried, is called almost in all places throughout Europe, Flatus; Playly, lib. 20. cap. 1. The Greeks call it also, sewepa o ἄγος, ἠφτυκία, ἀρτολία, ἀπεργνωμένος, which is as much as to say, to sweep, stir up, or force violently, to purge vehemently, and therefore Flatus est medicamentum vehementer pungentem. Hence in his Foundation of Theophrastus calls it, Αππωρία. "Noli me tangere" is doubtless one of the strongest of all Purgers.

IV. The Description. It has a Root white and firm, thicker and fouler than any other root of Gourd or Cucumber bars, having internal juice adjoining Fibres, very bitter, as are all the other parts of the Plant. From this Root springing forth many large fleshy, brown, rough tailed Branches, spreading themselves over the Surface of the Earth, like either Cucumbers or Gourds, on which grow very rugged, rough, hairy and divided green Leaves, fairest,
is usually ripe in August, at which time the Elaterium is also made of it.

VII. The Qualities. The whole Plant is hot and dry in the third Degree, Aperitive, Alkaliferous, bitter In Tincture, and warning away. Oaten will have the Juice to be hot but in the second Degree, cæsting, and of thin parts: it purges away Humors, and is certainly the best Cathartic in the whole Repub- licke of Medicine.

VIII. The Specification. Elaterium is a peculiar Medicament for the Cure of Droppties.

The Virtues.

X. The Liquid Juice of the Leaves. Dropped into the Ears, it itches them of the Pains and Noises therein, and very much prevails against Destructs; bathed upon the Skin, it takes away Freckles, Lentils, Diseolorings, yellow Spots, Scurf, Morpheus, Tumours, Swellings, and other Deformities thereof, used Morning and Evening for some time.

XI. The Liquid Juice of the Root. It is good a-gainst the Falling-sickness and Kings-evil, put into the Nostrils, and taken inwardly also, and the Sturnatick Swellings being daily Morning and Evening bathed therewith, it provokes the Terms, but is not to be given to Women with Child, because it is apt to destroy the Fruit or the Woman. It purges viscous and watry Humors, and from the Stomach, and therefore it is used in Clysters. It has also all the Virtues of the Juice of the Leaves, as to external Diforders, if it is applied in like manner. Being taken from 2 to 3 drams in any convenient Vehicile, it prevails against the Dropptie and the yellow Jaundice, and opens all Obstrucons of the Liver and Spleen, partly evacuating Water.

XII. The Elixir made of the Juice of Leaves or Roots. It is made by mixing 2 parts of the Juice with 1 part of Water in which Nitre is dissolved. Some make it by mixing the Juice 2 parts, with Milk 1 part. Smitt up the Nodrills it cures an Eplepy, as also an invenetor Megrim or Head-ach; for it wonderfully purges the Head and Brain from Excrescences, and cures a splitting Breath coming from the Nodrills, and is a prevalent Medicine against Lethargies, Carus, Sleepiness and Ape- lxies.

XIII. The Liquid Juice of the Fruit. It has all the Virtues of the Juice of the Leaves and Roots, and may be used in the same manner to all those Intentions; but it is much more powerful, as being more Achromatic, and therefore is to be used in a smaller Degree. An Eplepy, may be also made of it, as of the Juice of the Leech or Roots, very be- neficial and potent to all the same Purposes, being much stronger than is Juice of Roots or Primrose.

XIV. The Syrup of the Juice of the Roots or Fruit. It is good against the Scoury, Dropptie, Jaundice and Gout, carrying off all sorts of putrid Humors, chiefly Flegm and Water, by which it gives a general Relief to the whole Body, and to prevals against Head-aches, Apoplexy, Enfeebilities, Cere- Leathyng, Vertigo and Madneffis. It is good against Surfeits and Agues, and kills Worms in the Body. The Dose is from a Spoonful to 2, 3 or 4, in the Morning fasting, mixed with a glass of warm Pof- fetrink or White-wine: if it is acted on with choice Sours, it will be much more powerful and ef- ficials to all the Intentions and Purposes before enumera-fd.

XV. The Infusion of the Root. Take of the firft or green Root well bruised a pound, put it into a pint and half of strong White Port Wine, in which let it infuse for 24 hours or more. Dofe 3 ounces, for three or four days together.

XVI. The Decotion of the Root. It may be made in Wine or Water, or with a Mixture of both. This being drunk (fays Hillary) helps the Dropptie, for it wonderfully evacuates watry Humors, and prevals against the Yellow Jaundice, and all Obstrucons of both Liver and Spleen. This Decotion gorged in the Mouth, and held therein for some time, gives perfect Ease in the Head.

XVII. The Vinegar of the Root. If the Root is infuted or boiled in strong Vinegar, and that Vinegar is bathed upon the Skin two or three times a day, it is good to cure Tettars, Ringworms and a single Herpe, as also to cure Scurf and Morpheus, and clean the Skin of all Diseolorings, as Yellowfeet, Scurff, Fonderfeet, Lentils, and other Spos of that kind.

XVIII. The Powder of the Root. Smitt up the Nodrills, it is a good Elixir to purge and cleanse the Head and Brain of cold moff and vicious Hu- mors, which cause the Head-ach, Megrim, Vertigo, Leathyng, Apoplexy, Eplepy, Palsies, &c. Disease of the Naftrills, that being applied to the Skin or Face, it cleaneth it from all Scurf, and takes away the Dise- coloring of Scurf. Inwardly taken, to a scruple or half a dram, mixed with Crescents, it will kill Worms, purges the Bovels, and carries off fliny Humors.

XIX. The Eleythorpy of the Root. It is made of the Pound mixt with Honey. Taken inwardly, from a dram to two drams, according to Age and Strength, in the Morning fasting, it purges Flegm, Choler and watry Humors, and abates the rebellious Ferments of the King's-evil, it cleanses and heals old Sores and Ulcers, being used Plaifter-wise, cleansing them throughly, and wonderfully healing them. Applied upon a Herpes, Tartar or Ring- worm, or other like Breathing, or put upon any Deformity or Scurf, does annul the Skin, auftroy forth the mulfing Juices, and heal those Breakings, taking away all Marks, Spots, Blackfeet and Bloods coming upon the Skin and Bath by Con- tusions and Blows.

XX. The Oil of the Root. It is made of the bruised Root or of its Juice, by Infitation, or boiling in Oil Olive. Anointed upon the Temples, it is said to cure an inverte Megrim, as a medicinal of the Juice, being smitt all up the Nodrills. An- nointed well upon the Hip and thicke-bone Morning and Evening for half an hour together, it cures the Pain of the Sciatica.

XXI. The Caputplasm of the Root. It may be made either of the Root bruised, or of the juice of the Root brought to a thickness, with Pouder of Flecamptune-roots. Applied after anointing with the former Oil, it gives great cafe in the Oste and Sci- atics.

Salmon's Herbal. Lib. I.

atrics, difficultes Tumors arising from simple Contusions, abscesses and Acids lurking in the Skin and Scar-fain, and takes away Deformities thereon: as, Scorbut, Morphew, Leprosity, Yellowwebs, and other Discoloration of the Skin.

XXII. The Subtilisation of the Root. Apotheceas, fays Parking, do most usually take the Root of this Wild Cucumber, as a Subtilis for the Root of Colquepiptida or the bitter Guard, that not being so frequent, or so easy to be had as this.

XXIII. The Compafon of the Leaves. It has all the Virtues of the Camphor of the Root, but not fall out to effectual, because the Leaves have not the fame Strength with the Root: yet, notwithstanding, it is an excellent thing for the Purposes intended, exceeding many other things of like kind. It clarifies the Skin from Discolorations and many other Deformities.

XXIV. The Compufion of the Leaves with Goats. Purg. If it is laid upon any hard Tumors, Swellings or Kernels, such as are cholic of the Kings-Evil, it resolves them, and also eases Pains of the Goat in what part of the Body ever so, and refifite the Putnum of malignt Ulcers.

XXV. Green Euterium, or the Infufifie Juice of the Cucumber. Take Wild Cucumbers almost ripe, open them on one fide, and take or protractor out their thinner and fatty Seeds, which finn from the Seeds, referving the Juice; then beat the reft of the Cucumber greedily in a Marble Mortar, put all into a Bag, and in a Preis force forth all the Juice+ put this Juice to the former, which is beat in a Retort, and in a gentle Sand-heat draw forth all the Water, (which keep for a Comfectick) continue the fame gentle Heat till the Magna be perfectly dry'd, then break the Retort, take forth the Mater, and keep it in a Jar-Glafs, tied clofe over with a wet Bladder, for life. If you have no Retort, and care not for keeping the Water, you may evaporate it to dryness over the fame gentle Sand-heat in an open flat-bottomed Glafs, often infifting it, (to break the Skim) that it may evaporate the better, which then take and preferv in a Jar-Glafs, as before. It has the Virtues of the following, but not fall out fo frequent, and therefore may be given in double Dose to it, viz. from 6 grains to 20 or 24, in any convenient Mixture. Tes, notwithstanding its being weaker than the following, a moft noble Medicament.

XXVI. Euterium album. The white or common Euterium, which is indeed the roughed and beft. It is thus made: Take Wild Cucumbers almost ripe, open them with a Knife upwards, preff out the Juice gently with your fide Fingers, let it run thro' a Sieve into a clean glaz'd Veffel, let it fette, and decant the clear Water into another Veffel; then dry the Settings in the Sun, and in a Jar-Glafs, tied clofe over with a Bladder, keep the Euterium for life. See our Pharmacopoeia Londoniæ, lib. i. cap. 6. feh. 32. If you pleafe, you may keep the clear Water for Unguentum Ariton. Some Authors fay, that this Euterium will keep two hundred Years, and yet be of wonderful Virtue, Vix Crusio: others, as Paracelsus, fay it retains its Virtues well fifty Years, at which Age it be to a bundant in Flomandry, that put to the Flame of a Lamp or Candle, it will put it out: but Cufforde fays it is good from two Years old until ten, and that that is the best which being put to the Flame of a Candle, it will make it burn the more bright. Tho. Hoffmann his Euterium is green, (which is, as I fuppofe, the former Infufifie Juice of the Cucumber;) but he fays his Euterium is white, which is indeed the Juice, as taught in this Problem, and this is that which Myfien fays is the beft. The green will continue moift many Years, after it is evaporated and dried up hard, retaining or giving with the Air, fo that it requires a long time to confume it in Humidity, whereas the white Euterium being once dried, will remain white, hard and dry for a great number of Years, unless it is left open in a moift Air, or stand in a moift place. This white Euterium works very well, being given from 1 to 5 grains, in strong Bodies: Authors fay it may be given to 10 grains. Parking fays, that half a grain being put into a purge Medicine, to quicken it, has oftentimes been tried to trouble the Stomach, with very much diftuffion, and vomiting, and working abo downwardly with more Violence than it could be thought that double the quantity could do. Diffcorde fays the Dose is from half an Obolus to a whole Obolus. Now, the Obolus is 10 grains, or 1/2 at the most, as fome take it, which throws the large Dose which the Ancients gave of this Medicine, which we dare fearely follow. It purges Choler and Hoen from all the Parts of the Body, and drives forth waters Humours to a Miracle, being an extraordinary thing to open the Pipes of such a cry and fhort Wind; and is indeed a Spectacle for the Cure of the Droopy, especially of that kind called Sorenet or Anephora. When you give it for Purgings, it may be given more out their than one Dose, the same evening. Take one Dose in the Morning, the other at Night, and thre it will drive the Water, and with a ftrong fipe therein, to touch the lower part of the Tongue, as low as you can, but in my Opinion, it is much better to take the whole Dose down into the Stomach. It is a prevalent thing against the Megrim, Head-ach, Carus, Lethangy, Vertigo, Apoplexy, Epilepsy, being used fometimes as an Erhine, dilu€ed in Water or Milk, and fometimes taken inwardly to both Vonit and Purgé. And thus taken, it is faid alfo to ease the Kings-Evil, the Palsies affected being ailmned likewise with it outwardly. It provokes the Courtes in Women where they have been long ftopt, and very much prevails against the Green-fickets in Vingels. It is fo Strong and forcible, that it is faid to kill the Child in the Womb of one Woman Impregnated much by all means avoid it, but this is more efpecially to be underftood, being applied in a Pefary or Ointment to the womb. It caues the Goat in any Part, by its great and tastefull Faculty, carrying off the tarracic, vifcous or clamary Humors from the Joins, which breed it. The common Dose is 4 gr. 1. ad. v. and to very Strong Peritonis 4 gr. 2. ad. v. well corroborated with Water, Spiritkand, Aflfaids, Liquorice-pouter, &c. It curcs Alhmas, Jaundice, Scutir and Hypochondrias Malanchy, mixed with Ox Gall and applied, it helps the Quiltiny and Goat, and clears the Skin of Scorbut, Morphew, Testas, Ringworms, Mange, Itch, Puthes, Scabs, and other like Deformities.

XXVII. The Diftill'd Water from Roots or Fruit. If to every quart of it you add an ounce of Opium Ne- tre, distilling it over a gentle Heat, it becomes an excellent Comfetic to beautify and clear the Skin of any Deformity, being two or three times a day often laid on, and fuffered to dry in it, after it is fift well cleaned with fair warm Water. This Water is alfo an excellent thing against an Erythelias or Antony's byr, the Palsies affected being bathed therein, and Cholin in Water, and fuffered to dry upon the Part: It abates Inflammations, and being given inwardly, (well fweeten with white Sugar) it cools and abates the molt violent with the Goats, being well bathed therewith in Morning and Evening.
Chap. CLXXX.

OF CUDWEED Common, or, COTTONWEED.

I. THE Names. It is called in Greek, Ἄσπεδρα; in Latin, Gnaphalium, Centunculus, Centuncularia, Tumescens, Tumescens, Tunicatus, Tunicatus, Centunculius, Bambaxo bunius, Albicans, Chamaeylon Plini and Fidago: in English, Cudweed or Cottonweed.

II. The Kinds. There are four principal Sorts of Cudweed, 1. The Common, of which in this Chapter, 2. Gnaphalium Inflatum, Wicked Cudweed, of which in Chap. 181. 3. Gnaphalium Maritimum, Sea Cudweed or Cottonweed, of which in Chap. 182. 4. Gnaphalium Americanum, American Cudweed, of which in Chap. 183.

III. Of the Common kind there are, 1. Gnaphalium vulgare major, Home Cent. Gnaphalium Anglicum folio longiore Lobato, English Cudweed. 2. Gnaphalium minor, Filago minor, Dodona, Gnaphalium vulgare minor, Gnaphalium medium Tabern-bonitani, The Vulgar or Common Lesser Cudweed.

IV. The Definitions. The first, or English Cudweed, has a Root which is small and thready; from whence rise up one, two or three Stalks, set thick on all sides, with long and narrow Whiskers or Woody Leaves, almost from the bottom of the Stalk up to the top: with every Leaf stands a small flower, of a dun or brownish yellow color, but not so yellow as in some others; in which Heads, after the Flowers are fallen, some small Seed, enclosed in the Donut, and which, when perfected, is carried away with the Wind.

V. The second, or Lesser Cudweed, has a thready Root, almost like the former, from whence shoot forth small brown Stalks, full of Branches almost from the very Ground, with downy slender, clearer and narrower Leaves thereon, of a more dusky brownish color, like fine Cotton or Wool’s, some standing singly, and some more at a Space or Joint: the Flowers below stand at the tops of the Stalks and Branches only, and not all along, as in some of the other kinds, one Branch above another, but all of them rising almost to an even height, and are of an even round yellow color; it grows commonly about nine or ten inches high, falls down to a foot, unless in about Ground. The flowers are yellow, and grow like Button at the tops of the Stalks, and the Seed is carried away with the Wind.

VI. The Places. They both grow in barren, dry, sandy and gravelly Grounds in most places of England: the first has been found growing in Hampstead Wood, and in Woods near to Deptford, by London.

VII. The Times. They flower in June, July and August, and their Seed is ripe in a little time after.

VIII. The Qualities. They are temperate in respect of Heat or Cold, but dry in the third Degree, and therefore very Astringent, Hepatic, and withal Anthelmintic.

IX. The Specification. They are peculiarly agreeful to Cataracts, Fluxes of the Bowels, Prodromus of Blood in any Part, and the Quinsy.

L 12 X. Tis.
Salmon's Herbal

Lib. I.

X. The Preparations. You may have therefrom,
1. A liquid Juice. 2. An Efficacy. 3. A Decollec-
tion in Wine. 4. A Powder. 5. A Cataplasma.

The Virtues.

XI. The liquid Juice. Taken inwardly to an
ounce or more, mixed with 2 Gills of Red Port
Wine, or in some other proper Vehicle, it stops a-
y inward Bleeding: it cleanses old and filthy Ulcers,
and cautes them quickly to heal. Taken in
Wine, or in Milk, it is (as Pliny says) a sovereign
Remedy against Heart and Swellings in the Throat,
and, as we are told (by Pliny), especially to this
Solif. and he farther says, That whatsoever shall take it shall
never be troubled with that Disease again. And for
the Time Recruitment People give it to their
Swine, with this Observation, That whichsoever of
them will not take it, will afterward die.

XII. The Efficacy. It has the Virtues of the li-
quid Juice, but more powerful, and over and above
in the curing of old running Sores and Ulcers, it is
of admirable Excellency. It stops and cures all
Fluxes of the Bowels, the old long standing, and
renews their Tone again to Admiration. It cures
the Whitlets in Women, as also the Overflowing of
their Terms, is singular against rebellious Cataracts,
and cures simples Contusions; kills Worms in
Children, and heals Ruptures.

XIII. The Decollection in Wine. It has the Virtues
of the Juice and Efficacy, but in a lower degree, and
may be given from 4 to 6 or 8 ounces, according to
Age. 1. In the Morning fasting. 2. Half an hour
before Dinner. 3. At Night going to Bed. Possi-
bly this may be beat for weak Stomachs.

XIV. The Powder. It cures all kinds and afflictions,
and therefore is profitable for the Difafflements of Rheums
from the Head upon the Lungs, as also to stop
Fluxes of Blood wherefoever. Taken from 1 to 2
drams in Red Port Wine, it prevents against the
Bloody-flux, and eases the Tortion of the Bowels
coming thereby. It stops the Overflowing of the
Terms, and heals Wounds whether inward or out-
ward, being made into an Elixir with the liquid
Juice, and so used. This Powder being either drank
or inglued up the Internum Retinum, mixed with
Red Port, cures the Disease called Tensinares, which
is an often Provocation of going to Stoel and doing
nothing.

XV. The Cataplasma. It may be made either of
the green Leaves bruited with a small quantity of
Wine, and made by the Powder of the Herb made into
the Concoction of a Cataplasma with the liquid Juice.
Being applied, it immediately stops the Bleeding
of Wounds, and in a short time afterwards cures them:
it also cleanses, dries and heals all old and filthy
Ulcers.

III. The Descriptions. The frust of these has a fi-
brand Root, from whence shoots up a few or short
Stalk, set with shorter Leaves than the former, but
somewhat more white or hoary, and a little broader
at the tops whereas stand a larger and more open
Flower than in the two others, and of a poler yellow
color. from the false of this Stalk spring forth diver-
s short Branches, set with such like, but smaller
Leaves than those which grow below, with such a like
yellow Flower as the other. which Branches, with
their Blossoms, do always rise higher than the middle
Stalk, and the Flower upon it: sometimes also the
Branches will have other smaller Branches springing from
them, bearing Leaves on them, and Flowers on the
top of each of these also rising above the Branches
with their Flowers in the same manner, that the first
Branches did unto the main Stalk: the Seed follows
the Flowers in a bounty Bed, and is carried away with
the Wind, as the rest.

IV. The second, or Larger Wicked Cudweed, has a
large Root with several pretty thick Branches, and
many Tubers springing from the same, from which
sometimes springs up but one Stalk, and sometimes
two, three or more principal Stalks, very much, in
their Magnitude, way of Growing, Shape or Form of
the Leaves and Flowers, like the former, but much
larger, and for the most part twice Flowers which
appear first, are the lowest and biggest, and are al-
tways overtopped by other Flowers which come on younger
Branches, and grow bigger, as Children seeking to
overgrow or surpass their Parents, (as many wicked
Children do;) for which Caue it obtained the Name
of Gnaphalium impium, and Herb impia, Wicked Cudweed,
Wicked Herb, and not for any evil or malig

of CUDWEED Wicked.

I. The Names. It is called in Greek, \textit{Gnaph-}
allyum impium, \textit{Gnaphalium minoris,} \textit{Gnaph-
allyum minor,} \textit{Gnaphalium major,} \textit{Gnaph-
allyum impium minor,} \textit{Gnaphalium impi-
pis minor.} The greater part of the latter Cudweed, Wicked Cudweed the greater.

C H A P. CLXXXI.

V. The Places. They both grow in dry, barren,

3. of CUDWEED Wicked.

4. of CUDWEED Wicked.

5. of CUDWEED Wicked.
VI. The Qualities, Specification, Preparations and Virtues are the same with the English and Common Cudweed in Chap. 180. to which you are referred; yet it is thought by some, who have made Tryal of both, that this Sea Cudweed is the stronger and more effectual Medicament to all the Purposes for which the Common is intended.

CHAP. CLXXXII.

Of CUDWEED Sea.

I. THE Names. It is called in Greek, Graphisbium, in Latin, Gnaphalium Maritimum, Elychrysum Sylvestre foce, pluviae Budhima; in English, Sea Cudweed.

II. The Kinds. It is a singular Plant of the Sea kind, and is called for the most part, Cottonaria, or Cottonweed; also Gnaphalium Maritimum nomena-

fun.

III. The Description. It has a long and woody Root, which perishes not yearly, as several of the other sorts do. From this Root rise up several small and very white yellow Stalks, seldom growing above a handful or half a foot high, set thick with many short, flat and very white, soft and hoary or mossy Leaves, so hoary as that they were nothing but Cotton, bearing at their tops small hoary or cottony Heads, with a yellow Thrum breathing out in their middle; these are the Flowers, which, at the tops of the Stalks, look like small round Buttons, of Color and Beauty like to the Common Cudweeds. Within these Heads, in a dusty Bud, the Seed is contained, which is somewhat longer than the Seed of the other.

IV. The Place. It is found upon the Western Sea Coasts of England, in divers places. It is found growing also at a place called Mersey, six Miles from Chelford, near the Sea side. It has also been gathered upon the Sea Coasts of Wales.

V. The Time. It flowers from June to the end of August, and the Seed is ripe in September.

CHAP. CLXXXIII.

Of CUDWEED American.

I. THE Names. This Plant, as far as I can learn, was wholly unknown to the Greeks; yet modern Authors have given it this Greek Name, Aphanus, Argyrosorum, (i.e. Silver-heard: ) in Latin it is called, Gnaphalium Americana, and in English, American Cudweed, also Livelong, and Life-everlasting.

II. The Kinds. It is a singular Plant of the kind: and is accounted one of the Species of Gnaphalium Carolinum Cronius, from the Likeness of the Umbles or Tuits of Heads, tho' they are greater and whiter than those of the other kinds of Cudweed; all of which are of a kin to the Golden Tuits. This Plant has been called by some of our English, Livelong, and Life-everlasting, because of the Durability or long Duration of their Flowers in their Beauty.

III. The Description. This Silver Tuit or Indian Cottonweed, has Roots which are long, and black on the outside, creeping very much under Ground: from whence spring up many white Heads of Leaves, covered with a hoary Woolliness, like Cotton, which rising into hard, thick, round Stalks, contain little the same Hourainties upon them, as also upon the long and narrow Leaves which grow thereon, more especially on the under side, for the upper sides are of a dark shining green color. The Stalks are divided at the top into many small Branches, each of which have many fey, pointed Heads set together, covered over with Cotton before their opening, and then parting one from another, shedding very white or the outside when they are fully grown, but with a small yellow Thrum in the middle of each Flower, which in time will turn into yellow Down, apt to be blown away with every Wind.

IV. Gerard says, that this Plant is of greater Beauty than the rest, and has straight upright Stalks, three feet high or more, covered with a soft leaf, and fine Wool, and in such a plentiful manner, that a Man may with his Hands take it from the Stalk in great quantities. This Stalk is beset with many long and narrow Leaves, green on the inner side, and hoary on the other side, somewhat like in form to Rosemary Leaves, but greater. The Flowers do grow at the tops of the Stalks in Bunches or Tufts, confining of many small Flowers of a white color, and very double or compact, and in confining of little Silver Scales thrust close together, which do make the same very double. When the Flowers have long flourishe'd, and is grown old, then comes there, in the midst of the Flower, a certain brown yellow Thrum, such as is in the midst of the Daisy; and the same flowers being gathered when they are young, may be kept in such manner as they were gathered, to use in such Frostheds and good Colors, in the face of a whole Tear after, and that in a close Cheif or otherwise, where by this long keeping of their Frostheds and Colors, it is, that our English Gentlewomen called it Livelong, &c. to which, on this occasion, it very aptly answers.

V. The
V. The Places. It grows plentifully in America, in several parts of the West Indies. II found it growing in parts of the Southern parts of Carolina. It grows naturally near unto the Mediterranean Sea, from whence it has been brought and planted in our English Gardens. But this is, that it grows frequently in Brattleborough, and others, which first set it forth by the Name of Argaroonce or Amphiphleum Americanum, had his Plants out of England. We have also had it brought to us out of Orleans, so that now it grows well and plentifully with us, if Care be taken of it by a Skillful Gardener.

VI. The Time. It flowers in June and July, and the Seed is ripe in August.

VII. The Qualities, Specification, Preparations and Virtue of this, are the same with the last and the others foregoing, and therefore refer you to Chap. 184, for full Satisfaction.

CHAP. CLXXXIV.

OF CULLIONS Sweet, or, LADY-TRACES.

I. Herba. This Plant is called in Greek, φυκός; in Latin, Orchis adrurus, Te
cllidus obtusus, vel aromatica; and in English, Sweet Cullion, Sweet Orchis, Sweet Lady-Traces.

III. The Kind. They are of the Kinded of the Orchis and Orchis Guatia, according to Parkinson; but of this Species he makes eight several forms, but there are four principal kinds of these Sweet Cullions, viz. 1. Thole with one single Tefide or Stone. 2. Thole with two Tefides. 3. Thole with three and sometimes with four Bulbs. 4. The Creeping or Bifurcated kind.

III. Of the single bulb'd Orchis, there is but one Species, viz. 1. Orchis Rubra obstris, fertima Cult. The sweet Musk Orchis.

IV. Of the double bulb'd, there are three Species, viz. 1. Orchis alba obstris minor, Orbis alba minor. 2. Orchis floridus major, Orchis floridus minor; Labelis. The Ieffer sweet Cullions, or Lady-Traces. 3. Orchis Fraxia Lobelia. Fryelase Orchis or Lady-Traces. 4. Orchis floridus Lobelia. Orchis floridus Lobelia, Fryelase Orchis Cult. The dwarf Orchis or Zeland. 5. Of the treble bulb'd Orchis, there are also three Species, viz. 3. Orchis alba obstris, and obstris major, Orchis alba foplica Labelis. The greater sweet Lady-Traces. 6. Orchis floridus Lobelia, Orchis floridus minor Lobelia. Labelis, Lady-Traces of Ligea. 7. Orchis floridus Lobelia Genus folio globos. Orchis floridus terstis Lobelia, Lady-Traces yellow, with smooth Leaves.

VI. Of the Creeping kind, there is one only Species, viz. 8. Orchis Radii repente, Small Creeping or Bifurcated Orchis.

VII. The Description. The first of these, or Musk Orchis, has a Root which consists but of one small round Bulb, of the biggest of a Pea, whereof it has long Strings running forth, and whereof New Plants are encraved, from this Root sprin
ging up usually but three small and narrow green Leaves, among which grows up a Stalk of an hand breadth in height, having a long narrow Spike of pink or green Flowers, ending in three Points, and Juliecating like Musk.

VIII. The second, or Leffer sweet Cullions, have their Roots growing by Clumps or Pairs, which are small, and somewhat long as well as round; from these Roots these Leffer Lady-Traces have much smaller Leaves growing forth, and lying near the Ground, than those of the Greater Lady-Traces in Sect. 11. following; but they are of the same-fashion with those, and almost like unto a very small Platane Leaf. If the Stalk is not above four, five or six inches high, with some small flower of little pieces of Leaves thereon to the Flowers, which are of a white color, daintly over with a thin Blossom, standing in this long Spikes, compounding the Stalks, which are of a very sweet Smell.

IX. The third, or Fryielase Orchis, or Lady-Traces, has a Root consisting of two small round Bulbs, from whence springing up two or three small, somewhat long and hairy Leaves, yet shorter than those of the Rhihs Plante. The Stalk is about a span high, viz. about four or five inches, and bears round about six small yellowish green Flowers, much taller than the former, and yet in the same kind of the Orches.

X. The fourth, or Dwarf Zeland Orchis, has a Root consisting of two Bulbs for the most part, and sometimes of three, which are covered of yellowish or yellow, being greenish within, and sweeter in Tullus, the lower of them being lank, as in others. It has two fair, but small Lily like Leaves, about two inches long, rising up from them, and a Stalk about three or four inches high, the Flowers being not much unlike the former. This sort is thought to be the Pleto-orchis Cultivat.

XI. The fifth, or Greater sweet Lady-Traces, have three bulb'd Roots, which by chance may sometimes be fourfold, being round, and longer than any of the former Orchises, with several short Fibres springing out round about them, contrary to the modus of all the rest. From this Root come forth several very fat green flowering Leaves, like unto the Leffer Plante, but smaller pointed, which rise up in September, after the Stalks, with the Flowers, are withered, which do alike grow all the Winter and presish in May.

The splendid Stalk, which crooks and winds itself a little, rises up in August, full size.
Chap. 185. English Herbs.

For a great length, with many small, white and fucet Vrouers, compounding it round, and hanging down and about it.

XII. The forth, or Lady-Trace of Liese, have a triple bud'd Root, and sometimes Quadruple round and a little long, not much unlike in 2ope to some kind of Barrenness. The stalk is rather running downward in to the Ground, of which too are for the most part large, one small, out of which several small Fryers proceed. The Leaves of this are somewhat more like unto the good-leaf'd Plantane, but yet smaller and narrower, three or four at the bottom of the Stake, which otherwise is bare, and has none upon it, and the Flowers are yellowish, like the others, at the top, coming above another.

XIII. The fourth, or Yellow Lady-Trace with smooth Leaves, which has a Root composed of three small Bulbs, almost perfectly round, the one full, the other less, from which growing up better and another Leaves than those of the Friedland Orchis at Sect. 2. afo foregoing, but the Stalks and Flowers are very like them, yellow of color, and pleasfely sweet; the Figure of this Plant Label has given as from Cornelian Gemma.

XIV. The eighth, or Small creeping Orchis, has a Root very unlike all the rest, being long and full of Strings, growing thick together, and interchanging themselves one among another, yet have they at the upper part thereof, next under the Leaves, (as Camararius fays) some few of small Bulbs sometimes to be seen. From these Roots arise Leaves which are thin, somewhat fpace one from another, of a dark green color: the Stake is flender, and set full at the top with feveral white Flowers, fpetted with Blood-red Spots. Parkinfl will have this to come nearer to an Helbezone than to a Orchis.

XV. The Places. Thofe all generally grow in dry Grounds, Heaths and wafte untill'd Places, in many places of Englands, but are for the most part met with, up with us in Garden.

XVI. The Times. They all flower late in the Year, feaflily before Auguft or September.

XVII. The Qualities. They are all (except the luft) hot and loft in the fecond Degree, some hot but the fift Degree, and loft in the fecond. They atteinne, are Stomackick, and Stomackick, Al- terative, Analeptick and Spermatozoeick.

XVIII. The Specification. They flir up luft, and cure Barrenness in either Sex.

XIX. The Preparations. You may prepare there- from, 1. A fiquid Juice. 2. An Effence. 3. Saffet or Blood.

The Virtues.

XX. The liquid Juices: Taken to 2 spoonfuls or more in Chars, or rather Alimac. 1. In the Morning eafing. 2. An hour before Dinner. 3. At Four in the Afternoon. 4. An hour and half after Supper, juft at going to Bed. it brings much Seed, this up luft, strengthens the Instruments of Generation, and cures a female Goodftone, or Gleet of the thinner parts of the Seed.

XXI. The Effence. It has all the Virtues of the former, and may be taken in the fame Dole, and at the fame time, but is much more powerful, to all the Intenions, and is eficacious to cure even Ulcers of the Proftate from a virulent Carne.

XXII. The Saffet or Blood. & Pull of the Roots made by well haunting them in a Stone Mortar. 4 pounds: Crumbs of Bye and Wheat Break, of each 1 pound: mix them well together, adding a little white Ford Wine, to make them pretty moft: put 2d into a Beak-head, filling it well with Cork and Spauld Wax, or Sealing Wax, fo that nothing may

transpire, digest in a warm Balneo or Horse-dung, till the Matter is changed into a Rubicund or Bloody Chyle, then force it strongly out with a Prefs, putting the expressed Blood into a Balneo Vaporia, that by this fned Digestion it may acquire a greater Redness, and some koves may settle, which continue till the Blood becomes abfolute clear, and of a moft perfecr Red, which then separate from the Koves by decanting it: put this into a Glof Anthick, and in Balneo Vaporia abflyf some of the thin, clear and limpid Water or Spirit, leaving the Bloody Ex- tract at the bottom of a very red color. This ad- minibly corroborates the Womb, and the Vessels and Instruments of Generation, both in Man and Woman: it is a Specifick to caufe Conception in Women, to remove Barrenness and cause Fruftiful- nefs. It alfo cures Impotency in Men, and restores them to their Priftin Vigor. Dofe 1 hugeful Morning, Noon and Night in Generous Wine.

CHAP. CLXXXV.

Of CUMIN Garden.

The Name. It is called in Greek, Ῥάμος: in Latin, Cuminum: in Arabick, Cumum and Cumin. In English, Cumin.

II. The Kinds. It is twofold, viz. 1. Ῥάμος φυωσις, Cuminum Hortens, Garden Cumin. 2. Ῥάμος νικτίτος, Cuminum agriffe, Wild Cumin, of this we shall difcours in the next Chapter.

III. The Garden kind is threelfold, 1. Ῥάμος άρ- αβίς, Cuminum vulgare, Our ordinary Cumin. 2. Ῥάμος γονος, Cuminum dulce, Cuminum meliferfe dulce, Sweet Cumin, and Small Cumin. 3. Ῥάμος άρμ, Cuminum acris, Cuminum mefitere acris, Sharp called Cumin, and Great Cumin.

Garden. Cumin.

The Virtue.

XX. The liquid Juices: Taken to 2 spoonfuls or more in Chars, or rather Alimac. 1. In the Morning eafing. 2. An hour before Dinner. 3. At Four in the Afternoon. 4. An hour and half after Supper, juft at going to Bed. it brings much Seed, this up luft, strengthens the Instruments of Generation, and cures a female Goodftone, or Gleet of the thinner parts of the Seed.
IV. The Descriptions. The first of these is a Root which is long, small, white, and perfishing every Year, from whence springing up several slender Stalks, of foot and half or more, and some of them 6 or 7 high, each branching themselves out gradually, and growing white at length, having fcore of Leaves, which are small and long, like unto those of Fennel. The Flowers are somewhat reddish, growing in Umbels at the tops of the Stalks, which turn into fmall, long and almost round whitish Seeds, crefted or forked on the rounder side, and fmaliling fmall.

V. The second, or Sweet fmall Cumin, has Roots, Stalks, and Leaves like to the former, and like it in its manner of Growing, 3 but its Seed is small, and like unto Allie Seed, and sweet or Sweet Fennel Seed: so that it fomes to be nothing different from the former, but in the Shape or Korn, Magnitude, and very fweet Taffe of the Seed.

VI. The third, or Sharp-flung green Cumin, is like the Ordinary or Common Cumin in its Roots, Stalks, Leaves, Branches, Flowers and manner of Growing, failing that it is every way greater, but it principally differs in its Seeds; for they are not only greater than thofe of the fifth or Ordinary Cumin, but they are longer also, and pointed at both ends, crefted likewise on the rounder side, and of a much duller colour,ymmetrically and turtle upon the Tongue, hot, quick and biting, like Carrots or Pepper.

VII. The Places. They grow all of them in England, in our Gardens, the Seed being found, but they are the Offices of other hotter Countries, as Spain, Italy, and the Islands of the Mediterranean Sea, as also in Syria, Palifiea, and other Eastern Countries, where they grow famall and plentifully. The fifth of these grows most common with us in our cultivated Grounds, but admirably well in the South parts of Carolina, and other parts of Florida, where I saw it in Perfeclion. The fow'd grow, if sown in all the places aternated, very plentifully in the Isle of Malta, where they put it into their Bread and other Meats, and Trade with it to other Parts in exchange for other Commodities. The third (as well as the fift) grows in feveral parts of Arabia, Ethiopia, Egypt and Asia, where it more admirably obtains that acrid or sharp Taffe: however, they delight to grow in purined and hot Sells.

VIII. The Times. Parkifon fays they come not often to Perfection with us, unless in a kindly Year, and often in the middle of the Spring; fo that the they flower and fend early in hot Countries, yet it is late with us before the Seed comes to Ripeness. Gerard fays, that he had proved the Seeds (of the fift fork,) in his Garden, where they brought ripe Seed, much fitter and greater than any which comes from beyond Sea. It is to be fown in the middle of the Spring: Thenefies fays, that a Shower of Rain preffently following its Sowing, hardens much the Growth thereof. Gerard fow'd it in the middle of May, and it fprings up in fix days after, and the Seed was ripe in the end of July.

IX. The Qualities. The Seeds, which is principally used, is hot and dry in the third Degree, full of Sulphur and Mercury, it is Apetitive, Anodyne, Astringent, Astringive, Cardinative, Digestive, Diffipative, Diuretique and Sudorific, Cephalic, Neurolitic, Scemantic, Pelhor, Nephtiric and Hepatic, Emmenagogic, Lithiontripique, Alexipharmic, Ameleptic and Spermatogonitic.

The Speciation. It has been found, by Experience, to be a fingular Care for the Collick.

The Virtues.

XII. The liquid Juice of the Leaves. It expels Wind and Urine, provokes the Terms, and is good against the Bittings of Mad Dogs, Serpents, and other Venomous Creatures. Dofe 2 spoonsfull at a time Morning and Night, in a Glafs of Wine or Ale.

XIII. The Effenence of the green Herb. It has the former Virtues, besides which, it prevails against the Collick and Fluxes of the Bowels, is good against Pains in Women, is a good Pectoral, opening Obftructions of the Bref and Lungs. Dofe 1 or 2 spoonsfull Morning and Night in Wine.

XIV. The Cataplasm of the green Herb. It dif-culties Wind in the Bowels, strengthens the Joints, diffufes windy Humors in thefe or any other Parts, repercerues Humors in fimple and recent Contusions, diffufes Flammations in the Scrotum, and prevails against the Gout.

XV. The Powder of the Mixt. Mixed with Ho-ney (a dram at a time,) it is Pectoral, and very good against Coughs and Colds. Mixed with Vin-egar and put up the Noftritis, it is folid to ftop Bleeding there. Made up into a Quartz, fpiffened with good Wine-Vinegar, and made very hot upon a Warming-pan with Coals in it, and fo applied to the Side, it takes away Pains and Stitches, and gives caufe in the Pleurisy. Taken to 1 dram in a Glafs of Generous Wine, it caufes Pains of the Stomach and Womb, gives Relief to the Collick, and is good against the Gripings of the Guts. It makes Iftch as liffe it much inwardly to look very pale.

XVI. The Spiritual Tincture of the Seed. It is a true Anointing, given to a Spirit in Wine or Ale, strengthens the Stomach, and refiores the Tone thereof, and is a singular good thing againft the Bloody-flux, and all other Fluxes of the Bowch.

XVII. The Acid Tincture. It is a moft admirable Stomartic, expels Wind, fortificates the Ventrie, caufes a good Appetite and an exceeffive Digestion; and, if taken vefted with the former, it prefently removes them, reforing the Stomach to its prifon State of Health. Dofe 1 or much at a time as to make the Liquor plentifully fapp. It gives eafe in the Gout and cures it, If the Parts af-bleed he bathed therewith for some time.

XVIII. The Oily Tincture. It immediately cures the Cholick to a Miracle, being given from 20 to 40 or 50 drops at a time, in a Glafs of Wine, or some other proper Vehicle: it opens Obftructions of the Womb, provokes the Terms, and removes Sand, Gravel and Turboe Matter from the Reins, Ureters and Bladder, giving fanguine caufe in a very fhort time. Anointed outwardly upon the Joints affhced with the Gout, it gives eafe, and in a fhort time after cures it. It cures Cramps and Convul- lions to a Miracle, by anointing it on the Part affh-ced.

XIX. The Saline Tincture. Given from 20 to 49 drops, or more, in a Glafs of White Fort Wine, it cures the Mifery of many people, and brings the Reins and Urines more plentifully, it cleanseth thofe Parts of Sand, Gravel or Turboe Matter, and cures the Patient to Fife freely. outwardly bathed upon places affected with the Gout.
it gives Faff and Relief. It attenuates, digests and diffuses Humors.

XX. The Oil of the Seed. It is a Specific against Pains of the Stomach and Bowels, gives present ease in the Cholick, as also in the Stone, provokes the Terms in Women, and has all the Virtues of the Spirituous and Oily Tinctures. Given ad gust.

12 or 20 in a Glass of Wine to a Woman in Travel it facilitates the Delivery. It is good against Coughs, Cold, Alburn's, thirsts or Diathes, difficulty of Breathing, Wheezings, Hoasthins and other like Diffemps of the Brest and Lungs. It encreases Seed, provokes Luf, strengthens the Instruments of Generation, returnes in Consumptions, breeds Milk in Nurses, and retells Poyson: it is alfo prevalent against the Bittings of Vipers and other Serpents; also the Bittings of Mad Dogs, and other Venemous Bittings, being inwardly taken, and outwardly applied to the place.

XXI. The Spirituous Water. It may be used as a Vehicle for any of the former Internal Preparations, and has in some measure all their Virtues: it is a very good thing for Nureres to take, because it very much promotes the breeding of Milk.

XXII. The Balfum. It is made of the Chymical Oil, mixt with five times its quantity of pure Oil of Nutmegs by Exprefion. It is of wonderful Use to allain the Genitals of a Man, who is grown Impotent either by Age, Accident, or a long Diffuf of the Air; the Oil of the Seed being in the mean Season taken inwardly. Anointed upon Parts affected with Fumus and Convolutions, it generally cures them, and strengthens any Part which is much weakened, either by the Gout or other Accidents. Anointed on the Stomach and Side, it comforts them, and cures the Pains of the Pleurisy.

XXIII. The Decoction of the Seed in Wine. If Eggs are added in the Bolling, it will be the more Efectual, and so good for such as are threathened or are otherwise troubled with an old Cough, Hoasthins or Wheezing, difficulty of Breathing, and other Difficulties of tho' Parts; and withal it expels Wind from the Stomach and Bowels: and if it is confum'd drunk for a whole Year together, it obliterates the very Roots and Foundation of the Gout, and by keeping the Body foble, and sweetening all the Juices, it carres off the Tartorous Matter which breeds that Diffuf, and that without either Puring or any other Medicines. But when it is thus generally used, the Decoction must be made sometime in Water and sometime in Wine, for the Stomach fake, and it must be used as the Patients common Drink. I try all this from manifold Experience.

XXIV. The Cataplasm of the Seed. If it is bruifed and fryed with Yolks of Eggs till they are barb, and then beaten up with a little Oil of Nutmegs by Exprefion, or with some of the former Balfum, and applied to the Head, (the Hair being firft shaved off) it gives wonderful and speedy Relief in an old Head-ache, tho' it be vifente, more especially if it comes from a cold and moist Caufe; and applid to the back part of the Head, it stops the Rheum which falls into the Eyes, and helps such as are Blood-thronted; more especially if within it is made with Wax into the Form of an Empiander, and applied warm over the Eye-lids. The Cataplasm made only with the Seed and Yolks of Eggs, and applied to a simple Convulfion, diffuces it; but with the Oil of Nutmegs, being applied to the Scrotum, it is excellent to diffues a windy Tumor of that Part.

The Names. It is called in Greek, Κομην, or Κυμην: in Latin, Cuminum Sylvestre: in English, Wild Cumin.

As for thefe two latter, tho' Camerarii, Dom- enens, Label and Gerard, with fome others, do account them as Species of Cuminum, or kinds of Wild Cumin, yet they are fcarcey fo to be accounted, for that they have neither the Appearance or outward Refemblance of them, neither yet the Medical Qualities or Virtues answerable to them, but rather have the Qualities and Properties of Poppy; however, because Cajtor has given them the Name of Wild Cumin, we fubmit, and rank them in the fame Order.

IV. The Description. The firft, or Wild Cumin, has a Root which is small and white, with fome Fibers adhering to it, and quickly perifhes with the leaf Blotts or Dew of cold Nights, and therefore comes
SALMON'S HERBAL. Lib. I.

Of CYPERUS Sweet, or, HERB-CYPERUS.

I. THE Names. It is called in Arabeck, Sobroode: in Greeck, Κοπέρως: in Latin, Cyperus, Juncus angularis, Juncus quadratus, Juncus trigulatus, Aegialion, Hypecoum; and in English, Cyperus, Herb Cyperus, Sweet Cyperus, Guinea, and Galangal English.

II. The Kinds. It is fourfold, viz. 1. Cyperus odoratus, Sweet or Herb Cyperus, or English Galangal round-rooted. 2. Cyperus longus, Cyperus Cyperus, Herb Cyperus or English Galangal long-rooted. 3. Cyperus dactyliferus, Serratus, Cicuris rotundus, Round Sea Marth Cyperus, or Marth English Galangal: all these are found growing in England, and shall be treated of in this Chapter, to which add 4. Cyperus dactyliferus, Serratus, Cicuris rotundus, Round Sea Marth Cyperus, or Marth English Galangal: all these see hereafter in their proper place.

III. The Greeks have other Names for the Plants treated of in this Chapter, the Κοπέρως is the general Name, and is that by which the first kind is called, (so called from the Roundness of the Root) which in the Cyperus rotundus oloratus: or Names, Cyperus longus odoratus, is the second, or long-rooted foot kind: Κοπέρός, Cyperus teres, is the third, or Marth kind, of all which in their Order.

IV. Note. This is to be taken notice of, That many Anatomiers, being not well acquainted with their botany, do use the long sweet Cyperus Roots instead of the round Cyperus Roots, and others, tho' they know better, yet constantly make use of the long, instead of the others, contrary to the Appointment of the Ancients, and of the Natives, who do not choose to be furnished with the Genuine or True, because the one is much cheaper and easier to be had than the others, are thus falsifying the long for the round, which, tho' upon receiv'd a Substitute may be admitted, yet no Succeedesman, viz. a spiced pop gun, is to be allow'd of, when the true Ingredients is to be had; forasmuch as no Substitute can be so effectual to every Intention as the Genuine is: this Abuse ought indeed to be rectified for the future.

V. The Descriptions. The first, or Common sweet round kind, has a Root which is compose of many long and round blackish brown Small Roots, of the bigness of small Olives, or Roots of the Greater Filippendula, which are joined together by long Strings, and are of a sweet Smell, even when they are green, but more when they are dry, which then are
Chap. 187. English Herbs.

are of a bitter Taste, somewhat the unto Galanga: from this Root grow forth many Heads of long and narrow Leaves, somewhat ridged in the middle, and very Leaf seeming thereby to three square, and somewhat hard and rough in handling; some also in Scents from among these Leaves rise up many smooth flowered Stalks, about a yard high, flagged with a white Path, and not hollow, without any Knot or Joint therein, unto the very tops, where stand a few short Leaves, and many small stalks or softly green Spikes, or Ear of small Leaves above them, which afterwards contain the Seed. "thin them.

VI. The second, or Long-rooted sweet Cyperus, has Roots which are of a moderate sise, long and round, and of black or blackish brown color on the outside, but whithin white, full and firm, and creeping, bitter and thurber, taking up much Ground, by reason of their spreading, it creeps under the Superficies of the Earth, round about, by which it is quickly much encreased, and is of a most pleasing sweet Smell when it is broken, tho' it be green and fresh, and yet more pleasant when it is dry. From this Root spring forth long Leaves, which are as in several square, like the former, and as rough and hard in handling also, almost like unto the Common Reed, but that they are lesser and shorter. The Stalk is smooth and three square, flushed with a white Pith, like the former, and rising three feet high or more, and having also some short narrow Leaves at the tops thereof, and small long Panicles, like unto the other in all things, so that they are scarcely to be discerned under about Ground, the only or chief Difference confiting in the Root.

VII. The third, or Matth kind, has Roots which are tuberous and almost round, hard and black, and without Smell, many Tubers hanging sometimes upon one String, they are not large, but grow almost after the manner of Virginia Potatoes, white and firm within. The Leaves and Leaves are much like to the first kind, but the Heads are wattle, for these are rough and blackish, about the biogens of a Viltert, hanging about six or seven in number, at top of the Stalk.

VIII. The Places. The first and second of these grow naturally in Fenny Grounds, yea they thrive very well in Gardens, as we daily see by Experience. The first grows naturally in Italy and Spain, as also in Egypt by the River Nile, as Apium dys, but is only to be found with us in parts of England, where, unless much Care be taken, it difficulty endures the Hardship of the Winter. The second grows in Syria and Conly, but with us only in Gardens. The third and last grow about Ditches and the Banks of Rivers, where Salt or Sea Water comes: it is found plentifully in the Marches below Crowesfield, in Shrop, Tewce and other like places.

X. The Time. The first flowers or bears its basty Tops in Augst, with us here in England: The second produces its tufted Head in July, or towards the end of that Month, for the most part: and the third Flowers always in July and Augst.

X. The Qualities. The Roots are only of Life, and are accounted hot and dry in the second Degree: they aregethe, are Aperitive, Alteffive, Affringent, Carminative, Digestive and Diurieutc, Cephalic, Stomutick, Nepfrick and Hydricr, Lithuritick and Alexipharmick.

XI. The Specification. They are peculiar against the Stone, Gravel and Oldfitution of Urine.

The Virtue.

XIII. The Decotion in Wine or Water. If it be made in Wine, it ought to be White Port Wine: it cleanses, sweetens and purifies the Blood and Juices of the Body, provokes Urine, and helps to break the Stone in the Bladder, and to abate the Water in a Dropsey, to wit, in an Arsepepe, being drank Morning, Noon and Night, or other, half a pint at a time. It provokes the Terms, and is good against Pains of the Mouth or Womb, more especi- ally, if, besides taking it internally, it be licked up, and the Region of the Womb be also farbed therewith warm. It is good also to wash all sores of a black and nasty Ulcers of the Gums, Mouth and Throat, as also eating Canker, for that it clears drys and heals them: it open Oldfutations, and provokes the Terms in Wome: it also helps a Blushing Breath, being drunk for some time.

XIV. The Powder. It is an excellent Remedy for all running Sores, old Ulcers, Cankers, the spreading and eating, in any part of the Body, it drops Putridity, cleanses, drys and heals, doing what it does without any thing of Heat or Sharpness. It drys up the over much Moisture of Ulcers, and by its Affringent Quality, helps all sorts of Four Months, and Ulcers in the Sixth Parts. It is of an inclining or cutting Quality, and therefore given in one dram Morning and Night in a Glas of White Port Wine, it provokes Urine and the Terms, and helps such as are crowded with the Stone: the Decotion in Wine being drunk inwardly also at the same time.

XV. The Copulphium. It is made of the Peppers of the Roots, and Berry berries, mixed in equal quantities, and made up with Brys and Wine. This being laid upon the Belly of one that has the Dropsey, is said to help them very much, taking at the same time the Decotion inwardly oftentimes.

XVI. The Powder. They have the Virtues of the Powder, but are more sharp, by reason of the Salt.

Salmon's Herbal. Lib. I.

C H A P. CLXXXVII.

Of Cypress. Moss or Heath.

I. The Name. It is called in Hebrew, מָפָה Sept., 26. 10; in Latin, Chamaecyparissus, Cupres-
Fus, vel Cypris fusnum, (herba nomen) Capresius
vel Cypris muscisum: in English, Mafa Cypress, or Heath Cypress.

II. The Kind. It is without doubt one of the kinds of Mafa, and Singularius fus generis, for which
Repton Authors have called it alta, Myrtus Lenticabruna, and Cupressus communis: Myrtus communis folius, Cuprec-
Syconis Tragi, Chamaecyparissus, Tuberamontani &

Tannery, and in English it is not unfillly called, Heath Cypress.

The Helps. It has a small fibrous or stringy Root, from whence spring so several Stalks, some rough and others naked, being hard and branch-
ed, with very short and thick Leaves growing on them, something resembling a Branch of the Cypress-
tREE, and of a dark green color, bitter in Taste, but
without Smell. From the tops therefore sometimes
spring forth small and soft jirded Heads, viz. such
Ears or Cattails as are those of the Club or Woolly-
Claw Moss, which are of a yellowish color, and grow-
ing on small foot-stalks. This Herb is a sub Plant,
and abides always green, both Winter and Summer.

IV. The Pods. It grows in Woody and Mountain-
ous places, where they call it Field Sassa.

V. The Times. It fruitifies and is in its chief
Verdure in the Summer Months.

VI. The Qualities. It is temperate in respect of
Heat or Cold, Drying, Binding, Inflammatory and Volun-

tary.

VII. The Specification. It is of singular Use for
branching of Blood, and other Fluxes of Urna.

IX. The Decotion in Red Wine. It is very Aper-
gent, stops Bleeding, and cures any Flux of the
Bowels, if it is present. It also stops the overflown-
ning of the Uterus in Women, and is good against
fainting and pining Blood: Wounds and Ulcers
without therewith, it drys and heals them.

X. The Spirituous Tincture. It strengthens the
Stomach, stops Vomiting and Fluxes of the Belly,
and gives ease in gripping Pains of the Bowels, and
stops the Lodes in Women in Child-bed. Dose
from 2 to 4 drams, morning and night, in Canary
or other fit Vehicle, as the Occasion requires.
Chap. 189. English Herbs.

269

In flows Flwoes and flying of Blood: outwardsly applied, it flows Bleeding in Wounds, and strewed upon moist and running Ulcers, it cleanses them, dries up the Humidities, strengths the Part and induces the healing.

CHAP. CLXXXIX.

Of DAFFODIL Broad-leav'd single, one flowered.

I. The Names. It is called in Greek, Narcissus, in Latin, Narcissus, and in English, Daffodil.

II. The Kinds. It is divided into two principal kinds, 1. Narcissus vulgaris, The true or native Narcissus, or Daffodil. 2. Narcissus angustifolius, Narrow-leav'd. The Species, we shall only describe twenty of the most usual, viz. 1. Narcissus latifolius omnium maximus, angle calice flowe, only incomparably val purpureus, The Incomparable or great round-fleck Daffodil. 2. Narcissus omnium maximus flore & Calice flowe, The incomparable great yellow Daffodil. 3. Narcissus griseus maximus calice flowe, The gray perfolis Daffodil. 4. Narcissus latifolius flore, angule calice, The lesser yellow perfolis, with a large Cup. 5. Narcissus indicus flore rubro, indius Jakobus, The Weet Indian Daffodil, with a red Flower. 6. Narcissus Triumphatoris flore, late-flowing, The early Daffodil of the West, and the Daffodil of the East.

Daffodil Single
VII. The Descriptions. The first, Incomparable, Nonsuch, or Non-such Daffodil, has a great bulbous Root, as large or larger Daffodils, which bear large Flowers, which is covered over with a breadth Coat or Skirt, from whence comes three or four long and narrow Leaves, of a grecyfhe green color; among which rises up a Stalk two feet or more high, at top colored, out of a thin empty Heart, which all Daffodils bear, comes forth one large single Flower, (commonly no more) consisting of six very pale, yellow, large Leavers, the bottom wherof, next unto the Stalk, is narrow and round, rising wider to the Mouth, which is very large and open, and uncercily cut or cutted about the edges. The Coffee or Cap much resembles one of our old Silver Baskets, with a narrow bottom, and a wide Mouth. The Flower being poll, there comes sometimes (the not often) a round green Head, and a black round Seed therin, like to other Daffodils, but greater. This Plant does sometimes bring forth a Flower with ten or twelve Leavers, and a Cap much larger, as if it was two, and as the Flower seems to be.

VIII. The second, or Incomparable great yellow Daffodil, differs nothing in Form, Attitude or manner of Grown, but on the Color of the circling Leavers of the Flower, which are of the same yellow color with the Cap. This sometimes degenerates, and also grows Luxurious, bringing forth two Flowers upon a Stalk, each differ from others, and sometimes two Flowers thrill together, as if they were but one, but this is very rare. This Plant is a peculiar Plant, not conform to its kind, nor abiding yearly in the same Form.

IX. The third, or Grey peelers Daffodil, is whilily like to the two former in Root, Leaf, Stalk and Flowers, but the Leavers are somewhat greater, and the six outward Leaves of the Flower are of a glittering whisthey grey color, and the Cap yellow as the former, but larger.

X. The fourth, or Leffer yellow Nomparelle, has, from a bulbous Root, Leaves rising somewhat like to those of the first kind, but not altogether so long or broad: the Stalk rises not all out so high, and bears but one Flower, like the former, which is better, and both Cap and Leavers are of one color, of a pale yellow, yet more yellow than the other: the Cap is also a little leffer, and a little differing, neither fully so small in the bottom, nor so large at the edges, nor so enclining to the middle, as that of the former, yet it is certainly of a more greeny color, that is manifestly of a quite differing kind from the others.

XI. The fifth, or West Indian Daffodil, has a round bulbous Root, of a brownish color on the outside, and white within, which sends forth several broad Leavers, somewhat like to the Common white Daffodil, of a grecyfhe green colors, from the sides of which, as from the middle of them, rise up sometimes two Stalks together, but most usuallie one after another, (for it is oftentimes flowers truce in a Summer) and often also but one Stalk alone, which is of a finer reddish color, about a foot high or more, at the top wherof, out of a deep red Skin or Hous, comes forth one Flower, hanging downwardly, consisting of six long Leavers, without any Cap in the middle, of an excellent and pleasing color, tending to be a creation of three of those Leavers, which turn upwards, are somewhat larger than the three which hang downwardly, bearing six Threads or Chives in the middle, rife with yellow Elbowes, and a Three-ferfed Sile longer than the rift, and turning the end thereof. This Althinus, Cardinal Paradisius his Physician, says, that at Rome it rise up with Stalks of Flowers before any Leaves.

XII. The sixth, or Early Daffodil of Threlidizond, has a bulbous Root, but not very great, blackish on theoutside, and yellow under that blackish or outwardly Oat, so very like to the Autumn Daffodil, (excepsing for that Yellowness) that they may easely be mistaken one for another: it has three or four very short green Leaves, very like to the Leaves of the Autumn Daffodil, excepting that they are broader or so long, nor rising in Autumn. In the midst of these Flowers rife up a short green Stalk, four, five or six inches high, bearing at the top, out of a whipish thin Skin, stript with green, one Flower a little bending downwards, consisting of six Leavers, and laid open almost in the same manner with the former West Indian Daffodil, of which there do a little turn up their Points, of a fair pale yellow color, having six white Chives within, with very yellow Remnants, and a longer Pointed.

XIII. The seventh, or Small early white Daffodil, has a bulbous Root of a moderate largeness, yet fuller than the Roots of the later kinds, from whence spring Flowers broad, very green, and not whitish, but others, three or four standing together, about a foot or longer; among which rise up a green Stalk, not full so high as the Leaves, bearing one Flower at top thereof, of an indifferent bigness, but not so green or yellow as the latter, consisting of six whitish Leavers, but not perfect white, rather of a Cream color, and of a good sweet Smell.

In the middle is a long yellow Cup, half an inch long or better. 

XIV. The eighth, or Early Straw-color'd Daffodil, from a bulbous Root has green Leaves, as the former, but much narrower, the Leaves of the Flowers are more enclining to yellow, but yet very pale, as if of a light Straw color, seeming to be a little more narrow, and pointed, as the former: the Cap is long and yellow, and the Smell fower, as the latter.

XV. The ninth, or Great late-flowering white Daffodil, has a moderately large bulbous Root, covered rather with a pale than blackish Skin, from whence come greeny or whitish green-color'd Leaves, somewhat narrow and long, among which springs up a Stalk half a yard high, bearing one Flower at top, made of six white Leaves, having the Cap in the middle, as long as the former, and of a deep yellow. The Edges of the Cup are sometimes plain, sometimes a little crumpled, and often circumcised at the brims with a Saffron color, and often also without it, the Smell of which is very pleasant. This Flower sometimes flowers in a Form so that these Differences in the former, that is manifestly of a quite differing kind from the others.

XVI. The tenth, or Late Straw-color'd Daffodil, has a bulbous Root, with Leaves and Stalk like the first, but the chief difference is in the color of the top of the Flowers, for that this is of a more yellow color, and a little larger than its, and the brims or edges of the Cup are of a deeper yellow or Saffron color, the Smell of this being no least sueter than the former.

XVII. The eleventh, or Late white Daffodil, two Flowers on a Stalk, alike it is very like to the former, yet is certainly a kind of it self. It is conformed in its manner and form of Flowersing, commonly bearing, without misfong, two Flowers upon a Stalk, very like unto the former great kind, so that no difference is to be seen betwixt them, but in the mode of the Flowers of one Stalk, the Caps of which have seldom any touch of a Saffron color on their edges, as some of the former had.

XVIII. The twelfth, or Common English white Daffodil, (called also Primrose Peelers) has a moderate large bulbous Root, exceeding more a better Plant, from whence spring long tender bread Leaves, and a round bulbous Root, bearing at its top, of a whitish yellow, sometimes but one Flower, but most commonly two,
the leaf, (but larger for the most part than any which bear many Flowers upon a stalk) of a pale purple, or rather grayish color, higher to that of a pale Primrose, with a small round flat Crown, rather than a Cap, in the middle of a pale yellow color, with some pale Cloths flinking therein, and of a pretty focket, &c.

XIX. The thirteenth, or Late-blooming white Daffodil, has a bulbous Root, like the former, but the Leaves are slower, and the stalk rises not so high by much, and bears but one Flower, (of a pure white color,) made of six small Leaves, and something narrow, flinking severally one from another, and not so close together as the former, but appearing like a Star; the Cap is small and round, of a pale yellow color, but Saffon like about the brims, having six small pale Cloths in the middle of it, the Smell of which is much stronger than the former.

XX. The fourteenth, or Early purple-ringed Daffodil, from a bulboos Root, has many long narrow Leaves, sometimmes narrower and flimmer than the former Common white Daffodil, among which rises up a long nacked hollow stalk, (as all other Daffodils have,) bearing at the top one Flower, (of the form white,) consisting of six long white Leaves, flinking close together about the stalk; the Cap is yellow, and so flat, that it might rather be called a Crown, for it stands very close to the middle, and very open at the top, like a Bell, and is circled with a yellow Color, having also several Cloths in the middle of it, whose Smell is very sweet, exceeding severall other kinds.

XXI. The fifteenth, or Late purple-ringed Daffodil, from a bulboos Root, greater than the last, but Leaves broader than it, some being near twice as broad. The Flower is like the former, being large, and its Cloths more narrow, and forming close together, to the idea of another. The Ring also, which compasses the yellow Coronet, is sometimes of a paler reddish purple, and sometimes of as deep a red as the former, from which it differs but a little, in the time of blooming, which is not until the other is past and gone; the Smell is sweet, like the former.

XXII. The sixteenth or Great white-purple-ringed Daffodil, has a bulboos Root, greater than the former, and off its Leaves and Flowers, the largeness of which makes it only to differ from the last, and to be a distinct kind, it flowering with the latter of the Purple-ringed Daffodils.

XXIII. The seventeenth, or Stormy purple-ringed Daffodil, from a bulboos Root, has a little narrower and greater Leaves than the former kinds: the Flower has six white Leaves, not so broad, but narrower, and forming longer than they, not cliuing together, but flinking apart one from another, making it seem like a white Star: it has also a yellow Coronet not in the middle, circled about with purple, like the former, flimming finest, but nothing so finest as the Early purple-ringed Daffodil.

XXIV. The eighteenth, or Perianth Daffodil, has a bulboos Root, a little blackish on the outside, somewhat like the Root of the Autumn Daffodil following: bears off its Leaves and Flowers, at a foot high, bearing one pale yellow Flower, breaking thro a thin Skin, which first enclosed it, composied of six Leaves, the three outermost being a little larger than the three within, the middle for small Cloths, and a larger Petal, or a of unpleasant Smell. After the Flower is past, the Leaves come up, sometimes before Winter; but most usually after the deep of Winter, in the beginning of the Year, which are broad, large, of a pale green color, like the Leaves of other Daffodils, but not green, as the Autumn Daffodil is, they also raise themselves a little, as some of the Pancratium or Balfard Sea Daffodils do. This differs from all other kinds of Daffodils in its manner of growing, for it bears never Leaves and Flowers at one time together, whereas it is like unto a Colchicum, but in Root and Leaf it is a Daffodil.

XXV. The nineteenth, or Greater Autumn Daffodil, has a Root very round and covered, covered with a blackish Skin, from whence rise up three or four fair broad and short Leaves at first, but afterwards they grow longer, and of a very deep green color, in the middle of which rises up a short stiff round foot-flath, bearing one fair yellow Flower, enclosed at first in a thin Skin or Husk, and composed of six Leaves, as the former, with several Cloths in the middle, as many other Daffodils have, which falls away without any appearance of Seed, or Head for Seed, the under the Head there is a little green Kist, which possibly might contain and bear Seed, if the Chloe was warm and friendly enough, or our short Winters did not hinder it.

XXVI. The twentieth, or Lesser Autumn Daffodil, has a Root like the former, but lesser, and covered with a blackish Skin, from whence springs forth six deep green-colored Leaves, as in the last, but smaller and narrow, a little bolloten in the side, and after them the Stalk and Flower, which is lesser than the other, and a little paler, consisting of six flowers like Leaves, narrow and sharp-pointed. Clusius says, that the flowering of this Daffodil is more like to the Perianth Daffodil at end 23. above, than to the former Great Autumn kind, the with us it seems to imitate the latter or Great Autumn sort, in sending forth its Leaves first, then its Stalk and Flowers.

XXVII. The Place. Whence the first, second, third and fourth first came, is now unknown: the fifth the Title flows out of the fiftext, and was first brought into Spain, and thence it was sent to us, and into several other parts of Europe: the sixth came from Constantinople or Trébizonde; the seventh, eighth, ninth, tenth and eleventh are Natives of the Pyrenean Mountains, from whence they have been brought to us: the twelfth is said to grow naturally in England, and is plentiful enough in all Country Gardens: the Original of the thirteenth is unknown: the fourteenth, fourteenth and seventeenth are Turkish Plants, and came to us from Constantinople: the fifteenth grows in many places of Europe, as in France, Germany and Italy, as Clusius has said: the eighteenth grows in Peru and Turkey, and came to us from Constantinople: the ninetenth and twentieth are also Turkish Plants, and were sent to us from that Metropolis. Now, by Transplanting and great Care, they are made Dias-
XXX.  The Preparation.  They have been found by Experience to be good against Coughs, Asthma's and Colick.

XXXI.  The Preparation.  The Root is only in Uge, and therefore you may have, 1. A liquid Juice.  2. A Loache.  3. An Efficse.  4. An Ointment or Balsam.  5. A Cataplasm.  6. A Mixture.

The Virtues.

XXXII.  The liquid Juice.  Taken to 2, 3 of 4 ounces, or more, according to Age and Strength, it cursets Vomiting, and very much clears the Stomach by that means, casting a good Appetite and Digestion.  It may be mixed with White Wine, and taken in the Morning fasting, and so it is good against the Colick.

XXXIII.  The Loache.  It is made of the Juice, mixt with half its weight of Honey.  It is good against Coughs, Colds, Hoarse-Sneezings, Sore Throats, and Breath and difficulty of Breathing.  Dose one spoonful at a time, twice or thrice a day: or it may be often taken with a Liquorice Sticks.

XXXIV.  The Efficse.  It wonderfully clears, dries and heals: it conglutinates or clogs the Mouths of great Wounds together, yea, cheeses of the Veins, Arteries, Nerves and Tendons: the Wound being wafted therewith, and Lint dip therein, being bound thereon.

XXXV.  The Balsam or Ointment.  It is figular against Bumings and Scaldings, whether with Fire, Water, Oil, Gun-powder, Pitch, &c.  It cleanseth old Ulcers, dries and heals them: and being applie to green Wounds, it conglutinates or joins their Laps together, and quickly heals them.  It also draws forth Pricks, Thorns, Splinters or other like things gotten into the Flesh.

XXXVI.  The Cataplasm.  If it be heesen and made up with Honey, and applied Emplaster-wise, it is clearing and attractive, cures Burnings and Scaldings, and conglutinates Sinsews which are cut abouts: and so applied to Sinsews or Wrinkles of the Wrists or Arms, or Joints pathed with the Gout, it gives Relief.  If to the Cataplasm Meil or Flower of Dauris is added, it becomes very attractively, and draws forth Thorns, Splinters, &c. out of the Fleshes, and applied upon Skin-burnings and Morphohs, it takes them away.  The Root made into a Cataplasm with Hogs-Lard and Rye-Bread, it hithers the Suppresion of Apoptomes, even of those which are not easily ripened.

XXXVII.  The Mixture.  It is made of the Juice mixt with an equal quantity of White Wine Vinegar, and an eighth part of Acorus Seed in poudre.  It is good to remove Dehiscences of the Skin, as Scurf, Morphoh, Taming, Yellownefs, Brownnefs, Pimpls, Freckles, Lentils, Tetras, Skin-wounds, and other like Afflicts molesting the Face.

CHAP. CXC.

Of DAFFODIL broad-leaf'd, many-flowered.

I.  The Nature.  It is called in Greek, Narcissus or Nymphæus, after the Name: in Latin, Narcissus latifolius Polyanthus flore simplex: in English, Daffodill broad-leaf'd many-floured single.

III.  The Description.  The fyll, or Great yelow African, (a noble and flately Flower) has a great bulluous Root, covered with a blackish Skin, from whence spring many very long and broad Leaves, of a better green than many others, in the midle of which comes up a Stalk, not rising so high as the Leaves, bearing at the top, out of a thinne Husk, many faire, goodly and large Flowers, ten or twelve in number, if the Root is well growen, and it grows in a warm place, each Flower being larger than any of the French, Spanish or Turkey Daffodils, which bear many single Flowers on a Stalk, (this coming near to the large-flower'd of our English Daffodill) (as chap. 139. sect. 16.) before descibed, or the French describ'd at sect. 12. following, which indeed is also a kind of our English at sect. 16. of this chap. but bearing more Flowers: Thes Flowers are of a faire shining color, having large, round and open Cups or Bowls, yellower than
the outward Leaves, and of no exceeding force. Smell, this is almost ready to overtake, at least facilitate the Sense.

V. The Cowslip, or Lesser yellow African, is as well the same flare with the former, but wants somewhat of its flatly Height, Largeness of its Flowers and Caps, and Beauty of Color, in being of a paler yellow, and in all those respects inferior to it, nor is its Smell altogether so fragrant.

The third, or Yellow Turkev Daffodil, altbo from its bulbous Root it has very long Leaves, and a high Stalk, yet it comes short of the Beauty of that which was last described; for in this the Flowers are not so many, not being about four or five, nor so large, being not much greater than the Common French Daffodil at fect. 17. following, nor is so fair a color, but much paler, nor having a Cup fo large this being manifestly smaller, nor of fo fragrant or sweet a Smell, this being also weaker.

VI. The fourth, or Greater Lirieron-color’d, from its indifferent large bulbous Root, has three or four very long and green Leaves, half a yard long at least, among which riseth a round, yet clefted Stalk, not fo high as the Leaves, bearing five or six large Flowers thereon, every one of them being greater than the Common French Daffodil at fect. 17. following, or the Italian at sect. 13. they are of a faint, yet pleasant yellow color at first, but when they have been in flower a fortnight, or thereabout, change into a rich golden; this flower in an inch is also much larger than in the foregoing, and of a deeper yellow color than the other Leaves, having only three Choises within it, and is of a very pleasant Smell.

VII. The fifth, or Lesser Lirieron-color’d, from its bulbous Root has broader and shorter Leaves than the former, nor green like them, but of the color of other Daffodils. The Stalk riseth here higher than the tis above, bearing about four or five large Flowers upon shorter Foot-flakes, and no bigger than the Common French Daffodil, of a pale yellow, which some call a Brinmolam color; the Cup, or rather Conus in the middle, is very small, and much open, of a little deeper yellow, having many Ovirs within it, and as it were, surrounded over with a kind of Meatline. It is not full so of force a Smell as the former.

VIII. The sixth, or Many-flowed Milk-white, has its Bulbous Root with a black-house, underneath Leaves of a mean flat, both for length and breadth, greener than the ordinary Trees, which have none Wheaten in them. The Flowers are many upon the Stalk, as small as for the most part as any of these kinds which bear many together, being wholly of a Milk, or rather of a Snow white color, as well the Cup, which is small, as the outward Leaves, which encompass it: after which come small Hoodes, in which is contained round black Seed, as all other Daffodils have, but more green, some leafer, according to the Magnitude of the Plants.

The Smell of this is very pleasant.

IX. The seventh, or Milk-white with the great Cup, is threefold. 1. One which has its Leaves somewhat broader, and the Flowers greater than the former. 2. Another which has its Leaves smaller, and its Bulbous Root, also, the Caps are likewise smaller, and are next seen fully open, but as it were half closed at the brims. 3. Another sort, whose Leaves are as broad as any of the other sorts, and whose Cup in the middle of the Flower is somewhat larger than in any of the kinder sorts, but leffer than in the greater kindes, the Leaves of whose Flowers do a little turn themselves upward, from whence it is called Perunus. There are so usually called Narcissus tons tus, albus compositus, maius, minus, minus, according as the differences are.

X. The eighth, or Early Narbonse, has from its bulbous Root, which is great, Leaves springing up a Month or two before the following kind, being also shorter and narrower. The Stalk is not very high, bearing several Flowers at the top, breaking third a thin Skin, as it common with the Daffodils, every one of which is small, consisting of six white Leaves, and a yellow Cup in the middle, of a pleasant sweet Smell, but making so strong as many others. The Root of this seldom parts into six, or in all the following do, which bear many single Flowers.

XI. The ninth, or Common French Daffodil, has its bulbous Root covered with a blackish Skin, from which rising long and broad green Leaves, a little bulbousstuff in the middle, and edged on both sides; the Stalk is about half a yard high, bearing on its top several Flowers, somewhat larger than the former, consisting of six white Leaves, something round. The Cap is yellow in the middle, small and round, like unto an Acon Cap, or a little fuller in the midst. This is the Description of those which come to us out of France, but with us I think they either degenerate or alter in Form, making in flower the Cap shorter, in others flatter, and some longer than the rest, some of a paler and some of a deeper yellowness.

XII. The tenth, or Narbone with great Flowers, has a Root not so great or round as the former, but in all is more plentiful in Offsets than any other of the French or Italian Kinds. The Leaves are almost like the last, not full out so broad, but full out as long, and strong, firmer, fuller out of the Ground, yet not so early as the eighth at sect. 10. foregoing. The Stalk is flatter and rises higher, bearing four or five Flowers, much larger than any of this kind, every one equaling the English Daffodil (in cap. 169. sect. 17.) but whiter than it, and the yellow Cup larger and more open than in any of the rest.

XIII. The eleventh, or Italian Daffodil, from its bulbous Root has Leaves as large or larger than the Common French at sect. 11. above, but in its Stalk is somewhat bigger, bearing many white Flowers, very like to the said Common French, but a little larger, as it also the yellow Cup in the middle, and rounder than is commonly seen in any of the French Kinds, except the Narbone with great Flowers at sect. 12. above.

XIV. The twelfth, or French many-flowered, with Saffron-colored Cups, has a bulbous Root, Leaves of a greyish green color, not so broad or so long as the Italian, but coming nearer to the Common French. The Flowers are white, and many upon a Stalk; the yellow Cup is somewhat large, and circled with a Saffron like brim or edge, which indeed makes the chief difference.

XV. The thirteenth, or Other Saffron-color’d, has also a bulbous Root, from whence spring Leaves large and long, in the midst of which grow up a Stalk, bearing at its top several white Flowers, which are larger than any of the other French, except the Narbone with great Flowers at sect. 12. above, but the Cup is small and flat, rather seeming a Conus than a Cup, of a deep Saffron color all about the brims or edges.

XVI. The fourteenth, or Great English Daffodil, has a bulbous Root, from whence spring Leaves not much broader or longer than the Saffron with great Flowers at sect. 12. above. The Stalk with the Flowers rises not so high as it, bearing many Flowers in all, being much greater than, yet whiter than the Common English (in cap. 169. sect. 17.) but nothing fo large, and such flat, broad, and shall round. Leaves, standing close one unto another. The yellow Cup in the middle is double-faced, somewhat deeper than in any of the former, but not much greater, and the Smell thereof is very justes and pleasant.
of Daffodil broad-leaved, double flowered.

T HE Daffodil is a double Corm, which arises without any leaf, and increases in size year by year, so that it is seldom seen, but with a little care, it may be increased much. The flower is large, and the leaves are long and narrow, and the flowers are yellow, with a purple ring, and the petals are thick and fleshy.

Of the Daffodil broad-leaved, double flowered.

I. The Name. It is called Daffodil in Latin, Narcissus in Greek, and Narcissus in English, from the Greek word "daffos," which signifies a flower.

II. The Species. There are several species of Daffodil, of which the following are the most common: 1. Narcissus pseudonarcissus, a species found in the mountains of Italy, and called the Double Daffodil. 2. Narcissus poeticus, a species found in the mountains of Greece, and called the Double-flowered Daffodil. 3. Narcissus pseudonarcissus var. giganteus, a species found in the mountains of Spain, and called the Giant Daffodil. 4. Narcissus poeticus var. pallidus, a species found in the mountains of Sicily, and called the Pale-flowered Daffodil. 5. Narcissus poeticus var. albus, a species found in the mountains of Turkey, and called the White-flowered Daffodil.

III. The Description. The Daffodil is a bulbous plant, with a bulbous root, which is white and fleshy, and is covered with a thin, white, papery skin. The stem is green, and is covered with a sheath of leaves. The leaves are long, narrow, and pointed, and are arranged in a spiral. The flowers are yellow, with a purple ring, and are borne on a stalk, which is erect and不分权杖。

The Daffodil is a bulbous plant, with a bulbous root, which is white and fleshy, and is covered with a thin, white, papery skin. The stem is green, and is covered with a sheath of leaves. The leaves are long, narrow, and pointed, and are arranged in a spiral. The flowers are yellow, with a purple ring, and are borne on a stalk, which is erect and不分权杖。
Chap. 192. English Herbs.

The they are double, and bear many upon a Stalk, like unto the former, yet this has the pieces of the yellow Cups lift with purple, as if they were fired or scattered among the white Leaves, whereas the other has only the yellow, without any appearance of purple Tips upon them: the Smell of this is as strong and sweet as any of the other.

VIII. The inches on many-flowered double yellow of Cyprus, has a bulled Root, like to the former, and its Leaves are almost as long and broad as the other. The Stalk is a foot high and more, bearing on its top four or five Flowers, every one very double, of a fine pale yellow color, and of a strong sweet Smell.

IX. The Places. The first was brought into England out of Cambray, where it grows wild. All the rest came from Constantinople at several times: the last also grows in Cyprus, and some also lay in Barbary, about Algiers and Fez, and some of them grow in Candia, as also about Alexas, and some others in the Turks Dominions. Now they are made Denizens of our Kingdom, and grow frequently in our Gardens.

X. The Times. The first flowers about the middle or end of April: all the other Turksy kinds flower very early, in the middle or end of March, or beginning of April at the least.

XI. The Qualities, Specification, Preparations and Virtues, are the same with those in Chap. 189, going on, to which you are referred.

CHAP. CXCII.

Of Daffodil narrow-leaved

I. THE Name. It is called in Greek, "Narcissos boeotavos"; in Latin, "Narcissus angustifolius simplex"; in English, "Single-flowered, narrow-leaved Daffodil".

III. The Description. The first of these, or Early white narrow-leaved Daffodil, from a bulbous Root but or end of April: all the other Turksy kinds flower very early, in the middle or end of March, or beginning of April at the least. The Stalk rises not so high as the Leaves, on which grows one Flower, (not so tall as the late-flowering Daffodil), with a long Cap, among the Bread-leaved kinds which conflict of six pale-color'd Leaves, not of a pure white, but with a mixture of a light yellow among the white. The Cup in the middle is round and long, (yet not so long as to be accounted a Bulbous Daffo-
Chap. Cxcii.

Salmon's Herbal. Lib. 1.

Salmon.

The kinds. It is twofold; viz., 1. Narcissus angustifolius flore albo pleno. 2. Narcissus angustifolius albus simplex, The white Jonquilla. 2. Narcissus...
funiculius albus magnae Calicis, The white Junquilia

III. The Description. The first, or White Junquilia, has a small bulb; the Root covered with a blackish Skin, from whence spring forth small long Leaves, a little broader, and of a whiter green color than the Ordinary yellow Junquilia, or Ruth Daffodil. The Stem rises up half a foot high or more, bearing two or more short Flowers, a Stalk, yet somewhat larger than the Common yellow Junquilia, having a small round Cup in the middle, white asfo, as the Leaves are. The Seed is small, Maid, and the Seeds of the other Daffodils are.

IV. The second, or White with a great Cup, has a Root, Leaves and Stalk in all respects like the former, the Flower and Seed is also like, but in this it differs, that the Cup in the middle of the Flower is a little larger than the former.

V. The third, or White turning, but a bulbous or round Foot, small and a little long, whitish, covered with a blackish Skin, from whence springing four, five or six long green Leaves, yet flower and broader than the Common yellow Junquilia, and fully as green, from among which rises up a slender green Stalk, a foot high, bearing at its top, out of a shiny Head, three or four, or more Scrofuloso Flowers, standing upon long green Foot-stalks, every Flower hanging down its Head, and turning up its six narrow and long Leaves, even to a very Foot-stalk again; from which the Flower hangs down a long round Cup, as white as the Leaves, within which are contained three small white Chines, tips with yellow, and a small long Pointed, thrusting out beyond the brims of the Cup; after the Flowers are past, there comes up in their places small three-square Heads, in which is contained very small, round and black Smoking Seed. The Flower is white, without any good Smell, or ended rather none at all.

VI. The fourth, or Yellow turning up, has a bulbous Root, from whence rising up long Raphile Leaves, but they are greater and longer than the former, and of a pale green color: the Stalk rises somewhat higher than the Flowers, itself, with a Golden yellow color, both the Cup and the Leaves, which turn up again.

VII. The fifth, or Yellow turning up with a white Cup, a Round Root, several long Raphile Leaves rising up, and standing upright, like the former, between which rises up a green Stalk, about a foot or more high, bearing two or three Flowers thereon, which turn up with fair pale yellow, and the Cup of a pale white, but not of so delicate a color, or pure a white as the former.

VIII. The sixth, or White turning Junquilia with a yellow Cup, differs not much either in its Roots, Leaves, Stalk or Flowers, save, that the Foot that had the Leaves of the Flower, which turns up again yellow, and the Cup white, so that this has contrarywise, the turning up Leaves of a whiteish yellow, and the long Cup yellower, otherwise the difference is inconceivable.

IX. The yellow turning Junquilia with a great Cup, has a round or bulbous Root, from which spring larger Leaves, and longer than the Ordinary or Common yellow Junquilia, being a little flat on one side, and round on the other, but of the same Greenness with all the rest: the Stalk rises up two feet high, bearing two, and sometimes three Flowers thereto, being of a fair yellow color, with a large open Cap in the middle, of a little deeper yellow color, like unto the Great Junquilia with the great Flowers before described, of which this double leaf is a kind, but that this is smaller and less than that, both in Leaf and Flower, and Cup, &c. being somewhat lusher in all its other parts.

X. The eighth, or Common or Ordinary Junquilia, has a round or bulbous Root, which is blackish on the outside, from which springing four or five long, round, green Leaves, like unto Raphile, from whence came the Name, from among which rises up a Stalk, round and green, a foot and half or more high, bearing at the top three or four Flowers, all yellow, but much smaller than the last, and jo the Cup also. The Seed is small and black, and the Flowers small and rounded. The Smell of the Flower is very sweet in all these sorts of Junquilia, or Ruth Daffodil.

XI. The ninth, or Middle-sized Junquilia, is like unto the former in its bulbous Root, Raphile-like Leaves, Stalks and Flowers, save, that the Leaves are smaller and rounder, and the Stalk rises up not so high, nor the Flowers so great, but the Leaves of the former is a little rounder, and not so pointed as in the former, but in all things else they are alike, this being only the lesser.

XII. The tenth, or Small Junquilia, has a Root round, small and black, very like unto the last, from whence springing up five or six small green Leaves, a little broader, but not so long as the last, from among which rises up a Stalk almost a foot high, bearing one or two small Flowers at the top, of a paler yellow color than the former, with a yellow open Cup (or Crown rather) in the middle, bigger than in either of the two last.

XIII. The eleventh, or Yellow Junquilia with white Lines, has a Root not differing from the former, from which springing forth round, long, green Leaves, like to the Ordinary or Common Ruth Daffodil, with a Stalk bearing two or three yellow Flowers, having Leaves somewhat rounded at the point or end, with a Line or Stroke of white in the middle of every one of them: the Cup is short and Crowned, and a little crumpled about the edges or brim. The Seed is like to the other kinds.

XIV. The twelfth, or Autumn Ruth with a green Flower, sends forth from its Root but one only Leaf, very long, round and green, which while this green Leaf is fresh, and to be seen, bears no Flowers at all, but that being faded away, a Stalk afterwards rises up, very much like to the former green Leaf, round, naked and green up to the top, where two or three Flowers break forth out of a small thin Skin, every one consisting of six small and narrow green Leaves, very short-pointed at the end, and all as were ending in a small Privet or Thorn, in the middle of which is a small round Cup, (or rather Crown) of a pale good color, with the Leaves and Stalks, which Flower finall very sweet, like unto the root of the Ruth Daffodil or Junquilia.

XV. The Places. The original or native plant from...
Salmon's Herbal. Lib. I.

from whence these have been brought to us, were Italy, Spain, the Peruvian Mountains, and Southern parts of France: the Narcissus is a native of Barbary and was brought to us from France. Now, by Industry and careful Cultivation, they are all become true Dagdolls, if not Natives of our Country, where, in the Gardens of our Florists, they thrive very well.

XVI. The Times. They most of them flower in the Spring, in March, (if it be mild,) and April and May, the Seed ripening in some reasonable time after; but the lift or lound flowers not till October, and the Fruits coming after, causes it sudenly to perish.

XVII. The Qualities, Specification, Preparations and Virtues, are much the same and the same with those of the Common Daffodil in Chap. 189. to which I refer you.

CHAP. CXCIX.

Of Daffodil Ruth, double-flowered.

I. The Name. It is called in Greek, Ναρκίσς, Narkissos, in Latin, Narcissus flammeus, or aureus, means in Latin, Narcissus flammeus flor in multipli, Narcissus flammeus flor plen, Barun Vonmontisius Daffoletis flor pleno: in English, Ruth Daffodil, or Junquilia doubled-flowered.

II. The Kinds. There are but two usual kinds of this double sort, viz. 1. Narcissus flammeus latero flor pleno, The double Junquilia, or Ruth Daffodil. 2. Narcissus flammeus latero flor pleno minoris, The lesser Junquilia, or Ruth Daffodil.

III. The Descriptions. The soft of these has a Root which is bulbs or round, and blackish brown on the outside, fo like unto the Common Ruth Daffodil, that it is almost impossible to know the one from the other; from which springs forth long, round, green Leaves, like the Leaves of the Common or Ordinary Junquilia, or Ruth Daffodil, and of the same height, among which rise up, a long, slender, green Staff, bearing two or three, seldom more, small Flowers, yellow and double, viz. with several Rows of Leaves, bearing the double Cup, or Cup in the angle of the Flowers, broken into small fronds or pieces, running among the Leaves of the Flowers, which pieces in four Flowers are not so finely seen, being smaller than in others. This bear on Eaten or Head under the Flowers, for Seed.

IV. The second, or Lesser kind, is in its Root, Leaves, Staff and Flowers very like to the former, save that its Flowers are smaller, and not so double, being one, two or three at most upon a Staff, and also of much less Beauty.

V. The Places. They are Natives of Italy, Turkey, Spain, the Peruvian Mountains, and some Southern parts of France: hut Hauril very well with us in our Gardens.

VI. The Times. Their chief times of flowering are in March, April, and May.

VII. The Qualities, Specification, Preparations and Virtues, are much the same with those of the Common Daffodil in Chap. 189. foregoing.

VIII. An Observation. The Juice of the Root, whether of single or double Junquilia. It may be given, to cande Vomit and cleanse the Stomach, from 1 to 2 oz. or more, mixed with a Glaas of White Wine or warm Water, in the Morning falling, it carries off thick and vicious Humors, and the Matter which causes the King's evil, diverse home mix it with Vinegar for the same purpose. It also purges downwards afterwards, the rest of those thick round Animemones.

IX. Observ. 2. The Daffodil in Wine. It does also the same thing with the Juice, but it is pleasanter, and works more gently, and mildly by Stool, if it is conciliated with Anself, Ginger and other Spices, to abate the Cribulations of the Working. I have found it by Experience to be good against a Paralyse, if it was recent, and the Patients had Strength and Youth on their sides.

X. Observ. 3. The Root made into a Catephlas, and applied, or into an Ointment, as you do Fihpoor Roots, is an excellent thing to be applied to Strumous Tumors or Swellings in the Throat or other Parts, whether they be whole, or broken or ulcerated.

CHAP. CXCVL

Of Daffodil Sea.

I. The Name. It is called in Greek, Ναρκίσς, Narkissos; in Latin, Narcissus marinus, or merius: in English, Sea Daffodil.

II. The Kinds. There are four kinds thereof, the first is commonly called, Narcissus Marinus major, or Turriculato Matutino, The great white Sea Daffodil, or Matutinus his third Daffodil. Chaffus called it Lilamaconiris Hemeoraculis, and Hemeoraculis fattles, and yet this seems not to be a proper Name, for that his Hemeoraculis is a plain Plantation, or Sea Bafford Daffodil, whole middle Cup is longer than the Cup of any true Daffodil, which is the chiefest Note of Difference between a True and a Bafford Daffodil. It may most fitly be called, Narcissus Marinus major, the greatest Sea Daffodil, because it is a true Daffodil, and the greatest of all others, as also because it has been found chiefly in Ireland, or Places near the Sea. 2. Narcissus indicus Antiquialis, quarrandom Lolita, Pericarpum Indicum, The Indian Autumn Sea Daffodil of Label. 3. Narcissus Marinos Africanus, fum Exoticus Loliti. The African Sea Daffodil. 4. Narcissus Marinos Exoticus, The Strange Sea Daffodil; of all which in order.

III. The Descriptions. The first, or Great white Sea Daffodil, has a Root which by Age or a long Continuance, standing in one place without being removed, grew to be much greater and larger than any other Daffodil whatsoever, sometimes to be as large as any Ordinary Squill or Sea Onion, being black on the outside, and having many long, thick and white fibres or long Roots, curiously branched, and spread under the upper parts of the Earth, besides four others which grow denominates, and perish not every Year, as the fibres of all or most of the other Daffodils do, for which Reason this Plant will not spoil and bear Flowers, if it is often transplanted, but delights to continue in one place without removing, and where it may not be overgrown with other Herbs standing too near it, which thence will flourish, and bear many fine Flowers. From this Root arise few or fe- ven, or more Leaves, twice fo broad almost as any of the former Daffodils, but not so long by half as many of them, being rather short in Comparison of the breadth, and of a white green color: from the
of August. The second flowers in Autumn, viz. in September and October. The third and fourth flowers in the Summer Months, earlier or later, as the Season is in Warmth.

The Qualities, Specification, Preparations and Virtues, are the same with those of the Common Daffodil in Chap. 193. aboegoing, which see in their places.

CHAP. CXCVII.

Of DAFFODIL Baftard, broad-leaf'd single-flowered.

I. The Name. It is called in Greek, Pseudonar-...fus', or Naturalus flore singulis: in English, Baftard Daffodil broad-leaved, with single Flowers.

Yellow: Baftard Daffodil.
Salmon's Herbal.

III. The Description. The first, or Common English, has a Root which is bulbous and somewhat blackish on the outside, from whence springing forth the Stalks, that rise in several branches, among which rises up the Stalk, about a foot or somewhat more high, bearing at the top, out of a round Knob, (as all other Daffodils have) one Flower, sometimes two, furnishing large, bearing the fork Leaves which bend like Flowers of a pale yellow color, and the long Trunk in the middle of a faint yellow, with the brims or brim a little crumpled or arched. After the Flower is full, it bears a round Head, forming three foars, containing round black Seed.

IV. The second, or Our common English white, is in Root, Leaves and Stalk, like to the other in all respects but the Wings of its Flower are much more white than the former, and in a manner of a Milk-white color, the Trunk remaining almost as yellow as that in the foregoing, but not differing in any thing else.

V. The third, or Sixcomeral, has a Root like to the others, from whence springing two or three long and fomewhat broader Leaves than in the two foregoing, between which comes forth a Stalk, bearing one Flower, somewhat large, bearing the six outward Leaves of a pale yellow color, and the long Trunk placed or curved exactly as the former, all the parts of a little deeper yellow than the Wings.

VI. The fourth, or Great yellow Spanish, has a considerable great Root, and blackish on the outside, deepening into the Ground, and wither run quite down, where it will encroach into many Off-sets; from whence rise up many stock, long and fift Leaves, of a greyish green color, among which rises up a round, fomewhat Stalk, sometimes a yard high or higher, bearing at the top one only fair large yellow Flower, standing forth right, and not pendulous, confluting of fax short and furnished broad Leaves, with a very great, large and long Trunk, of an equal Bigness, but open at the Mouth, and turning up the brims a little, which are something crumpled. When the Flower is full, there enters on the place a strong-smelling Head, containing round black Seed, like to other Daffodils.

VII. The fifth, or Mountain Daffodil, of divers kinds, is very bad off all a bulbous Root, whiter blackish on the outside but of this there are several sorts, 1. One which has very broad and white green Leaves, something short in Comparison with others of that breadth: the Flower is wholly yellow, but a little paler than the former Spanish kind, bearing the Leaves of its Vomer long and a little narrow, standing like Wings about the middle of the Trunk, which is as long as the Leaves, and smaller than in many others of this kind, but a little yellower than the Wings. 2. One which has narrower green Leaves than the former, and larger, the Flower is all yellow, but the Trunk is larger, wider and more open at the Mouth than the other, and almost as large as the former Spanish, but not so high as the last. 3. One which has the Wings of the Flower, of a Straw color, but the Trunk is long and narrow, of a faint yellow. 4. One which has fomewhat yellower, but that is shorter, both in the Wings and the Trunk. 5. Another which has the Wings of the Flower longer than the long Trunk, and furnished shorter. 6. Another which has its Wings all yellow, or only a little more pale or white, like to the English kind. 7. Others which have their Trunks long and narrow, or larger, and wider open, and crumpled at the lower part.

VIII. The sixth, or Early Straw-colored, from a bulbous Root, has Leaves rising up, of a mean size, between the broadest and narrower kinds, of a greyish green color, and not very long; the Stalk rises up a foot high or more, on the top of which grows one large white or yellow Flower, equaling the largest. Spanish Baffodil, before described, in the Largeness of its Trunk, and having the brims turned up a little, which makes it seem the larger. The Wings or outward Leaves are in a manner as soft as they are in the greatest Spanish kind, (and not long hanging down, like unto the Mountain kinds) and stand straight upright. All the whole Flower is of a free color, viz. a fine pale yellow, not much unlike to the color of the free Limon Peel, but a little whiter, which we commonly call a Straw-color. It is a large Flower, and early in the Spring.

IX. The seventh, or Greater white Spanish, has a Root greater and thicker than the first Spanish at Sept. 6, above, but does not encroach so much, nor is covered with a black, but rather with a whitish Skin. From this Root divers Leaves rise up together, long and broad, fomewhat like to the first Spanish kind at Sept. 6. but a little broader, and of a whiter green color, yet not so white as in the Lefter Spanish white Spanish, only after described. From among these arises a round, short Trunk, about two feet high, bearing at its top one white Flower, bending down the Head, and as these White kinds do, but is not of the same bottom. The Flowers of these is not set forth as the Greater white Spanish kind, next to be described in Sept. 10. The whole Flower, as well Trunk as Wings, is much larger than the Lesser white Spanish kinds, and almost equalling the first Spanish yellow, but a little longer and narrower, a little crumpled, and turning up at the brims, after which, there follows a Head and Seed, like to the first.

X. The eighth, or Greater Spanish white, has a Root like to the former, but greater, being white on the outside, and not black. In the manner of its Growing, it is very like to the last, both in its Leaves and Flowers, but larger in both. The Flower of this is not fast open to white, but has some trace of Paleyness therein, and more upon the upper opening of the Flower than afterwards, and is in great altogether as the Spanish yellow, at the foot a longer and somewhats narrower Trunk, after which come Heads of Seed, like the former.

XI. The ninth, or Lefter and mean white Spanish, is two others, one better than another, and both inferior than the two former White Spanish Daffodils. The Roots of both are like one another, but do differ in Creatures. The Leaves of both are of a small kind, green colored, and much crumpled. The Flowers of both are pure white, and bending down their Heads, that they almost touch the Stalk again: the greater Flower has the larger and narrower Trunk, and the fffer Flowers, the shorter Trunk, open, yet both a little crumpled at the edges or brims. From the Seed of these has grown great Variety, few or none keeping either the Color or Height of their Original.

XII. The Places. The fift is common thro' all England, in Cefnes, Woods and Orchards, infomuch that by its growing Wild, it is of the lufier value in our Gardens. The second is also English, yet is found growing on the Pyrenean Mountains. The third grows in Gardens. The fourth was brought out of Spain. The fifth, fifht, seventh, eighth and ninth come from the Pyrenean Mountains, and are also found in some parts of Spain: but with us they all grow in Gardens only.

XIII. The Times. The fift, fecnth and fexth are the mofl early. The reft in April, and the great Spanish, somewhat earlier than the other greater or fetter white.

XIV. The Quantities, Specification, Preparations and Virtues, are much the fame with the Common
Of Daffodil Baftard, broad-leav’d double-flowed.

The Names. It is called in Greek, Wilder, in Latin, Pseudonarcissus latifolius flore multiplex, and in English, Baftard Daffodil broad-leav’d, with double Flowers.

II. The Kinds. Of this sort there are five kinds, viz. 1. Pseudonarcissus Anglica florum pleno, The English double Baftard Daffodil; or Gerard’s double Daffodil. 2. Pseudonarcissus aureus major Anglica florum pleno, The greatest English yellow double Baftard Daffodil, or Tradescant his great Roche Daffodil. 3. Pseudonarcissus aureus major Anglica florum pleno, The English great yellow double Baftard Daffodil, or Wilkins’s great yellow double Baftard Daffodil. 4. Pseudonarcissus aureus Hypoehicus florae pleno, The great double yellow Spanisht Baftard Daffodil, or Parkinson’s Baftard Daffodil. 5. Pseudonarcissus Gallericus major flore pleno, The greatest double French Baftard Daffodil.

III. The Descriptions. The first, or English double Baftard, has a Root which is small, very like many of the French double kinds, especially the Leef, to which it is so like, that it is hard to know the one from the other. From this Root ariseth Leaves very like unto the Single kind, being of a whitish green color, and something broad, a little shorter and narrower, yet stiffer than the following French kind. The Stalk riseth above a foot high, bearing at top one very double Flower, the outermost Leaves being of the same pale color which is to be seen in the Wings of the Single kind, these which stand next them are some of as deep a yellow as the Trunk of the Single, and other of the same pale color, with some green Stripes on the back of divers of the Leaves. This is the larger Flower, separately mixt with pale and deep yellow, and some green Stripes among them, when it is fully open, and the Leaves diffus’d and broken. Sometimes the Flower beares a close and round yellow Trunk in the middle, separato from the pale outward Wings, which Trunk in very double, forming some pale Leaves within it, diffused among the yellow; and sometimes the Trunk is more open, or in pale broken, showing forth the pale colors intermixt within it. As length the Flower palleth away, and without giving any Seed, as all other bulbous Roots do, which bear double Flowers.

IV. The second, or Greatesst English yellow double, (called by Parkinson, The Prince of Daffodils) has a great round Root, like unto other Daffodils, covered with a bronziest Skin; from whence riseth up four or five somewhat large and broad Leaves, of a greysish green color, yet not fully so long and large as the next following; from the midle of which riseth up a Stalk, almost as high and as great as it, bearing at its top, out of a chiney Huck, one fair, large, double Flower, (the Buds, before it breaks open, being flatter and thicker in the middle, and ending in a longer and longer Point than any of the other Daffodils) very much spread open, consisting of smaller and shorter Leaxes than the next following, but more in number, and thicker and rounder set together, making it in form as great and double as any Province Roche, and intermixt with divers yellow and pale Leaves, as it were in Rows, one under another. It continues long in Flower, and spreads by standing long, to be the broadest in Campus of any of the Daffodils, but it fades away at last without giving any Seed, as all double Daffodils do.

V. The third, or English great yellow double Baftard, has a thick great bulbesse Root, which excels as well as any other Daffodils, from which spring three or four large, long and broad Leaves, somewhat longer and broader than the former, and of a yellowish green color. The Stalk riseth to about two feet high, if it grows in a fit and fruitful Soil, and is strong and something round, bearing at the top, out of a thin Huck or Shin, one large and fair double Flower, each Leaf of which is twice as large and broad as the leaf described, successively intermixt with a Row of pale, and a Row of deeper yellow Leaves, wholly diffus’d throughout the Flower, the pale color as well as the deeper yellow, in this as well as in the Small English kind, growing deeper by standing longer; sometimes and spread the Leaves thereof are fatter and spread wholly, making it a fair, broad, open Flower; and sometimes the outer Leaves stand separate from the middle Trunk, which is white and unbroke, and very thick of Leaves, and sometimes the middle Trunk will be half broken, neither expressing a full open double Flower, nor a close double Trunk, as it is also seen in the Small English kind: at length the Flower palleth off without having given any Seed. This Great double Baftard Daffodil doth near resemble our Common double English kind, that there is little other Difference found between them, but in the largeness of the Leaves and Flowers, and in its Stateliness, and magnificent way of GROWING.

VI. The fourth, or Great double yellow Spanisht, has a great bulbesse Root, covered with a dark-colored Skin, and whitish on the inside: from this Root diverget Leaves rise up, slimmer, narrower, and not of so whitish a green color as the former, but more dill or greyish, plainly resembling the Leaves of the Single great kind, from whence its fold this took its Original: The Stalk hereof also riseth almost as high as it, and the height of the leaf described, bearing one double Flower at top, always spread open, and never forming a double Trunk, but a certain height of Leaves, and not so fair and large as it, the outermost Leaves being of a greenish color at first, are afterwards more yellow, and do a little turn themselves back again to the Stalk: the other Leaves are some of a pale yellow, others of a more Gold yellow color: those which stand in the middle are smaller, and some of them flecks as if they were hollow-truncheoned, so that they seem to be greenish, Whitish, yellow and Greyish yellow, all mixed one among another. Parkinson thinkes himselfe to be the first that ever had this Flower in England, his being of his own raising, and flowering first in his Garden.

VII. The fifth, or Greatesst double French, has a Root very like unto the Leffer kind, but a little bigger and longer; from which spring whithish green Leaves, longer and broader than the Smaller French kind, hereafter to be described, and broader, but not so thick as any Procer, and more timber than the Double English kind at first. above. The Stalk riseth up not much bigger than the Smaller French kind, but a little bigger, bearing at its top one great double Flower, and more upright when it is perfectly blown open, (which is but seldom, by reason of the Leave cleaving very short one to another) becomes a fair and goodly Flower, larger by half than the Smaller kind, and fuller of Leaves, of the same pale whithish yellow or Limon color with the
the Letter, or rather a little obiter, and not for in the same Order of Rows, as that is, but more confu- 
sely together, and turning back the edge of our Letter last, the Small again, neither of which is 
founded in the Letter kind.

VIII. The Place. The first is natural of our own Country, for Gerard found it in an old Women's 
Garden in the West of England, where it grew be- 
fore the Woman came to dwell there: and Parkin- 
son, for Days, that he found that it was a Native of 
the life of Night. The second is unknown as to its 
Original, but it seems to be a Native in John Tra- 
defort, his Garden. The third, as far as we can 
learn, is an English Plant, growing in the Garden 
of Vincent Sion, and dwelling on the Bank 
side of the River Thames, from whom Mr. Wilmer 
of Stratford Bow had it, after which it went by 
Wilmer's Name. The fourth, Parkinson, says, of 
his own raising: he says it was artificially raised 
from the Seed of the Great Spanish Single kind, 
which he sowed in his own Garden, and cultivated 
it, till it gave such a Flower as is described. The 
Lift, its Origin is not certainly known, some think 
it came from France, others from Germany. 

IX. The Times. They all flower much about 
one time, viz. from the middle of March, as the 
Year is in forwardness, unto the middle of A-
pril.

X. The Qualities, Specification, Preparations 
and Virtues, are much the same with those of Common 
Daffodil in Chap. 189, aforesaying, which see in the 
place cited.

CHAP. CXCIX.

Of Daffodil Baffard, narrow-
leave'd, single-flowred.

I. THE Name. It is called in Greek, θριμ- 
νικός τριγυρος κλατέρος; in Latin, Pseudonar- 
cissus angustifolius florae simplex; in English, Baffard 
Daffodil, with single Flowers.

II. The Kind. Of this there are three several 
Kinds, viz. 1. Pseudonarcissus angustifolius florae 
velutinae Tubo biflatis abflatis, Baffard Daffodil narrow- 
leave'd, with a clip Trunk. 2. Pseudonarcissus His-
panicus medius & minoribus, Spanish yellow 
Baffard Daffodils, the two latter kinds. 3. Pseudonar-
cissus Hispanicus lateris minimi, the leat 
Spanish yellow Baffard Daffodil.

III. The Description. The first, or Narrow-
leave'd Baffard, with a clip Trunk, has a bulbus 
Root, from which spring long and narrow green 
Leaves, bearing one single Flower at the top of 
its Stalk, like unto the former Single Baffard kinds, 
having its outer Leaves of a pale yellow color, and 
it's Trunk of a deeper yellow. The chief Differences 
of this from the English double Baffard as the former 
Species, is in the Leaves, being narrow, and then 
in the Trunk of the flower, which is not crumpled 
or turfed, as most of the others are, and that the 
edges or edges of the Flower, are as if they 
had been clip at or cut even.

IV. The second, or Spanish yellow Baffard 
leaver kinds, have a Root which is but 
small and covered with scales hard. These two 
Letter kinds do differ but in Greatness the one 
from the other, and not in any thing else, so that in 
describing the one, you may understand the other. 
The Baffard then has three or four narrow, flate, 
whitish green Leaves, from

among which comes forth a short Stalk, not above an 
Hand Breadth or half a foot high, bearing one single 
Flower, not by standing out of the overla- 
ried Leaves, but the Stalk again, neither of which is 
found in the Baffard kind.

V. The third, or Leaf Spanish yellow Baffard, 
has a Root smaller than either of the former, the 
Leaves of this Smaller kind are smaller and shorter 
than the first, seldom exceeding the length of three 
inches, and very narrow whole, but of the same 
greyish green color, with the former; every Flower 
stands upon a small and short Fruit-Stock, facing 
above the Ground, so that its Nape, for the mid 
part, does lie on or touch the Earth, and is formed 
after the same fashion, and of the same color with 
Stalk immediately going before, but much finer.

VI. The Place. The first is a Native of the 
Pyrenaeous Mountains. The second are Natives of 
Spain; and the third was also brought from thence 
to us, and are all now natural'd up in our Gardens.

VII. The Times. The first flowers at the end of 
March. The second and third about the beginning 
of March: but with us they flower somewhat later, 
because of the Coldness of our Clime.

VIII. The Qualities, Specification, Preparations 
and Virtues, differ not much from the Common 
Daffodil in Chap. 189, aforesaying; but these are 
apposed to be something weaker.

CHAP. CC.

Of Daffodil Baffard, narrow-
leave'd double-flowred.

I. THE Name. It is called in Greek, θριμ-
νικός τριγυρος κλατέρος; in Latin, Pseudonar-
cissus angustifolius florae multiplex, vel pleno, 
and in English, Baffard Daffodil narrow-leave'd, with 
a double Flower.

II. The Kinds. It is Iugularis sive generis, with-
out any sub-ordinate Species, and is vulgarly cal-
led, Pseudonarcissus Calixmenioris minor florae 
plena, the letter French double Baffard Daffodil.

III. The Description. The Roots of this Letter 
French kind, are like unto the Double English kind, 
as also to the former Double greater French kind, 
and the Leaves are of the same whitish green 
color, but narrower, and not longer: the Stalk rises 
a little higher than the English, and not fully so high 
as the Greater French, bearing one four double 
Flowers on its top, of a pale yellow or Limon color, con-
sisting of four Rows of Leaves, every Row growing 
smaller from other unto the middle, and so set and 
placed, that every Leaf of the Flower does stand di-
rectly almost in all, one upon or before another, unto 
the middle, where the Leaves are smallest, the exter-
rior being the greatest, which makes the Flower seem 
the more beautiful. This and the Greater kind has 
no Twists, or any of any other thing in the middle, 
as all or most of the other former Double Baffard 
Daffodils have, but are Flowers wholly compos'd of 
Leaves, standing not like the former, double even to the middle. Per-
haps kind doubts whether this or the Greater French 
Baffard, ought to be called Baffard Daffodil or not, 
because the Flower in neither of them is made after 
the fashion of other Baffard Daffodils, but rather 
resembles the form of the Double white Daffodil.

IV. The
Of DAFFODIL

Baftard, Rufli-leav'd.

THe Name. It is called in Greek, Λυκίνθιον, in Latin, Pseudonarcissus
Juncifolius, and in English, Sea Baffard Daffodil.

II. The Kind. So far as we know, it is a singular
Plant of the kind, the Authors report, that
there are other sorts of it, some of which bear yel-
low Flowers, and others which bear red, but of
these we can say nothing in this place.

III. An Observation. Some have called this
Plant Pancreatum flore Lili, but this was a Mis-
take. Others thought it to be a kind of Scylla,
and used it instead of Squills in Thrasya, but this
was a dangerous Error. Others, as Chaos Ther-
cid He Mercurialis, thinking it to be a Lili, and
Clusius does thereupon call it Hemerocallis Valen-
tinii, but was wholly in the wrong; for it is neither
Pancreatum, nor Scylla, nor Liliun, but it is cer-
tainly a kind of Daffodil, as the Form of Root,
Leaff, Stalk and Flower demonstrate.

IV. Observation. To this true, Dioscorides will have
Expression to be a kind of Scylla, and so it was
called In his time, viz. Squilla rubra rubra, which
had a Leaf like a Lili, but longer, and was used
both with the fame Preparation and Quantity, and
for the time Dafilds that Squilla was used for, only
that it was found to be weaker. But beware of using
this Sea Baffard Daffodil by such a Mistake, be-
cause of its dangerous Effects, which are said to be
deadly; for it is reported, that one, out of Malice,
did before hand cut the Root of this Plant with the
Knife which another was presently after to cut his
Meat withal, and that with an Intention to kill
him by the Poison thereof, with which the Knife
was poisoned.

V. The Description. It has a large white bul-
ously Root, from which rise up two or three long
and very green Leaves, very
like unto the Small yellow Junquilia, or Rufli Daf-
fodil before described, but not altogether so round:
from among which rise up a short Stalk, about six
inches high, bearing at top, but of a skinny Plaint,
eight small white Flowers, sometimes declining to a pale
color, having six small and short Leaves standing
about the middle of the Trunk, which is long, and
much wider open at the mouth than at the bottom.
The small outward Leaves or Wages are a little
tending to green, and the Trunk, as I said, is either
white or whihihi, having the brims or edges a little
uneven. The Seed is small, black and round, like
most other Junquilia, or Rufli Daffodil, but
smaller.

IV. The second, or Greater yellow Baffard Jun-
quilia, has a ballous Root, bigger than the former,
and the Leaves of this Greater kind are longer,
greater and a little broader than the leaf described.
The Stalk also is higher, and the Flower larger, more
open at the Mouth, and more crumpled than the
White, but wholly of a yellow color. The Seed is
also larger, according to the Proportion of the Plant.

V. The third, or taller yellow Baffard Junquilia,
is in Root, Leaves, Stalk and Flower, and manner
of blooming, as in all things so like unto the left,
it is needless to trouble you with any farther Descrip-
tion thereof; the only Difference is in the Magni-
tude of the Plants, this being smaller in all its Parts.

VI. The fourth, or Late yellow Baffard Junquilia,
is in Root, Leaves, Stalk and Flower, also in man-
er of blooming, very like unto the former Greater
yellow Baffard Junquilia, but with this Difference,
that the former, the Sea Daffodil bears the flower
first, and the Flowers after something later than the
Daffodil does.

VII. The Place. They all came to us from the
Pyreneeous Mountains, and being tender Plants, are
with much Care, must’d up in our Gardens.
Salmon's Herbal. Lib. I.

284

VIII. As to the Qualities and Medical Virtues hereof, Authors have said nothing about it, but do account it a violent Poison, rather than any thing else: and yet it is possible it may be prepared for external Applications, with singular Advantage against many febrifh and rebellious Diseases, such as are Struma's, Oedema's, and other Intumities of like kind.

3. C. H. A. P. (CCXII. 1-2) of DAFFODIL Chequer'd.  

T H E Name. This Plant was unknown to the Greeks, as far as we can learn, and so has no proper Greek Name belonging to it: but it is called in Latin, by Authors, Fritillaria, by Dioscorides, in Greek, Trefilakos, because of the Variety of the Colors in the Flower, agreeing with the Colors of the Flowers of a Greny Heart: by Lelbel, Loko-mercurian, Variegata, & Eur-paque variegata, & Tiuliatum, (making it a kind of Tulip:) others, Lilium variegatum: in English, The Chequer'd Daffell, The Chequer'd Lilly, The Greny Hen-flower, and Fritillary, by which last Name it is most known.

II. The Kinds. Some Authors will have it to be of the kind of the Daffell, some of the Tulip, some of the Lilly, and others is partaking of Something of all of them, and therefore have placed it between them: but because it is now most commonly called, A Chequer'd Daffell, we have placed it immediately after the Daffell. Hereof there are many Species found out of late, as White, Red, Purple, Yellow, Black, of each of which there are also several sorts; but the Purple kind was that which was most known.

III. Authors make several Species hereof; some more, some less: tho' which we shall take notice of in this Chapter, are the thirteen following, viz. 1. Fritillaria vulgaris, The common Chequer'd Daffell. 2. Fritillaria vulgaris pultifera, Procus & Serenius, the early and late common Chequer'd Daffell. 3. Fritillaria floro aqua rubens, The Blood-red Fritillary. 4. Fritillaria maxima purpurea, purpura violacea, The great purple or red Fritillary. 5. Fritillaria alba, The white Chequer'd Daffell. 6. Fritillaria floro duplits albo-vittata, The double blusht Fritillary. 7. Fritillaria floro latero purpureo, The albo-lute yellow Fritillary. 8. Fritillaria floro latero vario fote pallidante, The variegated yellow Fritillary. 9. Fritillaria latero maxima alba, The great yellow Italian Fritillary. 10. Fritillaria perpusilla flore purpureo, Inclusa, The Small Italian Fritillary. 11. Fritillaria latero Junosfola Latifolia, The Portugal small yellow Fritillary. 12. Fritillaria Pyrenae, flore Apennino, The Pyrenean black Fritillary. 13. Fritillaria Umbellata Hispantica, The Spanish Umbelliferous black Fritillary. Some think, that the Name Fritillaria was given to it from Fritillus, the Chequer'd Board, upon whichGamblers play at Dice; this delighted Fower being Chequer'd in like manner on its Leaves.

IV. The Decription. The first, or Common Chequer'd Daffell, has a small white bulbous Root, but fome are much made at it were of two Clones, and divided in manner into two parts, yet joining together at the bottom or fect of the Root, which holds them both together. From between this Clift or Division, the Bud for the Stake appears, which in some flies up to be a foot or feet and half high, being round and of a bronzish green color, more especially near unto the Ground, whereon there grows differently four or five narrow, long and green Leaves, being a little below. As the top of the Stake, between the upper Leaves, (which are smaller than the leaf,) the Flower flows it fell, hanging or turning down the Head, but not turning up again of any of its Leaves, as some Lillys do. Sometimes this Stake bears two Flowers, and sometimes, yet but very seldom, three, confiding of six Leaves apiece, of a reddish purple color, spotted diversely with great Spots, appearing like unto fowre Chequers, of a deeper color. The inside of the Flower is of a brighter color than the outside, which has some Greenness at the bottom of every Leaf. Within the Flower do appear six Clovers, rife with yellow Peduncles, and a three-forked Stile or Papel, compounding a green Head, which, when the Flower is full, rises upright again, and becomes the Seeds-Velfel, being something long and round, yet having a small hole of Edge, [flat at the Head, like the Head of a Lilly, and without any Crown, as the Tulip has, in which it contained pale-colored flat Seed, like unto thighs of the Lilly, but finer.

V. The second, or Early and late common Chequer'd Daffell, are of the same kind with the former, but with these following Differences, viz. 1. That some of them do flow early, with or before the Early-flowering Tulips, and some of them flower later, to cut, a Month or more after the former. 2. That in some the Color is paler, and in others again of a very high or deep color. 3. That sometimes they have eight Leaves, and sometimes ten or twelve Leaves, as if two Flowers were made one, which some call a Double Fritillary. The Flowers at top of the Stake are Chequer'd most admirably, and yet on the same, Nature has kept a wondrous Order, surpassing the most curious Painting which Art can perform: one square is of a greenish yellow color; the other purple, keeping the same Order, as well on the backside of the Flower as on the inside, sometimes they are blackish in one Square, and of a Violet-color in another, so that Nature seems in a simple Flower to bring forth Variety in Perfection.

VI. The
VI. The third, or Blood-red Fritillary, has a Root
form'd, as it were, and richer than the
afore mentioned, from whence the Stalk rises up, being shorter and lower
than in any other of these kinds, having one or two
Leaves thereon, and at the top thereof two or three
more set closer together, which are broader
and shorter than those before, almost like unto the
Leaves of the Yellow Fritillary, from among
which top Leaves comes forth the Flower, somewhat
binding down, or rather standing forth, being
larger than any of the former, and almost equal in
Lengths to the Yellow Fritillary, of a darkly grey color
on the outside, and of a very dark red color on the
inside, densely spotted or farded: this very hardly
encroaches by the Root, and as feldom grows ripe Seed,
but with flowers of the rather or early sorts, and
before the black kind, and abides a left time in Flower,
or than any.

VII. The fourth, or Great purple or Red Fritillary,
has a Root equal to the Largeefl of the ruff of its parts,
from whence rises up one, and sometimes two
Stalks, having one, two or three Flowers apiece on
them, as Nature, and the Stalks soar: each one of these
is larger than the size of those before described, and pulchelius in like manner as they
are, of a fuid red or purplish color, with many tawny
and crofs Frons on them, and small long Harke, which
fome are of a white or flronger, and of a fomewhat
confpicious as in the former. The Stalk is ftrong
and high, whereon are feveral long oblong green
Leaves, larger and broader than those of the former.

VIII. The fifth, or White Fritillary, has a Root
fo like unto the former, as not to be diftinguifh'd,
and the whole Plant is fo very like unto the ftrift, that it is nearly to make no diftinction, but only
from the chief Differences. In this the Stalk and
Leaves are wholly green, by which this is diftinguifh'd from that, which is brownish at bottom. The
Flower in this is white, without almoft any fome of
Spots or Mark in it, tho' in fome they are more plainly
to be feen, and in fome there is again a kind of
faint blufh color to be feen in the Flower, especially
on the inflife, the bottoms of the Leaves of every one
of which are greenifh, having also a fmall Lift of
green coming down towards the middle of each Leaf:
as for the Head or Seed-Veifel and Seed, they are
fo like to the frift, as not to be diftinguifh'd from
them.

IX. The frefh, or Double blufh Fritillary, has a white round Round Root, like unto the left, bearing
a Stalk with long green Leaves thereon, little difer-\nfering from it, or the firft defcribed kind. The Flower
is conpof'd of many Leaves, be-\ning thin at the leifl, but most usually thickcfl, of a pale
white or purple color, fotted like unto the Paler ordi-
nary eafily ftriftiali, fo that one would think it to
be an accidental kind thereon, whereas it is (as is
aforefo'd) confant in its Appearance and manner
of flowering.

X. The feflenth, or Absolute yellow Fritillary, has a white Root more round and not fo flat as the
former kinds, and of a mean Largenefs. From the
middle rifes up a Stalk a foot or half high, and
sometimes higher, on which grows, without any Order,
fouch of a pale yellow color, like unto the Leaves of the Black Fritillary, but not above half fo broad: the flower is fomewhat
smaller and longer, not much unlike to the Black for
Show or Forms, but fome are finer and rounder pointed, of a faint yellow color, withouit any
Spots or Chequers at all, either within or
without the flower, having fome Chefs and yellow
Vendors in the middle, as are too be feen in them all.
The Seed is like to that of the fift kind.

XI. The eightilh, or Variegated yellow Fritillary, has a Root like to the other, but not fo flat. It
grows not much larger than the former, and blooms
at the rifting up, having its Leaves white, broader
and longer than it, and almoft round-pointed. The
Flower is greater and larger spread than any of
the foregoing, and of a fair pale yellow color,
kind, and of a fomewhat green color, at the top of which Stalk, which bends
a little downwards, do not usually grow three or four
Leaves, between which comes forth a black common
but one Flower, which is longer than the left, hang-
ing down the Head, as all the others do, confipicuouf
the Flock, of a dark yellow or purplish Color, fotted
with fome small red Chequers. This flowers late, or
not till all the other are past.

XII. The ninth, or Small Indian Fritillary, has
much thete Root and Stalk, but smaller: the Stalk
has several small, fhort, green Leaves thereon to the
very top, but it bears a greater number of Flowers than the former, but they are much fmalller, and of a yel-
lowifh green color, fotted with long and fmall
dark red Marks or Chequers.

XIV. The eleventh, or Portuguefl small yellow
Fritillary, has a Root much like the other before-
mentioning: the Leaves are fo fmal, narrow and long, that
it has caufed it to obtain the Name of Ruthles, or
Fritillaria semeolifia, Ruth Fritillary, which grows up-
on a long, weak, round Stalk, fix without Order.
The Flower is fmall and yellow, but thicke or
Chequers with red Spots than any other yellow
Fritillaries, the Stalk of the Flock at Head thereof
being alfo of a yellowifh color.

XV. The twelfth, or Pyrenean black Fritillary,
has a Root which does often grow fo great, that it
seems like unto the Root of a Small Crowned Imperial.
The Stalk is ftrong, round and high, yet without Or-
der, with broader and witer green Leaves than any
of the former, bearing one, two or three Flowers,
not being so large as thofe of the common purple
Fritillaries, but smaller, longer and rounder, at
feveral turning up the brims or edges of the Leaves
again, and are of a yellowifh shining color on the
inflife, fometimes fotted with red Spots, almost the
whole inflife of the Flower, unto the very edge,
which fides of a pale yellow color, and fometimes
again there are very few Spots to be feen, and thofe
from the middle only on the inflife, (for on the out-
side of this fort there neuer appears any Spots at all)
and fometimes without any thofe of Spots; fometimes
also of a more pale green, and fometimes of a more
yellow color. The outlude of the Flowers do likeofe
blurry, for in none the outlude of the Leaves are of a
dark dull yellow, fometimes of a more pale yellow,
and other times of a dark purplifh yellow, which on
the fome is fo deep and fo much, that it rather feme
black than purple or yellow, and this chiefly about the
bottom of the Flower, next to the Stalk, but the edges
are feveral of a yellowifh green. The Head and Seed
are like unto the former, but larger in all refefts.
five from the Head together, hanging downe, round about the Stake, like unto a Crown Imperial, and one of a yellowish great color on the infus, spotted with a few red Spots, the out side being bl MID as the former.

XVII. The Flowers. The fift of these came from France, where, about Orleans, it grows plentifully; the other sorts grow in those Countries which their Titles indigitate, but are all of them used up with us in Gardens of Florists, and are most of them become Natives of this Kingdom.

XVIII. The Things. The early kinds do flower in the beginning of April, according to the Mildness or Hardness of the aforesaid Winter: the others flower after the first are past for a Months space, one after another, and the Great yellow is very late, not flowering till about the middle or the end of July.

IX. As to the Qualities, Specification, Preparations and Virtues of these Plants, or any of them, Authors have said nothing at all, whether inwardly to be taken or outwardly to be applied; nor have I had any Experience of their Effects in my Forty Years Practice: they are a glorious and admirable Flower, of an extraordinary Beauty, and their chief Elice with us, is to be an Ornament for Gardens, which they nobly beautify, and therefore deserve our Cultivation, Entertainment and Observation, especially of Florists, and other Lovers of Curiosities of this kind.

CHAP. CCIV.

OF DAISY GARDEN.

The Name. The Daisy is called in Greek, as some hypothesize, from Thaophrastus lib. 7. cap. 9.). Abyias; but this I judge to be a Mistake, for it does not plainly appear in any Greek Author, that the Greekers had the Knowledge thereof; in Latin, Bellis, Plan lib. 26. cap. 5. and in English, Garden Daisies. The Latins also call it, Herba Margarita.

IV. The Description. The first, or Single red Daisies, has Roots which are small, white and fibrous or threadly, from whence rise many smooth, green, round-pointed Leaves, lying upon the Ground, a little falt about the edges: from which rise up many slender round Fort-Salks, rather than Stalks or Stems, about an hand-breadth high at most, and sometimes not so high; bearing one Flower apiece, confiding of many small Leaves, as a Falle or Border, for about a middle Thorn or the Leaves are almost wholly red, whereas in the middle they are white or white.
VI. The third, or Lefter double Daisy, has a white fibrous Root, from whence rise Leaves, lying upon the Ground, in Form like to the Common Single Daisy, but differs little from them, but that they are finer, and little or nothing about the edges. The Stalks likewise are smaller and lower, but bearing as double Flowers as any, being compofed of many small Flowers, and fomewhat together of various colors; for some are wholly of a pure white, others have a tiftled, either difpersed upon the white Leaf, or on the edges, and sometimes on the back of the Leaves: some again from to be of a thick red, more or lefs than white, when indeed they are white Leaves, difpersed among the red; others are of a deep or dark red color, and fome are fpotted or striped with white and red through the whole Flowers: and in some the Leaves will be red on the upper fide, and white underneath; and fome (the but very rare) are of a greenifh color. Of this kind there have Stalks and Heads which are round, and fomewhat again fuch as ftep or ftep known to degenerate into round, and fo to continue.

VII. The fourth, or Doble double Daisy, has no difference in Root, Leaf, or Stalk from the former kind, but that in this there are many small double Flowers, fomewhat upon very fhort Stalks round about the middle of the flower, which is equal to as great and double as any of the other double kinds, and is either wholly of a deep red or fpotted with other colors, or elfe greenifh, all the fmall Flowers about it being of the fame color with the middleft one.

VIII. The fifth, or Blow Glogue Daisy, has a hard and fibrous Root and Affay with the Plant lfl defcrib'd, both in Form of its Leaf and Vener. It has many narrower, shorter and bluer green Leaves than the former, fying round about the Growth, and more Hie up hinder, but flifer and hard Stalks, fix inches or more high, set here and there with fmall Leavers, and at the top a fmall round Head, compof'd of many small blew Leavers, fome- times like unto a Brooch, and faftenes or edges with white Heads of Flowers. The whole Plant is of a bitter Taffe. 

IX. The fith, or Yellow Gloque Daisy, has a Root of a longer length, round and hard, with a thick Black Stem and a deep paining Taffe and ftring Smell: from whence rise up many thick, fMOOTH round, pointed Leaves, fpread upon the Ground like the former: among which fhooting up feveral fmall round yellow Stalks, a foot high, bearing about their middle two fmall Leavers at the Joints, and at the top round Heads of Flowers, with fmall twigs together, finging in fluffy Mäh with one of which Flowers do blow or fpread into f prejudices in the cow, and of a fplendor yellow color, fneeling not much unlike to Broom Flowers, with many small Threading in the middle, compofed of a flat Vener, turled or bended two ways. After the Flowers are fold, rife up Seed-Vefels, which are round, fneeling out in the middle, and divided into four parts at the top, containing within them round, flat, black Seed, with a small Cat or Notch in them. The Leaves of this Plant are of a sharp and bitter Taffe. 

X. The Place. The firt four are planted and fomany odd only in Gardens, and require to be often replanted, otherwise they degenerate into fingle Flowers, or at leaft into lefs double. The two laft are also Garden-Flowers, but more rarely to be met with than the others: the Blow Daisy is a Native of Monpleiter in France, and of the Mountains in many places of Italy, the Yellow kind in Holland, and found up and down in the Kingdom of Naples.

XI. The Time. All forts of Daffies almof Sept.
XXII. The distilled Water. It is cooling, and has the Virtues of the liquid Juice, but very much weaker; however, it may be used as a Vehicle to convey refrigerating or cooling things in: it abates the Heat of Fevers, sharpens inward Inflammations, and allows the Ferment of Cholera.

XXIII. The Acid Tincture. It is singular good to cure Fevers, especially such as are burning, malignant or phlegmatic: it cools powerfully, quenches Thirst and compels the Spirits. Dose 20, 40 or 60 drops or more in some convenient Vehicle, or in any thing the Patient drinks, and to be as often repeated as they call for any thing to quench their Thirst with.

XXIV. The Oily Tincture. It is a singular thing against all Wounds and Punctures of the Nerves: it also cures Convulsion in what part of the Body the flower, and it's a famous thing against Palsies, if the Back-bone, as also all the Parts affected, be well anointed therewith by a cheerful Fire, and it is well rubbed in for half an hour at a time, and this twice a day, in Morning and Evening.

## CHAP. CCV.

### Of DIASIE Field.

I. **The Name.** It is called in Latin, Bellis argentea, Herba margarita, and by some, Convolvulus minor: and in English, Daifie, and Field Dafie.

II. **The Kinds.** There are two principal kinds thereof, which are very common, viz. 1. Bellis minor Syn. Syringa, The lesser Wild Dafie: 2. Bellis major Syn. media Syringa, The greater or middle Wild or Field Dafie.

III. **The Description.** The first, or Small common single Field Dafie, has a Root which is small, white and fibrous, from the Head of which springeth forth many thick and somewhat long green Leaves, lying upon the Ground, small at the bottom, but broad, and almost round towards the point or end, and a little dented about the edges. From among this heap or tuft of Leaves rise up many very slender, weak and noted Stalks, or rather Foot-stalks, of three, four or five, or more in some very high, bearing every one of them a small green Head, from whence rise many small white Leaves, encompassing a yellow Thrum, which is in the middle. Sometimes the green Leaves will be found much longer in one place than in another, and the Flower likewise will in some be reddish at the ends, and sometimes under flamin'd, and yet notwithstanding all this difference, they are but one kind or sort, and not divers, as some maintain.

IV. **The second, or Greater or middle Field Dafie,** that is another Species, yet it agrees with the former in most respects, falling that its main Root is thicker and longer, with many small white Fibres proceeding therefrom: the Leaves are larger and dented in almost in like manner on the edges: the Stalks are thicker, but round and somewhat higher, and the Flowers, like the other, white, and sometimes on the tips of their Leaves with a blith of red, but they are larger every way: the Thrum in the middle is also bigger, but of the same yellow color with the before describ'd.

V. The Places. They grow wild almost every where, in most Meadows and Pasture-Grounds of this Kingdom.

VI. The Times. They flower in most of the Summer Months, viz. in April, May, June and July.

VII. The Qualities, Specification, Preparations and Virtues, are the same with Garden Dafies, only they are with this Advantage, that the Field Dafie is more effectual for all the Purposes designed: see Chap. 204. sect. 12. ad 24, abroging.

---

**Great Daisy**

**Common field Daisy**
of Daisie Great.

CHAP. CCVI.

OF MAUDLIN-WORT.

The Name. It is called in Latin, Bellis magnum, Maximae & Major, and in English, The great Daisy, (but it is the greatest of all the faces of Daisies) and Maudlin-wort.

II. The Kind. It is Singularis fæ generis, and is called by some Authors, Confolida media. The middle Confound, but the true middle Confound, is Bugula et alia others, to make a Difference in the Name between Bugle and this, call it Confolida medii Vulnerarum: however, it is taken by all to be Confolida medi generis, or a kind of middle Confound, from the Virtues it is endowed with.

Great Daisy

III. The Decription. It has a Root which is a Bush of white Yokes or Strings, which aside many Winters with the Leaves, shooting forth every Spring many long, narrow and narrow-pointed Leaves, lying near the Ground, but cut in on both sides, making it seem almost like the Drygonia of some sorts of Oaken Leaves, or rather like the Leaves of Groundell: the Stalks grow to be somewhat tall, viz. about a foot and half in height, with divers Leaves thereon, much in Shape like the others, but smaller and leffer divided than the inner, and growing yet smaller and leffer divided, the nearer they grow to the top. At the tops of the Stalks grow pretty large Flowers, with white Leaves, and a yellow Thrum in the middle, like the Bloss of the Single Field Daisy, or those of May-weed, but something leffer than this last named, each Flower grows upon a several Foot-

flatt, and the white and narrow Leaves are as a Rule or Border round about the middle yellow Thrum and are of no Smell at all: after the Flowers are past, then comes the Seed, which is somewhat long, and is blown away with the Wind.

IV. The Places. It grows almost every where, by Hedge-fides, in Meadows, the Borders of Fields, and other waife Grounds.

V. The Times. It flowereth and flowers in the Months of May and June.

VI. The Qualities. It is cold in the first Degree, and temperate in respect to Dryness and Moisture, but in some Authors Opinions it continues to Dryness. It is Altringent, Conglutinative and Vomitory, appropriated to the Liver and Joints, and is Analoptick.

VII. The Specification. It conglutinates and conglutinates the Lips of Wounds to a Miracle.

The Virtues.

IX. The liquid Juice. It is given to very good Purpose to heal any inward Wound, conglutinates the Rustures of any Vejfel in the Thorax, cure Spitting or Pifling of Blood, and helps Rustures of the Intreatines. Dose two or three ounces Morning and Evening in a Glass of old Malaga or Red Port Wine.

X. The Essence. It has all the former Virtues, besides which, it is excellent against Bloody-fluxes, and all other Fluxes of the Bowels; and has sometimes been found of good Use in overblowing of the Loches, or of the Terms in Women. Dose two, three or four spoonfuls Morning and Night, in a Glass of Generous Wine.

XI. The distilled Water. It is said to be good againft Rustures of the Bowels; and may be used as a Vehicle to convey other Medicines in; sweetened with Sugar Candy, it is very good against a Cough.

XII. The Wound Drink. Of this Daisy Leaves, five handfuls: Sanicle, All-heal, of each three handfuls: Bingle three handfuls: Angelica one handful: boil all in Water, six quarts to three: drain out and add thereto an equal part of white Port Wine, which sweeten a little with white Sugar as it is taken. Dose eight ounces Morning, Noon and Night: it is of great Effect in the Cure of all sorts of old and malign Ulcers, Fittel's, and the like.

XIII. The Ointment or Salve. It is made with Oil, Turpentine and Wax, and is excellent for Wounds, especially those, in which there is any thing of Intoxication, and will not come to Digestion or Maturation, as are those Simioue or weeping Wounds made in the Knees, Elbows and other Joints.

XIV. The Cataplasme. It is good against all burning Apodons and Ulcers, as also an Intoxication and Running of the Eyes, being applied thereon to: it likewise eases the extreme Pain of the Gout, being applied, and renewed as often as need requires.

XV. The Clyster. It gives ease in the vebement Torment of the Guts, Gripping of the Bowels, and is profitable in the violent Heat of Agues; and alters the Habit of the Belly where there is a great Sypetick or Binding: and in a Bloody-flux, Diarrhoea, or Lenteria, it does much good.
Salmon's Herbal. Lib. I.

CHAP. CCVII.

OF DAISY Thorney.

I. THE Names. It is called in Latin, Bellis 
spinae, vires later, audo, also Bellis major 
spinae: in English, The Thorney Daisy, or 
The naked-flowered Daisy, with prickers Leaves.

II. THE Kind. It is a singular Plant of its kind, 
and noted because of its naked Flower.

CHAP. CCVIII.

OF DAISY American.

I. THE Names. It is called in Latin, Bellis 
Americana, Bellis Americana Umbellifera, and 
Bellis major Rumpa Americana: in English, The 
Great white, or American Daisy.

II. THE Kind. This is also singularis fai 
generis, and therefore admits but of a single Descrip-
tion.

III. THE Description. It has a fibrous or stringy 
Root, from which springing one, two or more Stalks, 
which grow higher and greater than the Great Daisy 
in Chap. 206. after going the Leaves are also longer, 
and broadest towards the ends, but longer and 
smaller at the bottoms, dented likewise about the edges, 
shorting forth several branches, and all of them 
bearing many white Flowers at their tops, as it were 
in an Umbel, yet not so great, nor the white Leaves 
so large as it, but smaller, and more in number, 
with a greenish yellow Thorn in the middle, some of 
which are a little larger than others: the Seed is al-
so smaller than that in Mandlin-wort.

IV. THE Places. It was first brought to us from 
Virginia, and grows well enough in our Gardens; 
being looked after with a little Care: I also found it 
growing in several places in the Southern parts of 
Cardinal, and other parts adjacent thereto.

V. THE TIME. It flowers in May and June, and 
the Seed is ripe in some short time after.

VI. THE Qualities, Specification, Preparations and 
Uses, are the same with those of the Great 
Daisy in Chap. 206. aforementioned. It is indeed 
a singular Wound-Herb, and ought to be commend-
ed for the speedy curing of Simple green Wounds, 
being made into proper Ointments or Balsam, or 
applied in the Form of a Chaplet.

CHAP. CCIX.

OF DANDELION, or

PISS-ABED Common.

I. THE Names. This Plant seems to be un-
known to the Greeks, and therefore can have 
no Greek Denomination, the some Authors will 
have it to be the Nestus, Plini lib. 20. cap. 8. 
and others, that it is the Aphanos, Thapsophas, which 
is Ambelinche, a kind of Daffy, or Preusa Crown; 
but in Latin it is called, Daven Leioni, Daven Pro-
cium, and Corvus vol Cotap Ateochi, and in Eng-
lishe, Dandelion, or Piss-bed.

II. THE Kind. It is double, one of the kinds 
of Wild Succory, of which there are several Spe-
cies, viz. 1. Daven Leoni vulgaris, Our common 

Dandelion,
Dandelion, of which in this Chapter. 2. Dens
Peregrineus, Outlandish Dandelion, of which in the
next Chapter.
III. This our Common Dandelion is also two-
fold, viz. 1. Dens Lemnitis latifolium usque, Urs-
aria, Hieracium majus Trago, Hieracium parum
Cordi, (in Hiefortis) Hieracium minus Gesneri, (in
Harris) Chondrella altera Thubii, Didoneus, Gesalpi-
mi, Hedypanus major Vulp., Hedypanus Galechanium
& Languetii, Taraxacon minus Loriceri, Taraxa-
con venenum of Scripul & Ascienz and so it is used
with us in all Compositions wherein Taraxacon is
named ; Our Common broad-leaved Dandelion. 2.
Dens Lemnitis angustifolius folitis. Aplaoe angustifolius
folis Gesalpii, The narrow-leaved Dandelion.

Dandelion.

IV. The Descriptions. The first, or Broad-leaved
kind, has a Root which grows downward very deep,
which being broken off within the Ground, will ne-
evertheless forth forth again anew, and with difficulty
be destroyed when it has once taken deep Rootings
from the Head of this Root spring forth several long
and deeply puffed Leaves, lying round about it on the
Ground ; the ends of each Leaf or Rag on both sides
looking downwards to the Root again, the middle Rib
being white, which being broken, yields much bitter
Juice, of a Milk-white Color and Subflance, but the
Root much more. From among these Leaves (which
always when green) orifice many slender, weak, naked
Root-flakes, (rather than Stalks,) of about five, eight,
or ten inches high, very rarely a foot long, every one
of them bearing at the top one large yellow Flower,
confisting of many Rows of yellow Leaves, broad at the
Points, and matched in, with a deep Spit of yellow
in the middle, which, being grown ripe, the green
Husk, in which the Flower stand, turns it self down
to the Soil, and the Head of Down becomes as round
as a Ball, with long reddish Seed underneath, each
Seed bearing a part of the Down on its Head, which
Seed, together with the Down, is blown away with
the Wind, and when perfectly ripe, may with a Biffl
of ones Mouth be blown perfectly away.
V. The second, or Narrow kind, is to its Root,
Stalks, Flowers, Down, Seed and manner of Grow-
ing is wholly like the before described ; the Leaves in
springing forth, growing round the Root, the Number
and Density of the Guards or Deficiens on the edges,
are much like the former also, but in this the Diffe-
rence is, that the Leaves of this latter Plant are
narrower, and. by this one Note it may be diftin-
guished.

VI. The Plants. They grow almoft everywhere,
in all Meadows and Pallat-grounds, in Cloths
near to Water-Ditches, as also in Gardens and High-
ways. The first is common almoft everywhere,
but the second is somewhat rarer, yet often to be
met with.

VII. The Times. They flower thro' all the Sum-
mer Months ; and the first is found in some place or
other in Flower every Month of the Year, especially
if the Winter is mild, and not extremly cold.
VIII. The Qualities. Dandelion is cold and dry
in the first Degree : Aperitive, Alhurific, Diuretic
and a little Affrangent, Stomachick, Hepatick, Splen-
nerick and Nephritick.
IX. The Specification. It is singular against Ob-
structions of the Viscera, and Hypochondriack Me-
ancholy.

X. The Preparations. You may here therefrom,
4. A Decollation. 5. A distilled Water. 6. An Oint-
ment or Balsam. 7. A Cataplasm.

The Virtues.

XI. The Sallet. Whether eaten raw with other
Herbs, or boiled, and fo dressed up with Butter, Vin-
egar, Salt and Pepper, it is said to be a good Food
to open Obstructions of the Bowels, cleanse the Stom-
ach, caufe a good Appetite, and purifie the Blood : the
French and Dutch are frag to eat them often in the
Springs, but I believe for the most part as a
boiled Sallet.

XII. The liquid Juice of Leaves and Roots. It
may be given to two or three ounces in a Morning
Soffage, and likewise at Night going to Bed, either
alone by it self, or mixit with a Glass of Vine or
Wine, to purifie the Blood and Juices, open all fform
of Obstructions of the Bowels, expel the Jaundice,
provok Urine, refhit Hypochondriack Melancholy,
and eafe the Pain of the Spleen.

XIII. The Efficence of Leaves and Roots. It has
all the Virtues of the liquid Juice, being more pow-
erful to thole Intentions : besides which, this iripens
and dippfs inward Poofoms of the Viscera and Ur-
inary Paffage, breaks, cleanses and heals them, and
more powerfully opens the Pafages of the Urine,
whether in Young or Old. Doe three or four
Spoonfulls in White Lisbon Wine, Morning and
Night.

XIV. The Decollation in Wine or Water. It has
the Virtues of the former Preparations, but in a lower
degree; however, it is good to be drank half a Pint
at a time Morning and Evening, by such as are in-
clining to a Confumption, or have an ill Difpo-
ition of the whole Body, called by the Learned, Co-
chenas, in which cafes being used for some confide-
table time, it gives a wonderful Relief, befits, be-
ing made in Water, and acuited with a few Drops
of Oil of Sulphur, it prevails alfo againt all forms of
burning, putrid, malign and petitional Fesers.

XV. The distilled Waters. Aqueatd with Oil of
Sulphur, it prevails against the Smoote-ler, and the
Plague in felf : mixed with the liquid Juice or

P 2

Efficence,
Salmon's Herbal. Lib. I.

Of DANDELION Outlandish.

I. THE Name. It has no Greek Name, but is called in Latin, Dens Leonis perennis, and in English, Outlandish Dandelion.

II. The Kinds. There are five Species herof, viz.:
2. Dens Leonis minus folio robusto, Truncatella Basarnian Cornus, Sweet Dandelion.
3. Dens Leonis minus folio alpino, Small rough Dandelion.
4. Dens Leonis, altera Hippocrates, Dens Leonis Monfperienjum, five Alphabet wisly, Baoban, Bulled Dandelion.
5. Dens Leonis Galofo, Ceboriom Conflantinopoliticus, Spanilh Dandelion.

III. The Descriptions. The fist, or Fine jagged Dandelion, has a thick reddish Root full of Fibres, growing with many very green and finely cut Leaves, each of them about a Hand breadth long, and two inches broad, being deeply jagged or divided again into two or three or other small Roots or Divisions, and long in a small point. The Flowers which stand at tops of the Stalks, which are naked, are white, and are cut off from those in the former Chapter, which being past, the downy Heads and Seed proceed, as in the former.

IV. The second, or Sweet Dandelion, has a small and a soft Root, which is white within, and very fiolet in Folie, (as are the Leaves also,) which is so very tender, that it persifles with the first Cold it feels; and therefore with us it is always to be hoosed in Winter and Cold Weather, by which means it will endure many Years, and yield its Seed in the due Season. From this Root spring up many Leaves, which spread themselves on the Ground, about three inches long and half an inch broad, cut in on the sides with very deep Gashes, whose ends have each of them three very deep Dents, each of them having divers Points standing like a Star or Spur, the Pota, or fides thereof are a little hairy: from among these rise up many slender, slender, naked Stalks, one of which stands upright, not above a Hand breadth high, the ftrt are hollow, and bend downwards, each of them having a small yellow Binner, like unto other Dandelions, which being past, turn into Down, and flies away with the Wind, carrying the Seed with it, which is something long and broad, with hard Hairs, like a Bird, at the top of each Seed.

V. This third, or Small rough Dandelion, has a Root fmall and substiut, which sends forth several small Leaves, lying round about the Root upon the Ground, and which are three inches long and one inch broad, cut, divided, or torn in on the sides, and each of them set with small, fmal1, sparly Pricks or Hairs, not much united to the P Erick Sawthistle. The Stalks are about two or three inches high, and bear each of them a large, pale, yellow bloomer, like to the other Dandelions, which being once past, do presently after turn into Down, with Seed like unto the former.

VI. The fourth, or Bulled Dandelion, has a Root boomed or spread out into several long tender Stems, which come call long Earls, madl like to those of the Alothod, but smaller, shorter, and more point at the ends. From the Head of these Roots spring forth many large and blumy green lovely Leaves, lying upon the Ground, unevenly waved or cut in on the edges, but not deeply girt, like the Common Dandelion, but which are of a sharp and bitter Taffe like it, from among which rise up several bare or naked Stalks, with Flowers at their tops, larger and more double than those of the Common kind, but of a paler yellow color, which puts into Down, like the other kinds, bearing also like foolish Seed.

VII. The fifth, or Spanish kind, has a Root of a moderate Length, long, white, tender and fibrous, which withes with us all Year, if it is mild, otherwise, if we have hard Frosts, it persifles; from this Root spring up the Leaves and Stalks more in length; the middle Leaf of the Root is bare from the Root to the half length of the Leaf, and then it has but many Roots or Car or each side, very much resembling the Leaf of the Common Dandelion, but smaller and narrower; from among these Leaves rise up likewise long Roots, as in the Dandelion, upon which tops grow small and yellow Flowers, which turn into Down, that is carried away with the Wind, with the Seed also, which is small, long and reddish, like unto some of the Hawkweeds.

VIII. The Places. The first is found in Meadon and Paffure Grounds. The second is an Original of Italy, and from thence it came to us. The third grows about Florence, and other parts of Italy, also about Monfperl in France. The fourth is also of Italian Origination. The fifth came from Spain, and grows in the Island of Gaul or Cadiz, as Boel Eith, who calls it Ceboriom Galeofy, but Clafius Cura poteriore calls it, Ceboriom fylvtjre pumilum, sity Hedyosyn.

IX. The Times. They all flower thro' all the Summer Months: the fifth or Spanish kind flowers in July, August, and September; and the Seed is foot ripe after the Flower is past.

X. The Qualities, Specification, Preparations and Vertices, are the same with the Common Dandelion in Chap. 290. aforegoing, and therefore we shall say no more thereof.

C H A P. CCXLI.

Of DARNEL.

I. THE Name. It is called in Greek, "Ano & Gamma,) by moft Greek Authors, and in English, Barley, because in Latin, Lolium, and Arabo Peiuius, Tri- ticium Tenens, Triticium Satum Lomiers : in Arabich, Zizania, and in English, Darnel.

II. The Kinds. There are three sorts hereof, viz.:
1. Lolium album, Herdern marianum Delbras, White Darnel.
2. Lolium Rubrum, rosfer, Phaenix Di- creta, (a feminum colore phantes) Red Darnel.
3. Lolium alternatum ascesseum gans, Another Darnel with Oaten tops.

III. The
Englijh made the Dofe Oil Fajiorum growing is of A The The and faid hot of it into very it A Et continued from fee ms for Stalk, tops moft ny nel, in with Chap. III. Joints, which containing Stalks narrower eaftly with these fecond ftringing forth Leaves, several Stalks also arife, with many thick Joints, al- moft like Knots, from which Knots arife thofe e- foresaid narrower Leaves, contained up to the flinby tops of Seed, on the top of each Stalk is a long Spike, composed of many Heads, as it were at fo ma- ny Joints, fet one above another on each fide of the Stalk, containing two or three small chaffy Heads, with ſharpe, but ſhort Beards or Annes at the ends, in which Heads, being somewhat tough, it contained the Seed, which is lefs than that of Wheat, and which is easily floated out of the Ear.

IV. The fecond, or Red Daramel, has a Rift more buſty or ſhrouſe, from whence arife Leaves thinner and narrower than thofe of Barley, as alfo feveral placed Stalks, with Leaves ftringing from each Joint, but as the Joints are lefer than the former, fo the Leaves ftringing from them are alfo narrower and somewhat ſharper. The Stalks are redſhy, with reddiff Joints, about ſeven or eight inches ſhigh, jel- daul attaining to the height of a foot, unless the Ground is very good: as the top of each Stalk is a small and tender flat Spike or Ear, very like the for- mer, but smaller and ſharfer, and somewhat reddiff alſo, more especially when it is found growing in the dryer parts of Land.

V. The third, or Daramel with Oten Tops, in its Roots, Leaves and Stalks differs little from the first kind, faying that the Stalks grow somewhat higher, and the Leaves are a little larger: but in this it differs from the fecond, that the feveral Heads of Seed are more like to winged Oten Heads, growing on ſtead of flat-Stalks, and which Heads of Seed are al- fo armed with ſharpe Points.

VI. The Places. Thofe all grow in Arable Land, in Fields of Corn, as of Wheat and Barley, and are to be found in such like places, in moft parts of the Kingdom.

VII. The Times. They flourish in Summer, and the Grain is ripe in Harveft time, viz. in Auguf.

VIII. The Qualities. Daramel is hot in the third Degree, and dry in the fecond, as Oaten Eggs: it bounds with a Volatile, Nuxcorick, Salt and Sulphur, which is thought to be detrimental to the Head and Brain: it was accounted hurtful to the Eyes and Sights, as appears from that Verfe in Ovid, l. ii. Follurum, Et current Latis maris situantibus agri; and from this Caufe it feems came, that the old Proverbs in Plauto, Mitif. 6. fe 3. verf. 50. Latin milliter, was wont to be spoken to one dim- fighted.

IX. The Specification. It is fald to be peculiar against Defaginations of the Skin, and to flop Gou- genes.

X. The Preparation. You may have therefrom,

The Virtues.

XI. The Decotion in Red Port Wine. It flops the Terms, and all sorts of Fluxes of the Bodies; and prevails against Diabetes: Dry two or three ounces; but it is apt to caufe a kind of Giddines in the Head. It is alfo good to waft places affeeted with Scarif, Morphew, Lopofly and Kindworms, and flop the Pregrief of a Gangrene: made with Water and Honey, it is good to baſhe with for the Scirrhus.

XII. The Meal or Flower. Being applied mixt with Spirit of Wine or Brong Wine, it is of special Use to flop the Running of Gangreons, and hinder the Fretting and Eating of old putrid Sores, Can- kers and Phagedenick Ulcers; and to cleanfe the Skin of Lopofly, Turrets, Kindworms, Harpes, Scarif, Morphew, and other the like Diftempers.

XIII. The Ointment. It is made thus: 6 of the Flower or Meal eight ounces: Sulphur Wine in five pounds four ounces; Oil of Raff three ounces; Vi- negar enough to make it into the kind of an Oint- ment. It has all the Virtues of the Meal or Flower afo foregoing, and much more powerful to all thofe Intentions, being applied fresh Morning and Even-

XIV. The
Salmon's Herbal.  Lib. 1.

CHAP. CCXII.

OF DARNEIL-GRASS.

I. THE Names. It is called in Greek, Δερνή, Δρανκονί, and Δαρνέλλα, Gramen Phcenicum; in Latin, Phoenicu H Gramineum, and in English, Darnel Grass.

III. The Descriptions. The first, or Smallest single Darnel Grass, has a fibrous Root, from whence springing up from all graffy Leaves and Stalks, which are very like the Red Darnel, from the first, but that it has very few, fhriller and shorter Stalks, and the Leaves narrower, and the fhrilled Head has a few single Heads, very narrowly thence.

IV. The second, or Greater single Darnel Grass, has Roots and Leaves like to the Red Darnel; but the Stalks grow a yard high, pointed and fhrilled; and the Spike is thinly fit with fhrilled Heads, but they are bigger, rounder and thicker.

V. The third, or Small prickly Darnel Grass, has a small white fibrous Root, whence springing narrow graffy Leaves, six or seven inches high, being rough, hard and full of Points, pointed or prickly at the ends, and with a few fhrill Leaves on them, which have neste fhrilled Stalks, short, rough and changy like Twigs, fhrilled at the ends, and fit at the Points.

VI. The fourth, or Branched Darnel Grass, has like Roots, Leaves and Stalks, which are pointed at the others are, and slender; half a yard or more high, and narrow Leaves, Grass like: the fhrilled Head is as it were branched into others, wherein confists the chief Difference.

VII. The fifth, or Double Darnel Grass, has Roots, Stalks, and Leaves, differs little or nothing from the last, but in the fhrilled Heads, which are thicker fit together, and the tops of them bow down, or turn a little round.

VIII. The sixth, or Branched Marsh Darnel Grass, has a creeping white pointed Root, with many Fibres adjoining to it, from which foot forth two or three pointed Stalks, two feet or more high: the fhrilled Head is a flat long, branched as the fourth above is, each Branch of aingers length, with winged Heads, like unto Ours.

IX. The Places. They grow in Meadows, Cornfields, Pott-woods, and Borders of Fields, almost everywhere: but the first in Marsh and Wet Grounds, and on the Edges of Ponds.

X. The Times. They spring and growth with Corn, and the Seed or Grains are ripe in August.

XI. The Qualities, Specification, Preparations and Virtues. Authors have laid nothing of: however, it is manifest that they are of a cleaning, drying and affettng Faculty.

CHAP. CCXIII.

OF DEVILS-BIT Common.

I. THE Names. It seems to be unknown to the Greeks, for which Repton it has no Greek Name: but it is called in Latin, Serpyll, and Marcus Diosbi, and in English, Devil's-bit.
Chap. 213. English Herbs. 295

bios: some have thought it to be the Grass of the Ancients; others to be Nigra Billis, but Fabius Columna refers it to Piochomum Discolor, it is either Common, called, Morus Diaboli vulgaris, or which in this Chapter, or Various, of which in the Chapter following.

III. The Description. It has a Root which is somewhar thick, but short and blackish, with many Strings following thereto, and adling after Scabious, many leaves: from this Root rises a round, green, smooth (not hairy) Staff, about two feet high, set with divers heads, somewhat narrow, smooth, dark green Leaves, sift a little about the edges for the most part, being otherwise all whole, and not divided at all, or but very feathery, even to the top of the Branches, which yet are smaller than those below, with one Rib only in the middle, and being broken, yield not such Threads, as the Scabious does. At the end or root of each Branch, stands a round Head of many Flowers set together in the same manner, or more nearly and separately than those of the Scabious, and of a delicate purple color, fast of a dark red, as Gerald says which being pof'd away, there follows Seed, like unto that of Scabious, which falls away in the same manner.

IV. Note. 1. Some make of this kind a Greater and a Lesser: but this, in my Opinion, comes from the Nature of the Soil or Ground, rather than from the Nature of the Plant; that being the larger and firmer, the Species grows upon the rider or tatter Ground, and that the lesser which grows on the poorer Soil.

Note 2. Some are of Opinion, that the St John's-baptist rather Anagallis Alba belongs to this Plant, because it has a short Root with many Strings; Banksmans makes mention of one of this kind, which has hairy Leaves, and not differing in any thing else and he, from Gentian, calls it Morus Diaboli bifuta.

VI. Note. 3. Some Monks and Priests (as I suppose) have failed that the Devil, envying the Good which this Herb might do to Mankind, bit away part of the Root, by which means it became fo short a Stump as it is, and from thence it came to have the Name of Morus Diaboli, or Saga, Devil-bite is too redundantly, that one which has but a Grass of Senecio or Rehan can never believe such a Fiction.

VII. The Places. It grows as well in dry Meadows and Fields, as moist in many places of our Land; as also in Woods and by Highways sides: a great deal of it has been found growing in Hampstead Wood next London, at Lee in Essex, also at Raleigh in Essex, in a Wood called hammer, and in several other Places.

VIII. The Times. It flowers in August, which is something later than the Scabious, and is hardly to be known from Scabious, but when it is in Flower.

IX. The Quality. It is hot and dry in the end of the second Degree, and is Stomachic, Cordial, Sedative, and Altheopathic.

The Speciation. It is a peculiar Antidote against the Plague, Poison, and Biting of Venemous Beasts.

The Virtue.

XII. The Liquid Juice. Taken inwardly to two, three or four ounces, according to the Age of the Patient, it is powerful against the Measles, Small-Pox, Calenture, malign and spotted Fevers, as also against the Plague, and all malign and pestilential Diseases, Poison, and the Bitings of Vipers, Rattles, or any other Venemous Beasts: and is an excellent thing to induce the Healing of Wounds and Ulcers.

XIII. The Essence. It has all the Former Virtues, but is more powerful to the Field Intentions: behoves which, it is good against Fits of the Mother and Vapors, and provokes the Terms in Women. Dose two, four or six Spoonfuls Morning and Night, in a Glass of the Distilled Water, or in a Glass of White Wine.

XIV. The Decoction in Wine. It has all the Virtues of the Juice and Essence, but is yet less powerful: it may be used as a Wound-drink by Such Patients as have Wounds, Ulcers or Erysipelas which are infective, or of Difficult Cure. It is prepared with Honey of Roffes, it is said to be very effectual to help invertebrate Tumors and swellings of the Almonds and Throat, which do hardly come to Ripeness; for it digests and cleanses, confines the Elegm sticking thereto, and diffuseth the Tumors by often gargling therewith. Dose four or six ounces Morning and Night.

XV. The Powder of the Root. If it is taken in any convenient Vessel, it kills Worms, and drives them forth of the Body. It breaks and difficulties Wind in the Bowels, and reficks Poyson and all sorts of malign Pevars. Dose one dram mixt with Water, the Essence foregoing, or any other proper Vehicle.

XVI. The Ointment or Balsam. It cures simple green Wounds, many times at once drinking; for it is an incomparable Vulnary. It tipples Apotheles, and such other Tumors as will in time come to Supparation. It digests old Ulcers, cleanseth, healseth, and in a short time induces the Clearness, or causes them to be healed. Applied to the Gout, it eases the Pain, and in a short time cures it.

XVII. The Cataplasm. It is made of the green Herb and Root, and applied, it diffuses Tumors in simple Convolutions, and is probable to be applied to any place hurt or bruised by any Fall, Blow, or the like, or crushed by any Caution, diffusing the clothed or congealed Blood, and taking away the black and blue Marks, which may afterwards remain.

XVIII. The Distilled Water. It is good to wash green Wounds and old Sores, cleansing and drying them; and given inwardly with the Juice or Essence, it cleanseth the Body inwardly. If a little white Viole is diffused in it, it is then good against Scurf, Morphew, Herpes, Tetrars, Ringworms, Iris, Pimpls, running Sores and Ulcers, Freckles, Yellowpocks of the Skin, and other like Deformities, if the Parts affected be two or three times a day washed therewith, and so festered to dry out without wisting.

XIX. The Spirituous Tincture. It is powerfull against Poison, and the Malignity of huning and pestilential Fevers, as also the Biting of Mad Dogs, Serpents, and other poiysonous Creatures: it has all the Virtues of the Juice and Essence, but more effectual than they are, where the Heart and Vitals are immediatly concerned. It is good against Convulsions, Leancers, and all other cold and moist Diseases of the Head, Brain, Heart and Nerves.

Dose two or three drams.

XX. The Acid Tincture. It is a singular Medici-
Salmon’s Herbal. Lib. I.

Of Devil’s-bit Various.

I. The Names. It is called in Latin, Morsus Diaboli vorticosa, and Morbus Diaboli diversus: in English, Various Devil’s-bit.

II. The Kinds. It is twofold, viz.: 1. Morsus Diaboli thalamis, Devil’s-bit with a white Flower.

III. The Descriptions. The root of this herb with the white Flowers, has a short Stem of a Root, like the former, from whence many thickly Radiate sprigs: from the Head of this Root arises a round, green, smooth Stalk, near two feet high, with long, narrow, smooth, dark green Leaves, a little broader about the middle, but not as thick divided, which Nodes or Branches grow finer and smaller, as they grow nearer to the tops of the Branches; and on the top of each Branch stands a round Head of many Flowers, like the former Devil’s-bit, proving that they are only white, whereas they are of a blushe purple: and indeed this Plant differs not from the former in any other thing but in the Color of the Flowers, which is of a pure white, as four other sorts of Devil’s-bits are, and that the green Leaf is not altogether of so dark a green.

IV. The second, or that with the blushe-colored Flowers, is in Root, Stalk, Leaf, Color of the Leaf, and Form of the flower, the same with the former; but in this it differs therefrom, that the flowers hereof are of an inaccurate or blushe color, whereas in the common they are of a blushe purple, and in the former of a white color only.

V. The Places. These two are more hard and rare to be met with than the common kind, yet they are both found growing Wild about asparagus, near Rye in Suffolk; and in several other places of this Kingdom.

VI. The Times. They Flower later than any of the Scabious, and commonly not until August.

The Qualities, Specification, Preparations and Virtues, are the same with the common Devil’s-bit described in the former Chapter, so that no more need be said of it here, save that neither of these are in the least inferior to the vulgar in any of their Preparations or Virtues.

CHAP. CCXVIN. Of DILL Garden.

Dill.
II. The Kinds. There are two principal kinds hereof, viz. 1. Anethon Hortense, Garden Dill, of which in this Chapter. 2. Anethum Syrphifrons, Wild Dill, of which in the following Chapter.

III. The Description. It has a Root which is small and woody, pervading every Year after Seedtime, and is unprofitable as to Phthisick, never being put to any Use. From this Root rises up for the most part one or two Stalks, seldom more, nothing so large, nor seldom above half the height of Fennel, being round, and with fewer Joints therein, whose Leaves are softer, and somewhat long, divided almost into an infinite number of fibrous parts, almost like unto Fennel, but harder in bohinding, and somewhat thicker, of a stronger smell also, and not so pleasant. The tops of the Stalks have fewer Branches, and are replete with Umbles of yellow Flowers, smaller than those of Fennel, which pafs into small Seed, somewhate flater and thinner than Fennel Seed, and of a stronger and more poignant Tyle.

IV. The Places. It is most usuall yown in Gardens, and such like Ground for the purpose, and is also found Wild with us in some places: but if less found, yet it is not the worse for the Use.

V. The Times. It flowers in July, and the Seed is ripe in the end of August.

VI. The Qualities. It is hot in the third Degree, and dry in the second; more especially being green, but when the Harbor Seed are dry, they are hot and dry in the third Degree, and abound very much with Mercury and Sulphur, being Aperitive, Carminative, Digestive, Digestive and Digestive, Neuropathic, Pulmonare, Suede and Hypothentick, Sudorific, Alexipharmick, Analgetick, Galactogogenick, and Spermagenick.

VII. The Species. It is a peculiar Remedy for the cholick, and Windludes of the Stomach and Bowels.

The Virtues.

IX. The found Juice of the Herb. Mixt with the diffiluted Water, one or two spoonfuls of the Juice to four of diffiluted Water, and so taken Morning, Noon and Night, it encourages Seed, as also Milk in Nuries; if it expels Wind, and caifes Pains of the Bowels, being driny. If two or three spoonfuls of the Juice is mixt with Chicken-Broth, and exhibited as a Clyster, it helps in a Terataja.

X. The Essence of the Herb. It has the Virtues of the Juice, besides which, if it be given two or three spoonfuls at a time in the Morning fasting, in a Glass of Generous Wine, it wonderfully strengthens the Stomach, caises the Pains and Windludes of the Bowels to abate, and very effectually to digest raw and vicious Humors in the Stomach and Bowels.

XI. The Syrup of the Herb or its Juice. It is Potent, good against Coughs, Cold, and Icterus, Wheezing, and other Obstructions of the Lungs from what Cause ever. Mixt with Nuries Milk, it encloses Milk in her Brusts, and makes it more wholesome for the Child. It is a singular thing also against a tickling Catarrh, or an Inverseuse Flux of Urine upon the Lungs, being often taken.

XII. The Peculiarity of the green Herb and Seed. If it is made in Water, it encourages Seed, as also Milk in Nuries. If it is made in Wine, it fills up Lufh, and provokes to Cotton; and if it be too much taken, may provoke to vehemently for a time, to an excess Venery, by a too Lascivious Ejection of the Sperm.

XIII. The Powder of the Seed. Taken to one Dram in any fit Vehicle, it warms and comforts the Stomach and Bowels, and powerfully expels Wind: mixed with Honey, it is good against Coughs, Colds and tickling Catarrhs, and is good against Hourfick, Wheezing and Icterus of Voice. Drink mixed with Wine, it is good against the Hiccough, Vomiting, Lothing and Convulsions of the Stomach and other Viskers.

XIV. The Ointment of the Herb and Seed. It is, heating and drying, warms Parris which are cold and chlicled; and is good to ease Pains in any Part proceeding from Cold, Moliture and Wind. It diffuses and diffuses recent Tumors; but digests and matures Apparition, and is good to smooth with for the Piles, and to diffuses any other like Tumor in the Fundamentum, and dries all up moost and running Sores wherefoever, but more especially in the secret Parts. It is an Anodyne or Eater of Pain, and gives Relief.

XV. The Cataplasme. It diffuses recent Tumors, and is probable to be applied to any simple Contusion, provided it is done upon the Hands, whether in Hands, Knees or Feet, it has been found to give Relief: if it is heat very hot in a Frying-pan, and applied to the Side, it caies the Pains of the Pleurisy, and takes away Swells: and so applied to the Region of the Ankors or Belly, it prevails against the Cholick and Gaping of the Guts. Applied very hot to an Apopleny, and often renewed, it brings it quickly to Supputation, and breaks it.

XVI. The diffiluted Water of the Herb and Seed. It is a good Vehicle to take any of the Preparations in, whether Galenicke or Chymick: and being drank frecussed with double-refined Sugar, beets much Milk in Nuries Breasts, whatever Galen may say to the contrary.

XVII. The Spirituous Tincture of the Seed. It powerfully warms, comforts and strengthens the Stomach, expels Wind, and caises a good Appetite and Digestion. It is good against Lothing and Vomiting, stops Fluxes of the Bowels, and digests raw and vicious Humors in those Parts. It may be given from two to three times a day, in a Glass of fragrant Wine, in the Morning fasting.

XVIII. The Acid Tincture of the Seed. It strengthens a weak Stomach, includes tough and vicious Humors in the Bowels, and diffuses them, making them fit for Excretion. It cuts tough Flegm and severe Humors in the Stomach and Lungs, and makes it fit for Expectoration; for which Reason it prevails against Hourficks, Lots of Votse, Shortness of Breath and Difficulty of Breathing. It abates the Heat of Fevers, and refills Purity, in what part of the Body ever. Dole to much may make the Vehicle feasibly sharp, whether it be Ale, Beer or Wine.

XIX. The Oily Tincture of the Seed. It is good against the Palsy, as also Contusions, Swells, Numlocks, and Pains in any part of the Body, proceeding from Cold and Moliture, externally anointed upon the Parts affected, and inwardly given in a proper Vehicle, from fifteen to thirty drops or
more, as the Exigency or Extremity may require.
It provokes Urine admirably, and gives ease in the
Stomach and Stone, clearing the Renis and Blad-
der from gravel, Sand and phaenitic Slime lodged
in those Parts. It is a singular thing able to cure a
Puncture of the Nerves and Tendons, in which, be-
ing applied, it gives present ease to the Pain, af-
frighting the Tumor, and soon ekes out the Aff-
fection.
XX. The Saline Tincture of the Seed. Mixt with
the distilled Water aforesaid, it makes a good
Wash for moity and running Ulcers and Sores, clean-
ing and drying up the Moiture, and diffloping them
to healing. Given to two drams in a Clyster, it
prevents against the Cholick: and taken internally
one dram in White Port Wine, it opens and clarifies
the Urinary Passages.

XXI. The distilled Oil of the Seed. It has all the
Virtues of the Juke, Eleven, Dill, Pouter, Pouder,
Spirituous, Acid and Oily Tinctures, but it is more
powerful than any of them, and may be given to
Strengthen the Stomach, refill Leaffhing and Vomiting,
cause Appetite and a good Digestion, expel
Wind, ease the Colick and Tortures of the Bowels
from sharp Hurnes, cure Convulsions, Apoplexies,
Lenthanges, Palsy, Gout, Stone, Obstructions of the
Reins, Ueters, Bladder and Worms, &c. Dole
from eight to twenty drops, being first dropt into
white Sugar, and then mixt with some proper Ve-
hicle, in which it is to be given Morning and
Night.

XXII. The Spirit of the Seed. It has all the Vir-
tues of the Spirituous, Acid and Oily Tinctures, but
not all out so powerful, yet it is much more grate-
ful or pleasant to the Palate, and may be taken,
being diluted, either alone or mixt with some proper
Vehicle, from two drams to fix.

XXIII. The Potentatories or Powers of the Seed. They
have all the Virtues of the Gynical Oil, Juice, Eleven,
Tinctures and Spirit, but has more powerful
and firm, piercing admirably tho' all Parts of the
Body. By outward Application, being bathed upon
the Parts affected, they are good against Pains, Jukes,
Numbnes, Palsy, Lamentick, Convulsions, Spasms
proceeding from a cold and moist Caufe: they re-
move Hurnes, disfus Tumors, and refill Detoxi-
cious upon any Part, by strengthening the fame. Dole
inwardly from one dram to three or four, in any
proper Vehicle Morning and Night.

XXIV. The Elixir of the Seed. This has all the Vir-
tues of the diffiht Oil, Eleven, Tinctures, Spi-
rit and Powers, and is more firm and powerful
than any of them, and therefore may very profit-
ably be used to all thole Intentions, both by inward
Exhibition and outward Application. It is indeed
an admirable Stomnack, scarcely any better in the
whole Republick of Medicine: and for provoking
Luft, one of the most powerful of Vegetables. Dole
from one dram to two, in a proper Vehicle.
Chap. 217. English Herbs. 299

and painted Hanks, into some of the Villages or

Twelve-Milelands, in which the Seed is contained, on

loft hot and fiery in Style, and exalterating the Skin,

than the Seed of the former.

VI. The Place. The root of this is found pro-

ving naturally in many places of England, as June

in Essex, also near Exeter, and upon Bolchefer-

Common in Kent, as Snaith-Abbey next Wombury, in

Lancashire: it delightes to grow in sandy and flint-

jury places which are something moyst, and is alfo

nurth up in Gardens. The other two are of pro-

Origination, growing about Welfmouth, but with

us are nurth in up in Gardens.

VII. The Flowers. The root flowers about the end

of June and in July. The second line with us, in Au-

gust, but unefton ever gives rip; Seed in England.

The third flowers in July, and the Seed is ripe in

dauft.

VIII. The Qualities. They are hot and dry in the

fourth Degree; Pyretick, Stomatick, Articular, Phly-

mack and Acrifpharmacick.

XII. The Preparations. They are peculiar for the

Cure of the Sciatica or Hip-Gout.

X. The Preparation. You may have thereon,

1. A liquid Juice. 2. An Infusion. 3. An Infusion

in Wine. 4. A Powder. 5. A Concoftion. 6. A

Spirituous Tincture. 7. An Acid Tincture. & An

Oily Tincture. 9. A Solute Tincture.

The Virtue.

XI. The liquid Juice. Parkinson fays, that the

Women of Bury in Suffolk do usually give the Juice

touched in Ale or Beer to Women in Labor, to pro-

cure a speedy Delivery in Travail. You may give it

from one Spofful to two at a time.

XII. The Infusion. It has the former Virtues,

besides which, it is powerful to provoke the Temps

in Woman where they are flopp, dry up Cabbage

and tickeing Rheums which fall upon the Lungs,

and being held in the Mouth, gives exile in the

Toothach to Administration. Dole one Spofful or

more at a time, in a Glass of Ale, Beer or Wine.

XIII. The Infusion in Wine. It warms and con-

forts a cold Stomach, expels Wind, provokes Ap-

petite, and helps Concoftion, and gives exile in all

Pains of the Stomach and Bowels proceeding from

Wind, or Sharpness of Humors, the Cholick, or

being drunk for some time by women, it is fad to

cure Fruitfulness. Dole a small Gill of three or

four ounces Morning and Night.

XIV. The Powder. Snuff up the Nodhils, it is a

good Earhine to purge the Head and Brain of cold,

moift and flegmatick Humors, which it does very

effectually. Taken inwardly from a feruple to laff

a dream, or two fpoonfuls in the Morning laffing, it

kills Worms in Children, and expels Wind out of

the Stomach: and used as a Topick to moift and

running Scur and Ulcers, it clears, dries and in-

duces their Healing.

XV. The Concoftion. It is made of the green

Leaves, either alone or mixed with Hogs-Lard, by

heating them together in a Mortar. It is hot, tery

and sharp, is as that of Sciatica Grief, and works

the fame Effects, for both Panels Agines and

Phly fay, that it is effeclual for the Cure of the

Sciatica or Hip-Gout, or any other Pain or Gout in

the Joints, or any other Invercute Grief, being ap-

plied in the fame manner as Sciatica Grief, and

ifed in the fame order, it is alfo good against the

Determities or Difcolorings of the Skin, and takes

away Marks and Scars, Scabs, and Distemperes made

by burning with Fire, or the like.

XVI. The Spirituous Tincture. It curcs the Pain

Q 2

Dittander.
Salmon's Herbal. Lib. I.

of the Stomach and Bowels, the Cholick, and Torsion of the Stomach: also, being an antidote against pestilence from sharp and corrosive Humors. It strengthens the Villers admirably, and snatches Flowers of the Belly of all forts, as the Diarrhœa, Dysenteries, Liquerias, Hepaticks, and with all restores the Tone of the Paries hurt, by warming and combating them. Dole half a Spoonful at a time in a Glass of Wine.

XVII. The Acid Tincture. It cuts thick and tough Flagon, dilates numerous Matter in what part of the Body the foccer, strengthens the Stomach, restores its depraved Tone, cures a good Appittance and a strong Digestion: and by its Influence into the Mas of Blood, it destroys its Diffusion and so effectually roots out the Scary, whether in Old or Young. Dole so many drops as to make the Vehicle pleasantly sharp.

XVIII. The Oily Tincture. It is good against Rheumatic Pains and Achs in any Part of the Body, the Sciatica and Gout proceeding from a cold Cause, as also Palpites, Convolutions, Spainys or Cramps, in all which Cases it is to be heated twice a day upon the Pans afected, rubbing it every time well in; in a Palt, it ought alfo to be anointed all along upon the Back-bone, as well as upon the Part afected.

XIX. The Saline Tincture. It prevails against Tettars, Ringworms, Herpes, Scirriff, Morphaw, Itch, Pimpls, Pustules, Scabs, Leprofy, and other like Boils both out. It also takes away Swelling, Tannin, Flickes, Lentils, Redness, Yellowness, and each other like Defections of the Skin, being only bathed Morning, Noon and Night upon the Part afected, and then letting it dry in.

CHAP. CCXVIII.

Of DITTANY Bafillard White.

I. THE Name. It is called in Greek by some, Χαριντας or Χαριντελλα, (as it is φραξινας buxina, but that it is not;) in Latin, Fraxinella, Dipotamus and Dillanium, also Dittamno vel Dittany. It alfo in English, White Dittany, White Bafillard Dittany, and Fraxinetta.

II. The Kinds. There are three kinds, viz. 1. Fraxinella vulgaris, Fraxinella fiere rubrante, Common or vulgar Bafillard Dittany with a reddifh Flower. 2. Fraxinella fiere rubra, Bafillard Dittany with a red Flower. 3. Fraxinella fiere albo carminis, Bafillard Dittany with an Alb-colored Flower.

III. The Descriptions. The fift, or Common Bafillard Dittany, has a white Large Root, spreading many ways under Ground, if it stands long: it is a Hardy Plant, and rises up with several Round, hard, broadt Stalys, near two feet high, the inner parts whereof are furrished with many winged Leaves, somewhat like unto Liquorice or a small young Althea, confifling of feven, nine or eleven Leaves fett together, which are something large and long, hard and rough in handling, of a darkift green color, and of an angularflesh ftrong reftuant Smell. The upper parts, the Flakes and fiere are furrished with many fliuer green Stipes-Spikes, in certain ifances one from another, confifling of five long Leaves quenece, of which, four which fand on the two fiere are fome what bending upwads, and the fifth hanging down, but turning up a little the end of the Leaf again, at a fain or pale red color, ftriped thro' the leafe with a deeper red color, and being in the middle a Taflet of fure or fcarl purpliff Threads, which bow down with the lower Leafe, and turn up alfo the ends again, with a little brize or Thrash at the ends of every one. After the Flowers are pull, arifes hard, lifht, rough, clamby Hacks, forne or pointed at the end, four or five landing together, somewhat like un to the Seed-Veijels of Wolfs-bane or Columbines, but greater, thicker and harder, in which is contained round, lining, black Seed, larger than any Columbine-Seed by much, and smaller than Peony-Seed. The whole Plant, as well Roots as Leaves, is of a Strong Scent, not fo playing for the Smell as the Flowers are beautiful to the Sight.
X. The Preparation. You may have therefore,

The Virtues.

XI. The liquid Juice of Leaves and Root. Taken from one spoonful to two in White Port Wine, it is good against the Strangury, provokes Urine, and is laid to break the Stone in the Bladder, and expel it; it also provokes the Terms, and brings away both Birth and After-birth.

XII. The Infusion of Roots and Leaves. It has all the former Virtues besides which, it is good for Weekness and Blains of the Stomach, prevails against a cold and moist Disorders at the Worms, and is proper against the Stingings and Biting of Hornets, Scorpions, Serpents, Mad-Dogs, and other venomous Beasts: it prevails against deadly Poison, and all sorts of malignant and pestilential Diseases. Dose one or two spoonfuls Morning and Night, in a Glass of Generous Wine.

XIII. The Infusion of Leaves and Roots in Wine. It has all the former Virtues, but does not fall out so powerful, and may be given to Moor or fix courses it expels Wind, and eases the Cholick.

XIV. The Pouder of the Seed. Given to a dram or more in White Port Wine, it prevails against the Strangury, provokes Urine, and breaks the Stone (as Authors say) in the Bladder, and drives it out.

XV. The Powder of the Root. It is given to a dram with fifteen grains of Rhubarb, it kills and drives Worms: and being given from one to two drams, it effectually refits Poison and the Venom of Serpents, Mad-Dogs, &c. prevails against the Plague and other contagious Diseases, kills Worms in the Stomach and Belly, and gives ease in the Stone.

XVII. The Spirituous Tincture of the Root, or of Root and Leaves. It has all the Virtues of the Juice and infusion, but more powerfully warms and comforts a cold, weak and sick Stomach, refires a depraved Appetite, and caueth a good Digestion: it expels Wind, and gives ease in the Cholick. Dose two or three drams.

XVIII. The acid Tincture. It heals inward Wounds, and prevails against the Epilepsy or Falling-sickness, Vertigo, Lebeagry, Head-aching, Megrim, and other cold and moist Diseases of the Head and Brain. It cures coughing Fits of Cough, opens Obstructions of the Lungs and other Visions, helps to break the Stone, and expels Sand and Gravel, as also any kind of tarmalous Matter from the Bladder, and other interiors. Dose to many drops as may make the Vehicle pleasantly sharp, to be taken three or four times a day.

XIX. The Oily Tincture. It is good against Constipations and Cramps, as also Lumbards, Numbness, Pains, Aches, Falls, and other like things out of the Elbows.

C H A P. CCXIX.

Of DITTANY Bastaed, Outlandish.

I. The Names. It is called in Greek, Φυκάδημον, in Latin, Vfendolium, Φυκαδόλιον: in English, Outlandish Bastaed Dittany.

II. The Kinds. It is opposed as the false kind of the Dittany of Greece, of which we shall treat (God willing) in the Third Book of this Iterbut. At this Bastaed Dittany there are two principal sorts, viz. 1. Vfendolium Primus, which, as Angustara says, is called by the new Greeks, Κακασμα. 2. Vfendolium Altena Dittania, The other Bastard Dittany.

Bastaed Dittany.
III. The Descriptions. The first has a pretty long Root, which is hoary, hard and woody, rooting down deep into the Ground, with divers Strange Siringing from it. From this Root rise up Stalks or Branches, half a yard long, sometimes, on which are set such like round and hoary Leaves as the True Dictay of Crete has, but neither so thick in handling, nor so thick, yet on the Branches, but more differed, yet two above together, one against another, from the middle of these Branches, to the top of them, come forth the Flowers round about the Stalks at the Joints with Leaves, which are gaping, like those of the True Cretean Dictay, or Penneyroyal, Mint, Carhamint, and divers the like Herbs have, which Flowers are of a dull purplish color, standing in hoary Hats, after which comes the Seed, which is greater and blacker than that of the True Cretean. This Herb is somewhat hot and sharp, but not by half so much as is the True, or as is the Fraxinella in the former Chapter.

V. The second has a fibrous Root, which spreads itself, rooting pretty deep in the Earth, from which rise up many square hoary Stalks, more than a foot high, set with two Leaves on a Joint, like unto the former, but something larger and longer: towards the top white, or, with the Leaves, come forth hoary Hats, like unto those of the Great Affrivan Bawin, but shallower, out of which start gaping Flowers, mixed with white and red. The whole Plant flutters very well, and hides all Winter, as the other does, and is encrusted (as is also the former) by Slippering.

VI. The Places. The first grows in many places of Italy, as near Pisa and Laphbon; the other is a Native of the Island Crete; they have been both brought to us, and flourish very well in our Gardens, if the Winter is not too violently sharp and long. The first has been many times raised with us from Seed brought from Italy, but it grows very well also of the Stips, being put into the Ground about the middle of April, and a little defended from the Heat of the Sun for a time, after the setting, and now and then watered in the mean Season.

VII. The Times. The first Flowers with us all the latter part of the Summer, but seldom gives any good Seed: but the Seafsons of the other have not been observed.

WHENEVER. There are several kinds of this Plant, viz. 1. Lapathum foliaceum vulgaris, red Roman cumam, Common Dock, of which in this Chapter. 2. Oxyalthum officinale Lapathum acutum, Roman acutum, Sharp-pointed Dock, of which in Chap. 221. 3. Hydroalthum, Roman nigricans, Water Dock, of which in Chap. 222. 4. Lapathum Maritimum, Sea Dock, of which in Chap. 223. To these you may add 5. Lapathum Sanguineum, Blood-wort, of which we have already treated in Chap. 182. following. 6. Hippothamum Scitum, Patience, or Manna Rhubarb, of which in the following Part of this Work, in its proper place.
Chap. 220. English Herbs.

IV. The Places. It grows in Field and Meadows, waste Grounds, Orchards, by Ditch-sides, and Highway-sides, more especially in the moister Grounds, in most parts of England.

V. The Times. It flowers in June and July, and the Seed is ripe in the end of August, and sometimes earlier.

VI. The Qualities. It is temperate in respect to Heat or Coldness, and dry in the second Degree, more especially the Seed, which is very Astringent. The whole Plant is very Astringent and Alterative, with a kind of opening faculty, and is Traumatick or Viscerary and Hepatrick.

VII. The Specifica. It is peculiar for curing all Fluxes of the Bowels, chiefly the Bloody-flux. The Preparations. The Root and Seed are mostly in Ulc, the Leaves only whilt they are young. From this Plant you may make these Preparations. 1. The liquid Juice of the Root, extracted with White or Red Port Wine. 2. A Decotion of the Root. 3. A Powder of the Root or Seed. 4. A Vinegar of the Root. 5. The distilled Water of Herb and Root. 6. A Spirituous Tincture of the Root. 7. An Acid Tincture of the Root. of all which in order.

The Virtues.

IX. The liquid Juice of the Root. It opens Obstructions of the Liver and Spleen, cleanses and strengthens the Stomach and other Villera, stops a Diarrhea and Laceria, and heals the Corrodon of the Guts in a Dysenteria, strengthening them admirably, and prevails against the Jaundice after a singular manner. Dose four ounces or more, first at Night going to Bed, and as much in the Morning following.

X. The Decotion of the Root. It has all the former Virtues, but performs not full out so effectually as it is good against the wandering Pains and Sicknes of the Stomach, the Bloody-flux, and Bittings of venomous Creatures, and prevails against the Jaundice, Strangury or Stoppage of Urine, Stone, Gravel, &c.

XI. The Powder of the Root or Seed. It cures Fluxes of the Belly, and stops the over-flowing of the Courts in Women. Suspected upon milt and running Sores or Ulcers, it cleanses, dries and difpokes them to a Healing. Given to a drain or drum and half in choice Red Wine, it helps a Diabetes.

XII. The Vinegar of the Root. It is Aromatick, being inwardly taken, and prevails against malignant and pestilential Diseases, outwardly, it is good against Scurf, Morphew, Itch, Mange, Pimpls, Pustules, Sores, and other like Discontents of the Skin, the places affected being bathed therewith two or three times a day.

XIII. The distilled Water of the Herb and Root. If it is mixt with the Vinegar just abovergoing, or with Juice of Limes, it is good to clear the Skin of Morphew, Frieckes, Lentis, Sun-burning, Tanning, Yellowseeds, and other Difcolorings of the Skin.

XIV. The Spirituous Tincture of the Root. It admirably strengthens the Bowels, and is good against all their various Fluxes, as Diarrhea, Dysenteria, Lithency, and Hepatic Flux; it is singular against tasting and swooning Fits, and Griplings of the Guns, proceeding from cold, sharp and tinctuous Humors. Dose one spoonful Morning and Night in a Glass of White or Red Port Wine.

XV. The Acid Tincture of the Root. It is good against the Yellow Jaundice, being taken in all that the Patient drinks, whether Ale, Beer or Wine. It strengthens and fortifies the Stomach, provokes Appetite, and causes a good Digestion; cuts thick and tough Films, and carries off turruous Mallet lodged in the Stomach, Lungs, Reins, Ureters and Bladder, and destroys those Humors which are the Ground and Foundation of the Kings-evil.

CHAP. CCXXI.

Of Dock Sharp-pointed.

I. The Name. It is called in Greek, Ἀκτράτον, in Latin, Oxycapathum, Lapathum acutum, Rumex acutus, and in English, Sharp-pointed Dock.

![Large red sharp-pointed Dock](Image)

II. The Kinds. It is threefold, viz. 1. Oxycapathum majus, Lapathum acutum major, Rumex acutus Cordi. The greater sharp-pointed Dock. 2. Oxycapathum vulg. Lapathum acutum minor, Rumex acutus minor. The less or small sharp-pointed Dock. 3.
Oxypapathum, vel Lapathum acutum minimum, Rament acutum minimum, The smaller or least thump-pointed Dock.

III. The Descriptions. The first, or Greater, has a Root which is great, long, and many times fork'd, being blackish on the outside, and somewhat reddish and yellowish within, abiding many Years, but sometimes perishing by the Excruciation of Winter. From this great and long blackish Root springing forth many long, hard and narrowwich green Leaves, very sharp-pointed at the ends, much more sharp than is the former sort: from among which Leaves rife up a short hard Stalk, two or three feet high, set with the like Leaves, but smaller Hill up to the top, not much unlike to Sorrel, but that it is neither to tender nor but, rather of a bitterish Taste. This Stalk is branched forth towards the top into several large Branches or Sprigs, bearing small reddish Flowers in long Spikes, after which, in brown reddish, or dusky-colored Husks, is contained small triangular Seed.

IV. The second, or Fifth sharp-pointed Dock, has a Root which is long and slender, parted diversely with small slender appendix thereon: which Root is of a yellow color on the inside, and from which rife up a strong, stiff Stalks, about a foot, and sometimes a foot and half high, having Leaves therein, which are long and narrow, waited on the edges, as if they were crumpled: this Stalk is branched forth into several other large Branches, almost from the bottom to the top, all which Branches are also beset with such distances, with the like long and narrow Leaves, crumpled in like manner: the Stalks, Branches and Flowers, with the Seed following them, are like unto the former, but that they stand not on thick long Sprigs or Twigs, but clothe together, some at the joints, or compelling the Stalks, and others at the tops of, a darker color.

Salmon's Herbal.  Lib. I.

CHAP. CCXII.

Of Dock Water.

I. The Names. It is called is Greek, ἄκακα, in Latin, Hydroplatam, and Lapathum aquaticum, Ramex aquatiques: in English, Water Dock.

II. The Kind. It is twofold, viz. 1. Hydroplatam major, Ramex palustris Tragii, Lapathum palustre Taubertannianum; Hippopotamum syphilitri Gessneri, Matthiolii, Dodoens; Hydroplatam magnam, vel major aquatiquam. The greater or great Water Dock. 2. Hydroplatam minus, Ramex aquatiques minor, Lapathum aquaticum minus, The lesser or small Water Dock.

III. The Descriptions. The first, or Great Water Dock, has a thick Root, Blackish on the outside, but of a dark reddish, or reddish yellow within, which is floater than the Great sharp-pointed Dock, and taller of fibers: from this Root spring up several large Leaves, standing upon pretty long root stalks, which Leaves very much resemble the Common Dock Leaves, but that they are much larger and longer, a little crumpled at the Substance, but smooth on the edges, and for the most part sharp-pointed. These grow up also one large brownish green Stalk, which is sometimes pointed towards the region with a few reddish Spots: the Leaves growing upon this Stalk are much like those just now described, but leaffet, and growing leffer and laller as they approach near the top, with some little or laller Leaves.
Chap. 223. English Herbs.

Leaves springing from the lower Joints of the Stalk, where the greater Leaves grow, which latter Leaves seem to grow in the bottom, as it were, of the greater Leaves. The top of the Stalk this is fall: forth into several small Sprigs or Twigs, each of which, when in Flower and Seed, are of a spiked Form, and all together with the main top of the Stalk make one great spiked Head of Flowers and Seed; which Flowers and Seed differ nothing in appearance from those of the Common Dock, excepting that they always grow closer together.

IV. The second, or Latter Water Dock, has a Root like the former, but it is smaller, and full of long Fibres or Streaks; the leaf Leaves also are like the first Leaves of the former, but much thinner, long, and narrower, being also sharp-pointed. The Stalk is lower, and fuller of Branches, with Flowers and Seed like to the former, and to the rest of the Docks; so that there seems to be little or no other Difference between this and the Greater, but in the Magnitude of all the Parts, this being less in every way; but in its Form and Manner of Growing, it is much the same with the other.

V. The Places. They both grow in wet and plathy places, and by the edges of standing Waters and Ditch-sides: I have found them growing plentifully in the Fen in Cambridgeshire, in Ditches, and by Ditch-sides, and in the midst of standing Hallow Waters; as also in low midland Grounds, at the lower parts of the Land, bordering upon the feamy parts, where the Earth is moist and watry, and by Hallow Rivers-sides.

VI. The Times. These also flower in June and July, and the Seed is ripe in August.

VII. The Qualities, Specification, Preparations and Virtues of these, are the same with those of the Common and Sharp-pointed Dock, and therefore to the former Chapters I refer you: but this you may take notice of, That the Roots and Seed of the Water Dock are little inferior to those of the Sharp-pointed Dock; and some learned Men which I know, affirm, that they exceed in Efficacy.

VIII. An Observation. The Roots of Water Docks or Sharp-pointed Docks, being boiled in Water till they are soft, and then boiled in Mortar with Hogs Lard, and so made into an Ointment, is good against Scabs, Leach, Mange, Scorif, Leprosy, &c. the Patient being daily anointed with it.

CHAP. CCXXIII.

Of Dock Sea.

I. The Names. It is called in Greek, "Lapathum," &c.; in Latin, Lapathum Maritimum, Raucæ Maritimæ; in English, Sea Dock.

II. The Kinds. It is singular for genera, and because it is a very strong-seeded Plant, Authors are pleased to call it Lapathum Maritimæ Fullum, Stinking Sea Dock.

III. The Description. It has a long Root, which is pretty thick with some Fibres thence, and goes somewhat deep into the Earth, it being generally very light and sandy Ground in those marshy places. From this Root rises up a Stalk which is reddish, a foot, and sometimes half a yard high or long, which bends several ways. The Leaves grow at the jointy Joints upon long Foot-stalks, which are broad at bottom, long, with a breadth, roundish towards the top, and then sharp-pointed; they are of a dark red color, waved about the edges, and winged thinly at bottom, with two small pieces in the head.

The Stalk spreads it itself into many Branches, with the like, but fewer Leaves on them, and a little dented about the edges. At the top of the Stalk stands a Spike of Flowers, composed of many Leaves alternate, after which follow leafy round Heads, which contain the Seed.

Lib. I.

CHAPTER CXXIV.

Of Doddern.

The Name. It is called in Arabic, Chafjall, and Caffaith: in Greek, Καβιτά; in Latin, Caffina, Caffina, Caffata, Podagra pass, Angina foot: in English, Dodder.

And yet, notwithstanding all this Variety of Names, it is but one Plant or Herb, and has but one Description.

III. The Description: This Herb taking Root in the Ground from Seed, sows forth Threads or Strings crofter or finer, as the Property of the Climate, Quality of the Earth, and Nature of the Plant on which it grows will admit, creeping and spreading on that Plant on which it is sown, or upon which it climbs, be it high or low, differing about the very Grains, if it meets with nothing else. These Strings are many, but have no Leaves at all, and wind and interlace themselves so thick many times upon a small Plant, that it deprives it (as it were) of the Heart of the Sun, and seemingly choking it. These Strings are riper up to that height and strength, that they may draw Nourishment from the Plant upon which they climb, you shall fearfully see any Appearance of the Rife of these Strings from the Earth, they being broken off by some Accident, or withered by the Heat of the Sun, or otherwise decayed; (from which Appearance I believe it was, that Matthiolus and some others did think it so to grow without Root, and not first to springing out of the Earth, as it certainly does, and as they who may be pleased to sow the Seed in a Pot by itself, may observe, and see its springing up,) but if they meet with no Herb or Plant, upon which they may twine themselves and clamber, they soon perish and die away;) and from this Reason I suppose it is, that several have thought them to grow as Alleys upon Trees, or like Muse, but after they have left their Ground-roots, I am apt to think, that the whole Plant shews its Nourishment (like as they) from those Plants on which it grows. Upon these Strings or Threads, which are sometimes white and sometimes red, according to the Herb or Plant on which they grow, are found Clusters or small Heads of Flowers, out of which proceed whitish or white Seeds, which being past away, do afterwards give small pale-colored Seed, somewhat flat, and twice as large as Poppy Seed.

IV. Observation 1. Plant lib. 26. cap. 8. makes two sorts of Epipolinum, making the one to be the Flowers of Time, as Describers before him did; both green and white, the other to be red.Threads or Strings growing without Root. This Duplicity of kinds Matthiolus has confuted, and now most of our modern Authors acknowledge but one kind, tho' it may have sometimes white and sometimes red Strings, as Tragia first observed, growing on several Herbs, according to which, they are found to be of those two differing Colors.

V. Observation 2. By this all it may appear, that neither Time nor Savory, nor any other Herb, do naturally, of their particular Seed, bring forth these Strings, but that they spring from their own Seed, either fresh or heat or heat or coverd with themselves upon the Ground, or coming among the Seeds of other Herbs which are grown. As also they creep upon various Plants, so in the hotter Countries they do creep upon hot Herbs, as on Broom, Savory, Hyssop, Marjoram, Rosemary, see, but in England, they, for the most part, climb upon colder Plants, as on Fern, Elm, Hemp,
Chap. 225.

English Herbs.

Lycaon, Nettles, Dwarf-Elder, Tares, on which lift it grows abundantly in some places, where it diffours the Peace, or at least the name of it, and is called by the Country People, Helvedeeet, because they know not how to destroy it.

VI. The Places. Dodder grows in Asia minor, or Nabidh, Greece, the Thraci, Spain, India, and other Countries, as also plentifully in England; I found it growing Wild in several places in Cambri- bridge, upon Dwarf-Elder, and upon Nettles, as also in several Hemp-lands upon Hemp. It grows on several Plants upon Hemisagathis, as upon Fern, &c. as also on several places on Black-beard in Kent, where Parkinson says he found it. It grows plentifully upon Nettles in Somersetshire, and in several other parts of this Kingdom, as also upon Tares near London.

VII. The Times. It Bfirishes in July and Au-gust, in which times, and also after, it bears its Flower and Seed.

VIII. The Qualities. It is said to be hot and dry in the second Degree; but I am of the Opinion, that that Dodder which grows on the hot Plants, as Thyme, Marjoram, Savory, Hyssop, is hot in the second Degree, but that which grows on the colder and more temperate Plants, as Fern, Nettles, Vox, Hemp, &c. does not exceed the first Degree of Heat; for the Qualities and Properties of this Herb much follows those of the Plants upon which it grows, and do in some measure change and alter accordingly; so that inquiring into the Nature of the Plant upon which it is nourished, you may in part see into what Nature and Properties it may be altered. It is Altivibrant, with an affronting or binding Quality, especially that which grows upon the Branble, and other affronting Plants; since it is not affronted, that it receives a certain Quality from its Parents, by whose Jucate it is nourished. That which grows upon hotter Herbs, as Thyme and Savory, becomes hotter and drier, and of thinner parts. That which grows upon Brown is Diuretic, and provokes Urine more forcibly, and withal makes the Belly more soluble. That which grows upon Vox is left drying. It is dedicated to the Liver and Spleen, as also the Bowels, and has a gentle effect of Cathartic or Purging Faculty with it.

IX. The Specification. It is a peculiar thing against Oppressions of the Spleen, and Hypochondriack Malady.

X. The Preparations. This Herb admires not of many Preparations; the chief are, 1. A Juice or Essence. 2. An Infusion or Decotion.

The Virtues.

XI. The liquid Juice or Essence. It opens Obstructions of the Liver and Spleen, and purges Melancholy and Mud-choler from the Spleen and Hypochondriack, and indeed from the whole Body. Dole these ounces, sweetened with an ounce of choice Manna dissolved in it. It evacuates Flegm from the Head and Viscera, difcharges the Lungs, and is pro- fitable against a Vertigo, Napegrain, and other In- toperate Pains of the Head. It prevails against aching and stiching Fins, by carrying off the sharp and acrid Humors which cause them. It is powerful against Madness and Agues, especially Quarraumes, tho’ they have been of a long continuance. And as it is good against Hypochondriack Melancholy, so also it prevails against those Diforders which that Hu- mor breeds, as Skinth, Cancer, Handclicks of the Spleen, Pain in the Wrist and of the Snee, Stop- page of the Reins, Itch, Scabs, Leproidy, Elephantiasis, malignant and cancerous Ulcers, as also the Malignity of the Worms. It very much cleanses the Blood from Melancholy and adult Humors, is good against the Yellow Jaundice, and tho’ it has a purging Property, yet it also strengthens both Liver and Spleen, and cures Agues in Children, if a little Worm-seed be added to it. It provokes Urine sing- ularly, and cleanses the Urinary Passages from Blood, Gravel and phlegmatic Matter, especially if a little of the Powder of Antifet and Tincture of Wormwood be added, and then it also cures Gripings in the Bowels, and brings down the Terms in Women. Mix the Dose with a Glaif of White Port Wine, and let it be drunk.

XII. The Infusion or Decotion in White Wine. If you make a Decotion thereof, the Boiling must not be too much, for it will not endure long boiling, because it will loofe it felt. It has all the Virtues of the liquid Juice or Essence aforegoing, and may be taken to half a pint, more or less, at a time, tis- teed by diluting an ounce of pure Manna in the same. It is said to cure Children of Agues, being given from two to four ounces, as aforecald.

XIII. Note. Dodder of Vox is peculiar for o- pening Obstructions of Liver, Spleen and Gall. Dodder upon Branche is good against the Yellow Jaundice, and strengthens the Vitae much. Dodder of Nettles provokes Urine, opens Obstructions of the Womb, and locoens the Belly. Dodder of Thyme corrects and warms a cold Stomach, and reduces the Dificacy of the Blood and Humors, prevailing against old Head-achses, the Megrim, Vertigo, Mad- ness, Epilepsy, purging downwards black Choler and Melancholy. Dodder of Brown is good to open Obstructions of the Reins, Uterus, and Bladder, provoke Urine, expel Sand, Gravel and phlegmatic Matter, and give ease in the Stomach, expelling watry and hydroptic Humors. In a word, Dodder of all other Plants, in like manner, parakees of the Nature, Qualities and Properties of them on which they grow, (as above said,) whether they be hot or cold, cathartick or affronting, and it is thought to work more effectually for those Difforders, whereunto the Herb it self is applied. But Epistihmu, or Dodder of Thyme, is that which, by all Physicians, is accounted the most principal and most powerful Dodder, and doth drive the Heat of them all, to be used to cold and moist Habits and Constipations of Body.

C H A P. CXXV.

Of DOGS BANE.

I. Tbe Names. It is called in Greek, 'Abname, & Nepteg, (naca Comus, intero,) the Greeks also call it ointment, from its cliening Property: in Latin, Apocynum, and Periophc: in Eng- lish, Dog-bane.

II. The Kinds. There are five kinds hereof, viz. three European kinds, and two American. The Eu- ropean kinds are, 1. Apocynum angustifolium, five reper, Climing Dog-bane, or Narrow-leaved Dog- bane. 2. Apocynum luteum, nine reper, Broad- leafed upright Dog's-bane. 3. Apocynum johne an- gaioi Salich, Willow-leaved Dog's-bane. The Amer- ican kinds are, 4. Apocynum robustum, six angus- tifolium American, The taller upright narrow- leafed American Dog-bane. 5. Apocynum robustum majus, lintifolium Americanum, The greater upright broad-leaved American Dog-bane, or Virginian Silk.
of great height, twenty feet high, or more sometimes, if any thing grows or stands by it, upon which it may climb higher, or else falling down again into the top, on which stand at several good distances (having at the tops, where they stand thicker, set together) two Leaves longer and narrower than the next described, and pointed at the ends, somewhat thick, and of a deep green color, almost shining. The Flowers stand in the same manner as dole in the next, and consist of five thick Leaves, each of them pointed, and bending something backwards, forming to have two Leaves apiece, one lying upon another, like unto those of Barren-sort, the undermost being greener and larger than the upper Leaves which lie upon them, and are not so large to cover them wholly, but leave the green brims or edges of the lower Leaves to be seen round about them, which upper Leaves are of a dark purple or reddish color, and close to fall to the lower, that it is very hard to separate them. In the middle of each Flower stands a green Pointed, encompassed with five dark yellow Chives, each of them twining inward. After the Flowers are fallen, small long Cods appear (in warm Countries, but scarcely in England) two always joined together, but more fitly than in the following Plant, bending something more outward in the middle, and turning together almost at the points, in which lies flat Seed, wrapped in a kind of film down. This Plant looses its Leaves, but not its Seeds, in the Winter, fresh coming forth again in the Spring.

IV. The second, or Broad-leaved upright Dogs-bane, has a Root which grows down into the Ground, spreading it sett out into several Branches, with divers small Vessels adhering: from this Root spring up a woody Stem, of the thickness of one Finger, covered with a greyish Bark, from whence arise several woody, but flexible greenish Branches, easy to twist or wind about any thing, being very tough and hard to break, standing for the most part upright, and seldom trailing, or laying hold of any thing which may grow near it; having two broad dark green Leaves, but sharp-pointed, and not round, set at every Joint all along, but not very near one into another, full of Veins, and something finer than Ivy-Leaves, but thick-witbit, whole Stalks and Branches being broken, yield a pale yellow-colored Juice. But as Dioscorea and other Authors say, of a much deeper yellow, which thing may be admitted when it grows in warmer Climates than is this of ours. The Flowers spring forth at the Joints with the Leaves, growing upon Foot-stalks not very long; and at the tops three or four or more of them stand, sometimes together, which odd of five small pointed Leaves, of a whitish color, yet larger than those of Adenium or Swallow-sort. After which (in the hotter Climates, but fearfully in ours) grow long, crooked and pointed Cods, something more hard and woody than those of Swallow-sort, almost nothing so much as those of the Oenander or Rose Bay-tree, two mouth usually standing together upon one Stalk, but severed at the rising to the stalk, and are full of a liquid white Down, like the former in which lie dispersed many flat, blackish brown Seeds. This Plant looses not its Branches in the Winter, but only its Leaves, every Spring sprouting forth new again.

V. The third, or Willow-leaved Dogs-bane, has a Root much like the last, from which spring woody Stems or Branches, bearing set at every Joint of the latter, something Twigs two narrow Leaves opposite to the first kind, but they are not so thick, rather a little thinner, and much narrower than they, almost resembling the form of a Willow Leaf. The Flowers are like the first, and now as late, being very much
much like to the former Narrow-leaved in its Form and Manner of Growing; and it looses its Leaves in the Winter, as that other does, renewing them again in the Spring.

VII. The Jorobado or Lefser upright narrow-leaved American Dogbane, has a thick Root, but it creeps not in the Ground, as the Greater American doth; but from many long Fibers, it forms forth a round brown Stalk, about half a yard high, bearing at each Joint a pair of long narrow Leaves, and such a large Tafe of Flowers at the top, as the following has, but of a deeper purple color, which have a certain Charm in them, which will detaine Flies or other light things which happen to fall thereon. After which come long and thin Cods, (not crooked, like the Greater Jorobado) following with flat brown Sand therein, lying in a white kind of Down, like unto Althea or Snapdragon-ner. This being broken, yields a milky Sap or Juice, like the other.

VII. The fifth, or Greater upright broad-leaved American Dogbane, called Virginia Silk, has a Root, which is long and Alcoholic, in the thicknesse of a Man's Thumb, running under Ground very far, and showing up again in divers places, the Heads being set full of small white Kimbs or Knots, sending forth many Branches, if it finds any long and vast in a place. From this Root rises up one Stalk, and sometimes more, being strong and round, and three or four feet high, on which are set, at the several Joints thereof, two, four, long and broad Leaves, round-pointed, with many Veins therein, growing close to the Stem, without any Foot-flank. At the tops of the Stalks, and sometimes at the Joints with the Leaves, grows forth a great Bush of Flowers, out of a thin Skin, to the number of twenty, and sometimes of thirty or forty, every one with a long Foot-flank, hanging down their Heads for the most part, especially those which are outwardmost, every one standing within a Hank of green Leaves, turned to the Footward, like to the Lysimachia or Looseflower Flower of Virginia, and each of them consisting of five small Leaves apiece, of a pale purplish color on the upper side, and of a pale yellowish-purple underneath; both sides of each Leaf being as it were folded together, making them seem hollow and pointed, with a few short Clives in the middle. After the Flowers are past, long and crooked Cods, pointed, and standing upright, the Seedles in which are contained, that brown Silk Seed, disdifferingly lying within a great deal of fine, soft and whitish brown Silk, very like unto the Cods, Seed and Silk of Aftropea or Swamp-ner, but that the Cods are greater, and more crooked, and harder also in the outward Shell. The whole Plant, as well Leaves as Stalks, being broken, will yield a pale kind of Milk or Juice.

VIII. The Places. The first and third grow in Italy, Apulia and Calabria in the Kingdom of Naples. The second grows in Syria and the Eastern Countries, as also in Italy, as Mathioli reports; but with us they grow in Gardens. The two last came from our English Plantations in America. The fifth, Parkinson says, came to him from Virginia, where it grows abundantly; he raised it from the Seed which he had from thence.

IX. The Times. The third flower late in the Year, if they flower at all with us, viz. about the end of August, and to the middle of September. The two latter flower in July and August, and their Seed is ripe in August and September following.

X. The Qualities. These Plants are hot and dry in the fourth Degree, Excrementive, Venenick or Physick, and they are to great Poisons, as to kill Dogs, which they will do, if the Herb is mixed with their Bread, Broth or Meat, and so given them, and therefore they are not to be given to Mankind.

The three first are said to exceed in Malagify both Wool's-bane and Oleander or Rife-Bay, but as most Poisons have their Antidotes, as that of Thun is Aunbrea, that of Paradisianum is Herba Peris, to the Antidote to this Apocynum is Aftropea or Swamp-ner.

Some may object it as a Fault to me, that I have put into my Herbal such poysonous Plants as this is, but to such I answer, That the more poysonous they are, the more necessary it is to be known, that People may take notice of them, and beware of using them; yet these Poisons are not without their Virtues also; for tho' they are not fit to be given inwardly, yet sometimes they may be applied outwardly to advantage. As to the following Plants, as all Authors have concluded the third three under the Character of being Delirious or Deadly: as for the other two, nothing is yet known of them by Experience, but by their milky Juice, which is burning, fiery and exculatering, they may almost be concluded in the same Class, for which Reason I should desire every one to be cautious in their Use.

XI. The milky Juice of any of the three first Plants, is very hot and burning, and being outwardly applied, it is good against Tetters, Ring worms, Scirr, Mephw, Lepeopi, and to help Inflammation, and to make it go from Hides, if they be steeped in it. Even in the outward Application it is to be used with Caution.

XII. A Cataplasm made of the Leaves of either of the American kinds, by being beaten either crude or boiled in Water, and so applied, it is said to be good for Tumors and Pains proceeding from a cold Cause.

XIII. Gerard says, that the Cods of the last, or Greater upright broad-leaved American Plant, are flurerd full with a most pure Silk, of a thinning white color; The Cods (says he) are not only full of Silk, but every Nerve or Sinew, whereby the Leaves are ribbed, are likewise most pure Silk; as also are the Peeling or Bark of the Stems or Dike, like as is the Peeling or Bark of Dike or Hemp, Cordage for making Linen. But the Authors have not the Understanding in them to make use of it, as to cover their Nakedness, notwithstanding (says he) the Earth is covered over with this Silk, and they daily tread under their Feet, which would be sufficient to Cloath many Kingdoms, if it was carefully Cherished and Murthered.

XIV. This last Plant Parkinson tells us he raised up in England, from Seed which was sent for from Virginia, but he says there is another Plant growing in Virginia, called Silk-Grafs, which is very much differing from this.

### C H A P. CXXVI.

#### OF DOGS-STONES.

**L** *HE Name*. This Plant is called in Greek Rovatiches; in Arabia, Chufi alcher, and Chufi alchets; in Latin, Canis forberis, and Tepulacu cob Te- fulau Canis; in English, Dogs-stones.

**II. The Kind**. This Plant is of the kinds of Orchis, now, how manifold the chief and principal Species or Kinds of Orchis are, we think necessary to declare here, that things may be set in a true and clear Light. Orchis then are divided into nine principal kinds, viz. ens. 1. Canis forberis, Dog's

Note: The text is a transcription of an old botanical text discussing various plants with particular emphasis on their medicinal properties and uses. The document spans multiple pages, and the content is quite dense and technical. The text is read as if it were a natural reading of the document, with no additional information or interpretation added.
Salmon's Herbal. Lib. I.

Greater Dog-stones

IV. The Descriptions. The first, or Great broad-leaved Dog-stones, are a Root which is composed of three round white Bults, set together, like the two Stones of a Dog, with long Fibres at the Heads of them, one somewhat higher than the other, and always one of them, which is the higher, is firm, full and hard, the other two, wrinkled and soft, which weigheth nothing to nothing, leaving the firm Root, which fo abides all the Winter, and in the Spring a new centre is encended, and encloses from the side of the old one, and then that begins to grow tall, which the other new one encloses. This Root lends forth five or fix broad Leaves near the Ground, from a mong which rise up a round green Stalk, half a yard high, bare or without Leaves, or but one or two smaller standing below, at the top of which stands a spliced Head of purple Flowers, fir thick and close together, made like unto open Hoods, from the middle whereof hangs down a small Body, as if were, or a Dog, or other first Creature, being of a pale purple color it is, spotted with deeper purple Spots, and Lines, after which come somewhat long and round small Hanks, containing therein rather small Dells than Seed, it is to small.

V. The second, or Greater broad-leaved purple Dog-stones, has a Root like the former, but this here has Leaves somewhat narrower than the other; the Stalk is nearly of the same height, and the spliced Head of Flowers is neither so long nor so thick, and the Flowers are of a whiter purple color, marked with some purple Spots and Lines more inward, formed like open Hoods, and small Bodies hanging forth, like the former, the Seed being also like the same.

VI. The third, or Marth Dog-stones, has a Root like the former, and the Leaves of this are somewhat narrower than in the last; and the Stalk also is somewhat lower, with Leaves upon it, which are sometimes spotted, and the spliced Head short and thick, with the like Flowers for Form, but forming what left, thick set together, which are of a whiter purple color, and spotted.

VII. The fourth, or Smaller pale purple Dog-stones, which Gerard calls White Dog-stones, has Roots altogether like the first spangled, from which springs up a Stalk almost a foot high, set with few or no Leaves, clasping or embracing the same round about, and the leaf Leaves rising up, are like smooth, long, broad Leaves, but smaller and narrower than those of the first kind. The spliced Head of Flowers is short, thick, bulky, compact of many small whitish purple-colored Flowers, and spotted on the outside with many small purple Spots, and little Lines or Streaks. The small Flowers are like an open Hood or Helmet, having hanging out of every one, as it were, the Body of a little Man, without a Head, with Arms stretched forth, and Thighs huddling abroad, after the same manner almost that the Children are wont to be pitted, hanging out of Nature's Mouth.

VIII. The fifth, or Spotted Dog-stones, have Roots like the others, but fuller, or whence come forth narrow Leaves, ribbed in some sort like unto the Leaves of Narrow Plantain or Ribwort, covered with many black Streaks and Spots. The Stalk is a foot and half or more high, at the top of which does grow a Tuft or Ear of Violet-colored Flowers, mixed with a dark purple, but in the Harewooded thereof whithieth, not of the same Form or Shape which the others are of, but leffer, and as it were resembling something the Flowers of Larks-Spur.

IX. The sixth, or Greater Soldiers Dog-stones, have round bulbous Roots, great and thick, from the Heads of which Bulbs many Fibres or Threads spring forth. This Root lends forth several large Leaves below, and some larger on the Stalk, which form to enclose it. The Stalk is smooth, green, and about half a yard high. The spliced Head of Flowers stands somewhat looie, the Flowers being a little separated one from another. Each Flower is like unto Man, whole Body has its Arms and Legs cut off, and a Hood let therein, or a Legless Soldier with his Helmet on, the Hood or Helmet being white, and the Body spotted with purple Spots.

CHAP. CCXXVII.

OF DOGS-TOOTH.

I. THE Names. Some will have this to be Sarapis syropium, Dioscorides, b. & Satyrium abens Radixs Corticem rubram, Dufioc. lib. 3. cap. 144, but this other Authors will not allow of. Parkeiston will have that (and I believe rightly enough) to be our Tulp. Others will have this Plant to be a kind of Violer, (gło there is nothing like a Violer in it) and so call it Dogs-tooth Violer. It is called in Latin, Dentis cusius, Dentis Caifi & Lobelii, Hermadyllos Sefuri, Hesperoscytus Mithridati, and in English, Dogs-tooth.

II. THE Kinds. It is doubtless one of the kinds of Satyrium, tho’ not the true Satyrium Dens-caninus, and our Moderns have given to it the Name of Dentis caninus. It is threefold, viz. 1. Dentis caninus fiere alo, Dogs-tooth with a white Flower. 2. Dentis caninus fiere purpureafce, Dogs-tooth with a purple Flower. 3. Dentis caninus fiere rubra, Dogs-tooth with a red Flower.

III. THE Description. The frift, or White-browed, has a white scath Root, long and small, yet commonly larger than either of the two following, bigger below than above, with a small piece adjoining to the bottom of it. From this Root, in the beginner of the Spring, after the Winter-frost are past, two Leaves for the most part (very rarely three) rise up, when it will flower, (otherwise but one) which are closed together when they first come up out of the Ground, and enclose the Flower between them. The Leaves, when they are opened, do lay themselves flat on the Ground, or not much above it, one opposite unto the other, with the Stalk, and the Flower upon it, standing between them; which Leaves are of a whitish green color, long and narrow, yet broader in the middle than at both ends, growing
Salmon's 'Herbal.

Lib. I.

CHAP. CCXXVIII.

OF DOVES-FOOT.

II. The Hand. There are many kinds of this Plant, but the principal which grow in England are the three following, 1. Geranium columbianum vulgare, Pers Columbianum americanum, The common Doves-foot. 2. Geranium columbianum Lindanum, Pers Columbianum alter, The jagged Doves-foot. 3. Geranium dissectum, Pers Columbianum Saccatinus, The Stone or Rock Cranes-bill, or Doves-foot.

The stalk rises up seven or eight inches high, bearing at its top one flower, and no more. This flower hangs down its head, and is larger than any of the following kinds, and confits of six white, long and narrow leaves, turning themselves up again after it has felt the Warming of the Sun, that they do almost touch the stalk again, very like to the Flower of Geranium or Sunbread: it has in the middle of the flower six white Chives, tpt with dark purple Spots, and a white three-forked Sile in the midst of them. The flower has no Smell at all, but is commendable chiefly for its Beauty and Form. After the Flower is fall, there comes in its place a round Head, seeming three-square, containing therein small yellow Seed.

IV. The second, with a purple Flower, has a white bulbed Root, like unto the former, but leffer, as aforesaid: the Leaf hereof is not so long as that, but broad and short, spotted with darker Lines and Spots. The flower is like the other, but smaller, and of a delayed purple color, very pale sometimes, and sometimes a little deeper, turning it self as the other, with a Circle round about the middle. The Chives hereof are not white, but declining to purple: in all other Respects it is like to the foregoing.

V. The third, with a red Flower, has a like white bulbous Root. The Form and Largeness of the Leaf is like to the last described, so also the Form and Bigness of the Flower: but in this the chief Difference consists, that the Leaves of this are of a yellowish, merely green color, spotted and streaked with redder Spots and stripes, and the Flower of a deeper reddish purple color, and the Chives also more purple than the last, but in all other things they are very like one another.

VI. The Places. All the sorts of Dova cammis grow in Foreign Countries, as in Italy on the Euganean Hills, in the Apennines, also about Grasse the chief City of Provence, and about Bayonne, and in several other places: they also grow in the Gardens of our Florists in England.

VII. The Times. They most commonly flower in March, and many times in April, according to the Warming or Coldness of the Season.

VIII. As to the Qualities. Specification, Preparations and Virtues, they are much the same with the Orchids or Dog-flowers in the former Chapter, to which I refer you; only it is laid, that there are more efficacions for Venerous Afflictions than any of the Orchids and Saxifragas.

IX. Observation. The Pouder of the Root being given inwardly in Broth, Milk or Wine to one or two Jams, it is laid to be effectual against Worms in the Belly; to ease the Pains of the Cholic, to strengthen and nourish the whole Body, and to cure the Falling-fitsness in Children.

Doves-foot:
Stone or Rock Doves-foot.

VI. The Places. The first grows in Meadows and Pature-grounds, by Ditch-sides, and Banks of Ditches, and by Barkefields, almost everywhere. The second is also found in Meadow and Pature Grounds, where the Ground is fat, and near Ditch-sides, but not so frequent as the former. The third grows in Rocky, rocky and gravely Grounds, in Harpyena Juncus, as Cameraria and Thalbos Eys, and about Naphes, as Calomnias says: and it has been often found in several rocky, Rocky and gravelly places of this our Kingdom of England.

VII. The Times. They all flower in the Summer Months, in June, July and August, some more early than the others; and their Seed is ripe in some short time after.

VIII. The Qualities. They are cold and dry in the first Degree, Astringent, Carminative and Vermifacient;/archive: Arthriticke and Antiparik. IX. The Specification. It is a peculiar thing to thin Bleeding, and cure Wounds and Rupures.

The Virtues.

XI. The liquid Juice. Given to two or three spoonsfulls in a Glass of Sherry, Mustard, or other generous Wine, it prevails against the Cholick, as also against Wind and Pains in the Stomach, and o- ther Vipers: and it given in White Wine, it is good to expell the Stone and Gravel in the Reins.

XII. The Essence. It has all the former Virtues, besides which, it is good for such as have inward Wounds, Hurts or Bruises; it stops inward Bleedings, and dilutes and expels the congealed Blood. It is found also by Experience to be a singular good thing for Ruptures or Bloodflows, whether in Old or Young. You may give two or three spoonsfulls Morning and Night, in a Glass of White or Red Port, Sherry, &c.

XIII. The Decoction in Red Port Wine. It is an exceedingly good Wound-drink for such as have inward Wounds or Bruises: it stops the Bleeding, cleanseth and heals the Parts, and has indeed the Virtues of the Juice or Essence, but in a lower Degree. Do six or six ounces twice a day.

XIV. The Powder of the Herb and Root. Gerard says, that if it is given half a spoonfull at a time, in the Morning fasting, and half a spoonfull at Night going to Bed, in Red Wine or old Charet, for the space of one and twenty days together, it will not only cure Ruptures or Bloodflows, as he had oftentimes proved, by which he had gotten much Money and Reputation. If the Rupture is in an acute Paroxysm, it shall then be neceffary to add thereto (says he) the Poudre of red Snails, (chowf without Shells) to the number of nine, dried in an Oven, by which the Powder of the Herb will be fortified, so as it shall not fall of a Cure, tho' (says he) the Rupture be great, and of long continuance. It is good also for those who are wounded in the Body, to stop the Flux of Blood, and heal the Wound, as has been often proved. Do six or six ounces Morning and Night in Red Port Wine.

XV. The Balsam. It is admirable in curing of Wounds simple or contused, as also in healing of Sores, Ulcers and Fistulas: it digests, cleanseth, incarnates, dries and heals to admiration.

XVI. The Conglutinum. If it is made only of the Herb bruited, and so applied, it heals simple green Wounds after a singular manner. It is good also to diffuseth simple Contusions; and applied to Parts painted with the Goat, it gives heat in the same. It stops the Bleeding of green Wounds, allays the Heat of Inflammations, and diffuseth hot Humors. It gives heat in any Pains of the Extremities, proceeding from a hot Caufe, or from Detaction of Humors, or from any over-straining of the Nerves or Joints, by strengthening the same.
of Dragons, but rather a very large kind of Billet: of these three kinds we shall treat in this Chapter.

A. 

Salmonts Veredum: in Latine, Dracunculus aquaticus, and in English, Water Dragon, or Dragonworts; of which we shall treat in the next Chapter.

III. The Descriptions. The first, or Greater Dragon, is a thick tuberous Root, like to a Knob, many times the Magnitude of a middle-sized Apple, and covered with a thin Peel, full of white little Fibres appendent thereto, containing many Tears, very white within, and like unto Arrow-root, taking sweetish water like to it. From this Root, rises a Straight Stalk, a Cubit and half high or higher, which is thick, round, smooth, whitish, and hairless, but spotted very much with purple Spots and Strakes, or with Spots of divers colors, like those of the Adder and some other Serpents. This Stalk bears a few green Leaves, standing upon long Foot-stalks, much divided on all hands, they are great and wide, each Leaf consisting of seven or more joined together in order, every one of which is long and narrow, much like to the Leaves of Dock, smooth and slippery. Out of the top of the Stalk, in the middle thereof, comes forth a great long Husk or Hole, (of the Root is old enough) greater than that of the Cocklett or Arrow, of a greenish color on the outside, and of a crimson or dark purplish color on the inside, with a long flatter Pedal or Clipper in the middle thereof, which is blackish and pointed like a Horn, the Skins or Films wherewith, when the Seed grows big, being fretted or broken slender, there appears the Fruit, like to a bunch or Cluster of Grapes, the Berries whereof at first are green, afterwards red and full of Juice, in which is contained Seed, which is something hard.

IV. The second, or Small Dragon, has a Root not unlike to Arrow-root, having the Form of a Bulb, full of Fibres or Strings, with divers rude Shapes of new Flowers, by which it greatly encreases. The whole Plant is much like to Arrow in its Leaves, Hole or Husk, Pedal and Berries, (and seems to me to be the lesser sort of Arrows,) the Leaves are spotted either with white or brownish Spots, and perishes not prematurely, but endure together with the Berries, even till Winter; and the Berries are not of a deep red, but of a color equalling to Saffron.

V. The third, or Great Dragon of Matthiolus, has a round bulbous Root, larger something than the former, with many Fibres or Husks therewith, very thick, which rises one large, high, upright Stalk, with very great Leaves thereon, folded and lapped one within another; at the top of the Stalk comes forth
Chap. 230. English Herbs.

315

a spike of flowers, not much unlike to those of Bifort, with like small Seed. Some Authors will not have this to be a Dracuncium or Dragon-wort, but rather a very large sort of Bifort. Dioscorides says, — qui, in return named of, Bifort, Specie videtur.

VI. The Places. Dragons greater and after delight in to grow in shady places, and with us they grow in gardens.

VII. The Times. They flower in July, and the Fruit or Berries are ripe in August and September.

VIII. The Qualities. Dragon or the Dragon-worts are hot and dry in the third Degree; Aperientive, Attractive, Suppurative, Stomackick, Pelcoral, Hyderick and Alexipharmick.

IX. The Specification. Dragon-wort is an Antidote against Poison, Plague and Bittings of Venoms Cercuties.

X. The Preparations. You may have therefrom,
1. The prepared Root.
2. A Liquid Juice of Leaves or Root.
5. A Cataplasm of the fresh and green Leaves.
6. The Fruit or Berries.
7. A Spirituous Tincture of the Roots.
8. An Acid Tincture of the same.
10. A Saline Tincture.
11. A Tincture of Leaves.
12. A distilled Water of Leaves, Root and Fruit.

The Virtues.

XI. The prepared Root. It is prepared by boiling it till it is felt, and all the Acimony is boiled out. It then nourishes and is good for Food. It is also good to edify and chalybate and clamyments from the Brest and Labs; they also teftifie in Consumptions.

XII. The liquid Juice of Leaves or Root. It is good to remove the Pin and Web, as also Spots and Pearls in the Eyes, being of the nature to enter into Collyrium or Medicines which are made for the Eyes. Disorders of the Eyes, that the Juice being dropped into the Eyes, cleanses them, and helps Dimmbles of Sight. The same mixed with Olive Oil and dropped into the Ears, caues their Pain.

XIII. The Efficacy of the same. It has all the Virtues of the liquid Juice; beside which, being taken inwardly (Universally being promised to one) poulett at a time in the distilled Water, or in White Wine, and repeated as oft as need requires, it powerfully provokes the Terms in Women.

XIV. The Powder of the Root. If it is made into an Emulsion with Honey, it is good for such as are troubled with rheumata Coughs, Catarrhs, Convulsions, Cramps, &c. for it includes, asthmas and consumptive gouts, tough and tarterous Humors, and cleanses all the inward Parts. Dote of the Powder from half a dram to a dram. Outwardly applied, it cleanses all fretting and magick Ulcers, which are difficult to be healed; it also removes all Scabietick Breakings out in any part of the Body.

XV. The Lobbe of the Root. It is made of the Root prepared by boiling; (as foll. 11. above) by beating it in a Mortar with twice its weight of Honey. It is an excellent thing against Coughs, Salt Coughs and drover of the Throat.

XVI. The Cataplasm of the fresh and green Leaves. Being applied, it is good for Ulcers and green Wounds, and heals them after an admirable manner. Being dry, they are more prop or sitting, and not to fit the Venomous.

XVII. The Fruit or Berries. They are of greater Power than either Leaves or Root, and therefore are laid to cure Violent and magick running Sores and to speed any that contagious leprosy in the Nostrils called Polyposes: they are also good to be laid to Canker, and fick like trettling, eating and con-

ming Ulcers.

XVIII. The Spirituous Tincture of the Root. Give to one dram or two in any proper Vehicle Morning and Evening, (after the Life of Universal) it opens Obstructions of the Womb, and provokes the Courtes. It calms Pains of the Stomach and Bowels proceeding from Wind, or from cold, flemmy and tarterous Humors, prevails against the Cough, and warms and comforts all the inward Parts; and is an excellent thing against Poison, Plague, spotted Fever, or any other magick Disease.

XIX. The Acid Tincture. It is a famous Stomachick, takes away Nausea, and vomiting, warms and comforts a cold Stomach, caues a good Appetite and Digestion, and fticks at the Root of all Poyfons Vegetable or Animal, especially it withs the Biting of Vipers, and the Malignity of Mad Dogs. It is also a singular thing against maligem FEVERS, spotted Fever, and the Plague or Pellicence, by overcoming the perry Fountains of the infectious Misfortune. Dote of thirty, forty to fifty or eighty drops in the distilled Water, or any other Spiritick Vehicle, viz. so much as may it pleasantly acid, according to the quantity given at a time.

XX. The Oily Tincture. It is good against Scabius, Convulsions, Numulcent, Pelies, rheumatic Pains and Aches proceeding from Cold and Mofthare, or in a cold and cold Habit of Body: it is to be annealed upon the Parts affected Morning and Evening, and to be well rubbed in.

XXI. The Saline Tincture. It is good against Blackness, Greeneess and Yellowness of the Skin, and to take away Tanning, Sun-bumming, Scabrous, Leprous, Scabious, Fretlock, Lentiles, and other the like Deformities of the Cuticula or Scab-Skin.

XXII. The distilled Water. It was used as a Vehiculum, to convey many of the aforesaying Preparations in: it is also a Cofmetick, fit for the beautifying the Skin, or to mix other Cosmeticks with for that Purpose. It prevails also against the Pellicence, or any maligem and pestilential Fever; it is also the Poyfon of Serpents or mad Dogs, being drunk warm, with a dram or two of Miteriate or other like Antidote mixed with it.

CHAP. CCCXXX.

of DRAGON,
OR,

DRAGON-WORT Water.

I. The Name. It is called Greek, Δρακοντικα, Draconium or Dracunculus, Latin, Dracuncium aquaticum, Draconarius aquaticus, Arum aquaticum, Dracunculus paludum fæce aquaticæ, English, Water Dragon, and Water Dragon-wort, March Dragon-wort.

II. The Kinde. It is the last Species of Dragoon-wort mentioned in Chap. 239. Sect. 2.

III. The Description. It has a Root which is not round like a Bulb, but very long, creeping, pointed, and of a moderate bigness; out of the Roots of which arise the Stalks of the Leaves, which are round, smooth, and flumpy within, certain white and flem
Salmon's Herbal

I. The Names. It is called in Latin, Ficpendula, (good number of tiny in Radice bullulae, quod numerus illis in Radice bullulae) also Saxifraga rubra. (Red Break-stone.)

II. The Kinds. It is threefold, viz., Nicolai Myrepsi, Ficpendula vulgaris, Ficpendula major vulgaris. The common great Dropwort. 2. Ficpendula altera major, Another great Ficpendula or Dropwort. 3. Ficpendula minor, Small Dropwort. Some will have this common Dropwort to be Venas, Oenanthae Depsidae, in lib. 3. cap. 172, but it is a Mistake.

III. The Descriptions. The first, or Great common Dropwort, has a Root which consists of many small, black, tuberous Pieces or Drops, joined together by many small, long, Blackish Strings, which run from one to another. From this Root grow forth several long straight Leaves, viz., many small Leaves, some bigger and some lesser, set on each side of a middle Rib, and each of them dented about the edge, almost...
Chap. 231. English Herbs.

almost like a Sax, somewhat reviving Burnet or Wild Tansy, or rather. Agrimony, or between those two, but border on blending: among which Leaves refer up one stalk, and sometimes more, two or three feet high, but the same bush Leaves therein are grown below; and sometimes also divided into other branches, spreading at the top into many white, sweet-smelling blossoms, composed of five Leaves oppress, with five Throats in the middle of them, standing together in a V of Umbels, each upon a small root flat; which after they have continued for a good while open or blown, they fall away, and in their places small chaffy Heads appear, like Buttons, in which is contained a kind of chaffy Seed.

V. The third, or Smill Filipendula or Dropwort, has a Root manyfoldly spread out into several slender bushes or tuberous Kinds, like the first, but smaller and redder, and tied together by Stings, like them from this Root rife two, three or four such like Leaves as in the first, but much smaller, and more nearly reviving Wild Tansy Leaves, but not white, as they are, but of the same dark green color with the former. From among these Leaves arises up a Stalk, not above an hand breadth high, which is sometimes without Division, and sometimes spread out into two or three several Branches, on which stand many smaller white Flowers, and sweeter than in the former, but with Throats therein, like them, and fet together in an Umbel in the same manner, which being midst away, then come the Heads of Seed, small set together, and formed almost like unto a small Bunch of Grapes.

VI. The Places. The oft grows plentifully upon Sunny Rocks or Mountains, and rough places, as at

in territories Pastures: it is found upon St. Vincent's Rock by Brill; and is found plenty in a Field adjoining to San-leuje, some time a Montmore, near London, on the side of a Meadow called Stowe-Hermes, as also in the corners of dry Fields and Cloes, by their Hedge-sides. The second grows on the tops of rocky, stone or mountains places. The third also on very rich Grounds, especially without Mompertier in France, and in many the like places in England.

VII. The Times. They all flower in May, Jane and July, and the Seed is ripe in August.

VIII. The Qualities. Dropwort is hot and dry in the third Degree; Aperitive, Inflamatory, Diuretic, Stomachick, Pectoral, Neuritic, Hytectic, Emmenagogick and Alexipharmick.

IX. The Specification. It is famous against the Strangury, Stone and Gravel in Reins and Bladder.

X. The Preparations. You may have therefrom.

The Virtues.

XI. The liquid Juice. Taken three or four spoonfuls at a time in a Glafs of White Port Wine, is very effectual in opening all the Urinary Passages, to help the Strangury, and to expel Sand, Gravel, Small Stones, and other urinous Matter in the Reins, Ureters and Bladder. Authors say it is very helpful in breaking the Stone; and this the Juice will do, whether taken from Roots or Leaves, but that from the Roots is much more effectual, as aconite.

XII. The Essence. It has all the Virtues of the liquid Juice; besides which, it is very effectual to force away the Birth, as also to expel the Soundurine or After-birth, and prevalent against the Yellow Jaundice, Epilepsy, and also Obstructions of the Bile and Lungs, expels Wind and helps difficulty of Breathing. Drik two or three spoonfuls in a Glafs of generous Wine, Morning and Night.

XIII. The Decoction in Wine. It has the Virtues of the Juice and Essence, but not full all so powerful: it may be sweetened with Honey, and given Morning and Night, or upon an Exajency from four to six ounces: it very much comfort and strengthens the Stomach.

XIV. The Powder of the Root. Taken from one to two drams in White Port Wine, it provokes Urine powerfully, opens Obstructions of the Reins and Bladder, and is full to dissolve or break the Stone, and expel it, but this must be understood, where the Stone is composed of a Sub stance friable or brittle and gritty, and not grown to any great Magnitude. If it is made into an Elixir with Honey, it is an excellent thing for the Wind and Goat in the Stomach, as also to open Obstructions of the Bile and Lungs, help Coughs and Colds, Hoarsness, Wheezing, loss of Voice and throat, and Breath, causing an Expectoration of the cold, rough and vitious Hum from all the Parts of Respiration.

XV. The Balsam of the Root. It is good to dis- gell, cleanse, dry and heal old Sores, and fluxes proceed from the Kings-crotch, and mouth and running Ulcers.
Salmons differolves. The is an:

Helle. Applied to Parts afflicted with the Gout, it quickly cures the Pain, and in some cases attracts forth the hard Humors and mischief Matter there the Parts of the Skin.

XVI. The distilled Water. It is a good Vehicle to convey any of the other Preparations in: it is Diuretic; opening the Obstructions of the Urinary Parts.

XVII. The Spirituous Tincture of the Root. It is Alkaliophilous, good against Porous, Puffy, and all sorts of phlegmatic and malarious Diseases, and carries in common the Bowels, relieves the Pain of inward Parts; and is singularly good against Fluxes of the Bowels of all sorts, and forces away the Birth of a Woman in Travail. Dose from two drams to four in any proper or specified Vehicle. It powerfully expels Wind, controls sharp and acid Humors in the Stomach and Guts, and gives present change in the Cholick.

XVIII. The Acid Tincture. It is a high Stomachick, warm, corrects and strengthens it, causes Appetite and a good Digestion, dissolves crude and tannous Humors, and makes them fit for Expulsion, cleanses the Urinary Parts, and promotes the passing or dissolving the Stone in the Bladder or Kidneys. It breaks at the Root of those Humors which are the Cause of the King's-evil, and of Tumours or Swellings in the Throat or other glandulous Parts, cutting and dissolving them, preventing their Enfeebling or Generation, and making those which are previous to be fit for Extraction. Dose many drops as to make the Vehicle pleasantly tarry.

XIX. The Oily Tincture. It is good against Cramps, Convulsions, Numbness, Palsy, &c. being burned well in twice a day upon the Parts afflicted. Given inwardly to twenty or thirty drops in the distilled Water afterdose, or in some other appropriate Vehicle, it is an admirable thing against all manner of Obstructions of the Reins, Uriniers and Bladder, expels phlegm and tannous Concretions, and carries off the morbid Caufe of the Yellow Jaundice by Urine. It also prevails against Lethargies, Vertigo, Apoplexy, Convulsions, Epilepsy, Paralyse, and all other cold and moist Diseases of the Head, Brain and Nerves; and provokes the Terms in Women.

XX. The Saline Tincture. It is dedicated to Diseases of the Reins, Bladder and Uriniers; prevails against the Strangury, and dissolves the Matter breeding the Stone. Outwardly, it is good against Swallowings, Seals, Iches, Totters, Ringworms, and other Deformities of the Carcass, being bathed therewith twice a day.

XXI. The Spirit. It is a singular Cordial, clears the Heart, revives the Spirits, strengthens the Stomach, and fortifies the whole universall Frame. It is good against Thirst and swooning Fits, Sicknes at Heart, Wring and the Cholick Torsions of the Bowels, occasioned from either Fatnacy, Flux or the hard Humors. Dose from two drams to four, either alone or mixed with a little Glass of Canary, as often as occasion requires.

XXII. The Good Salt. It is a strong Diureticick, opens all the Urinary P Affagges, and expels large quantities of watry Humors in the Dropsey by Urine, and the morbid Caufe of all Fevers. Dose from two to four, or till a dram, in the distilled Water above mentioned, or in White Wine.

C H A P. CCXXXII.

DROPPWORT Narrow-leav'd.

The Name. Authors attribute the Great Name to this Plant, tho' it is not the true Oenanthe Hoferii; and therefore it is called in Latin, Oenanthe recepta Drzeptiam, or Oependaria anguifolus: in English, Narrow-leav'd Dropwort.

II. The Kinds. It is the second general Species of Dropworts, and is described by 1. Common Apii folis majori, filipendulae foliis filiis majoribus. The common or ordinary great Parsley-leav'd Dropwort. 2. Oenanthe et filipendula Apii folis minori, liliaceum spectaculorum. Two smaller kinds of Parsley or Smallege leav'd Dropworts. 3. Oenanthe anguifolus Lobelii, Lobel's Narrow-leav'd Dropwort.

Dropwort narrow-leaved

III. The Description. The 6th, or Great Parsley-leav'd Dropwort, has for Roots many round, white, and somewhat long Aphrodite-like Stalks, joined together at the tops, making one Head of a Root, and ending in small Leaves: from this Root many green-winged Leaves, made of many parts, cut into the form almost of Parsley or Smallege Leaves, but much smaller, even as small as Garden Cress Leaves: and from among them spring four or two or three flat, round Steaks, a foot and half high, and sometimes two feet high, before such like Leaves as grow below, but as they grow higher on the Stake, grow much smaller, leifer and narrower, to the perfect ending of the Form of those below. At the tops of the Stalks grow Umbles of white Flowers, which being past a way, there follows Henkel-like Seed, but smaller, and of a dark whitish color.

IV. The Second, or Small Parsley-leav'd Dropwort, which is too foul. The Roots of these two kinds are much alike, but only differing in Greatness, each of
Chap. 232. English Herbs.

5 of them consisting of several small Tubers, with many
Strings among them. Their Leaves are winged, and
like in their Divisions to the former, but both
smaller by much, and more green, the one of this being
also smaller than the other, and the leaves of them
a little finer jagged, which evidently shows the Dif-
ference as well as the Seed: the Flowers in both
are white, but differing in Greatnes. The Seed of
the greater of this is smaller by half than the Seed
of the former Great Hand: and the Seed of the let-
ter is yet smaller and rounder, and something like
unto Dill Seed.

V. The third, or Lobel's Narrow-leav'd Drop-
wort, has a Root composed of many white, long, ta-
berous parts, sending forth many Strings from their
lower parts, and on their tops all uniting in one
Head of a Root. From this Head or Root arises a
strong crafted Stalk, two feet high, dividing it self
towards the top into several Arms or Branches.
From the hollow Place or Bottom of every Joint,
out of which do grow these Branches; the Leaves
do also proceed, very much cut or jagged, like Fenn-
el. At the tops of these Branches come forth
spoky Rundles or Umbles of white Flowers, fash-
oned like Stars.

VI. The Places. They grow in many places of
England, but for the most part near Ditch-sides, and
Brooks or Rivers sides, and upon the Borders of
Ground near Standing Waters.

VII. The Times. They flower from May to the
end of June, and the Seed is ripe not long after.

VIII. The Qualities, Specification, Preparations
and Virtues, are the same with the Common Drop-
wort in Chap. 251. So that no more need be said of
them here.

CHAP. CCXXXII.

Of DROPWORT Hemlock like.

I. The Names. It is called in Latin, Cicuta
Centa fres; also Filipendula Ceneta frais: and in
English, Hemlock-leav'd Dropwort, Lobel's
Hemlock like Dropwort.

II. The Kind. It is singularis sui generis, there
being neither a greater nor less Foot of it.

III. The Description. This Plant has a Root
which is white and glandulous, or repleat with many
long and goaty Glandules, Aphydil like, which are
soft and tender, but sharp and unpleasant in Taste,
yielding a white Milk at the first, and turning yellow
afterwards, which is said to be poyneous, virulent
and exalterating. From this Head or Root spring
forth several winged Leaves, standing upon a long
Foot-fluke, more like Alcedis Roe than Sallagle or
Hemlock, having many small ones set together, of
a dull, dark green, and somewhat like Hemlock in
color, as also in the Flowers; but more in its Es-
fechts.

IV. The Places. It grows many times in moist
Plowed Land, as in the moist and wet Part of a
Field belonging to Battersea near London: it grows
also in great abundance in many places by the
Thames-side, as a little above the Horse-Ferry against
Lambeth, &c.

V. The Times. It flowers in May and June, and
some part of July, and the Seed is ripe in July and
August.

VI. The Qualities. It is hot and dry in the
fourth
fourth Degree: Exalterick, Artichick, and-flouerous, Vencick or Poyfoning.

VII. The Speciation. It troubles and overturns the Brain and Senses, causing Madness, and it taken in any considerable quantity, Death.

The Virtues.

IX. The Cat-aplasm. It exulcerates, or is blistering, and is of good Life to be applied in a Salaries, or Goat in Hands or Feet: it also draws forth the Poyson if it is immediately applied to the Bitting of a mad Dog, or the Biting of a Viper or Rattle-Snake, or other venomous Creatures.

X. The Ointment. It is good to anoint with in all sorts of scrophulous or Brumous Tumours, and to be applied in Kings-evil Sores, where it is not used without a lingual Advantage.

CHAP. CCXXXIV.

Of DROPWORT Water.

I. The Names. It is called in Greek, (according to our Moderns) Λανθάνη Βεδερων, &c. i.e. in Latin, Oenanthe aquatica, and Filipendula aquatica: in English, Water Dropwort.

II. The Kinds. It is the fourth grand Species of the Dropworts, and is twofold, viz. 1. Oenanthe, vel Filipendula aquatica minor, The lesser Water Dropwort. 2. Oenanthe, vel Filipendula aquatica maior, The larger Water Dropwort.

Water= Dropwort.

III. The Description. The first, or Greater Water Dropwort, has a Root like to the other Dropworts, replenished with many small, white Tubers or Kinds growing among the Strings, joining together above, and making one Head of a Root. From this rife several large spread Leaves next the Ground, and lying thereon, being winged and cut into many small Divisions, somewhat resembling Parsley, but much smaller, and divided into smaller parts than any of the former kinds. From among these Leaves rise up created, thick, hollow Stalks, with Leaves on them, cut into longer and finer Divisions, bearing at the top Umbles of white Flowers, which turn into small, flat, greyish Seed, Somewhats larger than Aniseed, and not much unlike Hankock Seed.

IV. The second, or Lesser Water Dropwort, has a Root made up with several small Tubers or Kinds, and fallet among the Tubers, which are as small as Hazes. From the Head of which Stalks springing up many small Leaves, lying upon the Ground, which are very finely cut in: after them springing up the Stalk, which carrying up the first sprung up Leaves with it, they freely form to be Leaves, but not like the ribs of Leaves, of a dark and filling green color, as the Stalk also is, which very nearly refembles a Chief, and below the top thereof, which is pointed like a Chief, cometh forth a small Umbel of small whitish sweet Flowers, which turn afterwards into small Seed as Smallage, but blacker.

V. The Places. They both grow in wet Grounds and near Brook-sides in many places in England; yet will they both flourish being nur'd up in our Gardens, but grow not there all cut to large and fair, as in their natural places: and as it grows by the sides of Rivers and Water-streams, so it has been found near the River of Thames, as near Sir George's Fields, and about the Bishop of London's House at Fulham, and in each other like places.

VI. The Times. The second or Lesser, flowers earlier than the Greater, and commonly the flowering time of the Lesser is past before the other comes, which is not until August.

VII. The Qualities, Specification, Preparations and Virtues, are the same with those of the Common Dropwort in Chap. 231. aforesaid, so that no more need be said of them here.

CHAP. CCXXXV.

Of DUCKS-MEAT.

I. The Names. It is called in Arabic, طبكة, or Tabok, in Latin, Lens palustris, Lent aquatica, Lentulca palustris, vel aquatica: in English, Ducks-meat, and by some, Water Lentils.

II. The Kinds. Authors make four kinds hereof, as 1. Lens palustris vel aquatica vulgaris, Common or vulgar Ducks-meat. 2. Lens palustris green-dfeld, Croft-hard Water Lentils or Ducks-meat. 3. Lens palustris turfola pandans, Broad-hard spotted Water Lentils. 4. Lens vel Lentulca aquatica bifolia Neapolitan, Neapolitan Water Lentils. Of all these, 'tis only the first which grows in England, which we shall treat of in this place: the rest being Strangers, we shall have nothing at this time to say concerning them.

III. The Description. This small Plant has for a Root only certain small fine Vobes or Turcies, white.
Chap. 536: English Herbs.

which grow only from the middle of each Leaf on the under side, and put down into the Water, but reach not to the bottom, to draw Nourishment from the Earth; besides these Roots, the whole Plant consists of nothing but small, round, green Leaves, lying on the Surface or Top of Running Waters, as Pools, Ditches and Ponds, without either Flower or Seed that could be ever observed.

![Image of Ducks-meat]

Ducks-meat.

ought to be premixed, and to be tied at the same time. Ulex verticillatus is a Remedy against St. Anthony’s-wire; all manner of inflammations, and the burning Fits of Agues. Ducks greedily devour it; also Hens, if mingled with Bran and given them.

IX. The Ointment. It is a fine cooling thing, good against Phlegmons and hot Pains of the Joints, and the Hemorrhoids of Piles, whether broken or not broken, if applied thereon.

X. The Cataplasm. If it is made of the Herb beaten up with Boryl-flower, it prevails against the Gout, and collocation Ruptures in young Children; and is profitable against the Swelling of the Cods, and of Women’s Breasts before they be grown too much, because it does not weakly repel the Humours. If it is made with Wheat Flower or Meal, it prevails much against hot Tumors, as Phlegmons and the like, as also Pains of the Joints proceeding from Heat; and helps the falling down of the Fundament in young Children.

XI. The distilled Water. It is applied against an Erythropolis, and Matthiolus affirm it highly for shedding all inward Heats and Inflammations, as also petitozal Fevers, to help the Redness of the Eyes and the Swelling of the Teeth, by repelling of the Humor, Cloths four times doubled being wet therein and applied: and so applied, it cools an Erythropolis or St. Anthony’s-wire.

CHAP. CCXXXVI.

Of DYERS-WEED, Called, WOLD or WELD.

T HE Name. It is a Plant which was unknown to the Greeks: the Latin call it Luteola and Herba Lutea; it is the Lutes Planti lib. 33. cap. 5. Pisanum lib. 7. cap. 14. calls it Luteum, and Virgil Bucol. Eclog. 4. calls it Luteum: in English, Dyers-weed, also Wold or Weld.

II. The Kind. It seems to me to be an Herb of his own kind, but Basium refers it to the Great Tinctura, or Green-weed, of which we shall, God willing, treat in the next Chapter, but to that we think it has no Relation. Some thought it to be the Beleves of Pliny, because they agree well in divers parts. Cephalis lib. 6. cap. 15. makes it the Alpigerum, vel Alpigerum Dispergulz; but all these things are to be disputed. It took its Name of Lutea and Luteola, not only from the yellow color of the Herb and its Flowers, when it is dry, but chiefly from the yellow color which it Dyers things into. Trigus took it to be Antirrhinum, because the Seed-Velids have (as it were) holes therein. Some will have it to be Pterium Dispergulz, others Strophium Dispergulz, as Lucana and Gynura. Matthiolus calls it Pseudostrophium, Daunorum, Herba Lutea. Lobel, Luteola. Linnaeus and Theserum, Catenae: but all these things is impossible to be, I am induced therefore to hold to my own Opinion before declared.

III. It is twofold; viz. 1. Luteola vel Luteola vulgare, Common Wold, Wold or Dyers-weed. In Conda there grows a small sort of Luteola, which some Authors would make to be a different kind from that just now named, which Honorius Bellicus compiler. 2. ad Gynura will have to be Strophium vo-
IV. The Description. *The herba*, or Our common Wold, Wold or Dyers-weed, has a Root which is long, thick and white, shading all the Winter. The Plant grows budding out, with many long and narrow flat Leaves upon the Ground, of a dark, melancholy green color, somewhat like unto Wood, but nothing so large, a little cramped as it were, and somewhat round-pointed, which do so abide the first Year. And the next Spring rise up from among them several round Stalks, two or three foot high, belted with many such like Leaves, but smaller and throwing forth some small Branches, which with the Stalks bear very many small yellow Flowers, in a long spiked Head at tops of them, after which come the Seed, which is small and black, exfoliated in Heads, which are divided at the top into four parts.

V. The Great Candia Dyers-weed has a Root which is very green and woody, and flows it self forth into many long Arms or Branches, which in the notice or natural places of its Growth, and other warm Countries, will abide many Years, but such as will scarcely endure our cold Winters (unlesse braised) as has been several times proved. From this Root this great Plant rises up (in Comedy) with several great Stalks, some of them as big as a Man's Arm, and in height five, six, seven or eight Cubits, sometimes nine or ten Cubits high, which yet perish in Winter: they are bare or naked of Leaves next the Ground for a foot and half high, the lowest Leaves being without Foot-flakes, being close at the Root: the other growing higher up towards the tops, have all of them Foot-flakes, of a span long: the Leaves of themselves are very large, made of many somewhat broad and long green itching ones, for one against another on a middle Rib, and not yet always directly opposite one to another, every one of them being something like unto the Leaves of Hemp, (of which it is most likely to be a Species) ragged or dentled about the edges, yet none of them divided, but the and Leaf, which is sometimes narrow, seldom into two, but sometimes into three: Divisions, each ending in a long Point. The Stalks are branched, but has only divers small Stalks or long Spikes of Flowers thrust forth, which are yellowish, green and mildly, bowing downwards, with many long and narrow Leaves among them, and hand in yellowish green Husks, in which, after the Flowers are fallen, come Heads full of very small reddish Seed. The barren Plant is like the former, save that it bears no Seed.

VI. The Places. The first grows every where by the Way-sides, as well in mild Grounds as in the dry, and in corners of Fields and By-Lanes, in and about Villages almost everywhere: in some places in Kent they low it in their Fields after their Barley, which blazes until the next Year, and then it is gathered. The other is a Native of Candia, and is nur'd up with us only in Gardens.

VII. The Times. The first flowers in June and July. The second flowers late in the one, and sometimes not at all.

VIII. The Qualities. It is hot and dry in the third Degree, the Root, as also the whole Herb, having an Aperient, Digestive, Atarctuating, Inclining and Reformative, Arthritic and Alcophilatic.

IX. The Specification. It is peculiar against Pustules of the Nores, Biting of Serpents, mad Dogs, and other poynous Creatures, outwardly applied, and inwardly taken; and prevails against the Infation of the Plague, for which Reason, as Matthioli says, it is called Thermochoria.

X. The Preparations. You may have therefrom,

1. The green Herb braised.
2. A liquid Juice.
3. An Essence.
4. A Dejection in Wine.
5. A Powder of the Root.
6. A Balsam or Ointment.
7. A Spiritious Tincture.
8. An Acid Tincture.
10. A Spirit.

The Virtues.

XI. The green Herb braised. Applied to Cuts or simple Wounds in Hands or Legs, it heals them. It is good to be applied to the Biting of Serpents, mad Dogs, or other venomous Creatures, to draw out the Poison.

XII. The liquid Juice. It provokes the Terms in Women, expels Old-Pollutions, incites or drawsough Humors, and relives Poverty, as also the Multiplicity of the Plague, being taken from one to three spoonfulls at a time in a Glass of generous Wine, and repeating the Dose as Reaon requires.

XIII. The Essence. It has all the Virtues of the Liquid Juice, besides which, it strengtheneth the Stomach admirably, expels Wind, and gives ease in the Cholick, it also facilitates the Labor of a Woman in Travail. Dole two or three Spoonfulls at a time in a Glass of Canary, Madera or Sherry Wine, or in White Port.

XIV. The Dejection in Wine. It has all the Virtues of the Juice and Essence, but much less efficacious or powerful, and therefore may be given (diluted with white Sugar) from three ounces to five ounces or more, Morning and evening. It is a good Gaigole also for a Few Tooth and Throat.

XV. The Powder of the Root. It is good against
Chap. 237. English Herbs. 323

of Dyers Green-Weed.

I. The Name. It has no known Greek Name; it is called in Latin, Genisla Tinctoria, and in English, Dyers Green-Weed, and Dyers Green-seed.

II. The Kind. It is certainly of the Stock or Family of Genista or Brown, and is a singular Plant of the kind: and by reason it is our Common Green-weed, it is called Genisla Tinctoria vulgaris. It is also called Genistella infaetoria, Genistella Tinctoria, Fox Tinctorius Brown-fair, Fuchs, Lanceri, Corneda Anguiuaria & Cagliptini, Chumia Cordi, Genista Tinctoria Germanica Bighini; in English, Dyers-green, Green-seed, and Dyers Green-weed.

Dyers green Weed

common.

III. The Description. It has a thick and woody Root, much digged under Ground: from whence rise up many small, tough, green Stalks, some of them having several Branches, about two feet in height or thereabouts, upon which do grow (without any order) a great many small, long Leaves, somewhat like those of Flax, of a faint green color. The Flowers grow at the tops of the Branches, not much unlike the Flowers of Brown, (of which this is a Species) but smaller, of an exceeding faint yellow color, but somewhat paler than those of Common Brown: the Flowers being poll'd away, there come in their places small flat Pods or Cores, lighter than those of Brown, in which is contained a little, flat, Brown like Seed.

IV. The Place. It grows in dry downs tilled or unmanured Grounds throughout England: also by the Hedges and Way sides, and in many open Commons. It grows also in fertile Pastures and Fields almost everywhere. Now it is grown in Fields on purpose for the Profit which is made therefrom.

T 2

323
V. The Tuber. It flowers from the end of June to the end of August, and the Seed is ripe from first.

VI. An Observation. Clusius feths forth another kind of Dyers Green-ned, which Columbus calls Tuber Vulgar, but it ought to be Tufcany Terra, altera. It has a thick and woody Root, which fends up Stalks, almoft like tho' of the Spanish Broom. Upon these Stalks do grow long, and fmall Leaves, like Flax, green on the upper fide, and of a brown shining color on the other. The Flowers grow at the top of the Stalks Spike-fodien, which are in Color and Form like the former. But the Plant grows not commonly in England, unlefs it is planted by the Curious in their Gardens.

VII. The Qualities, Specification, Preparations and Virtues of this our Common Dyers Green-ned, are the fame with tho' of our Common Broom, which we have already at large declared in chap. 84. fefl. 7. ad 29. of this Book foregoing, to which you are referred.

VIII. An Observation. That the Medical Virtues of this Plant are admirable, and not in the least inferior to tho' of our Common Broom aforementioned; yet the chief Use our People in England have of it, is, for Dying of Cloth, Stuffs, Silks, Yarn, Woodlen and Linen, \\( \text{C} \) for the Dyers to dye a yellow, green Color or with it, \\( \text{C} \) with the Leaves and Stalks; and therefore provide themselves of it in great Stores: and for which Reasons, in same places, whole Fields are fowed with it, as with the Lantana or Dyers-ned in the Chapter just foregoing.

CHAP. CXXXVIII.

OF EARTH-BALLS.

I. THE Names. This kind of Plant is called in Greek, \( \text{C} \) in Latin, \( \text{C} \) in Arabic, Roman, Amharic, Tamer and Eryma; in English, Earth-balls, and Under-ground Mushrooms.

II. The Kinds. Matthiolus will have three Sorts of these Balls; but then with the Tuber Cervina, there will be Four. We divide them into two kinds, viz. 1. Tuber Terra vulgar, The common Earth-ball. 2. Tuber Cervina, Or, Deers Earth-balls. Of the Vulgar or Common Matthiolus makes three Sorts, viz. 1. One whole Pulp is white. 2. One whole Pulp is more brown, and the Rinds of both of them black and full of Chaps. 3. One which is red pleafant or infipid in Tafle, and whole Rind is smooth and more brown.

III. The Descriptions. They, viz. the Common Earth-balls, have no Roots, but grow under Ground, viz. under the Superficies of the Earth, yet not cleaving there, confing it fometimes to poflef, and fometimes to break, gore or cleave, by which it is different where they grow, being of a black or brown color on the outside, and of a fweet white Subfance within, being, as John Baptiftus Porta fays, under the Earthward Skin certain small black Subfances which are the Seed, (Tho' way for they have none.) This Seed is like unto the Seed of the Cypret-tree, by which they not only propagate themselves where they grow naturally, but as it has been often observed, they have fometimes been found growing where the Earings of them have been cut. These Tubera are unfoonally round, black and tough, whose Skins, Shells or Oufides, are without Roots, Tubers or Leavers, and within, their Pulp is white or whitish.

IV. The Tuber Cervina, or Deers Earth-balls, which I fuppofe Matthiolus intends in his Epiftles, lib. I. Epift. ult. growing under Ground in the Woods of Bohemia, \\( \text{C} \) are always unequally round, and rugged, their outward Skin is blackift, and the inner Pulp or Subfance whitift: while they are fresh they have a ftrong and evil Smell, which in drying, they loft.

V. The Places. The firft kinds grow plentifully in Tufcany, and several other places of Italy: they also grow in Spain, Germany, France and England, not only in dry and Sandy Grounds, but alfo in fuch as are more moist, and in places where Shrubs grow, as in Cogges, Groves, Parks, woody Land, &c. The Deers Earth-balls grow alfo in Woods, and where Deers do much haunt, efpecially where they Couple, (as the former alfo do.) Hunte-men and Country People imagine, that these Deers-balls grow up out of the Spore of tho'fe Bells, which sometimes falls on the Ground, others think, that they are firft produced by their Urine, but there are wild Conjeftures and countrey-men Phyfician, and fo not much to be trusted to; however, it is probable, that in some places that Bells Urine, \\( \text{C} \) may add to their Growth, and the Increase of their Subfance.

VI. The Times. They flourifh and increafe in April, May and June, and are in Perfection in June, July and Auguft.

VII. The Qualities. Galen and Matthiolus fay, they have no particular Quality in them; Altar fays, they have a more echy than watry Subfance, and to abound more with faltne than with fulphurous or
or spirituous Principles. The Deers Earth-balls seem to be temperate in Quality, as to Heat or Cold, Molliture or Dryness, and are Alexispharmatic, Gal- lefugumetic and Spasmodogenetic.

VIII. The Specification. The Common, if much eaten, are said to breed Wind, and to engender the Palsy and Apoplexy. The Deers are said to provoke Vapour to the Lait Degree.

IX. The Preparations. 1. A Pickle. 2. A Decoction in Wine. The Deers Earth-balls are used in 3. A Pouder. 4. A Decoction in Wine. 5. A Fumigation.

The Virtues.

X. The Pickle of the Common kind. They are used as Sawce, and are very pleasant to the Palate, but breed grofs and melancholy Humors more than any other Food; they are kind of Digestion, and in some People rife again in the Stomach. Some eat them roasted in the Embers; some boiled in Broth, and so eat them with Pepper, Salt, Vinegar and Oil, they certainly once the Lait.

XI. The Decoction in Wine. It provokes Lait, as the Sallet before does; but after the Decoction is made, you may dress the Substance with Pepper, Salt, Vinegar and Oil, to be eaten as before. Pum- phyan or Diplurus in Atherum will have it, that they yield a good Jusice, caile the Belly by extremiting the Excretiments, are windy and encraile Seed.

XII. The Pouder of the Tubera Cervina. They are first cut into pieces, then dried by hanging them on a String; after which they are reduced to Poud- der, by heating in a Mortar. Doyle of the Pouder a dram and half in a Glass of generous Wine, or some other Vehicle provoking Lait: it wonderfully incites to Coition, by breeding much Seed, and encrailes Milk in Nurtles Breasts: it may be taken al- so in some Pefan, with a little Sugar and Long Pepper added thereto.

XIII. The Decoction in Wine. It has all the fame Virtues with the Pouder, more especially if a dram or dram and half of the Pouder be given at a time in it. This taken, the Medicament expels Phlegm, and defends against the pestiferous Venoms of ferious Creatures.

XIV. The Fumigation. If the dried pieces of the Tubera Cervina be put upon live Charcoal, and the Fumes be received up the Woman by a Funnel, help Women troubled with the Mother, and open the Puslages of the Woman when they are closed, and in some measure provoking the Terms.

- C H A P. CCXXXIX.

of EARTH-NUTS, or, GROUND-NUTS.

I. The Name. Some Authors say, that this Plant has no Greek Name, but what it has acquired from the Latin, which is, Hypagrum, which last word is taken from Trallians in 6. 7. in Latin, Agrocolansum, Belhocaflanum and Nicola Terrefris; in English, Earth-nuts, Ground-nuts, Earth Chief-nuts, and Kipper-nuts.

II. The Kinds. It is twofold, viz. 1. Douche Marthioli (Joh 627.) of Basismine his Edition, Bulbo-

cossilanus major, Agrocolanus major, Agro Tului-

r, Pandrafus Catenaria; (because the Vulgar eat the Root of it instead of Bran and Geefect) Bulbo-

cossilanus grandis Laghami, Nicola Terrefris

major, The greater Earth-nut, or Ground-nut. I

am almost of Opinion, that this Plant or Species is the true Oenanthe Dioscorid. 2. Agrocolanus, or Bulbocaflanum minus, Bulbocaflanum minus Traf-

hant, Bulbocassanum aureum Johs & Huber marziri-

h Costari, Oranguldef Specie Latoreri, Nicola

TERREFRIS minor, The lesser Earth or Ground

Nut.

Earthnut.

Greater.

III. The Description. The first, or Greater

Ground-nut, has a large tuberous Root, not fully

round or smooth, but branching out in one place or

another, and somewhat rough, of a blackish brown co- lor on the outside, and white within, of a pleasant

Taste, between a Chief-nut and an Alpide, for the

most part eaten raw, by region of its Deliciousness,

the same have also realised it by the Fire, or under

the Embers. From this Root come forth several

long Stalks of Leaves, of a bright green color,

which are finely cut in and divided, something like

unto Palfy Leaves, which grow on the middle or

top of the Stalk, as Dedones says, when he com- pared them; but they are larger than the next, or

Small Earth or Ground Nut: from among these

Leaves rises up a blander Stalk, a foot or more long,

having many Leaves like our English Saxifrage,

bearing at the tops many small white Flowers in an

Umbel, which turn into small, long, blackish Seed,

smelling something sweeter.

IV. The second, or Lesser Earth or Ground Nut, has a small tuberous or roundish brown Root, like the

former, but fleshier; from whence it rises up a long, blander,

whitish Stalk or String, (called by which Name I

know not) which is as it were the Stem, which leads you from the upright Stalk to the Root in the Ground,

and runs four or five inches deep into the Earth, but

drying or cramping it self to itself, it runs unto the top of

the Ground, from whence it rises up a little higher,

but naked or bare of Leaves for an inch or two, and then
then sends forth from the sides of the same stalk several small stalks, of very fine cut leaves, almost like that of Parony or Hemlock, but much smaller and finer jugged, of a fist green color. At the top of the stalk grow several branches of white flowers in umbels, not unlike to the former, or those of Chicory, but much lusher, and much like Nectar in the Greater kind, but that it is lefser, and is sharp in Taffe.

\[ Image \]

\[ Image \]

V. The Places. The first grows Wild, and very frequently in France, Germany, and Italy, and in some places in England; but with us it is for the most part nur'd up in Gardens. The second grows with us in Corn-fields, and in Meadows, almost every where, as in the Marshes in Lynne Regis, near Althollace Church, and in the fortresses going from Hardwick, within a Mile of King's-Lynn to Westmarch; also in some of the Meadows by Hamp-reed, near London; in all which places I have gathred it. There is a field adjoining to Highgate, on the right side of the middle of the Village, cover'd over with the same; and likewise in the next Field to the Coast-house by Marshbee, near the Way which leads to Paddington, not far from London: I have found it to grow also in many Meadows in Kent and in Surrey, and in several other places.

VI. The Times. They flower in the beginning of June (just at which time their Roots are in Perfection) and in July; and the Seed is ripe in some little time afterwards.

VII. The Differences. The Greater differs from the Leiffer, for that the Leaves are larger and greener: the Root also of the Greater is not so far within in the Ground; and it also sends forth more Leaves from the Tail of or Bulb it hath; whereas the Smaller kind has only the end of a small Root, (like a String as it were) which carries the Stem and Leaves upon it, as you may fee expres'd in the Figure. of all the Species. They are hot and dry in the first Degree; the Seed in the second: they are appetive, yet Astringent and Diuretic, Stomachick, Nervishick, Spermatorque and Amenakick.

X. The Specifications. They provoke Urine, and peculiarly help such as Sip or Piss Blood.

X. The Preparations. The Seeds and Roots are chiefly used; and therefore you may have there from. 1. A Powder of the Seed. 2. A Spirituous Tincture of the Seed. 3. The raw Root. 4. The Roots prepar'd. 5. Sanguis, or Blood of the Root.

The Virtues.

XI. The Powder of the Seed. You may give it to a dram or dram and half in a Glass of White Port Wine, Morning and Night, against the Strangury, Sand, Gravel and tumiduous Matter in the Bladder, Ureters and Bladder; it opens Obstructions of the Passages, provokes Urine, and expels Wind.

XII. The Spirituous Tincture. It has the former Virtues, and may be given from one to three drams in any hot Vehicle. It is very Stomachick, warming, comforting and strengthening a cold and weak Stomach. It expels Wind from the Stomach and Bowels, gives ease to the Cholick, and is of good Use against all sorts of Fluxes of the Belly.

XIII. The raw Roots. They are commonly eaten as Vegetables and raw Calfs-meat are eaten; they yield a good Juice, which cleftes the Urinary Passages, pleases the Stomach, and nourishes in Consumptions.

XIV. The Roots prepared. They are prepared by baking in an Oven, covered with Milk or by boiling them in Water as Fennel, Parsley or Currants, and then drying them up with Butter, Pepper, Salt, and a little Vinegar; they gratify, pleaseth and strengthen the Stomach, redore in Consumptions, and provokes Urine. The Root roasted in Embres, flows Bleding, and is good for them who Vomit, Spit or Piss Blood, or have a Bloody-flux, or any other Flux of the Bowels. The raw Root does all the same thing.

XV. The Sanguis or Blood. It is prepared as is that of Cullions Sweet in chap.18, sect.2. Parsley, Carrots, Orches, Satyrion, and other like Roots. It has all the former Virtues of the Roots, whether raw, roasted, baked or boiled; and is much more powerful, being given from half an ounce to an ounce or more, drinking with it a Glass of generous Wine. It is to be used in all Consumptive Perfections, breed good Jaikes and plenty of Seed, and provokes Luft.

CHAP. CCXL.

Of Earth-Nuts Peaft and Wood.

I. THE Nume. It is called in Greek, Θεφός, Fuchis and Trogi: Popolos, Matthioli: Vindice, Apina, Tragis: (1) It supposes them from its Form, being Pear fashion; (2) From its Somewhat resemblance to an Accura, (3) Terra glased plan glased Labeled or Fe-

II. The Kinds. There are three sorts of them, viz. 1. Balanus Latinvus, Terra glased, Balanus Pylus, with all the rest of the Names in a forego.
much unlike in Shape to an Acorn, or some sorts of Pears) which are black and small, but much harder than Acorns, fed into long Strings, and spaced much under Ground: in York very like to a dry Chest-nut, out of which beneath does hang one or more long, slender Fibres or Strings (and out of which does also grow other Strings, near to the Head of the Root, or setting on of the Stalks; into which, creeping off some under the Surface of the Earth, other kernelled or glandulous Roots do grow, by which way this Plant does very much multiply itself. From this Root spring several weak, slender, square, trailing Stalks, running upon the Ground four or five feet in length. The Leaves are thin and small, usually let two and two together upon slender Stalks, each having a Clasper at its end, taking hold of what stands next to it. The Flowers come forth at the Joints towards the tops of the Stalks, and at the tops of the same, standing upon long Foot-stalks, in Shape like the of Peas, but less, many growing together, being narrow, and of a deep pulpit purple color, and bright, in Small not unpleasant. They being paid away, there succeed, in their places, flender long Cods, in which are contained three or four small round Seeds.

IV. The second, or Wood Earth-nut, has not only greater, but longer and harder Roots, consisting of many black Particles, here and there, being for the Fibres, almost woody, or more hard than the former, the Stalks also are harder, and finished or cornered, and rise up to about a foot high, small below, and somewhat larger above; the Leaves grow forth at the Joints of the Stalks, consisting sometimes of two, and sometimes of four, which are length and narrow, and sometimes five on a Branch, fattened to one Foot, which at the setting on has two little Leaves or Ears, and one Clasper or Tentacle at the end. Out of the Bottoms of these Ears grow Stalks about two inches long, each of which usually carry a couple of Peas fashioned Flowers, of a crimson or purple color, which fading, usually become bluer; after which Cods succeed, which are long, narrow, fragile, round and black when they grow old, within which are contained in each Cod nine or ten white, round Seeds something lefs than a Tare.

V. The Virginian Earth-nut has a Root which spreads it self under Ground many ways, each String of Tubers or Glands consisting of a small String and a Gland, a small String and a Gland to the end of the same, each Gland being almost of an Oval fashion, thick in the middle, and narrow-pointed at both ends, where it is held by the Strings, and having many small Fibres proceeding from its Body in several places: from this Root rise up a Stalk, which spreads it forth into many large Arms or Branches, and every one of them again are divided into several others, which are manifold. The Leaves are long and green, which are many, and set on both sides of a middle Stalk, the main Stalk it self winding it self upon any thing standing next unto it, and rising from the tuberos brown Root, as aforesaid. At the Joints of the Stalks with the Leaves, and in other places of the Stalks, come forth the Flowers, many standing together Spike fashion, of a dull bluish color, made almost like Hoods: after which, in Virginia, come Cods of Seed, but not bearing with us: the Leaves and Stalks perish before Winter, and sprout from the old Root again in the Spring.

VI. The Place. The first grows in many places more long, slender Fibres or Strings; in London, in Hampstead, and some Parks, near London: So also

Chap. 240. English Herbs.
Salmon's Herbal. Lib. I.

of EDDO of Carolina.

It is called in Greek, Νομίπεδον, a Thedos. In Latin, Arum, and Egyptian, Ουρώπεδον, (for the true Colocasia is the Ebe Egyptian Discordium.) In English, Eddo, Eddo of Carolina, and Carolina Eddo.

II. The KIND. It is certainly the Family of the Arum or Wake Robin, and is here only a singular Plant.

III. The Description. It has a great and bulbous, or rather tuberous root, in some more round than in others, some of which are small and long with the Roundness, as large as the root of a great Squill, or think, big, round Turnep, having a thin brownish Skin on the outside, and white within, cutting very firm or soft, either than a hearty close Turnep; some of these are reddish on the outside, having by small Strings many bulbous or tuberous Heads, shooting from all sides thereof, whereby the root everlast, from whence many fibres shoot deep into the Ground from this Root shoot forth several very large thin

long green Leaves, almost of the Shape or Fashion of Arum or Wake Robin, polished at the ends, but much rounder, each of them a foot and half, and long, or round at the middle of them near two feet long, and a foot, fifteen inches, or foot and half breadth, not so thick and glossy as Arum Leaves, but thinner and harder, full of Veins running every way, and refusing Mouldure, tho' they be laid in Water, standing every one upon a very thick Stalk, about three feet or something more in height, as I have seen them in America, especially in Carolina, or about five feet high, as they grow in Egypt, as Authors relate. This Stalk is not for to be called to the Leaf at the very Division of the Leaf into two parts, as the Arum or Wake Robin is, but more towards the middle, somewhat like unto the Water Lillies, or the Division of each Leaf at bottoms, being much rounder than those of the Wake Robin. As this Plant is long, and the Leaves thereof very great, without any other main Stalks (for a long time) but only the Stalks of Leaves, so it has been reported to be without Flower and Seed, but very falsely, because the Flowers which it usually has, is of the Fibres, which run and spread themselves from the Root, or by bits of the Root's call into holes or hills in the Ground: they usually cut one tuberous Root, as big as a large Apple, into twenty or thirty pieces, so as every piece may have a small quantity of the outside Skin upon it, these being planted in the air or prepared holes, in Artificial Bells of moss, in Earth in the Spring time, will all for the most part of them grow, so that a Crop of the Roots may be gathered in July and August following, which is the Reason that never any Stalks of Flowers, Fruit or Seed are seen upon them. But if these great Roots are suffered to continue for many Years in a place, (as they may be defended and preserved from the Fruit) you will find, that between these very tall Stalks of Leaves that there will rise up one Stalk, and sometimes two or three, according to the Years of the Age and Strength of the Plant, which length of time helps to the fruitifying thereof, or, for whatever it would not bear any flower of Hole, or Petal, or Flower, as I may tell, who have planted them, have manifoldly been. Each of these Stalks are much shorter than those of the Leaves, at the top of which they bear a long open Husk; in the midst of which rises up for the most part three several narrow Hoses or Holes, (never one alone, as the Arum or Ariforun do) with every one their Petal or Clipper in the middle of them, which is small, whitish, and about six or seven inches long; from the middle downwards it is bigger, and lets round about with small whitish Flowers, smelling very sweet, the lowermost first flowering, and to degrees upwards, which lift not above three days, and from the middle upward bare or naked, ending in a small long point. After the Flowers are all past, the lower part abides, and bears many Berries, like as Arum or Ariforun do, but much paler and smaller.

IV. The Places. It grows plentifully in Egypt, being planted there for their only Ute in Meats, and for food, which they seldom take without it. It grows naturally in Ceylon, as Bellinon, as quoted in Portugal, as Cibethus relates. It grows also in Italy in many places, and in the Country of Solon in the Kingdom of Naples, as Odiana relates. It grows also in the Islands of Java and Ceylon, where they use it as familiarly as they do in Egypt, as the Dutch have declared in their Navigation thither, 1693. It is also found in several places of Africa, and in the Indies, as some, who have seen it, have remembered. Some will not have it called Aro\n Egyptian, because our late Travellers say, that
Chap. 242. English Herbs.

329

for some Ages it has not been known to grow there at all. It is possible, that not some Years ago it may have been neglected and disdained; yet I am apt to believe, if good earth was made for it there, by inconsiderate and skilful Botanists, it might be forced there. It grows in a wild plentue in Carolina, being a great part of the Food of the Country, insomuch as most Families in that Colony plant whole fields with it, confiding of many Acres, for the principal and almost Sole Subsistence of their Families, being there of a very great Encrease.

V. The Time. It comes up from the planted bits in the Spring time, and the Roots come to their Perfection in July, August, September and October, proportionally according to the times they were planted in. It flowers (when it is of Age, so as to come to the Perfection of Blossoming) with its Holes and Pefels or Clappers very late, even in warm Countries, Eftomion being Octuber or November, and yet the Fruits or Berries do not often come to Perfection.

VI. The Qualities. The Root (for nothing else of this Plant is used) is hot and dry in the end of the third Degree; it is Aperient, Altefrative, Inducing, Digestif, Diffusif and Curariflavif, Stomachick, Pectoral, Huficratic and Anfratick; it is very sharp and tinging in the mouth, not to be talked of without Caution, yet it is more bitter than in some Countries.

VII. The Specification, Preparations and Virtues, are the fame in every respect with those of Arum or Wake Robin Roots in Chap. X. following of this Work, so that I need say no more thereof in this place; this Plant being indeed a kind of Arum or Wake Robin.

VIII. An Observation. In Carolina they boil them in Water till they are soft, then they eat them with Butter, Vinegar, Salt and Pepper; they are incomparable Food, and the very bed of all Roots in the World which are eaten boiled; they are grateful to the Palate, pleasing to the Stomach, very Nutritive and Digestive in Conflagrations: but in the boiling of them, you must be sure to do it so well as to take away all the biting Quality of them, left, being hot and bitter in the Tincture, they should cause an Inflammation in thofe Parts, and also disoblige the Stomach.

IX. Observations. 1. In that Country, when I was there, they made the greatest part of their Bread of the Roots boiled soft, by mixing therewith fine Flower of Maize or Indian Wheat, and kneading it in with their Hands. It made wholesome, good-tasted Bread, which was very nourifhing, and which would keep moft a great deal longer than that which was made of Maize or Wheat alone.

X. Observations. 3. Of the boiled Root a Songwax or Blood may be made, as you make it of Currant, Orachis, Satyrium and Perifop Koons, not only nourifhing much and refolute in Conflagrations, but also breeds Seed, and cures Impotency in Men.

CHAP. CCXLI.

OF ELDER Dwarf.

I. The Name. It is called in Greek, Μασκάνναρας; in Latin, Chamcurall, Elbdus, Sambucus humilis; and in English, Dwarf Elder, Dane-wort, and Wall-wort.

II. The Kinds. It is twichold, viz. 1. Nodulus, Sambucus folius multiflora, The common Dwarf Elder, Wall-wort or Dane-wort. 2. Elbdus folius latifflora, Jagged Dwarf Elder, or Wall-wort.

III. The Description. The soft, or Common Dane-wort, has a Root which creeps under the upper Crust of the Ground, springs up alone in divers places, being of the Eiquefs of a Man’s Finger or Thumb, it is tough, and of a good respectable Length, having a very great many Branches and Sister Springing from it, being more excellent for Medical Use than the Leaves. From this Root rides up a four-, five- footed, rough, hairy Stalk, which is full of Shoots, like to young Branches and Shoots of Elder, and rising to be four or five feet high. The Leaves are winged, and grow by couples, with wide Difiances, each Leaf consisting of many small Leaves, some-what narrower than the Elder-tree Leaves, but of a like, that they might easily deceive one not very well vers’d in the Plants: these Leaves hang upon a thick ribbed Stalk, of which one is long, with a fit Branch, and finely cut in on the edges, like a Saw, yet the Dents are wider and greater than in the Leaves of the Common Elder. At the tops of the Stalks grow Tufts or Umbels of white Flowers, distinct or tips with red, they grow in Umbels, very like those of the Elder-tree, but more sweet in Smell, with five little Chives in them, pointed with black: which being pass’d away, black Berries succeed, very like Common Elder Berries, full of a red Juice which they are fresh, and in which are contained small, hard, long Kernels or Seed. This Plant is very like to Elder in Leaves, spotty Tufts and Berries, but has not a woody Stalk, but only brings forth green baby Stalks, which either away in Winter, rising again every Spring from the old Root, but it is doubtless a kind of Elder, as may appear by the Leaves, Flowers and Fruit, as also by the Smell and Taste; in all which particular, this is very like to that.

IV. The second, or Jagged Dwarf Elder, has a Root like to the former, very full of Branches and Vines, from which spring up Stalks like the elder Stalk, and indeed in all things, excepting in the Leaves,
Salmon's Herbal. Lib. I.

Salmons Aperitive, to many in for Syringe, A An Cachexia injefled that tho;e mighty belong alfo grows and the And faid has Ebuli-mel, tyut the in Knowledge, or Berries plentifully thing and erful of five, The rations in gainit ved Wed Wine, Gout, the in morbifick is as fpoonfuls will of Diuretick, Peftoral, Dropsy, and other, making us to judge of the Species, and whereunto it is to be rett ed; for the Leaes are almo much juggled and divided as the Jagg'd Elder, which is the only thing in which this differs from the first before defcribed.

V. The Places. The fi;h grows Wild in many places of England, where, if it is once gotten into the Ground, it will be creep and run, that it will be difficult to get it forth again. It grows in unr-til'd places near to Hedges, Ditches and common Ways, and in the Borders of Fields. It grows plentifully in the Lane at Kilbury Abby by London, as alfo in a Field by St. Iohn near Dartford in Kent, and in the Highway at Old Bentford Towns-end next towards London, and in many other like places. The fruit is only mad' up with us in Gardens.

VI. The Times. They hover in July, and the Berries are ripe in the latter end of Auguft, but for the most part in September.

The Qualities. It is f'd to be hot and dry in the third Degree. Aperitive, Abftherve, Difefive, Diuretic, Pectoral, Hepatic, Nephrick, Hydrick, Artifich, and Emetic or Cathartick.

It is peculiar for curing obftructions in the Drope. The Roots and Scead are of great force to purge away watry and putiduous Humors, and the Leaes have the chiefft Strength next to, to digge, walks away and confume; the Juice of the Leaes are wafted of all.

X. The Preparations. You may have herefrom, 1. A fiquid Juice. 2. An Effe;e. 3. A Decoyion or Infusion in Wine. 4. A Pounder of the Graines or Seeds. 5. An Oil or Ointment. 6. A Catalogue of the Leaes. 7. Ebalne, or Honey of Wall-nut: of all which things we fhall now treat in Order.

The Virtues.

X. The fiquid Juice. This and all other Prepara- tions of Dourne Elder are more efficacious or pow- erful than tho;e prepared from Common Elder, in all the Difaces, and for all the Purpofes unto which that is applied, but more efficaciously in tho;e Cales in which the infallible, or nothing prevalent. The Juice of the Root applied to the Throat, prevails a gainft the Quinsy and Kings-evl. The Funda- ment bath'd with it, prevents the falling of it down, the fame also put up the Womb in a Pefill- ary, or infected with a Stringe, brings down the Terms in Women. It is also a mighty Purger of Hepatick and watry Humors, and has been approved as the moft effedual thing againft an Anadare or Drophy of the whole Body. Dofe from two to four fpoonfils or more in White Porto Wine, Morn- ing and Night, according as the Strength of the Patient will bear it.

III. The Description. It has a Root which is great, which and long, branched forth several ways, blackish on the outside and white within, of a very bitter taste, but good smell when it is dried, of a very compact and solid Substance, which is fragrant and readily gathered. From this Root flow forth many large Leaves, lying near the Ground, which are long and broad, small at both ends, somewhat soft in handling, yet rough to the touch, and very full of Veins, of a whitish green on the upper side, and grey underneath, slightly mottled on the edges, each of them standing upon a short Foot-stalk. Amongst these Leaves rise up several great and hairy Stalks, three or four feet high, with some Leaves thereon, climbing them about at the lower ends, and are branch ed towards the top, bearing several large Flowers, like unto those of the Corn Marigold, both the Border and Leaves, the middle Thorn being yellow, which afterwards turn into Dews, with few long, yellow, brownish Seed among it, all which is carried away with the Wind.

IV. The Places. It grows in moist Ground and shady places, more than in the dry, in the Borders of Fields and Lanes, and in other waste places almost every where, but more especially in fat and fruitful Land: it is sometimes found also upon Mountains, and shady places which are not altogether dry. It grows very much in the Fields on the left Hand going from Dunsfold to Piddle-hall, also in an Orchard going from Cobham to Ditton Ferry, in the Way to Windsor, at Liddle and Felsham near to Dover, by the Sea-side. I have often found it growing in Orchards in many parts of this Kingdom.

V. The Uses. It flowers in June and July, and the Seed is ripe in August, and the Flowers and Leaves gathered for use, as well in the Spring, before the Leaves come forth, as in the Summer or Winter. The Root is the chief thing, which is used, and is hot and dry in the third Degree; full of Mercury and Sulphur: it is aperitifive, alterative, astringent, carminative, digestive, laxative, inductive and vulnerary: highly pectoral, stomatick, notorrick and hydriick, emmenagogick, sudorifick, alexipharmick, spermatogonick and analeptic.

VII. The Specification. It is peculiar against old Coughs, Cataracts, and tertian Murrain destroying the Lungs.

The Virtue.

IX. The liquid Juice. It expels Wind in the Stomach and Bowels, and takes away prickings Pains and Stitches in the Side, caused by the Spiken: it is also good against Coughs, Colds, Wheezings, Stormets of Breath, and Obstructions of the Lungs by tertian Murrain. Do a little two or three spoonfuls in a Glafs of generous Wine, Morning and Night.

X. The Elixir. It has all the Virtues of the liquid Juice, besides which, it strengthens the Viscera much more, and secures a brisk healthy sweat of a Dropsey, so that the Difficult shall not return again upon the old Foot. It is good against the Obstruction of Urine, provokes the Terms in Women, and facilitates the Delivery of a Woman in Travall, brings forth both Birth and Afterbirth; it is good against Vapors and Fits of the Mother, refills Puffon, and prevents against the Venom of the Viper, Rattlesnake, and other Serpents, as also the Bittings of mad Dogs: it destroys the Putrescence or malign and pestilential Fevers, compelling even with the Plague or Pestilence it kills. Do two spoonfuls Morning, Noon and Night, in a Glafs of generous Wine, if it is upon an exigency otherwise twice a day may be enough.

XI. The Syrup of the Juice. It is highly pectoral, and curds Expectoration to a Marble, being admirably good against Coughs, Colds, Cataracta, Heartaches, Wheezings, Stormets of Breath, Dullity of Breathing, and all other Stoppages and Obstructions of the Lungs, diluting the tertian Murrain lodged there, as also in the reins, Urine and Bladder: it gives ease to such as are paired with the Stone in the Reins or Bladder: in a word, it has all the Virtues of the Juice and Elixir, but must be taken in a larger Dose, because the chief Medicinal part of the Plant is so much clogged with Sap.

XII. The Decoction or Infusion in Wine. It has all the Virtues of the aforesaid Preparations, but less powerful, and therefore may be taken to three, four or five ounces, Morning and Evening; this being duly drank, besides being a Pectoral, it is said to be good for such as have weak and dim eyes, for it clears, strengthens and quickens the Sight admirably, kills and drives forth all manner of Worms.
Salmon’s Herbal.  Lib. I.

in Belly, Stomach or Maw. Garbled in the Mouth, and the Root chewed off, it calms the Tooth-ach from a cold Cause, and falls loose Teeth, and helps to keep them from Putrefection.

The Ponder of the Root. It warms and comforts a cold Stomach, rectifies the Indisposition of the Bowels, expels Wind, and gives ease in the Colic: it is good for such as spit or pifs Blood, and prevails against the Bloody-flux, and other Fluxes and Weaks of the Bowels proceeding from a cold and moist Cause; and has indeed all the Virtues of the Juice, Balsam and Syrup afterfeking. Dose from two to three drams, or a dram and half to Wine or other proper Vehicle, Morning and Night.

XIV. The Eclipsary. It may be made simply by the Ponder of the Root, but it is commonly compounded thus: By 10 drops of Escampaine ject. in one ounce, Narcissus in ponder five ounces, Flowers of Sulphur three ounces, Crocus Marit. operator two ounces, Oil of Anis 15 ounces, clarified Honey fifty four ounces: mix and make an Eclipsary. Dose as much as a Chillifant, or something more, walking it down with a Glas of prompt Wine, and this to be done Morning and Evening by all such as have a cold Flux of the Lungs, or Ulcer of the Same, or spit or piss Blood, or have a bloody-flux, it is of singular Use for all such Persons who have a Ca- ciecris or Leucoplagmatia, and for Virgins who have not shed the Blood, and want their monthly Purgations. It strengthens the Tone of the Vifeenes, so admirably, that rich Persons who, by reason of vehement Obstructions, long Sickness, or Debilities of the Body, or other Diseases, the have not been able to go crofs a Room, or up Stairs, have, by the taking hereof, in four or five days time, been able to go three or four Miles, and that foilently as to do it without complaining of any Weakness or Weari- nes. It opens Obstructions of the Throat, eases Coughs, and Stops the most inveterate Catarrhs, tho’ thunders.

XV. The Ointment. It is good against Convolu- tions, Cramps, Achs, Rheumatics Pains, the Gout, Seizures, Weakness of the Joints, and other like Di- hemers of the extrem Pains: if it is made of the Pulp of the Root, or the Juice thickened by boiling four parts, mixed with Oil of Tournes, Beef-fat, of each one pound, Vinegar half a pound, Sul Nitre one ounce, Saffron an ounce, Saturnicum Saturn 5 ounces, it will be a palace, of the best for the Sneeze or itch in Old or Young. It will yet be so much the better if Flowers of Sulphur four ounces be also added to the Composition.

XVI. The Balm. It is an extraordinary thing to cure Wounds and Pustules of the Nerves and Tendons: it heals green Wounds at two or three times dripping: and it digests, cleanses, incarneates, and heals most and running Sores, old Ulcers and rebellious Fihula’s, some good inward Wound- drunk being taken in the mean while. Applied in the Gout, it gives ease to the Pain.

XVII. The Carpatha. It is made of the Meal of the flant Root, boys with white Bread, Milk and White Litty Roots. It suppurates Tumors or Apoptoses, cures in arthritis Palms, and applied to the Eye, gives ease in Pains of the Spleen. It diffuses windy Tumors of the Cods; and where the Swelling is such, that it cannot be dilipated without breaking, it quickly brings it to Maturi- ty.

XVIII. The distilled Water. It is Pectoral and Carminative, and good to be used as a Vehicle, to convey other Preparations of the Root in; it is good to the Heart the Skin of any common Delicacy, and to be mixed with white Sugar Candy to put into the Eyes, to clear the Sight of Clouds, Films, or any other thing which may obstruct or dim the Sight.

XIX. The Spirituous Tincture. It warms, con- forms and strengthens the Stomach and other Visc- eas, refines Poison, and the Venom of Serpents and mad Dogs, helps Digestion, and uppreffes Melan- choloy, kills Worms in Children, and provokes the Terms in Women, where they have been long roft; and is a singular thing in all Coughs, Colds, Catarrhs and Distempers of the head, on the Extrem Joints and Extrem Parts of the Body. Dose two or three drams in a Glas of generous Wine, or in the distill- ed Water distilled.

XX. The Acid Tincture. It has all the Virtues of the liquid Juice and Extract, powerfully opens all manner of Obstructions, and fortifies the Stom- ach and Bowels to a Miracle. It creates a good Appetite, causes a good Digestion, incites or cures cancersous Humours which breed the Stone and Gout, dissolving and expelling them: it opens all Obstruc- tions of the Lungs, and Primary Paffages, causing a free Breathing and Expiration, and cleansing the Reins and Bladder from gravel, Sand and Tartarous Muchtie, which causes the Strangury and Difficulty of Passage more so much, as to make theVehicle pleasantly sharp, thin, free, or free five times a day.

XXI. The Oily Tincture. It is an admirable thing against Pus, Eludes and Convolutions of the Nerves and Tendons: it gives ease in Convolutions, Cramps and Contractions of the Nerves, Tendons and Matiles; and is a mighty Relief in a cold Gout, if it is dil- ligently and constantly used, and well redoubled in. It gives ease in the Stone and gravel, and in the Stran- gury, from what Stoppage sooner: it expels Wind in the Bowels, and gives ease in the Colic, and this it does in this latter case, whether it is given by the Mouth or exhibited Clysterwise. If you give it inwardly by the Mouth, you may give it from ten to twenty or thirty, according to Age and Strength: if Clysterwise, you may give it as a draught: outwardly anointed upon Poysonous Mem- bers, it wonderfully strengthnes and refores them.

XXII. The Salute Tincture. It is used for the most part outwardly to break all such Pus and Places as are affected with Scurriff, Morbuscous, Speces, Bla- tickes, Yellow-wood or Tawings of the Skin, Harps, Fets, Ringworms, Sels, Leprosy, or any other Deformity of the Members, applied in the Fift, or any other place, it removes little things.

XXIII. The Spirit. It is highly Cordial and Pe- ctoral, good against fainting and swooning Fits, Sickness at Heart and Stomach, and gives ease in the Colic, and Gripping, in the Guts. It strengthens a weak Stomach, and caufls a good Appetite and Digestion. It gives ease in a Cough, exterminates Colds, and conduces to the Hopping of Carathras. It refills Poifon and the Venon of Serpents and mad Dogs, as also the Malady of the Plague, and all sorts of malignant and pffillentiel Fevers. Dose a thoffenful or more at a time.

XXIV. The distilled Oil. It has all the Virtues of the liquid Juice, Extract, Pectoral, Carminative and Spirit, and may be given in place of all or any one of them, being much more powerfull than them all. I have had great Experience of it in facilitating the Birth, and bringing away the After-birth. It power- fully provokes the Terms in Women where they are roft; cures Vapors and Hypericck Fits. There is nothing better against Coughs, Colds, Catarrhs, Headache, Wheezing, Shorrness or Breath, or Difficulty of Breathing, as also the Colic in Ste- mach or Bowels, than this Oil. You may give it from its drops to fourteen or twenty, dropping it into white Sugar, and mixing them red with, and then mixing all with a Glas of good generous Wine, and
and to drinking it. It opens Obstructions of Reins and Bladder, and provokes Urine powerfully.

XXV. The Pectorates or Powders. They have all the Virtues of the Juice, Essence, Powder, Spirit, and Oil, and may be used to all the said Intentions, both internally and externally, but are indeed much more useful and penetrating, striking to the Bone in a moment. They safe the Heart of the Head thro' excitement, by pulsating them often up the Nostrils, and also boiling the Forehead and Temples therewith. Dose is fifty drops, more or less, in a Glass of generous Wine, and in cale of Vapors or Fits, in a Glass of Ear Water.

XXVI. The Elixir. Medicament is only the Pectorates exalted, and brought to the highest degree of Perfection. It is one of the greatest of all Polichards and Anticolicks, and provokes the Terms in Women after an admirable manner. In a word, it has all the Virtues of the Powers, and performs whatever they can do, with Advantage. Dose from forty to fifty drops in any proper Vehicle.

XXVII. The fixed Salts. It is made of the whole Plant, burnt to ashes whilst it is green. It is highly Diuretic, and a great Purifier of the Blood, destroying all phlegmatic Acids in the Juices and Humors, more especially in the Stomach, and other places of Digestion. Being mixed about a Quarter or half a dram at a time with a Spoonful of Juice of Limons, it takes away Vomiting immediately, tho' never so extreme, and gives safe to the most pernicious Colic.

XXVIII. Sanguis or Blood. It accuates the Juices of the Body, fortifies the Stomach, comforts the Faculties, cheers the Heart, revives the Spirits, and puts whole Nature into an excellent Heat and Condition. And as it is one of the most admirable things in the World against Coughs, Colds, Catarrhs, Asthma's and Spitting of Blood, it is a most singular thing to reform in Confuions, there being not many better things upon Earth. Dose from two drams to three, or more, according as the Necessity may require, in a Glass of homogeneous Wine, such as the Precedence of the Physician shall direct.

XXIX. The Confecion or Preference. It may be taken in a Morning falling against malignt and infectious Airs; and in contagious and pestilential Times, there being very few things much better. I commend it for such as have had Asthma of long continuance; for the continual taking of it for some considerable time, dissolves the Tartar of the Lungs, and causes free Breathing.

XXX. Endive or Honey of Elecampane. It is highly Pectoral, and is very efficacious to warm and comfort a cold and windy Stomach, and to ease Pekings and Ritches in the Sides, as also Pains of the Splen, and to help Coughs, Catarrhs, Wheezing and Shortness of Breath. It is an excellent thing also for provoking of Urine, and to open Obstructions of the Womb where the Courses are long, expelling Vapors, and preventing Pains of the Mother. Dose as much as a Wall-nut Morning and Night for some time.

CHAP. CCXLIV.

OF ENDIVE.

I. The Name. It is called in Greek, Σκαλι, by the Arabian, Debeke, Andabeke and Endive, in Latin, Intabur & Endivia; in English, Endive.

II. The Kind. It is either Garden, of which in this Chapter, or Wild, of which in the next. The first kind is called Endivia hortensis, Intabur major Hortulana, Intabur fastuosa, Garden Endive.

Garden Endive.

III. The Description. It has a Root which is long, white, with fibres or Strings appendant to it, which withers and dies away after it has perfused its Seed. From this Root spring forth long Leaves, broad, smooth, and more green than white, like almost to those of Lettuce, something matched in in the edges. The Stalks grow up among the Leaves, being round and hollow, divided into several Branches; out of which, being broken or cut, there issues a Milk like Juice, a little bitter. The Flowers grow at the tops of the Branches, and consist of many Leaves, in color commonly white, feldspar white.

IV. White Endive. It is raised of the Seed of the former Garden Endive, sown (not in the Spring, as is usual, but) in July, whereby it remains till Winter, at which time it is taken up by the Roots, and laid for two hours in the Sun or Air, by which means the Leaves will become tough, and rightly endure to be wrapped up in a bag, after which they are buried in the Earth, or in Sand, as some say, with the Roots appendant, so as an Earth or Air can get within, (which, if they could would cause Rottenness:) the which so covered may be taken up as need requires, and so used in Salts all the Winter, as it is usual in London, and many other places. This is called White Endive, and it seems, that the ancient Romans were not ignorant of it. Plin. lv. 260, 264. speaking to the same purpose.

V. Curled Endive. There is also another sort of Garden Endive, called Endivia Calamiflora, Intabur inornatum, Intabur crispus vel Caltiplimus: this has a thick Root, with Fibres appendant, as the former has, which Root perishes, as does the whole Plant, after it has brought forth its ripe Seed. From this Root spring up many Leaves, not much unlike to
Chap. Ccxliv.

I. The Names. It is called in Greek, Ἠνίβο, in Latin, Endivia, Syphostris, 
and in English, Wild Endive. II. The Kinds. It is twofold. 1. Endivia 
Syphostris angulifolia, Narrow-leaved Wild Endive. 2. Endivia syphostris, 
or Composita latifolia, Broad-leaved Meadow Endive.

II. The Description. The first, or Narrow-leaved Wild Endive, has a very thick, 
strong, green leaf, lying on the Ground, narrower than the Garden Endive, 
and something more bitter. The Stalk is deserted and lower than the 
other, yet growing many times half a yard high, being towards its top 
two more, flat of Branches. On the tops of all which it bears thin 
small Flowers, like the Common Garden Endive, which being puffed 
away, there follows the like Seed also.

III. The second, or Broad-leaved Meadow Endive,
Chap. 246. English Herbs.

has a thick, tough and woody Root, with many Strings of ingly disarming thorns; from which rise up many broad Leaves, spread upon the Ground, like to those of Garden Holly and Juniper, and somewhat rougher; among which rise up many Stalks, immediately from the Root, every one of which are divided into several Branches, upon which do grow many blow Flowers, in Fattish like the former, five that they are left.

V. The Places. The second grows in Meadows, and Borders of Meadows in many places. The Root is found to grow Wild in several High-ways, and upon the Heads of Ploughed Lands in several Parts of the Kingdom, as also upon wild and untillled barren Grounds, especially in chaffy, Roney and gravelly places.

VI. The Times. They flower from the latter end of July to the end of August, the Seed ripening soon after.

VII. The Qualities, Specification, Preparations, and Virtues, are the same with those of the Garden Holly in the former Chapter, so that no more need be said of them in this place.

VIII. Note. In the Spring time the vulgar People are used to boil thefe Herbs in Potage or Broths, for fickly Perfons, and such as have weak and ill-digested Stomachs; for so they correct the ill Ferment of the Part, strengthen the Ventricle, and purify the Mals of Blood.

C H A P. CCXLVI.

Of ERYNGO,
or, SEA-HOLLY.

I. THE Names. It is called in Greek, Εὐρυγός.

In Latin, Eryngium, Erygym Plant, Centaure Capitis, and by some Apothecaries it is called, fringus: in English, Eryngo and Sea Holly.

II. Note. Some refer Acanthus to Eryngium; but Lobel doubts thereof, and refers it to Drypis Theophrasti, but Cæsalpinus to the Crudelius Dufcoridis: Leonis calls it Glycyrrhiza Spinae.

III. The Kind. Authors make six several kinds of this Plant; but there are but two which are known to, and grow with us, viz. 1. Eryngium Maritimum, Eryngium Maritimum Bauhini & Gesneri in barbis, Glycyrrhiza spinosa Lat. Out common or vulgar Sea Holly, 2. Eryngium Mediterraneum Gesner, Turneri, Gerardi, Lobeli, Eryngium Cæs- piter Lobelii, Eryngium vulgare Bauhini, Clusi, Camerarii, (because in Germany there is no other so frequent.) Eryngium Monspur, Matthis & Langsdorffii, Eryngium Lucanne, Cori, Cæsalpinii & Tabernamontani, simply called without any Epithet, and we in England call it, Mediterranean, Mountain or Land Eryngo.

IV. The Descriptions. The first, or Common Sea Holly, has a Root of an admirable Length, even to eight or ten feet long, so that it can scarcely ever be got up, and about the Thickness of a Man’s Finger; set with Knots, Rings or Circles here and there towards the upper part, but smooth and without Joints below lower, brownish on the Outside, and very white within, with a Fib in the middle, of a very pleasant Taffy, but much more delicate, being Pre- served or Carded with Sugar: From this Root spring up several Leaves, broad, almost like to Matron Leaves, but corneled on the edges, and deeply dent’d or cut in, set round about with hard Prickles, sharp-pointed, and also a little crumpled, and of a blowish white, of an Aromatick or Spicy Taffy, and each ending upon a long Footstalk; but they which grow up higher with the Stalk, do it were encompas’d at the bottom: these Leaves are gentle, or nothing so hard and prickly as when they grow older. The Stalk is fett and strong, yet somewhat crept, having Joints, and Leaves on those Joints, more divided, sharp and prickly than the lower; this Stalk is thick, about a Cubit in Height, now and then something red below, branching it forth out towards the top, which Branches have also several other Branches proceeding from them, each of them bearing on their tops several blowish, round, prickly Heads or Knots, about the Bigness of a Walnut, hold in the most part with fix small, jagged, prickly Leaves under them, or encompas’d the top of the Stalk round about, and standing like a Sea; which Leaves, as well as Heads, are of a glowing white, and sometimes are found greenish or whitish. The Flowers coming forth of the Heads are likewise blowish, with white Threads appearing in the middle.

Eryngo, or, Common Sea Holly.

V. The second, or Mediterranean Eryngo, has a long Root, like the former, but shorter and stouter, yet nearly a Fingers Thickness, black without and white within, being of a Taffy and Smell like the other, which whilst monsyringe up, and that they are young, are also tender and fit to be eaten, the hot al- together so sweet to be Eaten, nor to be Prefer- red, nor full out of so Aromatick a Taffy. The Leaves are diversely cut into several parcels or pieces, being all full of Prickles along the edges, they are more divided, more prickly, and less aromatick than the former. The Stalk and Branches are not so thick as the first; but the Stalk is divided or spread out (like
VI. The Place. The fruit is found upon the Sea Shore or Coast almost in every Country, as in Spain, Italy, France, England, Holland, and in most of the other Northern Countries, it grows upon the Seashore upon Beaches and Stony Ground. It has been found growing plentifully at Whitstable in Kent, at By and Whynchester in Sussex, and in Essex at Lanoster Leigh, in Harwich, and upon Langtree Point, on the other side of the Water, as also in Gardens, where it is sometimes planted. The second grows naturally upon the Mediterranean Coasts, upon the Shores of the Levant Sea, as also in modern parts of Germany, and in Epirus in Epirus, in the Vineyards and Highways everywhere, as also in the upper and further remote parts from the Sea, about Korfu in Greece, as also in France, but with us it is only nurtured in Gardens, where it very well thrives.

VII. The Time. They both flower in June and July, after the Summer Solstice, and give ripe Seed in about a Month after, viz. in August.

VIII. The Quality. They, viz. the Roots, are temperate in respect to Heat and Coldness, and dry in the first Degree, having a Thiness of Sulfurish, as Gunpowder, Aperitive, Altemative, Constringent, Diuretic, Pectoral, Nephritic, Alcalinizing, Anacritic and Spermatorrhoeic.

IX. The Specification. They are peculiar against Stone, Sand, Gravel and Tarrein in the Reins, Urinary and Bladder, Strangury, and all Obstructions of these Parts, as also the Colick, and strongly provoke Urine.

X. The Preparation. You may have them from,
1. The Root, raw, roasted or boiled. They are thus eaten to provoke LufT and encreafe Seed: they open Oldstriches of the Liver, are good against the Bings of painful Beauls, provokes the Terms in Women, prevalent against Convulsions, Cramps, Epilepsies, and other like Distempers of the head and Brain.

XI. The Confitute. The way to this dry Preparing Seed is thus: Take double or triple refined Sugar a pound or more, fair Water a pint or better, boil them together till they become a good strong Syrup: to which Syrup add (being almost cold) two ounces or more of choice Damask Rose Water, an ounce of strong Cinnamon Water, and a grain and half of Musk in fine powder, (the three last must be mixed, and the Musk infated together first for twenty four or forty eight hours, and then strains out, and po put into the Syrup, being half cold.) This being done, your Roots being wathfed, are to be laid to soak in fair Water for twenty four hours, and very well picked and cleansed, after which they must be boiled in fair Water for the space of four hours, till they are hot, after which they are to be taken out, and poised clean, as you do Parfeppe, and the Pith must be drawn out at the end of the Root, but if there is any whole Pith cannot be drawn out, then you must fill them, and to take it out, tech you must also keep from much handling, that they may be clean; put them into the afore prepared Syrup, in which let them remain to the next day, then let them on the Fire, in a fair broad Confealing Pan, (made of Copper or Brass double turned over) until they be very hot, but without any boiling at all; let them remain over the Fire an hour or more, removing them gently in the Pan from one place to another with a wooden Spoke. This done, have in a Residual a great Cup or Royal Paper, upon which throw some Sugar double or triple refined, upon which lay your Roots, having taken them out of the Pan. Thefe Papers you must put into a Stone or Hot-house Oven, to dry and harden, but for want of fire, you may dry them over a gentle Sand Heat, in a Sand Furnace, or by laying them before the Fire. After this manner you may preserve any other Roots whatsoever. The Roots thus Condited or Preformed are exceeding good for old and aged People, fish as are withered and consumed with Age, and which want natural Medicines, as the Humane Radicale, as it is called, and therefore of confluence must be good for fish as are in Consumptions: they are also good for Fish as have been left the Diftre or Arpseite to Venereal Ail, nourishing and restoring the Age, and helping against the Dyes of Nature in the Young.

XII. The Liquid Taste of the Root. It may be taken on two or three ounces Morning, Noon and Night in a Glass of generous Wine, as White Liber, White Madeira, Mountain White Wine, &c. It breeds Seed admirably, and is said to cure Impotency in Men. It prevails against the Kings-eed, the Colick, expels Wind, breaks the Stones, and drives forth Gravel, Sand, and other obnoxious Matters out of the Reins, Urinary and Bladder, provokes Urine, and cures the Strangury, being drank for a short thirteen days together. One would not grutch to drink it for a Month, to have all these great and admirable things performed by it. It may be taken to four ounces, upon occasion.

XIII. The
**English Herbs.**

**Chap. 247.**

**XIV. The Essence.** It has all the Virtues of the liquid Juice; and by reason of its Fineness, much the better and pleasanter Medicine to be taken. It powerfully opens Obstructions of the Liver and Spleen, Reins, Bladder and Womb, is good against the Yellow Jaundice, Dropsy and Gout, and provokes the Terms in Women. It is good against the Bittings of Serpents, and the Poyfon of the Asperis, or other poisonous Herbs; but in caff of the Stone, Gravel, Sand, Strangury, &c. it ought to be taken for twenty or thirty days together, stiff falling in the Morning, and laid at Night going to Bed. If the Life of this Medicine is continued longer, it not only removes the Stoppage of Urine and piling by drops, with the Sand, Gravel and Tartar of the Reins, and all other Defects of the Urinary Parts, but it is full perfect to cure them, as also those who are troubled with the Stone, so that those Pains shall never return again, which thing Authors fay has been proved by Experience, on fuch as have been a long time troubled therewith. Dofe three or four Spoonfuls at a time in generous Wine.

**XV. The Decoction in Wine.** It has all the Virtues of the liquid Juice and Essence, but is lefs powerful, and therefore ought to be taken three or four times a day, sweetned with a little double-refined Sugar. It is ufually taken (as well as the other Things) to excite Cofion, and is fuppofed to be good against the Erench Difeafe it felf.

**XVI. The Powder of the Root.** This being taken to a draught in a Glafs of White Lisbon Wine, with the Addition of half a dram of Ducor or Wild Carnation, or twelve Stone and Gravel from the Reins and Bladder, provokes Urine and the Terms, confiders the Colick, refills Poyfon, and cures the Bittings of Serpents and other venomous Creatures. It is fuppofed to be good againft the Scrophula, or thofe Tumors and Kernels in the Throat called the Kings-evil, being often taken Morning and Night in two or three ounces of the Essence abovefald.

**XVII. The Ointment.** It is made of the bruifed Root, boiled in Hogs Lard. This being applied to broken Bones, Splinters, Thorns, &c. remaining in the Flefh, does not only draw them forth, but heals up the place again, makng new Flefh where it was conflamed or eaten away.

**XVIII. The Cataplasme.** It is made of the Roots beaten into a Pulp, or raw, or boiled, and then beaten into a Mafs. This being applied to Bruizes, or Kings-evil Sores, or to the Bittings of mad Dogs, Serpents, or of any other venomous Creature, it draws out the Malignity and Poyfon, and quickly heals the Sore. In the Gout, whether of Hands or Feet, it gives prefent ease; and applied to Apo- thems, it quickly ripens and breaks them.

**XIX. The diffiluted Water.** It is drawn from the whole Plant when the Leaves and Stalks are young; and is probablf taken for all the Purpofes afofald: It removes Melancholy from the Heart, and is good for Quartan and Quotidian Aques, as alfo for them who, by Convulsions, have their Necks drawn away, or cannot turn them without turning their whole Bodi- es; but in all these Cafes the Juice or Essence are more powerful; and they may be taken in this di- ftilled Water for a Vehicle.

**XX. The liquid Juice of the Leaves.** Being dropt into the Ears, it is fuppofed to expel a Poffeffion there- in. And Gerard fays, that being drunk with Wine, it is a Remedy for thofe who are troubled with a Gomorrhe or Running of the Reins.

---

**CHAP. CCXLVII.**

**Of EYE-BRIGHT Common or Meadow.**

**I. The Name.** It is called, as fome fay, in Greek, Εὔφραγία; in Latin, Euphragia, Euphrasyne, (which is alfo a Name of Bug- laria) Ocularis, Ocularia, Photofulceus and Euphrasia: in English, Eye-bright.

**II. The Kinds.** There are many kinds of this Plant, but there are but twoprincipal Species which are known to us, or at leafl grows in our Coun- try, viz. 1. Euphrasia, Euphragia, and Euphrasia vulgaris, Our common Meadow Eye-bright, of which in this Chapter. 2. Euphragia, and Euphrasia Eufrafae Coelestis, (yet the Leaves are far less than thofe of Flax;) Euphragia oculata, Euphragia, vel Euphrasia Ocularis, Woody Eye-bright, of which in the next Chapter.

![Eye-bright plant illustration](image-url)

**III. The Description.** It has a Root which is long, fmall and thready at the end, from which af- singly rises up one fmall, long, blackish green Spike, a foot high, or not much more, spread out from the bottom into feveral Branches, on which are fift small, long, dark green Leaves, pinned at their ends, and lined about the edges, though like a Sun, two al- ways fett together, and very thick. At the Joints with the Leaves, from the middle upwards, come forth fmall white Flowers, ftripped with purple and yellow Stripes, and Spots mixed therewith, after which follow fmall round Heads, with very fmall Seed therein. This being found on fome hilly Ground, does sometimes vary in Color of the Flower, as being fometimes more white, fometimes more yellow, and fometimes more purple.

**IV. The Places.** It grows in dry Meadows, in green and gruffy Ways, and Patches lying to this
Salmon's Herbal. Lib. I.

XXXI. There is a kind of Meadows near Ixworth, within a Mile or encouraging Moor of the Towns, in Meadows near Hornchurch, and between Hornchurch and Rainham: also in most parts of Kent, in the seven Hundreds and wards of Greenford, and in the places thereof, and indeed it is frequent in Meadows and fally places in most parts of the Kingdom.

V. The Times. It flowers in August and continues to September, the Seed ripening soon after.

VI. The Qualities. It is hot in the first Degree and dry in the second, and is effectually appropriated to the Eyes: it is greatly Astringent and Digestive.

VII. The Specification. It is a pithful Remedy (confirmed by Experience) against all Diseases of the Eyes.

The Virtues.

IX. The liquid Juice. Taken inwardly Morning and evening to two or three spoonfuls, in a Glass of generous Wine, it strengthens the Eyes and Optic Nerves, helps a weak Brain and Memory, strengthens a weak Sight, andreadonly it, being decocted, in a short time. Outwardly dropped into the Eyes two or six times a day, it takes away Clouds, Pains, Blood-shot, and other things which obstruct the Sight.

X. The Essence. It has the Virtues of the liquid Juice, being inwardly used and outwardly applied, may be given inwardly to two or three spoonfuls in a Glass of Wine, Morning and Night.

XI. The Decoction or Infusion in Wine. It may be made in White Lisbon or Madeira Wine, or your Spanish Mountain Wine. It has the Virtues of the liquid Juice and Essence, but not altogether so powerful: a quarter of a pint of it may be drunk in the Morning sitting, then half an hour before Dinner, as much as you in the Afternoon, and lastly, the like quantity at going to Bed. It strengthens the Stomach admirably, and by consequent the Head and Optic Nerves.

XII. The Powder. Its Virtues are the same with the Juice, Essence and Wine aforesaying, but it excels not its Virtue so obviously, or so soon: it may be given to one dram Morning and Night, in a Glass of Wine. If the Powder be thus compounded, you will find it much better: Take Powder of Eye-bright five ounces, Powder of Rosemary-flowers three ounces, Powder of Nettles one ounce, Powder of Aloe half an ounce, Powder of white Pepper two grains: mix them. Dose one dram, as before.

XIII. The Conserve. It has the Virtues of the Powder, but not altogether so effectual, because of its being cloyed with Sugar. You may take as much as a Wafer of it Morning and Night, drinking after it a Glass of good Wine. If you make it of equal parts of Eye-bright and Rosemary-flowers, it will be so much the more effectual: For Rosemary seems to be a Speciſtick to cure Difficulties of the Eyes.

XIV. The Drink. It is to be put into, or Turned up with new Ale before it has done Working, to every Gallon you may put eight handfuls of the Herb, which you may gently tittle, and put into a thin Bag made of a Dairy-Wives Night-cloth, with a Saucy twist to make it fertile. This is to be put into the Ale or Beer whilst it is Working, which, after three or four days, may be drunk as ordinary Drink: the agreeable Use of it admirably strengthens the Eyes and clears the Sight.

II. The Abridgment. The green Herb made into a Camouflage by beating in a Mortar, and then applied to the Eyes, is good against hot, sharp and cooling Rheums, Weeping of the Eyes and Blood-shot, affords the Illumination, eases the Pain, takes away the Dimness, and clears the Sight.

XII. The clarified Water. It is laid to have the Virtues of the Juice and Essence, but much more weak, but may serve as a Vehicle to take some of the other Preparations in. Outwardly used to the Eyes, (especially if a little white Sugar Candy is dissolved in it) it is of good Use against an Ophthalmia, Pains and sharp Humors, it takes away Clouds, Films and Pearls, and clears the Sight.

CHAP. CCXLVIII.

Of EYE-BRIGHT Woody.

The Name. It is called in Greek, Euphrayia lutea; in Latin, Eufragia, vel Euphragia lutea; Eufragia pratensis rubra: in English, Woody Eye-bright, Red Woody Eye-bright.

II. The Kinds. There are two Species hereof, viz. 1. Eufragia lutea major, Eufragia pratensis rubra major; The greater red Woody Eye-bright. 2. Eufragia, vel Eufragia lutea minor, Eufragia pratensis rubra minor, The lesser red woody Eye-bright.

Great red woody Eye-bright.

III. Natura. The first of these is the Eufragia alata Dodonaei, Lebede Amaranthi, the Solomon's pratenfae rubra Langhamensis: the Obitantes Tiberiores: the Euphrategia rubrum Thalle, and the Cauphrategia Euphragica Gerardi, who makes it a

Kind
kind of Crotanecus, against the Evidence of Dodo-
neum, which is indeed an Error. The second is the
Branche, (the Indian Bunch, (in his Pharmac.) but
the Euphrasia pratensis lutescentis, (in his Pi-
nax,) and Euphrasia purpurea minor, (in his Pro-
dromus,) and the Euphrasia mon scripta terestris
vulgaris.

IV. The Descriptions. The first, or Greater red woody Eye-bright, has a Root which is
made of several hard and woody Strings, from which
rises up one woody, square, brownish Stalk, divided
into several Branches, a little above the Ground, so
that it seems to be a pretty Bush, about half a yard
or two feet high, set with somewhat long and nar-
row Leaves, pointed at the ends, and a little demed
in about the edges, two always set together at a
Joint, one against another, which will, in the Heat
of Summer, turn reddish: the Flowers are gaping
and Hooded, of a purplish red color.

V. The second, or Smaller red woody Eye-bright, has a small woody Root, springy and block, from
which rises up one square, reddish, hairy Stalk, an
hundred or more high, sometimes without Branches,
and at last but two, very feldom more, which
are compisited with a few thick, hairy and almost
round Leaves, set two together, and deeply cut in-
to parts; the lower Leaves, which are the left, but
into three parts, but the upper, which are the grea-
ter, into five or fix parts. The Flowers come forth
sometimes from between the Leaves and the Stalks,
and sometimes they stand in Tufts at the tops, two
standing together, Hooded, and of a purplish color,
coming out of long green Husks; sometimes the
Flowers have been observed to be white, yet but
very seldom: which being faded or pulled away,
the same after them (contained in the said Husks)
long and covered with white Seed.

VI. The Places. They are found in several parts
of England, the chief chiefly in many places of Kent,
in barren Fields and waste Grounds, and in some
places near and about London.

VII. The Times. They flower about the latter
end of July, and in August, the Seed ripening soon
after.

VIII. The Qualities, Specification, Preparations
and Virtues of these Plants, are much one and the
same with those in the former Chapter, so that no
more need be said thereof in this place.

CHAP. CCXLIX.

Of FETHERFEW Garden.

I. THE Names. It is called in Greek, Μαλιττ, (Μαλιττά, quod plantam Virginiolam, qua woodenem mur-
bus utriniis meditar, & inde vulgo maritaria:) in Latini, Parthenium, Maritaria & Feftrigae: in
English, Fetherfew and Fetherfew, (from the Latin Name) it being good against FEVERS or Agues.

II. The Kinds. It is twofold, viz. 1. Partheni-
num, vel Maritaria horufris, The Garden Fether-
few, of which belong to this Chapter. 2. Parthenium, vel Brerifae foliifera, Wild Fetherfew, of which
is in the next Chapter.

III. The Garden kind is also twofold, viz. 1. Par-
thenium urbanum, Mufcifera, and Brerifae vulgaris, and Brerifae vulgaris furo fle-
plis, Thaeteaum Fetherfew, with a single Flower.
Galate says this was called Anthemia, Helme, and Li-
mefris in his time: Pliny says, that Helme was cal-
ed Parthenium and Parthenium, Alh. Lusantelitamam and

Toamptic, so that it seems Parthenium was a word
applied to many Herbs, but it is only proper to our
Maritaria. 2, Parthenium, vel Maritaria furo fle-
plis, Anthemia, aemifolia fle fle plenis, Double-
flowered Fetherfew.

Sweet Garden Fetherfew.

IV. The Descriptions. The first, or Single-
flowered, has a Root which is somewhat hard and
short, with a multitude of strong fibres at it, making
it like a Bush of them: from the Head of this Root
spring up many large, fresh green, winged Leaves,
very much cut in on the edges: the Stalks are hard
and round, set with many thick like Leaves, but
something smaller, and at the tops stand many sin-
gle Flowers, growing upon many small foot-stalks,
confiding of several small white Leaves, longish,
and pointed, standing about a yellow Thrum in the
middle. The Smell of the whole Plant is strong, but
agreeable enough to that Sense, and of a very bitter
Taste.

V. The second, or Double-flowered Fetherfew, has
a Root like the former, and in its Stalk and Leaves,
as also the Smell and Manner of Growing, it is so
like the other, as not to be easily distinguished from it
till it comes into Flowers, and in that is the only Dif-
ference, for whereas in the former the Flower was
only single, in this they are very thick, and double
filled, as it were, with white Leaves, so that only a
little yellow Spot is to be seen in the middle.

VI. The Places. They both grow in Gardens
with us, and yet they have both been found growing
Wild in this Kingdom, which is a Rarity. I rather
think, that where they have been found growing
so, that it was by some Accident they grew them,
as the Planting of some Seed, or by cutting the
Plants out, and calling them into some other
place, where possibly they might take root again,
and so grow up and fold, and find their Seed in the
same place.

VII. The Times. They flower in June and July,
and their Seed is ripe not long after.

VIII. The Qualities. They are hot in the third
Degree, and dry in the second, are Acute, fit for

Ey,
Salmon's Herbal

Lib. I.

Salmon's Herbal

Five, Afterfire, Astringent, Camminative, Digestive, Dittander and Saponarse, Cephalick, Neurrick, Stormrick, Pelcoral and Hysterick, Emmengogick and Alkaesperick.

X. Of the Specification. It is peculiar for provoking the Terms in Women, and forcing away both Birth and After-birth.

The Virtues.

X. The liquid Juice. It is good against the Fits and Ruffling of the Mother, the Hardness and Inflammation of the Womb, being taken once or twice a day, two or three spoonfuls at a time, in a Glass of Wine.

XII. The Efficace. It has the Virtues of the Juice, and comforts and warms the Womb and all the Parts of Generation afflicted with Cold and Coldness, andfluxed with thick, rough and cutaneous Humors: it provokes the Terms powerfully, and brings away the Child, either dead or alive, as also the After-birth: it cleanses the Roads, Urethra, and Bladder, expelling Stone, Gravel, Sand, or vitious Matter obstructing them. It provokes Urine, and gives ease in the Strangury. Dose two spoonfuls in the diffilled Water, or in White Lisbon Wine.

XIII. The Decoction in White Port Wine. It has the Virtues of the Juice and Efficace, but less powerful; and therefore must be given to all the_fail Intensions in a much greater quantity, viz. to five or six ounces, dined with white Sugar, and to be taken twice a day, viz. Morning, Noon and Night.

XIV. The Wine: It is made by a reiterated Infusion of the Herb and Flowers in White Lisbon or Port Wine, for a Week or more. It admirably strengthens the Stomach, warms and comforts the Viscera, and cleanses them from cold, putridious and vitious Humors: if it is drunk for some Months, it is fayd to rectify and strengthen the Consistency of the Seed, and to cure Barrenness in either Sex; it is good against Melancholy, and Heaviness or Suddens of the Spirits. Dose a quarter of a pint three or four times a day.

XV. The Syrup. It is dedicated to the Blood and Lungs, and is used with good Success against Coughs, Colds, Stuffings of the Lungs, Asthma's, Wheezing, Shortness of Breath and Difficulty of Breathing; it opens the Pipes, and cleanses them of the rough and vitious Matter adhering to them. Dose one or two spoonfuls, to be lick'd alone with a Liquoricke Stick, that it may dillfay the Throat and glottis.

XVI. The Powder of the Herb and Flowers. If it be taken, as Disturberg says, in Wine, to a dram or somewhat more, mixed with Oystef, it will purge like to Epitomium, both Choler and Flem; and will be available for all such as are Short-winded, or are Althunick, Bechick, or are troubled with Hypochondriack Melancholy, Heaviness, Grief or Suddens of the Spirits. It is good for such as have the Vertoing, or Pains or Aches from Stushings of Humors, or from a cold and molif Caffe.

XVII. The Conplion. Being made of the green branched Herb, and applied to the Crown of the Head, it effects all Pains thereof, as Cataractuar says, coming from a cold Cause: it is also profitable for such as have a Glorynefs or Swimiing in the Head. Applied to the Wrists, with some Salt mixt with it, two hours before the coming of the Fit of an Ague, the Patient with drinking at the same time half a pint or more of the aforementioned Decoction in Wine, it cures the same, being four or five times used.

XVIII. The diffilled Water. Authors say, that it is good to take away Freckles and other Defects in the Face and Skin. I think, that if to every quart thereof you put one ounce of Sal Nitritis or of Sal Tartari, mixing, diffolving and filtering it thro' brown Paper, you will then have an excellent Colicure to clear the Skin of Tumors, Sun-burning, Yellowows, Freckles, Lentils, Pimples, Scurf, Morphe, and other like Defects of the Cutis.

XIX. The Spirituos Tincture. It expells Wind, and is powerful against the Collick, whether in Stomach or Bowels: it warms a cold Stomach, comforts and strengthens it, revives the Spirits, clears the Heart, fortifies the Womb, and makes it vigorous and fit for Conception. Dose half a spoonful or more in a Glass of White Lisbon, Morning and Night.

XX. The Acid Tincture. It is good against Nausifing, and Hops Vomiting, strengtheneth the Stomach after an admirable manner. It is prevalent against all the Caches and the Green-Beefy in Virgins, makes a good Stomach and a strong Digestion, opens the Obstructions of the Womb and provokes the Terms, and rectifies the Defects of the Instruments of Generation, occasioned thro' Weakness.

Dose so many drops as to give the Vehicle a pleasant Acidity, and that three or four times a day or more.

XXI. The Oily Tincture. It is good against all cold and moist Distempers of the Head, Brain and Nerves, as Head-aches, the Megrism, Vertigo, Apoplexy, Epilepsy, Convulsions, Folly, Rheumatick Pains, Coldick, and other like Distempers of those Parts. It is inwardly to be taken Morning and Evening from twelve drops to twenty four or thirty, dropping it first into Sugar, and mixing them well together, and then drinking the whole mixture, and latter drinking it or. It powerfully opens Obstructions of the Womb, Reins, Ureters and Bladder, prevails against the Strangury, and expels Gravel, and other like Distempers of those Parts. Outwardly against Pains and Aches, Convulsions and Policys, it is to be well anointed upon the Parts affected Morning and Night.

XXII. The Saline Tincture. Thereto it provokes Urine and opens Obstructions of Reins and Ureters, yet it is mostly used against Pains of the Gout, external Affliction and Distempers of the Skin, such as we have enumerated as Soft and adhering: for which Purposes the Parts affected are first to be bathed with warm Water, to open the Pores of the Skin, then being wiped dry with a Cloths, the Saline Tincture to be laid on, washing the Parts well with it twice or thrice a day, and letting it dry on.

XXIII. The Spirit. It is highly Cordial, good against swelling and growing Pains, the spasm of malign Fevers, and the Poison of the Plague it fel. Given in a little Poffe-drink, it drives out the Measles and Small-Pox powerfully, and so secures the Life of the Patient. It is singular also against the Convolvulus.

XXIV. The diffilled Oil from the whole Plant dried. It has all the Virtues of the liquid Juice, Efficace, Tinctures and Spirit, but is much more powerful
Chap. 250.  English Herbs.

powerful than them all, and may be given to all the same Intentsions, from eight drops to fifteen or twenty, first drop into Sugar, and then mix with the Vehicle you design to give it in, whether it be Wine or any other Speciick Liquor. It may be given twice a Day, viz. Morning and Evening; but in case of a Woman in Labor, or in any Fits, whether of the Mother, Collick, Convulsions, Apoplexies or Falling-fits, it ought to be given at that moment only.

XXV. Potencies or Powers. They have all the Virtues of the Juice, Essence, Tinctures, Spirit and Oil extracted; in which the Virtue and Efficacy of the Plant is so Fidelized, as that it penetrates momentarily into any Part they are applied to, whether they be inwardly given or outwardly used. Do not rise from one to two draams, and upon Extremity to three, mixed with a Glas of Water, or any other Speciick Vehicle.

XXVI. The Elixir. This is the Powers elixirized and brought yet to a greater degree of Efficacy in Operation, being vehemently Subtil, and full much more elixirized in their Virtues and Effects. It may be given inwardly from half a Dram to a Dram and half or two Drams (according as the Necessity may require) in a Glas of Water or other in Vehicle, Morning and Night, or either, as you see fit.

CHAP. CCL.

OF FETHERFEW WILD.

The Name. It is called in Greek, Matricaria, in Latin, Parthenium, in English, Wild or Field Fetherfew.

Naked-flowred Fetherfew.

II. The Kinds. This is the second Species of Fetherfew, and is twofold, viz. 1. Parthenium, and Matricaria bullata, floribus aureis, Naked Fetherfew. 2. Parthenium, and Matricaria graci albus, Matricaria altiva, Communis, Anthemis tensifolia, odorata Tabernmontani, Matricaria odora, Fotherfew, Sweet-scented Fetherfew.

III. The Description. The fast, or Naked Fetherfew, has a bushy fibrous Root, like to the others, from whence spring up Leaves and Stalks, spreading themselves forth into many Branches, not at all differing from the former in Shape or Manner of Growing. At the tops of the Stalks and Branches grow the Flowers, not like the former, for this is a Head of naked yellow Thrums, without any Pale or Border of white Leaves, as are in the others, which is the only thing by which this kind differs from the other two, and for which Reason it is called Naked Fetherfew.

Sweet-scented Wild Fetherfew.

IV. The second, or Sweet-scented Fetherfew, has a bushy fibrous Root, like the first, Common kind, and in its Leaves, Stalks, Branching few and flower, it differs not at all from the first, being in all things so like, that there can no Difference be preserved between them, till you come to smelling it, and then you will find it to be of a more pleasant and odoriferous Smell, which so continues in the kind, and is not altered, nor made so by Air, but is the Work of Nature only, nor yet degenerates from this Excellency by any Accident or Casualty whatsoever.

V. The Place. It first grows in Essex, and was there found growing by one Mr. William Cops. The second has been found Wild in many places of England, (as well as the former naked kind.) Correvard also says, that it grows in an Island called Utop, in the Lesser Sea; but they are also (both of them) nurs'd up with us in our Gardens.

VI. The Time. They Boreer both of them in June.
OF FENNY-STONES, O R, MARSH-PALMS.

T H E Names. We know of no Greek Name belonging to them; but in Latin they are called, Serapias, vel Orchis palustris, and Orchis palustris palaefis: in English, Fenny-Stones, and Palmed Fenny-Stones, or Marsh-Palms.

II. The Kinds. There are several kinds of them, as: 1. Serapias vel Orchis palustris palaefis: Thin-leaf'd Fenny or Marsh handed Orchis or Stones. 2. Serapias vel Orchis palustris palaefis laticolus, Fenny or Marsh handed Orchis or Stones. 3. Serapias vel Orchis palustris palaefis carpefolia, Marh or Fenny handed Orchis smooth-leaf'd. 4. Serapias vel Orchis palustris palaefis maculata, Spotted Marsh or Fenny handed Stones. 5. Serapias vel Orchis palustris palaefis draconites, Marsh or Fenny Dragon handed Orchis or Stones. 6. Palma Christi palaefis maxima, The greatest Fenny handed Stones. 7. Palma Christi palaefis radicis repente, Creeping Fenny or Marsh Palms.

III. The Descriptions. The first, or Marsh handed Stones with broad Leaves, has a Root which has long Directions at the bottoms of the Hands, the top of the Root is thick and knobby, divided into fingers, like those of Palma Christi, of which that may be said to be a kind. From this Root rise up thick, fair and pouncy Stalks, set with broad, smooth, green Leaves, like those of Plantana, but much longer; these are growing in order upon the Stalk, even from the bottom to the top or beginning in the Spike of Flowers, growing smaller as they grow higher, and appear nearer to the Spike. The Tuft or Spike of Flowers is large, consisting of many small hooded Flowers, of a somewhat whitish of pale bluish color, spotted within with deep purple Spots, the backfides of which Flowers are of a Violet color mixt with purple: and every Flower, at its rising up from the Stalk, has a small greenish Leaf accompanying it.

IV. The second, or Thin-leaf'd Fenny handed Stones, has Roots equally like to those last described; the Stalk is also like, but it differs from the former something in the Leaves, for in this Plant they are smaller, being neither so broad nor so long, sometimes spotted, but more uniformly without; neither is the spiky Tuft of Flowers so large or long: they are thick like the fiff, nor has it so many green Leaves or long Leaves mixed with, or growing between the Flowers, which are of a Violet purple color, but not altogether so dark a purple as the former are.

V. The third, or Fenny or Marsh handed Stones smooth-leaf'd, has a banced and fanged Root, with some Strings adhered to the upper parts of them, like unto the two others: the Stalks are much alike: the Leaves are like the leaf, but smaller and narrower, and without Spots; and the Flowers are of a whitish color, but more purly white, the Flowers and the whole Plant being in Magnitude, Shape or Form, and Manner of Growing, but little differing from the others.

VI. The fourth, or Fenny or Marsh handed Stones spotted, has Root fashioned like a Hand, with some Strings adhered to the upper parts thereof: from the Head of which Root rise up a fair Rif Stalk, armed with large Leaves, very notably divided into thick blackish Spots, clipping or embracing the Stalk round about. At the top of the Stalk hands a fair Tuft or Spike of purple Flowers, with many green Leaves mingled among the same, which makes the Buff or Buff much greater. The Seed is nothing else but Dust; as it were, (like all the rest of the kinds) and is contained in small twined Vellvis, which Vellis are not peculiar to this alone, but common to most of the other Orchids.

VII. The fifth, or Fenny or Marsh Dragon-handled Stones, has elft or divided Roots, like Fingers, much like unto the Roots of Palma Christi, of which this is a kind; and from this Root rises up a Stalk of a foot high, set here and there with very fair Lily like Leaves, of a red color, and which do clip or embrace the Stalks almost round about, like the Leaves of Thorn-ium. At the top of the Stalk grows a fair Buff of very red Flowers, among which Flowers do grow many small sharp-pointed Leaves. The Seed is a thing hard or difficult to be observed, being much like Dust, which is blown away with the Wind.

VIII. The sixth, or Great Fenny handed Stones, commonly called, Great Fenny or Marsh Palma Christi, has banced Roots, like to the others, from which rise up a large Stalk, sometimes in the height of three feet; the Leaves are much like to those of the former kinds of Fenny-Stones before described, and the Growing on a large spiky Head are of an elegant purple, with little Hooks, like the top of an Helmet; whence Grama called the Plant, Gramaorchis [Complex]...
Chap. 252. English Herbs.

Chap. CCLII.

OF FENNEL Common.

I. The Names. It is called by the Arabians, Ramesini; in Greek, Μαροφαίον; in Latin, Foenicum; and in English, Fennel.

II. The Kinds. There are four principal kinds of Fennel, viz. 1. Foenicum vulgare, or Vulgar Fennel, which in this Chapter. 2. Foenicum dulce, Sweet Fennel, of which in Chap. 253. 3. Foenicum subulare, Wild Fennel, of which in Chap. 254. 4. Foeniculum, Hog or Saw Fennel, of which in Chap. 257. following.

III. Of the Vulgar or Common Garden Fennel, there are two sorts, viz. 1. Foenicum major vulgaris, The greater common Garden Fennel. But the smaller calls it Foenicum phylactum: Cowenrites in horro Days, that some took it to be Hippomarathrum, but that was a Miltale, as we shall shew in Chap. 254. 2. Foenicum minus, Foeniculum femine rotundum minor, Small Fennel, or Fennel with a smaller round Seed.

Fennell.

IV. The Descriptions. The first, or Common Garden Fennel, has a Root which is long and white, running down deep into the Ground; spreading it itself out into several branches: from this Root rise up diverse round Stalks, four or five feet high, which spread themselves out (as many of their Joints) into diverse Branches of long Stalks, of five, six, seven, or eight Foot long, fince Leaves, fucceeding fomentum fpring, but not infesant: and at the tops, on several Branches, there are Tufts or Umbels of small yellow Flowers, which turn into small, long, roundifh-colored, bittern; greenish Seed, two always together, as in the other Umbelliferous Plants, which being ripe, and once dried, become of a fad grey color. Of this Plant there are truly two sorts, (the one Definition does serve them both;) the one wholly with green Leaves; the other with reddish Leaves, or with reddifh green Leaves, they not differing one from another in any thing alike.

V. The second, or Small Fennel with smaller round Seed, in its Roots, Stalks and Leaves differ not from the former, but only that they are every way fmall, being much bow lower than it; and that the Umbels at the Heads of the Stalks are white, and the Seed which follows is less than the ordinary fort, being more like to Carum or Coriander Seed: the whole Plant, both in Small and Tall, and in its Form and Manner of Growing, is the same with the other Common Garden kind.

VI. The Places. These Plants grow in all hot Countries, in Asia, Africa and America, and in some of the West Indies Islands. To this, they feed their Cows with it: but with us in England it grows only in Gardens.

VII. The Times. They flower in June, July, and August, and the Seed is ripe not very long after.

VIII. The Qualities. According to Galen, it is hot in the third Degree, and dry in the first: it is admirably Aperifive, Inflifive, Anodyne, Carminative.
Salmon's *Herbal*.  
Lib. I.

**The Virtues.**

XII. *The whitened Leaves and Stalks.* They are whitened after the same manner as you whiten Carp-e Eadge, or Sallcy or Smallage Stalks, &c. being thus whitened, the Italians are said to take great delight in eating them as a Sallet, for then they are very tender, and pleasant to the Taste: they contain four and warm a cold Stomach, help to digest crude Spasmatick Humors bred from violent Meats. *Fennel* being thus eaten, it breeds Milk in Nurtos Breasts, provokes Urine, and encreases the Seed: opens Obstructions, expels Wind, and provokes Urine. The conutant eating of this whitened *Fennel* for some considerable time, I have known a very vehement Elibating Breath, and to make it as sweet as theirs which never drank milk.

XIII. *The liquid fials.* Mixt with a Glas of Wine or Ale, and to be taken by Nurtos, it encreases Milk in their Breasts, expels Wind, provokes Urine, and, cures the Pains of the Stomach and Stomach, expelling all the praetemural Matter in the Urinary Parts. It is said to break the Stones, more effectually if it be taken with a grain of Salt. Dole three or four foopunls Morning, Noon and Night in any fit Liquor.

XIV. *The Effences.* It has all the Virtues of the *Jujres*, with which it encreases Seed, provokes a glas against the Colick, cures the Tortion of the Bowels or Griping of the Guts from acid or sharp Humors, strengthens the Stomach, and caues a good Digestion. It opens all the Obstructions of Liver, Splen and Gall, and thereby much conduces to the Cure of all such Difficulties as arise from these Causes, as Whity Swellings of the Spine, Hepatick-flu, Yellow Jaundice. Being dropped into the Eyes, it cures almost all Difficulties affecting that Part. It opens Obstruclions of the Womb, and provokes the Cour- ries effectually. Dole three or four foopunls.

XV. *The Decoction of the Leaves and Roots, or Scientists Wine.* The^this has not altogether so much Force as the Juice and Effence, yet it is very good for all the same Intentions, and is much more used, because it is pleasant, but then it must be taken in a much greater Dole. It is an excellent thing to open all Obstructions in the whole Body, to cleanse the Blood, to stop the Ceste, and take away Gastrick, to provoke Urine and the Menstruus, to amend the Ill Color in the Face after a long Sickness, and to caue a good Habit thro' the whole Body. If such as are grown over the flood oft often drink of it, it would leen them their Fat, abate their Healt, and much remove their Unwholesomes, making them more nimble, agil and Pleate.

XVI. *The Syrup.* It is one of the greatest of Pel- chores, for as it is a powerful Oponer of Obstructions of the Lungs, and Dilatation of their Tumor, it famously caues Expulsion, and gives cafe in Affints, Coughs, Cold, Hoarsnecks, Wheezing, Stonefulness of Breath, Difficulty of Breathing, and other like Difficulties of those Parts. If here- with you lived well either the Juice, Effence or Decoction, and let the Patient take two or three ounces three or four times a day, it cures Ucers of the Lung, or any Soucrs of the Stomach, and much refines in Contaminations; in which last cafe it is good for the Patient to take a Mill-Diet, and to drink a quart of Milk warm from the Cow, well sweeneed with this Syrup, every Morning faffing, as much Milk as twoedeen at Eleven before Noon, another quart at Five in the Afternoon, and lastly, another quart at Bed-time in like manner. If the Patient cannot drink a whole quart, let him drink as much as he can, and continue this Course for several Weeks, or till he recovers, by this Method I have known several perfectly restored out of very deep Contaminations.

XVII. *The Powder of the Seed.* It strengthens the Stomach, gives cafe in the Colon, opens Obstruclions, and helps Stomate of Breath. You may give it Morning and Evening from half a dram to two drams in these Times. For a continuall Use of it wonderfully strengthens the Spirit.

XVIII. *The Oil by Infusion or boiling.* It is a

Azyne, and cures all sorts of Pains in any Part of the Body, coming from a cold and cold Cause. It gives cafe also in Infarctions, by gently diffusing some part of the thinner Matter. If it is an Apoplexy, which will come to Suppuration, it ban- kils it, and brings it as much as may be to a point. It cures the Gout and other Pains of the Joints and Nerves.

XIX. *The Balsam of the Leaves and Roots.* It is one of the greatest of Vulneraries, and cures cample Wounds at one Intention, for the most part at one Dressing. I am apt to believe, that this Balsam, for the Curing of Wounds and Ulcers, &c. is not inferior to the famous Balsam made of the greatest Wound-Heals, as Sanicle, Softleaf, Crown-Wound-cors, All- beel, &c. It dries fomt and cures Ulcers, cleanes, invencures, dries and heals after a very admirable manner.

XX. *The digilit Water.* It is of good Use, as a Vehicle, to convey other Preparation of this Plan, in, and has all the Virtues of the aforomng Prepara- tions, but in a much lower degree: it is not to be dropped into the Fyes against Ophthalmies or In- fiammations and Blood-shot, as also against hot and sharp Rheums, with which the Fyes are commonly allted, which cayes Clouds, Flims, Pearls, &c. to be seen in them, but it is better for all those Pur- poses, if white Sugar-Candy or clarified Honey be dissolved therein; then if uereted, it cleaneis the Ulcer or Sore, prevents the Afflux of Riwax, dries and heals it in any Part.
cath in the Colic, and prevails against the Yellow Jaundice. You may take from two drams to four in a Glass of White Port Wine, at time of Extremity, otherwise Morning and Night, so long as Need requires, with the Powder of Nux Vomica, or Balsamum, or of the Nervus and Tendons, and particularly any one of the Nervus and Tendons, and particularly any one of the

XXII. The Acid Tincture. It cures preternatural Dis Charges, Nervings, foraying any part, and of the Gout or Sciatica, Cramps or Convolvuls, in a short time it gives Safe and Relief.

XXIII. The Aed Tincture. It cures preternatural Dis Charges, Nervings, foraying any part, and of the Gout or Sciatica, Cramps or Convolvuls, in a short time it gives Safe and Relief.

It is powerful against the Biting of mad Dogs, Vipers, Rattlesnekkes, and all other Serpents and venomous Creatures whatsoever; and after a singular manner prevails against Atinna's, and all forts of Obliterations of the Lungs, inciting, diluting and causing an Excitation of the tarterous Matter affecting them. Dose for many drops as to make the Vehicle generally pleasant in all the Patient drinks.

XXIV. The Saline Tincture. It is good against Stomach and Gravel, being given a dram or more at a time in White Lisbon Wine. Outwardly bathed upon Parts affected with Herpes, Tetters, Kingworms, Pimples, Redness, Yellowness, Tawing, Stools, Feces, and such like and being given, makes the Skin, as also Sand, Gravel and tarterous Matter to be expelled by Urine. Bathed upon the Back-bone, and upon the Parts affected with the Palsy, it is very effectual in the Cure of that Diseas, but then you must rub it upon the Bony Portion Night and Morning, and it will very well in a considerabl time. It gives present eafe in the Gout and Sciatica proceeding from a cold Caufe, and by a constant Application thereof many cures these Diseases. Inwardly, to give Relief against Stone and Strangury, you may take from ten drops to thirty in any lque vehicle.

XXV. The Spirit from the Seed, or Juice for ments, is very efficaciously employed as a tied and Cordial, it refreshes, comfort and strengthens the Stomach after an admirable manner, taking away Vomiting, nausea, want of Appetite and Indigestion, &c. It cherishes the Heart, revives the Spirits, fortifies the whole Habit, and makes the Body able to withstand Diseases. It singularly expels Wind, and gives eafe in all gisting Pain in the Stomach or other Vifera. It may be taken to one spoonful or two, either alone or for itself (being delicated) or mixt with a Glass of Wine, every Morning fasting.

XXVI. The Oil distilled out of the Seed. It has all the Virtues of the Juice, efficacy, Decoction, Syrup, Powder, Tinctures and Spirit, and much exceeds them all in its Potency and Might of its Operation. It may be given from four drops to twelve, fifteen or twenty, according to the Age, and as the Necessity or the Affection requires. In the use of it, drop it first into white Sugar, and mix them well together, then mingle all in a Glas of Wine, and so drink it off. This may be done Morning and Night, or at the time of any Paroxism, so long as you see need. Outwardly anointed upon the Wound or Perforation of a Nerve, it gives immediate Eafe and Relief, anointed down the Back-bone, and upon the Parts affected with a Paralytic Morning and Evening, it wonderfully restores the Paralytic Parts, and in a little time after compleats the Cure.
Salmon's Herbal. Lib. I.

which, by means of the Gutter, you may receive in a Vessel, which keep for Life. This has all the Virtues of the former, and full as beneficial for the Blood, Bile, blood-shot, dim, cloudy and blinding Eyes as the other, being dropped into them three, four, five or six times a day, as you will need requires.

XXXII. The Gum of Fennel, or its Infusit, Juice. It has all the Virtues of the liquid Juice, and may be given from one dram to two, dissolved in any Specifick Liquor or Wine. If this Gum or Juice is dissolved in some of the distilled Water, and sweetened a little with white Sugar-Candy, and it is given to Nurses to drink, it breeds much Milk in their Breasts: and if it is dropped into the Eyes, it very much clears the Eyes from Clouds, Milks, Films, Blood-shot, and other like Matters which obliterate the Sight. In Southern Climes, and very hot Countries, if Fennel-Stalks are wound with which they are green and growing, the Juice will exsudate and become this natural Gum: but in our cold Countries, it yields not to this Operation; therefore we are obliged to make the Juice by Expressi

C H A P. CCLIII.

Of FENNEL Sweet.

I. THE Names. It is called in Greek, Melenon : in Latin, Foeniculum vulgare, and in English, Sweet Fennel.

II. The Kinds. It is the second general Species of the Fennels; but differs in Sweetness according to the Country in which it grows.

III. The Description. This is its Roots, Stalks, Leaves, Flowers and Manner of Growing, is perfectly like our Common Fennel, excepting that it neither in Foreign Climates, where it grows naturally, nor yet born with us in England, does grow so large, or rise to so great a height as the Common large Garden kind does: and with it with some difficulty endures the Hardships of our Winters; but the Seed of this is much larger and longer than that of the Common kind, yellower, and very much sweeter in Tafle, coming near to the Sweetness of Amoefed, which it continues in hot Countries, but holds not our any long time to that Perfection, neither as to its Magnitude, Color or Sweetness, but decaying yearly, does at the third Years Sowing yield as ordinary Seed as the Common kind.

IV. Note 1. From this you may observe, that it is the Clime and change of Soil that causes this Alteration, making it either larger or smaller, longer or shorter, yellower or paler colored, and makes it to be either sweeter or bitterer in Tafle; which Change of Accidents has made some think, that there were divers sorts of this Sweet kind, whereas indeed there is no more than one.

V. Note 2. There is a kind of Fennel, which the Italians call Cardam Fennel, and which they would make different from this Sweet kind; but it is no such thing, for it is only the Acre of the Ancient it, which seemingly makes the Difference from this Sweet, which is done by Transplanting and Whitening it, by which means the Leaves are made to grow much more thick and bulging together than the Ordinary, the Whitening of it also giving it a sweeter Kind, a pleasant Tafle, and a better Crispness in eating.

VI. The Places. It grows universally in almost all hot Countries; and flourishes well enough in our Gardens, being sown with Foreign Seed every Year, where the Seed is sown comes to Perfection; but you ought to sow every Year new Foreign Seed, not the Seed of the English Productien, because that is very apt to degenerate.

VII. The Times. It flowers and seeds with us in July and August, and if it is an early and warm Spring, towards the latter end of June, and the Seed is ripe in August or September.

VIII. The Qualities, Specification, Preparations and Virtues of this, are the same with the Common Fennel in the former Chapter, saving that this is accounted the more excellent and efficacious of the two, and therefore to the Discourse and Sections of the former Chapter I shall wholly refer you.

C H A P. CCLIV.

Of FENNEL Wild, or HORSE--FENNEL.

I. THE Names. It is called in Greek, Melenon, &c. in Latin, Foeniculum agrestis, Foeniculum vulgare, Hippomarathron, and in English, Wild Fennel, and Horse Fennel.

II. The Kinds. It is the third Species of Fennel, and is threefold, viz. 1. Foeniculum vulgare commuin, Foeniculum narthecium Matthioli, The vulgar or
or common Wild Fennel. 2. Fennelium stalbifre Creticum, Hippomarasbam Creticum, Honmari Bellii, Platanusino Creticum, Great or Horse Fennel of Candy. 3. Hippomarasbam Phoraepophila, Great round-headed Horse Fennel. Angulatus supposes the fist of these to be Hippomarasbam norma.

Horse Fennel

III. The Descriptions. The first, or Common Wild Fennel, has a Root like to the Common Garden kind, and grows up with great Stalks, but fewer than it, having also but few Leaves, and those very thinly set thereon, but somewhat stiffer or harder in bending, and shorter also. At the tops of the Stalks grow small Umbles of yellow Flowers, not much unlike the Common, saving that they are leffer, which being past away, the Seed follows, being small and a little roundish.

IV. The second, or Great Horse Fennel, has a great whitish Root, not much unlike the former, from whence springs up a round, but crested Stalk, three, four, or five feet high, about the thickness of one's middle Finger or Thumb, having very few Leaves therefore, but shorter than the Ordinary fort. This Stalk is divided into several Branches, bearing at their tops Tufts or Umbles of yellow Flowers, which being past away, there comes in their places great, large, and almost round Seed. This is the Plant which Bellon makes mention of in his first Epistle to Caesar, which is extant in the end of his History of Plants, whole Seed, as he there says, is as large as that of Cichory or Cynarae. Herb Frankincense, nearly as big as Hordes Decorativa, or Hulh'd Bury.

V. The third, or Great round-headed Horse Fennel, has a Root which is long and white, and endures many Years, from whence rise up large Stalks, four or five feet high, with Fennel like Leaves, and spreading themselves forthcoming the tops into many Branches. At the tops of which Branches grow round, Globe like Umbles of Flowers, of a purplish Violet color, which being past away, there comes in their places large Fennel like Seeds, but of a very strong Smell, almost smelling. This Plant is taken notice of by Alpinus libro de Exoticis.

VI. The Places. They all grow naturally in hot places, as Turkey, Barbary, Spain, Italy, &c. The first was brought to us out of Spain by Boel, and the last grow well in our Gardens, being raised from the Seed brought to us out of their native Countries.

VII. The Times. They all flower in the end of Summer and beginning of Autumn, as in July, August, and September, and the Seed is ripe not very long after.

VIII. The Qualities, Specification, Preparations and Uses of all these, are the same in all respects with those of our Common English Garden Fennel in Chap. 372, foregoing, so that nothing more need be said of them. Authors say, that these Wild Fennels are hotter and stronger than the Common Garden or Sweet Fennel, and therefore more powerful to assuage the Stone, but not so much to excite Milk in Nurses Breasts, because dryer in Quality.

Bellon says, that in Candia they use the Seed of the Second fort to Dye their Hair yellow.

CHAP. CCLV.

OF FENNEL Hogs, or, SULPHUR-WORT.

I. THE Names. It is called in Arabic, Harbatam; in Greek, Truxis; in Latin, Fennelium Porcinum, Fennelium and Porcinum; by Apuleius, Penuselum, (forsoode from its Prey smell;) and in English, Hog Fennel, Sow Fennel, Hoar-strange and Sulphur-wort.

Hogs Fennel
Salmon's Herbal. Lib. I.

III. The Decriptions. The first, or Common Hogs Fennel, has a Root thick and long, sometimes almost as large or thicke as a Man's Fingers, black without and white within, of a strong and sulphurous Smell, and full of a yellow Sap or Pith, which being expressed, quickly grows hard and dry, furnish ing me much animal to Sulphur or Brimstone, which induced some to call it Sulphur-wort, having also at the top, towards the upper Face of the Earth, a certain Bath of Hair, of a brown color, from a mong which the Leaves and Stalks do spring up. From this Root then, springs up a stiff and hard Stalk, full of Knees, Knots or Joints, befet with Leaves, like to Fennel, but greater, coming nearer to Fennel, or rather like to the Leaves of the Wild Fennel-tree, (from whence, as also from the Smell, might come the Name Pimpinellina.) At the tops of the Stalks grow round fowy Turfs, full of little yellow Flowers, which being paid away, do turn into broad brown Seed.

IV. The second, or Great Hogs Fennel, has a Root growing greater and deep into the Earth, with many other Branches and Fibres about them, having a strong Smell, like hot or melted Sulphur, which being cut, yields forth a yellow fliht or clammy Juice, almost like to a Gum. From the Head of this Root proceeds several long branched Stalks, of thick and somewhat long Leaves, three for the most part joined together at a place, among which rise up a frafted Stalk, ftrain, and near as thick as a Common Fennel-Stalk, with feveral Joints thereon, and Leaves growing thereon, towards the top of which it spreads it felf out into feveral Branches, and on the tops of the Stalk and Branches grow feveral Tufts of yellow Flowers, which being paid away, there comes fomewhate flat, thin and yellowifh Seed, twice as Large as Fennel Seed.

V. The third, or Small Hogs Fennel, which is the Dwarf kind, has a Root about the bignefs or Thick ness of a Man's Thumbs, sometimes greater, fometimes leffer, with a Bath of Hairs at the top, black ifh or brownifh on the outside and white within, with a thick Bark, of a pleafant fweet Taffe at first, and afterwards fharpe the whole Plant is lefs than the fift kind before defcribed, having fmalller and thinner Leaves, of a blufhing green color, of a little better Taffe, but almost of no Smell. The Stalk is fliender and round, about half a yard high, which spreads it felf into feveral Branches, at the tops of which grow fmall Tufts of white Flowers in an Umbel, which being paid away, there succeeds thick short Seed, almost like Parley Seed, but of an All color, and of a bitter fharpe Taffe.

VI. The Places. The fift grows in many places of this Kingdom, as in the fide low Marthes near Perifhim in Kent, and in the Meadows adjoining, which is it found plentifully; also on the South side of a Wood belonging to Waltham, in the Nofe in Esfex, by the Highway fide, also at Whiflable in Kent, in a Meadow near to the Sea side, fome time belonging to Sir Henry Crifp, and adjoining to his Houfe there. The fecond grows upon the Sea Cofts of Italy, Spain and France, and is only found with us in Gardens. The third was found on Vincent's Rock by Briffol, where Labu gathered it, and some others -- as to this third kind, Gerard says, that it grows not above a foot high, and is in Shape and Leaves like to the True Peucedanum, or our fift kind: but Johnson (the fucceffive Author of that Herbal) fays the Stalk is about half a foot high, divided into feveral Branches, croffed, broad, bearing at their tops little Umbels of white Flowers, confi sting of five Leaves apiece. The Reafon for these various Differences, as to the Height of the Stalk or Plant, I fuppofe must be from the Variety of the places where it grows, and from the Riches or Poverty of the Soil, which makes many Plants differ in that Reafon, making one and the fame Herb to be fometimes greater, fometimes leffer.
nine to purge the head of pituitious, cold and moist Humors, and so does good to those who are troubled with the Megrim, long and invertebrate Head- aches, Vertigo, Leukony, Epilepsy, Apoplexy, Phreni- ty, and all other Diseases of the Nerves and Tendons. Given to two or three spoon-fuls in a Glass of White Liquor, it purges the Belly gently, expels Wind, dissolves the Hardness of the Spleen, and cures the After-pains of Women in Child-bed.

XII. The Infusiate Juice. It has all the Virtues of the Liquid, being diffilved in Wine or Water, and used in the same manner: diffilved in Wine and dropped into the Ears, it cures the Pains in them, and put into an hollow Tooth, it cures the Pain thereof: diffilved in Water, and given to such as are troubled with Vapors or Fits of the Mother, it cures them: diffilved in Wine to the Thickness of Turpentine, it cures the Ruptures of Childrens Navel when they flick forth, being applied with good Bandagine: and given to one or two drams, diffilved in White Liquor or Port Wine, it provokes the Terms in Women, and facilitates the Birth, brings forth both Child and After-birth.

XIII. The Decoction of the Root in White Liquor and Wine. It has all the Virtues of the liquid and infusiate Juices, but in a much less degree. Efficacy: sweeten'd with Honey or Sugar-Candy, it is good for Coughs, Colds, Catarrhs, Affum's Swellings of Breath and Difficulty of Breathing, expels Wind, Colick, Coughs, and Cellies. Dole four, fix or eight ounces three or four times a day. It is a good Lotion to wash moth running Sores withal, for it cleanses and dries them, strengthens the Part, and induces the Healing.

XIV. The Powder of the Root. Being put into in- venterate and foul Ulcers, running Sores, and such like of difficult Cure, it cleanses them throughly, removes any Splitters of broken Bones, or other things in the Flesh, strengthen's the Part admirably against Diffusions, dries them, induces their Cica- trizing, and perfectly heals them, and therefore is also of extraordinary Use to be put into open Ulcers and Balsams as are Venerable, and applied to the Cure of Rubbous and rebellious Ulcers, Flibbity's, and the like. This Powder being taken to a draught of Water or mixed with the Seed of Garden Rais half a dram, and taken in Wine and Water mitch, or in Water alone, it allays Vapors from the Spleen and Womb, and cures Fits of the Mother.

XV. The Cataplais. It is good to be applied to the Blisters of mad Dogs, Vipers, Rattle-Snakes, and other Serpents and venomous Creatures, for by its powerful attractive Force, it draws forth all the Venom and Poison from the Part, and secures the Life of the Patient: but this is to be understood, that it must be made of the green Root beaten to a Pulp, and it will be so much the better, if half the quantity of Garlic be added to it, and also that it be applied to the Wound whilst it is recent, or pre- ferably after it is made. This Cataplasim draws forth likewise Thorns, Splinters, and such like things which are got into and in the Flesh: and it is good against Pains and Ach's of the Joints, or any other Pains, proceeding from Cold and Mole- flure.

XVI. The Balsam. It is good for cleaning, dry- ing and healing of old Sores, purifies and quickens Ulcers, and the like, in any Part of the Body. It is an excellent thing against the Scarcities and Great, whether in Hands, Arms, Legs or Feet, and gives ease in any other Pain, as also in Tumors or Swel- ling's, bringing Apotheoses to Suppression in a little time: it warms, comforts and strengthens any Part deflubbed from Cold, or a flux of Humors upon the same.

XVII. The Spirituous Tincture of the Root. It powerfully warms and conquers a cold Stomach, cleanses and incalculates the Womb, facilitates the Birth, and brings both it and the After-birth away, it is good against Fainting and sporing Fists, and all cold and moist Dis TEMPE of the Head, Brain and Nerves, as Vertigo's, Appoplexy's, Epilepsies, Leukony's, Convulsions, Pally's, and the like, being inwardly taken, and outwardly applied to theParts affected. Dole from one to two drams in some spirit Drink Vehicle Morning and Night.

XVIII. The Acid Tincture. It cures Nausco- nets and Vomiting, and so absolutely strengthens a weak Stomach, that there are for that purpose but few things better. It is a most helpful thing to expel Vapors and the Fits of the Mother, expels Wind, and gives ease in the Colic. Bathed upon places affected with the Gout for some time, it absolutely cures it. It causes a good Appetite and a strong Digestion, retifies the Difficulty of the Blood and Humors, purifies them, and absolutely cures the Gout, whether in a hot or cold Habit of Body. Dole so many drops at a time as may make a Draught of Beer, Wine or Ale pleasantly acid.

XIX. The Oily Tincture. It cures Dis TEMPE of the extrem Parts arising from Cold and Moisture, strengthens the Nerves and Tendons, being anointed on the Parts affected, and is a truly salutory thing against Convulsions and Pally's. It opens Obstruc- tions of the Reins, and cleanses the Ureters and Bladder from Stones, gravel, Sand and scurvy or vilous Matter adhering to them, and gives prompt Relief in the Strangury: it also repels the Eys of Agues, being given in some in Vehicle two hours before the coming of the Fit. Dole from one to twenty drops or more in a Glass of generous Wine, being first well mixt with white Sugar, and that Morning and Night.

CHAP. CCLVI.

OF FENUGREEK Garden.

I. THE Names. It is called in Arabick, Ḍub, Ḍubbe and Ḍolbe : in Greek, ἂνυγρακον. In English Herbs, 4\* 2

II. The Kinds. They are principally two, viz.

1. Fenugreecum sativum, Garden Fenugreek, of which in this Chapter. 2. Fenugreecum syriacum Wild Fenugreek, of which in the next.

III. The Description. It has a Root which is small, and made of many Fibres, perishing every Year after it has perfumed the Seed, before Winter; from this Root springing sometimes but one, sometimes two or three long, slender, trailing, hollow, green Stalks, which spread themselves out into several Branches, or which do grow, at several Spots, many Leaves, almost like those of the Meadow Trot-Mallow, but rounder and lighter, green on the upper side, soft and tender.
Fenugreek

I.
The Peas. They grow almost in all parts of the World: in Foreign Countries they grow whole Fields of it, for fodder for their Cattle: but with us it is only found in Gardens, and yet it grows as well here as in any other place.

II. The Times. In Foreign Nations they sow it for Seed in the end of January or beginning of February, but we in England sow it not until April, and it flowers with us in the beginning of July, and the Seed is ripe in the end of August or beginning of September: but for Food for Cattle, it is sown before Winter, as is before hinted.

III. The Qualities. Galen says it is hot in the record Degree and dry in the fifth: it is Apertive, Chalding, Astringent and Vulnaryry, a good Pesto
tal and Hyperiak and vitial Cathartic, purging away gross Humors.

IV. The Specification. It is peculiar against the Dysentery and other Fluxes of the Bowels, as also a Gonorrhoea.

V. The Preparations. You may have them from, 1. The prepared Pulfe or Seed. 2. A De

The Virtues.

for Food. This, says Alpinus, the Egypcians eat: and Callus says it was used (among the Grecians) in this time, for that it makes such as eat it to grow fat, and therefore is thought to cure Consumptions, and to be good for Conchiptive People. Those Egyptians did use to eat it as they did Lupins, not that it was more agreeable than Lupins, having nothing in its own proper Substinance which is ob
nous: sometimes the Peas is preserved in Pickle, and to cure to keep the Body soluble.

X. The Decollation in Wine. It mollifies the Hard

ess of the Spleen and Worms: and esases the Pains of those Parts, opens their Obstructions, and is good against Hypochondriack Melancholy, makes smooth the Bowels, and helps the Dilectile called Tensum, which is a defer to often go to Stoo, without doing any thing. It prevals against a Dysentery or Bloody-flux, and all other Fluxes of the Bowels. Applied to the Forehead with Cloths dipt therein, it less the Flux of Humors to the Eyes, eases their Pains, and takes away their Inflammation. Used also in Clyses, it is said to be good against the Stone, by opening and mollifying the inward Parts. It cures Ulcers in the Rectum and the other Guts: drunk to the quantity of half a pint, it purges and cleanses the Stomach of gros and evil Humors. If the Decollation is made with Dates and Honey, it mollifies or cleanses the Brest and Lungs, cures Expectoration, and heals Ulcers of those Parts. The Decollation being made in Wine or Wat
ter, and given inwardly half a pint or more at a time, Morning and Night, for some days together, cures a Gonorrhoea.

XII. The Bath. It is made by boiling the Seed in Water till it is broken. If Woman sit in it as hot as they can endure, it opens Obstructions of the Womb, and (if it be about the time) provokes the Terms. Rathed upon Parts affected with the Gout, it eases the Pain thereof, and removes Aches which come of Cold: it is also good to wash the Head and Neck, and to cleanse it from Scurf, Morphew and dry Scabs. It heals Ulcers of the Womb, strengthens the Part, cleanses, dries and restores its Tone.

XIII. The Meal or Powder. Taken to two drams mixed with a little Honey, it is Pectoral, and causes an Excretion of many pernicious Humors which lodge in the Stomach and Guts, matures inward Apoplectic, cleanses Ulcers in the Brest and Lungs, and heals them, and eases the griping Pain of the Bowels: but in some People it is apt to overturn the Stomach or cause a Loathing, especially in such as are weak and tender, but troubles not those as have Strong stomachs, as have most of your robust Country People.

XIV. The Maculage. Applied to the Joints, it gives ease in the Gout and other like Pains. Ap
died to the Forehead with Cloths dipt therein, it "pox Fluxes of Humors to the Eyes, easing their Pains and Inflammations. Taken inwardly with Honey, it is Pectoral, and causes an Excretion of thick, rough and goods Humors out of the Brest and Lungs, and is profitable against Coughs, Colds, Carvings, Afthma's, and other Dilectile of those Parts.

XV. The Oil, made by Expression or Infalvation. Label Eys it is of more Virtue than will be believed, and that it is good to diffuse hard Tumours or Kernels, affuates festerous Swellings, mollifies the Intestines, Womb and other Parts, removes Scurf and Morphew, and cleanses, dries and heals Ulcers of the privy Parts.

XVI. The Cataplasm. It is always made of the Meal, mixed with other proper Ingredients. If it is made by boiling it to a Thickness with Meal, it
is Emmollent, and wakes away hard Swellings. If it is made with Vinegar and Nitre, it cools all manner of Inflammations, softens hard Tumors, and eases them to aTrick away. It eases the Pain, and softens the Hardness of the Spleen. Applied to the running Sores of the Head, called *Aegota, Achoris,* it cleanses, dries and heals them: and if it is also applied to weak and feeble Parts, whether ulcerated or not ulcerated, it strengthens them; and it ulcerates, cleanses, dries and heals them. Made with Linseed and *Marshmallow* Roots, it is an excellent Emmollent, and also a Magistative, where the Tumor will be brought to Suppuration. The Meal beaten up with *Goat's Hair* made into a Pessary, and put up the Worm, softens the Hardness thereof, opens its Obstructions, and mollifies all the Parts adjacent to it. Made into a Complaid, by boiling it up with the left White Wine Vinegar, and applied to the Tতাক, it is an excellent thing to fortify and abate any hard Tumor or Swelling there, and to ease the Pain thereof. Applied also to the Joints, it eases the Pain of the Gout.

XVI. The liquid Juice of the Leaves. Physicians seldom use any thing of this Plant besides the Pulp or Seed; yet Experience has informed us, that if the Juice of the Leaves is taken with Honey, that it purges the Body by Stool from all corrupt and obstruitive Humors, cleanses the Stomach and Bowels, and by reason of its mucilaginous Substance, alleviates the Sharpness of the Joints, and eases the Torments of the Guts: and by reason of its cleansing and flouring Faculty, it expeditates tough and sharp Humors out of the Bruit and Lungs: it this it more effectually Performs, if it is made into a Lozeng, with Pulp of fat Dates.

CHAP. CCLVII.

OF FENUGREEK Wild.

I. THE Names. It is called in Greek Τικών *Tikón*; in Latin, Foenum Grecum *Foenum Grecum*; and in English, Wild Fenugreek.

III. The Descriptions. The first, or Greater Wild kind, has a Root which is thick, tough and fibrous, bearing some Fibres adhering thereto, from which spring forth several Stalks, which are round, and spread themselves forth into many Branches, which are full of Knobs or Joints, not much unlike to the Garden kind. From each Joint proceeds a small tender Foot-stalk, upon which do grow three Leaves, and no more, somewhat shapen about the edges, like as the former, or somewhat like to those of *Sain-Foire* or *Burgundy-Hay*; and from the same Joint also come forth small yellow Flowers, like unto the Maraud, which stand more together at the end, bringing forth small long Coils, like those of the *Garden,* and which contain within them several Joints and dark seeds.

IV. The second, or Letter Wild kind, has a tough creeping Root, with some Fibres thereon; from the Head of which Root spring up many tender Stalks, and no more, somewhat shapen about the edges, like as the former, or somewhat like to those of *Sain-Foire* or *Burgundy-Hay;* and from the same Joint also come forth small yellow Flowers, like unto the Maraud, which stand more together at the end, bringing forth small long Coils, like those of the *Garden,* and which contain within them several Joints and dark seeds.

V. The Places. They both grow Wild in Spain and Italy, but with us are only nurs'd up in Gardens.

VI. The Times. They flower with us in July, and the Seed is ripe in August or September.

VII. The Qualities, Specification, Preparations and Virtues of thefe, are not declared by any Author; but if one may make a Judgment by the Form, Smell, Taste, Substance and mucilaginous Properties of the Herbs and their Seed, they differ not from those of the Garden kind in Chap. 256. foregoing.

CHAP. CCLVIII.

OF FERN Male.

I. THE Names. This Plant is called in Arabic *Suax,* in Greek *Phegus,* in Latin, *Ficus,* in English, *Fern.*

Mal Fern

II. The Kinds. There are many kinds of Fern, as 1. *Ficus Majus,* called by Nicolas in Teucri, *Nicares,* or *Basses,* Male Fern, (and yet this very Species *Aeguta,* *Cuspinus* and *Griber* call *Fasina* of which we shall treat in this Chapter.) 2. *Ficus Femina,* Female Fern, of which in Chap. 257. 3. *Ficus Quern,* Oak Fern, of which in Chap. 260. 4. *Ficus Saxatilis,* Rock or Stone Fern, of which in
Salmon's Herbal. Lib. I.

Chap. 262. 5. Filix flexa, aquatic, erect, pate- 
first, Water Fern, or Olmound Royol, of which in 
Chap. 262. To thefe you may add, 6. Polypodium, 
Filoac, Polypodium, 7. Lachenia officinalis, Rough 
Spreader, or Birthworts Fern. 8. Asplenium ce-
rich, Smooth Spleen-wort, of all which in their
proper places.

III. The Male kind is that which we treat of in
this Chapter, and is called by Nicolades, Blechnum.
It is, 1. Filix vulgare, Our common Male 
Fern. 2. Filix aculeatae minor, Filix aculeata minor 
Bambus, Prickly Male Fern. 3. Filix minor, acu-
leta major Bambus, The greener prickly Male Fern.

IV. The Definition. The Jfr, or Common 
Male Fern, has a Root consisting of a brown, fcaly,
thick Head, from which Head nothing but a multi-
tude of small, black, hairy Fibres or Strings proceeds,
growing from the lower parts thereof; from this 
Head of the Root spring forth feveral hard, rough,
unbranched Stalks of smooth Leaves, naked or bare
at the lower ends. These at the beginning of the 
Spring you may perceive to come forth of their fold-
ing Scales, covered with brownish Scales or the Su-
facing Parts of the Earth, very closely joined together.
A young Plant has but a few Leaves, but an old one
has ten, twelve, or more. Each Stalk of Leaves,
at its lower end, near the Joining to its Fellows, at
its first appearing, before it is an inch long, is
borne of those black fibrous Roots for its Nourish-
ment. The Leaves being come to their full Growth,
have each of them a threefold Division, as the 
Fern Female. 1. The main Stalk. 2. The fide 
Branches growing from it. 3. The Nerves grow-
ing on those fide Branches beaing the Leaves. The 
main Stalks of fome of these Leaves, are sometimes
one, two, three or four feet in Length or Height,
which are full of fioe brownish Scales towards the 
Root, where they are naked of Leaves, as beforefai.
These Stalks of Leaves confift of many fide 
Branches of Leaves up to the tops, with one Leaf
at the end, and they are fat on both fides thereof,
not fully oppofite, but as it were, in the middle,
between two Branches of Leaves on the contrary 
side, from which there are certain brownish fmall 
Spots, which are faid to be the Sced, for by the 
felling of it this Plant does wonderfully en-
crate. The main Stalks of allfle Leaves are fmall,
the fide Branches round on the other fide, naked
of Leaves from ten to twenty inches, (according to the 
Height thereof) where the fide pitch Branches of 
Leaves fega, the longest of which fide Branches
are the third part of the Leaf, being in fome
Plants, fix, seven, eight or nine inches long; and
from this lengthy part they grow shorter and shorter
in the middle, between their Oppofites. The Leaves on the fide 
Branches, are from a fuch to almost an inch and
half long, and fo grow shorter and shorter towards
the tops of the fide fide Branches of Wings, from
twelve to fourteen to twenty in number on each fide
the longest Wing or fide Branch. The fmall Leaves
grow by couples for the molt part on the Nerve,
each Leaf being a little cut into on the edges, each
Leaf with a triangular Root, green on the upper
side, and paler on the under, each Leaf ha-
v ing two Kows of dully red Scales, of a brown or
blackish color. Towards the top of the main Stalk
those fide Branches change into Nerves, bearing only
the Leaves. When the Leaves are at their full
Growth, you may fee in the midst of them at their
Roots, the fide facle folding Cluthers, and as the 
old Leaves, with their black thready Roots, wholly
perifh, fo the fide facle folding Cluthers springs
up again; but in warm places, you will many times
find the old Leaves green all the Winter.

V. The fepend, or Prickly Male Fern, differs not
much from the former, but only that the winged
Leaves are not dentel'd, but whole, having a small
Prick at the end of each of them, and growing not so
high. This Parkerfon thinks he is the Filix acu-
leta minor Bambus, but thinks, that there is but
little difference between it and his major.

VI. Gerard defcribes that which he thinks to be
Filix aculeata minor Bambus after this manner: 
That male Stalks of this are of a deeper green than either
of the former, and are placed on the Nerve not very
clote together, but that you may plainly fee between them,
and this Leaf (especially thefe next the Stalk) 
being on that Side fayfeft off the Stalk, a large Ear
or Outgrowing, along with a very sharp Prickle,
and very fine or fmall, as doth also the top of the
Leaf. Some of the fides of the Leaves are also
nichet or dented on, ending with the like Prick or
Hairs, and each Leaf has two fome of foidly 
Scales.

VII. The Places. They all grow on Heaths and
open places of Hills, as also in frequenry places by
Fields fides; and are frequent in many Counties of
England. The fift grows plentifully in the boggy,
shadowy Moors near Durham Abby in Suffolk, as al-
fo on the muddy Shadowy Rocks by Maple Durham
in Hampshire, near Petersfield; it has also been
found growing on the old rotten Stocks or Bodies
of Osakes, near the faid Moors. The fegond grows
in shadowy Woods and Cafes. The third Mr. John Gooder f aid growing on the shadowy 
Moift Rocks by Maple Durham near Petersfield, 
afopemamed.

VIII. The Times. They feldom keep their Stalks
with their Leaves green in Winter, but feed forth
now from the Root in the Spring, which at their
fift fpring are brownish and folded in round, as a
foam; at the time when their Heads or Scales on
the back of them are ripe and do fall, is Midsum-
mer, and falling on the Ground, do spring again,
by which the Plant is increafed.

IX. The Qualities, Specification, Preparations, 
Vertues and Ufes of the Male Ferns, are the fame
with thofe of the Female, related in the next Chap-
ter, and thither I refert you.

C H A P. CCLIX.

Of F E R N Female.

I. T H E Names. It is called in Greek, Φίλιξ 
γενής, Vlex γενής, Thelypteris and Nymphopteron 
Wils.: in Latin, Ficca Femina, and in English, Fe-
male Fern, Brake or Common Fern.

II. The Kinds. It is the fegond general Species, 
and is threefold, viz. 1. Ficca Femina vulgarius. Our
common Female Fern: but Goodyer in his Yorks 
flates that Ficca Femina vulgarius is in Yorkshire 
mafe obfcura nee dentata. 2. Ficca Femina pinna
dentata, Ficca Femina altera ternafolra Thellis, Fe-
male
III. The Descriptions. The first, or Common Female Fern, has a Root which is long, and slenderer than the former, of about a Finger's Thickness, and bluish for the most part, creeping under Ground; from this Root rises up but one Stalk, (seldom two) which is round, shivered, and something edged, growing sometimes higher than the Male, and branches forth into such like winged Leaves, growing on both sides, like to the Leaves of the Male Fern, but licker, set on bud bases thereof, for the most part one against another, and more dentèd than the Male, yet not sharp, but round-pointed, as arising a Smell as the former, and having the like Spots on the backside of them. This Stalk (as also the Root, as some say) being cut aliope somewhat long, will in the white Pith thereof have some certain Reflection or Form of a spread Eagle.

IV. The second, or Dented Female Fern, has a Root like the former; from which springs up one main Stalk, which is fuller of Branches, and grows not up so high as the other, nor so strong: it has alth small winged Leaves, like the first or Common Female, which are set on each side of the middle Rib, but somewhat sharp-pointed, of a more flat, green color, and narrower than the other; and spotted on the backside, but in any thing else little differing from the first Female kind.

V. The third, or Sharp-pointed Female Fern, from a pretty thick black Root, feeds forth the main Stalk, which is about a foot in Height, and branches it self out into winged Leaves, each of which is not dentèd, but whole, and ending in a small Prick or Point.

VI. The Places. The first grows more frequently than the Male kinds on barren Heaths and Hedge-sides in most places thro' the Kingdom, and indeed in almost all barren, dry and defect Places. The two latter grow rather on moist Rocks and Shady Hills.

VII. The Times. They flourish at the same times that the Male kinds do, and their Leaves perish in Winter in like manner.

VIII. The Qualities. They are all of them, both Male and Female, hot and dry in the first Degree; Astringent, Aperitive, Alkali'tive, Colic'retic, Diuret'tic, and Vulnerary; dedicated to the Liver, Spleen and Womb, Cathartic and Emmenagogick.

IX. The Specification. Ferns kill Worms, provoke the Terms in Women, heal Wounds and cure putrid Ulcers.

X. The Preparations. You may have therefrom: 1. The green Leaves. 2. A Decotion of the Roots in Mead or White Port Wine. 3. A Powder of the Roots. 4. An Ointment. 5. A Mixture. After, of which Spains Barilla is made.

The Virtues.

XI. The green Leaves. They being eaten purge the Belly, cleansing the Bowels of colicke and wa'stith Humors; but they also at the same time trouble the Stomach, and cause either Vomiting or nausea.

XII. The Decotion of the Roots in Mead or Wine. It kills Worms in the Body, both long and broad, powerfully opens Obstructions of the Spleen, taking away its Swelling and Hardness, and repels Hypochondriack Melancholy. Dose half a pint Morning and Night, fasting an hour after it in the Morning, and taking it an hour after Supper.

XIII. The Powder of the Roots. Taken to a dram inwardly in a Glass of White Port, it opens Obstructions of the Liver, Spleen and Womb, and provokes the Terms: it is used with success in foul, putrid and malignant Ulcers, for it cleanses them, incursates and dries up the putrid Mortification, and induces a speedy Healing. The Powder of the Leaves, brings away both Birth and After-birth, being taken to one
Salmon's Herbal. Lib. I.

Chap. CLX.

Of Fern Oak.

The Name. It is called in Greek, Σωμέντα; in Latin, Elia Quercus et Ulmus; in Holland, Orschoff, quas Velic usus seco; and in English, Oak Fern; but here is to be noted, that there is another foot of Oak Fern, called Polyodon, which is in no Species of the Plant we here intend, and therefore shall lay nothing of it in this place.

II. The Kinds. This Oak Fern is threefold, viz. 1. Spotted fern, Elia Quercus repens, Dryopteris repens, Loddiges, Matricolio, Querni altruirigium, Dryopteris fovea, Vivus ortus, Trago; 2. Striped Fern, Dryopteris Eolo, Dryopteris Candida Daudesi, Adiantum album Floin, Adiantum filicis folio Blandis, White Oak Fern. 3. Omptides mar, Black Oak Fern.

III. The Definitions. The first, or Creeping Oak Fern, has a root which is small and blackish, creeping under the surface of the Earth, with several small black fibres growing from it, and is somewhat like unto the root of Polyodon, but much smaller and thinner, and of a more soft, soft, and flabby texture. From this root spring forth several slender blackish Stalks, little more than half a foot high, bearing many small winged Leaves, each standing against the other, something like to those of the Female Fern, but much smaller and thinner, and of a dark green color, the backside of which are not known, but with white spots upon them, fix in a double Row, as Loddiges affirms.

IV. The second, or White Oak Fern, has a thick Root, forming a bunch or knot of blackish fibres or Threads growing forth from it, so many as even to obscure the thick part thereof. From the Hend of this Root spring up many Stalks of winged Leaves, but not much higher than the former. When exceeding seven or eight inches in Height, the Leaves upon the Wings are broader than the other, and broader, also more deeply cut in on the edges: They are likewise of a much paler green color, and spotted on the backside with spots something like to those of the Male Fern.

V. The third, or Black Oak Fern, is both Male and Female: the Male has a root made up of many Strings, not much unlike the Male Fern, but shorter. From the Head of this Spring forth several Stalks of winged Leaves, which are diverse, but not to be exactly defined: the Stalks and the Ribs of the Leaves are blackish, but the Leaves themselves of a deep green color. The Female Black Oak Fern is almost like to the Male, saving that its Leaves are not so sharp at the Points, and are more white and broad than the Male, in which consists the chief Differences.

VI. An Observation. The first of these described at fect. 3. above, some Authors lay, 1. does not grow among themselves, like the Roots of Polyodon, but they are not above the Bigsack of a Wheat Straw, coal black without, white within, and about fix or seven inches long, having an innumerable company of small Fibres like Hairs growing thereon, and is of an alluring Taste, excelling to Sweeter.

2. That the Stalks spring from the Roots in several places, variable in number, according to the Length and Number of the Root: Some Plants have but one or two Stalks of Leaves, others again have eight, ten, fourteen, or fifteen, &c. 3. That the Stalk has a toofed Dividion, first the Stalk growing from the Root fix or seven inches high and no higher, (and yet some Authors say it is about a foot high): Secondly, the Nerve bearing the Leaves: the main Stalk is no bigger than a Grubs Stalk or Brist, flat on the one side and round on the other, smooth and green. 4. That the first pair of Leaves grow
Chap. 261. English Herbs.

grow about three inches from the Root, and all the leaf following grown by couples, almost exactly one eighth another, in number about eight, nine, or ten pears, the longest feldom exceeding an inch in Length. 5. The leaves grow also on the nerves by couples, eight or nine couples on a nerve, of a yellowish green color, and without any Dentate on the edges: yet some other Authors fly, that the leaves are like those of the Female Fern, but much thicker, and more finely indented or jagged, so finely cut in, that in them they resemble Ferns, fat round, about a small Rib or Sinew. 6. That the backfides of the leaves are sprinkled, not with ruf fet or brown Spots or Spikes, as the other Ferns are, but are as it were painted with white Spots or Marks, not fading out of the leaves in Scales, as the Spots in the Male Fern, but smooth or flat, and double in each leaf, close unto the middle Rib or Sinew.

VII. The Places. Thofe do indeed grow in shady thick Woods on Mountains, and sometimes in the open Valleys near them, as also among the Mufs growing on old Trees, chiefly Oaks, whence came the Name Milus Musgo, which is a kind of Mufs Fern, growing amongst the Mufs on Oaks and other Trees, and in the tops of their Trunks when they are grown up.

VIII. The Time. Neither thefe nor any of the other Ferns (except Water Fern) have any manifleft Flower or Seed, fo that their Siftions are not to be fpotted. As for the Leaves, they perfift in Winter, and put forth aftricks in the Spring.

IX. The Qualities. The first is hot in the first Degree and dry in the fourth; Astringent, biting and very thripick in Taffe, and, as Rendicrion thinks, of a delicious or monticulous Quality. The other three kinds are like in all their Qualities to English Maiden-hair Fern, and therefore, as to their Specifications, Preparations and Virtues, we fhall refer you thereon.

X. The Specifications. The fift of thefe kills Worms, and deftroy the Roots of the Hair.

XI. The Preparations. You may have therefrom,

The Virtues.

XII. The Powder of the Root. Matthioth fays, that it is mixed with Salt and Bran, and given to Horfes, that it kills Worms in them: but I fuppofe it must be repeated Morning and Night for several days.

XIII. The Cætophas. It is made of the Roots and Leaves bruised and beaten together. Diagnofes fays, that it is applied to places troubled with Hair after Sweating, (because then the Pores are open, and to give a more ready inlet to the Virtue of the Medicament) it is a Depulitory, or a good Remedy to deftroy the Roots of Hairs.

CHAP. CCLXI.

Of Fern. Rock or Stone.

I. The Names. It is called in Greek, Φυσκώσια, when more; in Latin, Filix Saxatilis; Chasfishia, in French, English, Rock or Stone Fern; also Dwarf or Small Fern.

III. The Description. The fift Small or Stone Fern of Clusius, has a long, black and Renter Root, creeping under the upper Court of the Earth, and spreading after, with a few slender hard Fibres, growing thither. From this Rudicke fpring forth several Stalks of winged Leaves, about a foot high, which is branched out into several Wings of Leaves, very like unto the Female fern, but much tenderer and delicate than they, and more finely dent'd on the edges, and spotted also on the Stems of them, like to the other Ferns.

IV. The second, or Second Stone Fern of Clusius, has a thick Head of a Root, much like to that of the fift Male Fern. From which fpring forth many small Knobs, with a vall number of black Fibres or Threads. From this Head of the Root fpringing, up several ftrait round Stalks of Leaves, green about at first, but blackifh when full grown, about four or five inches high, fhooting forth winged Leaves from the main Stalk upwards, with Densings in on both sides, like unto the Male fern, but much lefs, much tenderer and finer, and fpotted on the back of them, as the former.

V. The third, or Small Stone Fern with Leave not dented, has a Root like in the Male Fern, one grows very like it, with Stalks of winged Leaves. The faving that they are very much lefs, (as is the whole Plant) and not indented, on the edges, but whole or smooth, like unto the Water Fern.

VI. The fourth, or Small curled Stone Fern, has a Root compofed of many blackifh Fibres, fpringing out from the thick Head of a Root: from which Head fpringing up small Stalks, hardly four or five inches high, which are fat on both sides with tender fof Strings of very small Leaves, so finely divided and dened, that they fpread out; of a dark green color upwards, and paler below towards the bottom, having brownifh or reddifh Dull like Spots on the backfides, as Spleen-woot has.

VII. The fifth, or Small Rock Fern, is a small Dwarf Fern, reftembling in its Root, Stalks and Leaves the Common fern, but very much lefs, yet much lefs than any of the left defcribed; tho' it grows low, yet it fhothes with many small and dark green Leaves, reftembling the Ordinary Ferns.

VIII. The fith, or English Dwarf fern, has a thick brownifh Root, compofed of a multitude of four or five inches high, which are fat on both sides with tender foft Strings of very small Leaves, so finely divided and dened, that they fpread out; of a dark green color upwards, and paler below towards the bottom, having brownifh or reddifh Dull like Spots on the backfides, as Spleen-woot has.

IX. The seventh, or Naked Stone Fern, has a thick tufted Root, compofed of a multitude of small Fibres: from the Head of which fpring forth many hard and rough Stalks, naked or bare, without Leaves, having some Spots on them, as the Ferns have; these Stalks are only forked at the tops, divided into two, and sometimes into three fhort parts, bowing or bending down their Heads, having the Smell and Taffe of Fern. In my opinion, as this has not the leaft Refemblance in its Form of Ferns, but rather of Gramen or Grass, so it ought to be accounted.
Salmon's Herbal.

Lib. I.

IV. The Places. It grows in Moors, Bogs and Watery places in many parts of England: it did grow in the midst of a Bog, at the farther end of Hampstead Heath from London, at the bottom of a Hill adjoining to a small Cottage; also in divers Bogs on a Heath, or Common near unto Darort Wood in Essex, especially near unto a place formerly digged in search of a Gold Mine, but now it is laid to be rooted out of those places: it grows in wonderous plenty in boggy places, Swamps and low moitt Grounds thro' almost all Carolina: I found it in great plenty in moitt and boggy Grounds, bordering upon Wadmalaw River in South Carolina, where Cart Loads of it might be had, as also in divers places adjacent to Abdy, Cooper and Wadno Rivers, and in several other parts of the same Colony.

V. The Times. It is green and flourishes all the Summer, as do the other Fasers, and the Spikes of Flowers and Seed are in Perfection in June, July and August, the Leaves decay and die away in Winter, but the Root continues good, and lives for many Years. Gerard says, That if it is transplanted into Gardens, it prospers full as well as in its native Soil.

VI. The Qualities, Specifications, Preparations and Virtues, are the same with those of the Male and Female Fern in Chap. 159, foregoing, excepting that this is more effectual than they, both for inward and outward Difficulties, and therefore rather to be chosen than either of them, or any of them all: also over and above what has been theretof, the following Observations have been experimentally made.

VII. The Decocition in Wine. It is a singular good Wound-drink, and of excellent Use in curing green Wounds, running Sores, old Ulcers, Fistulas, and the like. It gives ease in the Colick, and all Difficulties proceeding from Oldfriughins of the Spleen, Worm, Rheu, &c. and it also prevails against Ruptures or Burntwells. If the Decocition is made in White Wine, it provokes Urine exceedingly, cleaning the Reins, Ulcers and Bladder.

VIII. The Balsam, Oil or Ointment of the Root. They cure any Simple Contusion, head Wounds, running Sores and old Ulcers; and are usefully good against the Gout, broken Bones, and Bones out of Joint.

Chap. CCLXII.

Of Fern Water, or

Osmund Royal.

I. The Names. It was unknown to the Greeks, and therefore can have no Greek Name; but it is called in Latin, Felix floridux, Felix aquatilis, Osmund Regalis, Felix pulchritudi, Felix Lanarius Gephyri, Felix festalodi Cordis, Velcosferum: in English, Water Fern and Osmund Royal.

II. The Kinds. It is the fifth Species of Ferns, and a singular Plant of the kind.

III. The Decription. It has a great and thick Root, folded, and covered over with many Scales, and intersecting Roots, having in the middle of the great and hard woody part thereof a small white Path, which by some is called the Heart of Osmund the
Chap. 263. English Herbs.

CHAP. CCLXIII.

Of FIGWORT Great Common.

I. The Names. It does not seem to be known to the Greeks, for it has no Greek Name, but it is called in Latin by many Names, as Feraria, Mille Albus, Ferraria, Caerulangula, Cyligranum, Pinnij, as some think, Galgophia Dioscoridis, as Ficubis, Cordus, and Dioscorides, also Scrophularia major, in English Figwort.

II. The Kinds. We make two Generical Kinds of this Plant, viz. 1. Scrophularia major vulgaris, The Common Great Figwort, of which in this Chapter. 2. Scrophularia major Feregrina, Foreign Great Figwort, of which in the next Chapter.

III. Of the first of these sorts there are two Kinds, viz. 1. Scrophularia major vulgaris, Deinallium alternam Fructus, Chrysanth Mat Oxfur in Horrid, Galgophia buckla, & Cordis, The more Common Great Figwort. It is called Scrophularia in most Authors, because it is available ad Scrophularia, and major, to distinguish it from Scrophularia minor, which is Elegant, of which in its place. 2. Scrophularia major altera Elegant, The Noble or Beautiful Great Figwort.

V. The Second, or Elegant Great Figwort, has a great, thick, white, and knotted Root, like the former, which sends forth from it one or more great, hard, strong, brown Stalks, with Leaves at the Joints, very like the other, but they are fairer, and more sometimes standing at a Joint, especially at the lower Joints. The Flowers are not gaping as the first, but made of four reddish Leaves, which commonly stand at the Joints with the Leaves, which being puff, there comes in their places hard round Heads of Seed Feoffs, but without any point in the middle, in which are contained small brownish Seed.

The Leaves of Water Betsy, so that they are sometimes mistaken the one for the other, being difficult to be known alike, without a narrow view of them; but these Leaves are not so round, being about the edges, and are also thinner at the ends. At the tops of the Stalks come both many Purple Flowers, for in Hasks, which are something gaping and open, but not so much as any of the Galeopis or Dead Nettles, but closer and smaller, somewhat like those of Water Betsy aforesaid, which being puff away, hard, round Heads come in their places, having a small point in the middle, in which is contained small brownish Seed.

V. The Place. They are very frequent, especially the first, in most places through the Kingdom, growing in moor and heathery Woods, and in the lower parts of Fields and Meadows; it may be found in great abundance in Horsey Wood, near London, as also in Store Wood, and Shotover, near Oxford.

VII. The Times. They Flower in June and July, and the Seed be ripe in a Month after the Flowers are past.

VIII. The Qualities. Figwort is hot and dry in the Third Degree, Anodyne, Digestive, and Vulnerary.

IX. The Specification. It is peculiar for Curing the Scrophula or Kings-Evil, as also the Hemorrhoids or Piles, Scabs, Leprone.

X. The Preparation. You may have therefrom
The Virtues.
XI. The Liquid Juice of Herb and Root. It is a most admirable Vomitory, taken to two Spoonfuls, or more, in the Diffilb Water of the Plant, it is effectual to dissolve chert, or congealed Blood within the Body, which happens by means of any Wound, or by any Bruise or Fall, and is very powerful to walsy away, confume, or destroy that Humour which is the Cause of Struma's, Scrophula's, Leproties, Scabs, and other like Breakings out.

XII. The Efficacy. It has the fame Virtues, but is more powerful to the Intention above named, being outwardly applied, by washing it upon Scrophulous Tumors, Hermoniords, Scabs, Scrotum, Maw, Leprotie, it is of singular good use, because it refills the Promotion of the Humours which cause them, and also washes away what is contained in the part afflicted, it also cleanses, dries, and induces the healing of running Sores, old Ulcers, Fultula's, and the like, and may be taken inwardly as a Diet, in order to inateifie those Cures.

XIII. The Diffilbion of the Roots and Herb in Wine. It is a singular good Wound Drink, and of great efficacy (being commonly taken morning, noon, and night) to the quantity of half a Pint for a Dose, for some are liable to the same to cure intemperance and malign Fultula's, or which yield a malign Jether, known by its putrid substance, ill color, and fetidity. The same is also a very effectual against the Kings Evil, or any other Piles, Bumcheeks, or Worms, growing in the Flesh, in what part of the Body soever. It is also of very good use to be applied to the Hemorrhoids or Piles when they grow painfull and fall down, and for such other Knobs, Tumors, or buncings out, (as Icacin in Arm) which sometimes happens to the Fundaments.

XIV. The Diffilb Water from the whole Plant. It is used for the fame purposes, either to take inwardly, or apply outwardly, by bathing, &c. It is of good use for foul and partical Ulcers, which are hollow or ecorconging, to dry the malignity, and to dry up the superfusious virulent moffiture of them. It also takes away all Redness, Spots, Freckles, Scarf, &c. in the Face and Skin, or any other foul Deformity thereof, tho' intemperance, as the Leprotie, &c. but it will be more effectual if you dissipate thence a proportional quantity of Nitre, Sulf of Tartar, or Sulfurum Saturni, according to the nature of the Diffilbion you apply it to.

XV. The Ointment of Herb and Roots, but more especially of the fifth Roots. It is made according to the usual Rule of making Ointments, but Authors have left this Prescriptions. Take the Roots, wash them clean, bruife them, and put them into a Jar Glafs, or Earthen Pot, with a sufficient quantity of Butter, or Hog's Lard, or Beef Suet, mixt with an equal quantity of Oil Olive, which is the better of the three, yea, over the Jar Glafs or Pot with a Bladder, or Leather and brown Paper, and let it stand in the hottest Sun for 15 or 20 days, then afterwards upulating it; you boil it fully for almost an hour, and whilst hot strain it forcil, and keep it in a Jar Glafs or Cally-pot close covered for use. You may also make it by boiling the bruised Roots and Leaves in a Pot of Oil and Wax, and then straining it out as aforesaid. It is exceeding good to anoint with, in order to cure Scrophulous Tumors, or Swellings in the Neck, as also Fucus in Amo, and the Hemorrhoids or Piles, it cures the pains, and many times diffilbes the Tumors, and if any of them are Ulcerated, it is of extraordinary use to heal all those kinds of Ulcers, as also Scabs, Leproties, Of the Root, of the Herb, or of Herb and Root, being beaten in a Mortar till they are fine, being applied it cures Simple Contusions, caused by any Blow or Fall, also diffilbes the congealed Blood, and soon heals the Hurt or Wounded part, and it is also no less effectual against Struma's, or the Kings Evil, and to dissolve any buncings out, Worms, or Kendells in the Throat or other parts.

XVII. The Spiritual Tincture. It drops inward Bleedings, and expels Wind out of the Stomach and Bowels, corrects the cold piniturous Humour which breeds the Kings Evil Kendells, and other like Tumors, in any part of the Body, and is very effectuall against the Collick, the pain of the Spleen, and Hypochondriack Distillations. Dole from two Drains to four in the Diffilb Water, or in Wine, or other proper Vehicle, Morning and Night.

XVIII. The Acid Tincture. It strengthens and fortifies the Stomach, and revives the Jears in their first Concoftion, preventing the generating and concreting of that Matter, or those Humours which breed Struma, or the Dilatate called the Kings Evil. It cures all Hypochondriack, and powerfully openeth the Obliterations of the Stomach, Liver, and Spleen, and therefore absolutely cures the Rickets in Children, of which I have had a particular Experience, caused by the use of Glafs or Wine, by drops as to make the Ale, Beer, or Wine grateful.

CHAP. CCLXIV.

OF FIGWORT Great Foreign.

I. THE Name. It is called in Latin Scrophula-
ria major Peregrina, and by reason the Roots are without Tubers, or Knobs, it is called by some Scrophularia major obliqua Tuberculis: in English Foreignt Great Foreign.

II. The Kinds. Authors have given us many Kinds of this Plant, divers of which we can never come at, but so many of them as may be found growing in the Gardens of the Curious here in England, or possibly grow in some of our Plantations beyond Sea in America, we shall here give you the Description of some, and these are: 1. Scrophularia major American. Scrophularia Curiosa gives Clilfj, American or Creick Great Figwort. 2. Scrophularia major Americana altera, vel Indica altera, Scrophularia major Hispamica, Scrophularia fulis Linnaciei Bausinni, The Second Indian or American Great Figwort. 3. Scrophularia strobilis Lacunae, Bausinni, Scrophularia maximia Montana Columnae, Great Figwort yellow Flow- ered.

III. The Diffilbions. The Kief, or American or Creak Great Figwort, but a Root which is of about a Finger thick, is, which spreads it self out into several Branches, running under the Superficiei of the Earth nor very deep, and having many Fibres springing from the same. From this Root rises up a Square corner'd green Staff, brownish on the fide near the Root, at the bottom of which grow several large and long Winged Leaves, fat upon pretty long Feofills, made of many parts, and almost in phe- nion like the common Thistle, but without Prickles. The Leaf is large, and much cut in on the edges, making
making every leaf look almost like to the Leaf of the Red Bette. From the middle of the Stalk up
wards it spreads it left out into other Branches, al
most othe very top, tho' Branches growing smaller
and smaller as they grow higher and nearer to the
top, having on all sides such like Leaves, but
leaves than the usual growing below. At the tops of the
Stalks and Branches are many small Flowers, far al
most like unto the first Common Flag, but part of a
deeper, and part of a paler Purple Color, with
some yellow Threads rising out of the middle.
W. The Second, or Indian or American Great Flag,
has a Root which is thick and bulky, which per
ishes in the Winter, if it comes up to flowering, but
if it Flowers not, it continues all the Year. From
this Root springing up divers thick, but weak, Stalks
or Branches, all lying round about upon the Ground,
full of Jolitus, with large and long dark green Leaves,
cut in to the edges into five long Divisions, all of
them dented about the edges, and from the same
Joints come forth also other leffer Leaves, divided
and dented, and with them, towards the tops of the
Stalks, several large Flowers of a yellowish color on
the curdle and lower parts, but of a reddish color,
mixt with yellow within. The Flowers being put
away, larger and harder Heads succeed than in the
Common Kinds, and pointed at the end of the red,
which contain within them small blackish Seed.
V. The Third, or Yellow Flowered Great Flag,
has a Root which is thick and blackish, with
many Fibres or Strings thereon, but without any Ta
bors or Knobs at all. From the Head of this Root
springing up divers square brown Stalks, a little
hairy and soft, above two Feet high, at the Joints
of which grow two large, broad, roundish, hairy,
soft, green Leaves, deeply indented about the edges,
and bending upon very long Footstalks, tho' at the
lower parts of the Stalks being largish, which in
Winter lie in a compass upon the Ground about the
Root, and those which grow on the Stalks leffer
and leffer till they come to the tops, at each joint with the Leaves comes forth, even al
most from the bottom, one small naked Branch,
bearing many Flowers in Tufts at the ends of them,
which are round and yellow, or somewhat like into the
Ordinary or Common Fagg, parted or cut in at the
brims into divers pieces, having some long yellow
thick Stalks in the middle. After the Flowers are
put away, large round Heads come then in the Com
mon Kind, but not so large as those in the last de
cribed, which have at the end a long point, a little
crooked, and contain within them small black Seed.

VI. The Places. The two first I have found
growing in several parts of Florida, in the South of
Carolina, and in those parts leading to the Cape of
Florida. The third also has been found growing in
Cardea, being Claudus his left Greek Specie. The
second has been found growing in Spain likewise,
but as I am informed was Transplanted thither from
America. The third is a Native of Germany and
France, from the former of which places it was
brought to us, but here in England they are all dust
up in the Gardens of the Curious.

VII. The Times. They Flower in July, and the
Heads of Seed will be ripe in August or September.

VIII. The Qualities, Specification, Preparations
and Virtues are the same with those of the Common
Kind in the former Chapter, and therefore I shall
speak no more of them in this place.

CHAP. CCLXV.

Of FLAG Sweet Smelling,

Or,

True Acorus.

T H E Names. It is called in Greek Acorus, &
Acoros, in Latin Acorus or Acorum, Acorus
varius, and Acorum varium: Galen says it is taken
to be Batoms Theophrasti: and in English The true
sweet smelling Flag.

II. The Kinds. Authors make but one Kind there
of, which Cormarum, Ciafinus, Cordus, Giffier,
Linum, Labrolis, Mattheus, Monardus, and others,
call Acorus, or Acorum, which is the vulgar Calu
mas Aromaticus Officinarum, according to Amarotus,
Brossiarius, Cefalusius, and Poelius, but it is not
the true Calamus Aromaticus of the Ancients, for
that was really a Reed, whereas this is really and
truly a Flag, (but sweet smelling) and the Root here
intended is the Root only of a Flag, as for the True
and Ancient Calamus Aromaticus I am apt to be
lieve it is not to be found thro' all Europe, that is to
say, not in the Shops, but of this we shall have oc
casion to speak more in our III Book.

Sweet Smelling Flag.

III. The Description. It has a Root like to the
Common Water Flag in the next Chapter, but much
fatter, and not so red, of a sweet smell and somewha
ter better, it is thick and long, lying under the up
per Edge of the Earth, flowing forwards, and with
such Roots, as Suckers on all sides, not much unlike
to Garden Valerian, without on the outside, or green
ish if it lies above Ground, and more pale or subtilis
on the inside, consisting of many Tubes from which
it shoots forth underneath many long thin Fibres, by
which it takes hold in the Ground, the thick part of

the
Salmon's Herbal

The Rose is of a form or shape, yet not easily, but commonly cut. From this Dividest it into several Parts, like into the Flower, or Flower-de-face in the following Chapter, but narrower, and two or three Feet in length, of a fresh green Color, and Aromatick Smell; yeT Sometimes they are brown, as in those of one. If one Leaf grows out of the side of the other, after the same manner that other Flags or Flower-de-face grow, which are thin on both sides, and rigid or thick in the midst, the longest for the moss part bending in the middle, and some of them curled or plaited towards the ends or tops of them, smelling very sweet when as they are dry, and kept a long time, as when they are fresh and green. These Leaves abide a long time in the Garden, as tho' they never did, or never would bear any Flowers, they every Year dying down to the Ground, and flowing our fresh every Spring, but after two, three, or Four Years continuance in a place without removing, it flows forth Leaves as formerly, (but no Stalk, as other Flags or Flower-de-face) before which it flows forth a long raw Leaf by it itself, flat, like unto the other Leaves, especially from the middle thereof upwards; but from the field middle downwards it is thicker, narrower and rounder, or rather almost triangular. From the middle of this Lone Leaf comes forth one long round Head, very seldom two, in form and bigness like almoast unto the Aget of Carthus in the Middle. The Head is grown upright, as lath and half, two inches, or more in length, as thick as a Large Reed, or ones little Finger, let with several small Lines and Divisions, like unto a green Fine Apple, and for the most part of a Purplish Green Color; or Gerard says, of a Greenish Yellow Color, curiously Chequered, as if it were Wrought with a Needle, with green and yellow Silk intermixt, out of its Branches small pale whithi Flowers shoot forth, consisting of four small Leaves apiece, (with or without any green smilll) which quickly fall away, without giving any Seed, so far as any Author has observed.

IV. The Place. It is a Foreigner, and grows with us only in Gardens, but bears very rarely its Fruit or Flower, and Country, for which reason some have held it that it is barren, but that doubtless is a mistake, for Clifton says that he has seen it bear its Flower or Head in this place that it grows naturally in England. But sometimes it must be known, its Native places are in several parts of Turkey, where it grows in mossy Grounds, and in rich like places it flourishes with us, where are found the hardiest Roots, the flioots, brimmes, white and sweeted, which being dryed are a little thinned. It grows in Candia, as Flory, says, as also in Galatia, and other adjacent places, and naturally at the foot of a Hill near to Praia, a City of Bithynia, not far from a great Lake. It also grows in great plenty in some parts of Retbar, but its Roots when dryed are more rank or small, not to you nor white, nor of so choice an Aromatick Smell.

V. The Time. It springs up with its Leaves in March and April, and bears its Catkin (in those Countries where it does bear, or is not barren) in the beginning of the middle of July and August. Johnin, upon Gerard says, that in May 1622, he received the Julian or Catkin from Mr. Thomas Glynn, of Glynnthorin, in Carneffective, from which it is manifest, that the Tree is a native looking after, it may with us be made to bear its Head of Flowers, yet here about London, tho' it grows well, and in great plenty in many Gardens, it has hardly ever been seen to flower. This may arise from the climate.

VI. The Qualities. It is hot and dry in the fe-

cond degree, Aperitive, Astringive, Astringing, Carter, Tonic, Vivifying, Capillasting, Nutritive, Serueck, Stomachick, Cordial, Sedative, and Aperitive.

VII. The Specification. It is a peculiar thing a-
gainst Poyon, the Plague, and all contagious Dis-
orders.

VIII. The Preparations. The Root is only of use, and you may have therefrom, 1. A Liquid Juice. 2. An Essence. 3. An Infusion in Wine. 4. A Dec-

\[\text{Continued in the following page.}\]
C H A P. CCLXVI.

Of FLAG Water, or,

Water FLOWERDELUCE.

I. The Name: It is called in Greek ∆ωρία, a Poison, in Latin ACORUS Palustris, GLY- 

DIRA, DODECATHEON, ACORUS acutus, ACORUS eufa, ACORUS prolificus, ACORUS 

truncatus, ACORUS palustris leafei, GLyCIRRHUS latius, in English Water Flag, Water Flower- 

deluce, SEG, and SEG.

II. The Kinds: Some will have it that there are two Kinds of this Plant, because sometimes it is 

found to exceeding large, as four Feet or more high, and sometimes again it is found not to be above 

a Foot and half high, or two Feet at most; but this 

difference in my Opinion arises only from the differ- 

ing Qualities and Goodness of the Soil, it growing 

to exceeding large when the Soil is light, and more 

slippery, and if it is not that in the manner and 

form of its growing.

III. The Description: It has a Root which is tu- 

berose, but flender and sneerer than those of the 

Garden Flowerdeluces, of a pale brownish Color on 

the outside, and of an Horse's Feet Color on the inside, 

with many hard Fibers springing therefrom; the whole 

Root is very Sweetish, and hard in Table. From this 

Root spring up Sword like Leaves, like to those of the 

Garden Kind, (the whole Plant growing almost 

exactly like to those of the Garden) but that this 

has much longer and narrower flid green Leaves, 

joined together in the same fashion; sometimes the 

Stalks grow to be between four and five Feet high, 

sometimes not above two Feet high, or a little more, 

according to the Richness or Poorness of the Soil; 

at the tops of the Stalks come forth Flowers of a 

perfect yellow Color, and shaped somewhat like un- 

usual those of the Flowerdeluce, with three falling 

Leaves, and other three arching which cover their 

A 2 a
given, one or two Spoonfuls at a time, in any proper Vehicle, but it is to be repeated as often at due intervals of time as need shall require; it profly stops the overflowing of the Loches of Women in Child-Bed, and strengthens the Womb, and all the weakend parts.

XI. The Infusion or Decotion in Wine. It has the same Virtues with the Juice and Essence, but is weaker, and therefore must be given in larger quantities, as five or six Ounces twice a day.

XII. The Powder. Given to one Dram, or more, in Wine, it stops all internal Fluxes of Blood, whether in the Luiga, Stomach, Guns, Bladder, or Womb; curatively applied also it stops Bleeding, and being dried up old, moist, and running Sores, it cleanses, dries up the meuliture, and induces their healing: flowered upon a Coal Bone it is said to cleanse it and cover it with Fleth.

XIII. The Celfrium. Take of the Distilled Water four Ounces, Red Port Wine two Ounces, of the clarified Juice of the Root one Ounce, mix them. Drop into four and wattering Eyes it stops the Flux of Rheum, dries and heals them; Cloths or Spunges may also be wetted therein and applied upon the Forehead, it takes away fife Clouds, Flutters, Piles, and the like.

XIV. The Cataplasm.Applied to the Joints in the Goat it eases the Pain, and strengthens the part afflicted, so that the Diastolic felem of no corpor never returns any more upon that Foot; it also stops any Flux of Humors upon the part.

XV. The Ointment or Balsam. It is used after cleansing of Wounds or Ulcers, to dry, incarcerate, and heal, for as it breafe Fleth, so it stops any Defluxion of Humors thereupon, hindring the growing of proud Fleth.

XVI. The Distilled Water. Drop into the Eyes it is good against the watering of them, applied to the Forehead in wet Spunges it stops Defluxions, and fomented on hot Tumors and Inflammations of Women's Breasts, as alfo upon Cancers, and all me tangeres, it cools and gives much cafe, and this more especially if it is mixed with a little Souchorum Satures, and then it prevails against foul and putrid Ulcers happening in the Privy Parts of Man or Woman, or in any other part of the Body.

C H A P. CCLXVII.

Of F L A X Manured or Common.

I. T H E Names. It is called by the Arbionian Barbaricmen, or Deschelton, in Greek blew, in Latin Linum, and in English Flech, and Line, which left Name alone will have from making Lines of it, but it take to be derived from the Greek Name.

II. The Kinds. Of Flech there are two principal Kinds, viz. 1. The Manured, of which we shall Treat in this Chapter. 2. The Wild Kind, of which in the next. The Manured, Garden, or Common Kind, is a singular Plant, (of the Pinnagins of which they make the Cloths) and is described as followeth.

III. The Description. It is a flmall flubrous Root, which perfides every Year, from whence rises up a round plant Stalk, about a yard high, befer with nar- row, long, and fift Leaves, without any order, and is branched on the top into three or four small Branches, each of them bearing two or three fine Blue Flewes, made of five round pointed Leaves, speer, with some
Chap. 267. English Herbs.

some threads in the middle, which being past away, round Buttones succeed, which are pointed above, and in which are contained flatish, smooth, shining, brown Seed.

Common Garden Flax

Flax

IV. The Place. It grows in England, France, Germany, Italy, and in most Countries of Europe, the Seed being Sown every Year; it grows in America also, as in Gardens, where I have known it to grow and flourish very well: it prospers best as Campanulæ frīs in a fair, moist, and fruitful Soil. Some, frīs Palliades, Sow it thinck in a lean Ground, and to have a fine sort of Flax. frīs says that it is to be Sown in Gravelly places, especially in Furrows. Experience has taught us that it grows admirably well in Light, Sandy and Gravelly Ground; in such as France abound with, where it grows in vast plenty, and in other Countries where the Ground is Sandy and Light, as in Florida.

V. The Times. Flax is Sown in the Spring, and Flowers in June and July, the Seed ripening in the mean Seasion, after it is plucked up, or cut down, as Pliny Lib. 19. Cap. 1. says, the Stalks being bound up in small Bundles, are put into Water subject to the heat of the Sun, and have some weighty things laid thereon, that they may the better steep, and they are so long; to lie in the Water, till the Kind of Peeling seems to be bound to so as it may easily peel off, then it is taken up, and dried in the Sun; after which the Peeling are prepared for the Block and Hacks, to make the Fibres thereof very fine, in order for Spinning and Making Cloths.

VI. The Qualities. There is nothing of this Plant used in a Physical way but the Seed only; and that seems to be temperate in respect to heat or coldness, and is Emollient and Laxative, Pectoral, and Antispas¬tic.

VII. The Specification. It is peculiar against Pleurisy, and all Contractures of the Nerves and Muscles.

VIII. The Preparations. You may have there¬from, 1. The Seed prepared. 2. A Pouder of the Seed. 3. A Decollion. 4. A Balsam. 5. A Cataplasme. 6. An Oil by Expression. 7. A Fumigation.

The Virtues.

IX. The Seed prepared. Galen says that some parched the Seed, and eat it with Honey for Food, and that others put it into their Bread, but says be primo Alimentorum, it troubles the Stomach, is hard of Digestion, and gives not much Nourishment to the Body, but as to the moving of the Belly downwards (says he) I will neither commend nor discom¬mend it, but it in some small measure provokes Ut¬rine, which it does best being parched.

X. The Pouder of the Seed. If it is mixt with an eighth part of Pepper in fine Pouder, and made into an Eletuary with Honey, and taken to the quantity of a large Nutmeg every Morning fasting, and Night going to Bed, it prevails against Coughs, Colds, Heartiness, Wheezing, Obstrications of the Lungs, and whatsoever Cataracts.

XI. The Decollion in Wine. Sweetened with Honey and drunk it cures the Bellyach and Colick, Stitches, and all Inflammations of the Villers; if Balsoms are boiled in it it operates (says Pliny) the Ob¬strications of the Liver; and if it is applied to any fretting or running Sore it dries it, and it dyes it from spreading further.

XII. The Balsam. If it is made into a Balsam with Robin, Pouder of Myrrh, and some of the Oil by Expression, and applied to Ruptures, or Swellings of the Serous or Tissues, it cures the one and diffcultes the other, it also diffcultes Tumors in any other part of the Body.

XIII. The Cataplasme. If it is made with equal parts of Lin Seed, Fenugreek Seed, and Mallows, and applied, it is of good use to mollifie and diffcult any Tumors or Hardness in any part of the Body. If it is made with Salt Nitre and Fig-Tree Athers it calms the Pains, and takes away the hardness of the Nerves, Tendons, and Muscles. If it is made with Figs and Wild Cucumber Roots, and applied, it draws forth Splinters, Thorns, Nails, Prickles,
Salmon's Herbal.

Lib. I.

Chapter CCLXVIII.

Of Flax Wild.

I. The Name. It is called in Greek, Λινόν, in Latin, Linum, Linum vulgaris, and in English, Wild Flax.

II. The Kinds. There are several kinds of this Plant, as, 1. Linum angustifolium, also called Narrow-leaved Wild Flax, called by the Country People, Mid-Mountain. 2. Linum filicifolium, also called Broad-leaved Wild Flax, yellow-flowered. 3. Linum latifolium, also called Broad-leaved White Flax. 4. Linum flavum, also called Yellow-flowered Linum. 5. Linum album, also called White Flax. 6. Linum purpureum, also called Purple-flowered Linum. 7. Linum usitatissimum, also called Common Flax. 8. Linum narbonense, also called Narbonese Flax. 9. Linum tenuifolium, also called Narrow-leaved Linum. 10. Linum perenne, also called Perennial Linum. 11. Linum usitatissimum, also called Common Flax. 12. Linum narbonense, also called Narbonese Flax. 13. Linum tenuifolium, also called Narrow-leaved Linum. 14. Linum perenne, also called Perennial Linum.

III. The Descriptions. The first, or Pering Wild Flax, has a crooked Root, which is small, white and fibrous, which sends forth sometimes one, but most commonly five, or more round Stalks, about eight, ten, or twelve inches high, of a brown or reddish color, every Stalk dividing it near the top, or from the middle upwards into many Branches, of a green color or than the lesser part of the Stalk. The Leaves are small, smooth, and of a green color, of the bipinn of Lentil Leaves, and have in the middle one Anis or Nerve, and no more that may be perceived, and grow along the Stalk, in very good order, by couples, one opposite against another. At the tops of the small branches the Flowers grow, of a white color, consisting of five small Leaves apiece, the Nails whereof are yellow. In the inflorescence, the tops of small clusters of a yellow color, after which come up little knobs or Sours, the tops of which, while the Seed is ripe, divide themstof into five parts, in which is contained small, smooth, flat, slippery yellow Seed. When the Seed is ripe, the whole Herb purifies.

The Plant is of a bitter Taste and hereby Snailed.

IV. The second, or White Wild Flax, has a Root which is tough and small, and grows like, and has Leaves like unto the Manured Flax, but narrower, and growing upon round, bright and shining Stalks, a foot long, having Flowers like the Manured Flax, but of a white color. But this Plant is sometimes found with deep blow Flowers, with Violet colored Flowers, and sometimes with white Flowers, Pickt with purple Lines.

V. The third, or Thin or Narrow-leaved Wild Flax, has a tough slender Root, with several fibers adjoining to it, which sends forth many Stalks, furnished with narrow thin Leaves; the Flowers consist of five Leaves apiece, of a light Purple color, which do soon fade and fall away. The Stalks are of about a Cubit in height, belit with small Leaves, you fether than those of Linaria purpurea. The whole Plant is very like to the Common Manured Flax, but in every respect different.

VI. The fourth, or Broad-leaved blow-flowered, has a Root which is great, and from after Seed-time, growing forth new Stalks, with woody Leaves on them, andWoody all the Winter. This Root, says Gerard, does continue many Years without dowing, enchanting by its Root into many other Stalks, rising up with many thick, stiff and hairy Branches, furnished with Leaves, of the same sort, as a foot, or foot and half high, and belit with many rough and hairy broad Leaves, (broader than in any of the other sorts) The Stalks towards their tops divide themselves out, and are belit with finer Leaves than those below. At the tops of the Stalks

do grow many low flowers, much greater and larger than those of the Common, 

Gerard’s Herbal) has given us an account of going to the

An Apothecaries Shop at Winchester in Hampshire.

I say this herb lying upon the Stall, which I had been long since I desired of him to know the Name of it, he told me it was called

Hill Mountain, and that Doctor Luke’s Man had given him the name of it, as also the Way how his Master the Doctor (who was afterwards Bishop of Bath and Wells) did use it.

XIV. The Virtues and Uses. Take a handful of

Hill Mountain, the whole Plant, Leaves, Seeds, Flowers and all, bruise it, and put it into a Priket, with a Pint of White Wine, and let it on hot embers to infuse all night, then pour off the clean Wine, and drink it the next Morning eating. This will give eight or ten Stacy, and purge and cleanse the Scotch and Bowels admirably well.

And this was the thing, which the said Doctor Luke always used for his Purge.

CHAP. CCLXIX.

Of FLAXWEED Narrow leaved, or

TOAD—FLAX Narrow leaved.

I. The Names. It is not known to have any

Greek Name, and yet Authors have called it Linaria, and Linaria: in English, Flaxweed and Toad Flax.

Flax weed or Toadflax

II. The Kinds. There are three General Kinds of this Plant, viz. 1. Flaxweed, Linaria. angustifolia, narrow leaved Flaxweed, or Toad Flax, of which in this Chapter. 2. Flaxweed, and Linaria latifolia, broad leaved Flaxweed, of which, in the next Chapter. 3. Chamaeliria, Linaria purpurea,
Of the first, or Golden Flaxweed, hath a Root consisting of a great number of thick stringy fibres, together, which, with the whole Plant perishes every Year. From this Root springs up most usually but one straight upright upright stalk, three foot and a half or more high, (as it grows in our Gardens) branching it self out divers ways, bearing therein, many long, narrow Leaves like our Garden or Mexican Flax, very thick set together, like unto a Bough, or rather like unto a half green Cypress-tree, growing broad below, and Spire Fashion upwards, of a very fair green Colour. At the several joints of the Branches towards the Tops, and among the Leaves, come forth small reddish Flowers, not exactly seen, nor much regarded, which turn into small round blackish grey Seed. This Brown Flaxweed, tho' it has no beautiful Flowers, yet the Curious Plant it is in our Gardens, because the green Plant full of Leaves, is very delightful to behold; being in Italy and other places, planted not only in their Gardens, but also in Pots, to furnish and adorn their Windows; and even with us it grows to be delectable a green Bath, that it is thought to be worthy to be enumerated among our Hortatory rarities and delights.

X. The fifth, or Golden Flaxweed, is a Root composed of many Strings, intertwined one within another, from whence rise up Stalks very thick and Woody, beseft with Leaves like the Common Linaria at Selt. IV. above, with Flowers at the tops of the Stalks, of a faint shining, yellow color, in form and figure, a little like unto Lycopsis major. This Herb is flattened and leaved like Common Flax, and thought by some to be the true Linaria, for which reason latter Writers have called it by a Compounded Name Linaria, it grows to be three feet or more high, and is in taste sharp and bitter, having a Camomile's or Guttinosis with all.

VIII. The fifth, or Golden Flaxweed, has a great tufted Eryops Root, from whence arise up many Stalks a foot and a half high, which are divided towards the tops into many small Branches: On the several Tops grow Tufts of small Flowers, each little Flower being parted into five parts, with a little thread or pette in the middle, so that it seems full of many golden Hair's or Thimns. The Seed is long and blackish, and is carried away with the Wind. Fabius Columns has proved this to be the Clypeole come described by Dioscorides, Lib. 4. Cap. 57. A
XI. The Seventh, or Buffard Flaxweed, has a Root which is White, divided into several Branches, and forms long, every Year sending up many Stalks, which are hard, pale, green, and forked, growing to be 3 Feet high or more, and upon these, without any orders, grow many hard, narrow long Leaves, like the Stalks of Flax, or of a very very, but afterwards of a biscuit Taste. The tops of the Stalks are branched out into several Foot stalks, which carry little white Flowers, consisting of five small leaves apiece, lying Stalk fashion, with some threads in the midst. These being past away, a single five cornered Seed comes forth, containing a white Pith, in a hard Film or Skin.

XII. The Eighth, or Purple Flaxweed, has a Root which is small and thready, purifying for the most part every Year, and springing again of its own Seed, if it is suffered to seed its Seed, except the hard- nesses of the Winter kills it. From this Root rise up several small, thick, long, and somewhat narrow Leaves, of a whitish green Color, among which rise up divers Stalks of a Cubit height, bespangled with long narrow Leaves, like unto those of our Common Flaxseed at Seed. IV. allargangi. These Stalks towards the Tops are repl adjusting with many small Flowers of a Purple Color, growing together one above another, spike fashion, which are small and somewhat fleshy, whilst they are fresh, and formed much like unto our Thistle or Common Flaxseed, with a gaping mouth, but they are much smaller, and want that crooked Spur behind. Sometimes they re of a Ted Purple, near unto a Violet Color, and sometimes of a Pale Blue Color, having a yellow spot in the middle, or gaping place. The Flowers being pelt small, hard, round hands come forth, in which are contained small flat, and greyish Seed.

XIII. The Place. The first grows almost every where, and the whole Kingdom, both by the Way sides, as in Meadows, and also by Hedges sides, and upon the side of Banks and borders of Fields. The seventh grows upon Mountainous places in Germany, and it has been found growing Wild in England, on the side of a Chalky Hill, in an Indolence, on the right hand of the Way as you go from Bradford to Poppies Hill in Hampshire, all the rest are only nurt up with us in Gardens.

XIV. The Times. They all flower in the Summer Months, from May to August, and the Seed is ripe soon after. The eighth, the it often flowes it self, yet by eafon a hard trothy Winter may kill the Seed, it ought to be sown new every Spring.

XV. The Qualities. They are hot and dry in the second Degree: Aperitive, Altheiferous, and Diuretic, Hepatic, Splenetic, and Nephritic, Cathartic, Emmenagogue, Soddfic, and Aperitive.

XVI. The Specification. They are peculiar against the Strangury, Drophe, Jaundice, and Poylon.

XVII. The Preparations. You may have therefrom, 1. A Jus, 2. An Infusion, 3. An Infusion, or Decotion in Wine. 4. A Powder of the Seed. 5. A Distilled Water from the whole Plant. Of all these kinds, the first is the most effectual, and most acid.

The Virtues.

XVIII. The Liquid Juice. Given to three or four spoonfuls Morning, Noon, and Night in a Glass of White Lisbon or Port Wine, it gives rise in the Strangury, powerfully provokes Urine when it is stopped by Sand, Gravel, or Tararous matter, and carries off by filling the Water in Drophe. It effectually provokes the Terms in Women, and drives forth the Dead Child and After-birth. Put into Foul Ulcers, whether they be Cancerous or Fihulous, with Tems rowelled therein, or the parts wasteth thereof, or it being injected into them, cleanses them thoroughly from the bottom, and in a short time heals them up fully. It also cleanses the Skin wonderfully from all sorts of thumfines and deformities, as Spots, Marks, Freckles, Lents, Yellowness, tawniness, Wheals, pimples Scales, Scour, Morphew, Leprosy, and other the like Deformations.

XIX. The Essence. It has all the Virtues of the Liquid Juice, besides which, it washes and cleanses the Reins and Uretery parts from Stones, Gravel, Sand, and Tararous Muclage, heaped up in those parts, and taken from two to four spoonfuls in White Lisbon or Port Wine, it moves the Belly downwards, and prevents both against the Drophe and Yellow Jaundice. Drop into the Eyes, it is a certain remedy against all Heat, Inflammations, and Redness therein. It opens obstructions of the Liver and Spleen, purifies the Blood, and is good against Hypochondriack Melancholy.

XX. The Infusion, or Decotion in Wine. It has all the Virtues of the Juice and Essence, but weaker in Operation, and therefore must be given in larger Doses, as to Fif, seven or eight Ounces. It expels Poylon, and is good against the Bitings of Mad Dogs, Serpents, or other venomous Beasts.

XXI. The Powder of the Seed. Given to One Dram with the Liquid Juice, or Essence, or Infusion or Decotion as aforesaid, and continued for several days together, it is held to be a singular Re-
of FLAXWEED Broad leav'd,

CHAP. CCLXX.

TOAD-FLAX, Broad leav'd.

I. THE NATURE. It is called in Greek, Λιβαν, or FLAXWEED, Broad leav'd,

Lib. fome equal or in fometimes Linaria narrow gives the The and bigger the The differing It CHAP., the greyilh little Stalks, and This white Sive wider eafe blewifh, From effectually, cuates medy be 'VivJi^tvzv and Antirrhinum leaved From with Chap. ny which order than in Flowers at which the pulpa may many the Dalmatian /p., in afternamed, and the Seed is alfo like the fame, and enclosed in like heads, but larger.

VI. The fourth, or Great broad leav'd Canvy, has a Root which is hard and white, bigger at the head, and small below, with four Fibers adhering to it. This Root fends forth a round thick Stalk, two or three feet high, spreading into many branches, on which are fometimes two, and fometimes three Leaves together, on a small foot-Stalk on each ife of them, fometimes againft another, and fometimes not, without keeping any order, each of which is larger and longer than thole of the Dalmatian kind, and of a greyilh green color, with three veins or ribs in every one of them. At the tops of the branches grow Flowers made for the Form, like the other kinds, but of a pale green, or of a pale blue, and more yellow underneath, with a pale or bifeath, and fometimes more purplifh Spur behind, the Heads and Seed, are alio like thole of the Common Wild kind at Cap. 269. Sel. 4.

VII. The fifth, or Blew three leav'd, has a Root which is small and white, which sends forth fometimes but one Stalk, fometimes more than one, which are White: At whols, young are fometimes but one, and fometimes three Leaves together, divided almost like the Rea leaves, but larger, and much deeper in, and pointed at the ends of a greyilh green, or fhid color. The tops of the Stalks are refplanted with fuch like Flowers, but almoft, and wholly of a blew color, excepting the Mouth which is yellow. They are pulling away, small round Heads follow, containing large, fat, and blackifh Seed.

VIII. The Place. Their Names or Title flew their Original, or in what places they are natives; but being brought to us are Nutrit uponly in Gardens: and the rift is a peculiar Garden Plant.

IX. The Times. They alfo flower in the Summer Months, from the end of May to the end of Auguft, but with us, scarcely give any ripe Seed; The American kind flowers very late, as about the end of Auguft.

X. The Qualities, Specifications, Preparations and Virtues, are the fame with thole of the narrow leav'd kind, and in efepect with the fift of that Species in theift Chapter, that being themof efficacious of them all; after which, thole of the broad leav'd kind come next in place.

XI. An Observation. The broad leav'd FLAXWEED is by much the more powerful opener of Obftrufions of the Reins, Ureteres, and Bladder, and the greater provoker of Urine; From which eminent faciity it was, that it obtained the Names of Uristis and Urinaria: It gives prompt exift in the Scenery, heat, pain, thermes and fielding of U- rine, and expels Stones, Gravel, Sand, and Tumourous Mucilag from the Urinary parts, being given the Juice, Efficace, Inflethe, Decoction, Syrup or Pouder, &c.
Chap. CCLXII.  English Herbs.

FLAXWEED Creeping, or TOAD-FLAX Dwarf.

The Names. It may be called in Greek Προκελερα, in Latin Flaxius, and in English Dwarf of Creeping Flaxweed, or Toad-Flax.

The Kinds. Authors make six or more kinds, most of them strangers to us in England; the chief which we shall take notice of in this place, are the three following, viz. 1. Linaria carulea report, the Creeping, or Dwarf, blew, or purple Flaxweed, or Toad Flax. 2. Linaria pumila Hispanica, Spanish Dwarf Flaxweed, or Toad Flax. This is a small, upright, and very hardy kind, which grows in many parts of Spain, and is often called Spanish Linaria. 3. Linaria quadrifolium sanguine, or quadrifolia Alpina, Linaria Alpine Gefferi, Linaria alpina syriaca Chief, Four leaf'd Creeping Flaxweed, or black Mountain Toad Flax.

The Description. The first, or Creeping Dwarf, blew, or purple Flaxweed, has a Root which is made up of many Fibres, and arises, not perishing in the Winter; this Root sends forth a number of small weak Stalks, leaning down to the Ground, scarcely being able to feed upright, for very full and wide- cut order, with little Leaves like those of matured Flax, which are very narrow, and Adhered, and are continued up to the tops of the Stalks, where they divide themselves into several other Branches, which have all of them long Heads or Spikes of Flowers, very small, and of a fine bluish purple color, with a yellow Spot in the Mouths of them. The Seed is much like to that of our Common narrow leaved kind, in Chap. 269. Sect. 4. aftergoing.

The second, or Spanish Dwarf Flaxweed, has a Root small, fibrous and white, creeping under Grounds, and perishing every Year, from which grow many small Branches, not able to feed upright, rising to be about six Inches or more high: on which do grow many long and narrow Leaves, very like unto our Common narrow leaved kind, as well for their color, as also the Flowers at tops of the Stalks, and the Heads and Seed are like the same. the Flowers being yellow, and the Seed flat and blackish; only in this the Leaves, Flowers and Seed, are all of them much less than the said Common narrow leaved kind, in which confits the difference.

The third, or Four leaved creeping Flaxweed, has a Root which is small, or slender, and white, spreading it self under Ground several ways, and perishes not in Winter, but endures many Years. From this Root grow several small weak Stalks, of the length of those last described, lying almost upon the Ground, and severally divided into many smaller branches, even from the bottom, upon which are set forth many small, short, with whith green Leaves, very orderly one above another, that is, at some but two Leaves, at some three, and at other four, not keeping always exactly to the same number, especially below, they growing more exactly upwards: these Leaves are softer than those of our Common narrow leaved kind, which is set forth in Chap. 269. Sect. 4. being thick and juicy, growing upon the Stalks at certain spaces, sometimes three, but most usually four together. The Flowers grow at the tops of the Stalks and Branches, and are in form like those of the Common narrow leaved kind aforesaid, but of a most perfect Violet color: they are somewhat great, and stand not to thick clustering together, the lower lip where it gapes, is of a gold yellow color, to wit, the Spot in the Mouth, the root of the Flower being of a delicate purple blew. After the Flowers are past, come round Heads, which are somewhat great and thick, and contain within them a flat blackish Seed, in two partitions or Cells.

The Places. This first grows in many places, as upon Stone Walls, gravelly Grounds, barren Fields, and along by Hedge sides. The second is a Native of Spain. The third grows upon the higher Alps: with us they are only Nurt up in Gardens of the Curious. The fourth. They all grow from the end of May, to the end of August; The Seed ripening in the mean Season.

The Qualities. Specifications, Preparations, and Virtues are the same with our Common narrow leaved Flax-weed in Chap. 269. to which we refer you, and therefore shall lay no more of them here.

CHAP. CCLXXII.

OF FLEBANE Greater.

THE Names. It is called in Greek Κονυζα: in Latin Conyza; and in English Flebine.

Flebane true Great
UI. Of the greater kinds of Fleabane, these offer themselves, viz. 1. Conyza Major vera Dioecesis, the true greater Fleabane of Dioscorides. 2. Conyza major Montana Germanica, a great Mountain Fleabane of Germany. 3. Conyza Helenaea mollis incana, the 2nd greater Fleabane, with Elecampane Leaves. 4. Conyza Helenaea folia laxior, Greater Fleabane. 5. Conyza Helenaea pilosa, Hairy Fleabane. 6. Conyza media, The medium kind of Fleabane.

IV. The Descriptions. The first, or true greater Fleabane, has a thick, long, durable and Fibrous Root, which sends forth many Stalks, two or three feet or more high, which are hard, woody, rough, hairy, fat, and of an overworn color. The Leaves grow without order, alternately embrace the Stalks, and are many, long, somewhat narrow, and of a yellowish green color, dented a little about the edges, twice as large as those of the Olive-tree, which are rough or hairy, and very fat or clammy, being as it were beinmoced with a fattiness or gumminess, which is much more in hot Countries than it is in the cool of ours; these Leaves are something like unto those of the Italian Star-Wort, but larger, and more pointed at the ends. Towards the tops of the Stalks come forth the Flowers, at every Joint with the leaves a yellow Flower, which is somewhat large and round, and not unlike to the Flower of Hawkweed or Greenfield, which when it is full ripe, turns into Down, and flies away with the Wind. The smell hereof is somewhat strong, but sweet withal, and not unpleasant; it is so glutinous and clammy, that what small thing there is, as Flies, Fleas, &c. shall happen to fall or light thereon, are held fast and caught; and for this reason it was called Fleabane, not for that it has any quality, of otherwise poisoning or killing them.

Fleabane great Jagged.

V. The second, or Great Mountain, has a Fibrous Root which sends forth several round green Stalks, two feet or more high, but not near so clammy as the former, having many long pointed Leaves

for these are without order, of a fad, or dark green color, each of which is four or five Index long, and an inch and half broad. The Flowers are yellow, somewhat larger than the other, every one standing at the tops of the Branches, upon a long Stalk, in the same manner as the former do, viz. with a Pale or Border of Leaves, and many small thrums in the middle, which falls into Down, and are carried away with the Wind, as the former are. Note. There is another of this sort with longer leaves, and lighter flowers.

VI. The third, or Hairy Mullet Fleabane, with Elecampane Leaves, has a Root which is compassed of many black Strings or Fibres, by which it takes hold of the Ground, which sends up several long, and somewhat broad Leaves, aloof in fashion like to Elecampane Leaves, but these are hairy or grey on the upper side, and of a brownish green on the under side, hereon somewhat like to the Leaves of the Ruta Helianthus, or Ballard Rhubarb with Elecampane Leaves. The Leaves are very hairy also, the Plant rising to be two or three feet high, set with the like Leaves as grow below, but smaller and smaller as they grow upwards, the roots of which flowers stand together, like unto the former Fleabane, and much greater than those of Greenfield, which turn into Down, and fly away with the Wind. The whole Plant is somewhat clammy, yet much less than the first, and much sweeter than it, tasting much like Honey.

VII. The fourth or Great Jagged Fleabane, has a buffy Fibrous Root, from which arise thick, crafted, and yellow Stalks, divided towards the tops, into several Branches. The Leaves which encompass the Stalks, are deeply cut or cut in on the edges, being of a very considerable length, and broad in respect to that length, all of them extended to a sharp point. The Flowers are Star fashion, of a yellow color, turn into Down, and fly away with the Wind.
Chap. 272.  **English Herbs.**

The whole Place is covered over with a foid and tender Down, and foands something like Honey.

VIII. The fifth, or Hairy Muller Fleabane, has a bulky Fleshy Root like to the last, but in its Stalks, Leaves and Flowers it is like the third foregoing, that there is no other difference to be found, but that in both Leaves and Stalks, besides the hoariness, this is much more hairy and rough than it, which causes it to be a differing kind from it.

**Middle-Fleabane.**

IX. The sixth, or Middle kind, has a Root which is pretty large and fleshy, from whence springs a branched Stalk of about a Foot and half high, en- compassed at certain places, with thick, rough, greyish, green Leaves. At the top of the Branches grow pretty fair yellow Flowers, of the length of a little Marigold, which being dried away, turn into Down, and are carried away with the Wind.

X. The Places. The lift grows in Syria, Claffan, found it near Lisbon, and in divers parts of Spain; but with us it grows only in Gardens. The second on Mountainous places in Germany, England, &c., as also in Gardens: Johanniss Thalino found it in Hortus Syrius in Saxony, and we in many places, of our own Country, as near Hampfied, &c. The third, fourth, and fifth are found upon the Hills in Artois, and some Hilly places in our own Land. The sixth is found growing in most places about Rivers and Pond sides, &c. and has been found in St. John's Park, Tottle Fields, &c.

XI. The Time. They flower all in the Months of June, July, and August, some earlier, and some later than others, the best yielding in the mean season.

XII. The Qualities. Fleabane is hot and dry in the third Degree: it is Aperitive, Alleviative, Diuretic, Nephrick, Nephritic, and Alexipharmick.

XIII. The Specification. It is fingular against the Strangury, Jaundice, griping of the Guts, Epilep- sy, green Wounds, bites of Mad Dogs, and all sorts of Venemous Creatures, &c.

**The Virtues.**

XV. The Liquid Juice of Leaves and Flowers. It provokes the Terms in Women, and expels the Dead Child and Afterbirth; it cures the Strangury, for it provokes Urine admirably when it is made by drops, by opening the Pohlappes, and expelling the Morbid Matter, be it what it will. Dose two or three Spoonfuls, Morning and Night, taken in a Glas of Brandy, or other fit Vehicle.

XVI. The Essence. It has all the former Virtues, besides which it opens all Obstructions of Gall, Liver, Spleen, Relms, and Womb; it is good against the Yellow Jaundice, and the Gripping pains of the Belly, and being taken to three or four Spoonfuls in Vinegar or Wine, it prevails against the Epilepsie or Falling-Sickness; injected up the Womb it brings away both Birth and Afterbirth, being also at the same time taken inwardly, given in Real Port Wine it stops any Flux of the Belly.

XVII. The Infusion or Decocition in Wine. It has all the Virtues of the Juice and Essence, but must be given in larger quantities, as to four, fit, or eight Ounces, being given Morning and Evening it admirably warms and strengthens a cold, moist, and weak Stomach, provokes Urine powerfully, and prevails against all sorts of Pains and Grievous of the Womb; if the Decocition is made in Water, it is good for Women to Bath in whole Courses are lofty, as also to take all sorts of Pains and Grievous of chole parts.

XVIII. The Oil by Infusion. Anointed on the Head it eases the Headache and Migrain, coming from a cold Cold, anointed all along the Back Bone, on the Stomach, and on the Piles, it is very efficacious to take away the itching Fiss of Agues, and those Tremblings which come from cold.

XIX. The Balsam. It is an extraordinary thing for curing simple green Wounds, it brings to Digestion, cleanses, dries, and heals after a singular manner, anointed on the Hemorrhoids it gives ease in the extremity of Anguish, and in a little time cures them.

XX. The Castor Plum. The green Leaves made into a Pulpice, by being in a Mortar, &c. and applied to any little green Wound, or Cut, anointed on it well washed or cleansed, heals it in a very short space of time, warms and comforts parts chilled with cold, and applied to the Forehead is a good expedient to cure the Frenzy, so also being applied to the Soles of the Feet, and so applied, it is said to stop any Flux of the Bowels.

XXI. The Spirituous Tincture. It is good against Vomiting and Nauseatfulness, expels Wind, and comforts and warms a cold, moist, and weak Stomach; it is good against Poysons, the Biting of Mad Dogs, Serpents, and all sorts of other Venemous Creatures; it cures all sorts of Fluxes of the Bowels, whether they be of Blood or Humors, and is an extraordinary thing to be taken two, three, or four times a day in any fit Vehicle, from two to four, or six Drums by such as are afflicted with the Palsey.

XXII. The Oily Tincture. This used as the Infused Oil foregoing, is much more powerful to warm those parts which are chilled with cold, and to take away the cold and shaking Fiss of Agues, as also to cure Tremblings, Nummuls of any part, Palsies, Convulsions, Cramps, and the like, anointed on the Piles which are not broken, it presently eases the Pile, diffuses the Tumor, and in two or three times anointing cures them, it is an excellent thing against Pustules, Hurts, and Bruises of the
Salmon's Herbal. Lib. I.

Nerves and Ten, or, and gives inwardly ten to twenty or thirty drops, (drawn first into the White Sugar) mixed with a Calis of White Port Wine, it facilitates the Birth, brings away the Afterbirth, or Dead Child, opens Obstructions of the Rings, Uterus, and Bladder, and brings present Relief in the Soreness, caused by fish, Barrows, Sand, Gravel, or Tartarous Matter lodged in the parts.

CHAP. CCLXXIII.

Of FLEABANE the Lesser.

The Name. It is called in Greek κινδύνος in Latin Conyza minor, and in English Fleabane the lesser.

II. The Kinds. It is the second Species of Fleabane, and is twofold, viz. 1. Conyza sativa Theophr., Conyza minor var. Diffusa, Pena, Chaffy, Geoffry, & altrorum. The true leifer Fleabane of Diffusus. 2. Conyza carota var. Trifidae flore alter Turvius, Conyza obovata caroidea, Briggens quar. turn Dominus, Vrentarius Geverfi, Conyza muturil. & Conyzae Caroidea Geverfi, Conyzae Caroidea Tabernonuntan. Another Mentioned Columnar, Blew Bladder Fleabane. These are some others of this leifer kind, but they are not all to be met with in England.

III. The Description. The short, or true small Fleabane, has a Root which is single, small and slender, with a few Fibers thereof, which persists forever Year. This Root sends forth seldom more than one Stalk, which is about a foot and half high, sometimes not above a foot, and sometimes not a foot high, according to the goodness of the Soil it is planted in: it is somewhat hairy and glutinous, or clammy, as the true greater Fleabane, but greener than that great kind. This Stalk is divided into many branches, which are also rough and glutinous. The Leaves are long and narrow, somewhat like those of Linaria, or Fleabane, but three times longer than those of the greater Fleabane in Chap. 272. Seed, 4. aftergoing, and are hairy and thickish or clammy all along. With the small Leaves, at the tops of the Branches, come forth small pale yellow Flowers, which are leifer, and let shining than in the said greater Fleabane, which palming away, the Heads are turned into Down, and are carried away with the Wind, as the others are. This whole Plant scents sweeter than most of the others do, and dies every Year, and raffles it self of its own Sowing, or else must be now Sown every Year.

IV. The found, or Blew flowered Fleabane, has a small Vulgar and yellow Root, of a very hard and lasting Orb, which from its Head sends up several longish Leaves, somewhat like those of the Garden Flax, but a little smaller. The Stalk is about half a yard high, and set alternately with tanned longish, narrow, and somewhat rough Leaves, of an overspren green color. Some Authors say, the Stalk grows sometimes to be about two Feet high, brownish at the bottom, and is set here and there up to the top, with longer and narrower Leaves, where it is divided into small and short Branches, on which grow many Flowers one above another, in small, longish, feally green Heads or Husks, composed of many small and narrow, mealy purple Leaves, spreading white at the clasps or tips, with a small yellow Bar Thrum in the middle, in which middle, there arises up several white threads, whereby each flower, confining of three colors, White, Yellow, and Green, makes it seem the more delectable to behold. After these flowers fall away, there comes in rote Husks or Heads which held them, small, long Seed, lying in the Down, each having four thereof at its Head, which together there (when ripe) is blown away with the Wind, if not gathered. The whole Plant is of a sharp taffe, but the Root much more, and is nearly as hot as Pepper, of a strong, but not unpleasant smell.

V. The Places. The first grows in Syria and Greece, also in Spain near Madrid as Clufius says, and in the Woods at Gramont near Almouapher, as both he and Leoel say. The second was found in divers places of the Kingdom of Naples, in moift Fields which are in the Mountains, as Columns Eys, as also in Sandy places near the River Rofeae by Lomis in France, and upon the Alps in Alniae as Clufius says. It grows upon many Chilly Hills in England, and Gerard says, that he in the Company of George Bowes and some others, found it near Farmingham in Kent, and one William Brown found it growing at the Black-house in Greccfand. The first grows with avyly in Gardens.

VI. The Times. The first Flowers in June and July: the second in Auguft, whose Flowers turn quickly into Down, and are carried away with the Wind.

VII. The Qualities, Specification, Preparations, and Virtues are the same with the True greater Fleabane in the former Chapter, to which we now refer you, but with this Observation, that these Fleabanes, are much more efficacious to all the purpofes aforesaid, and are much more powerful and efficacious to help any Flux, or bloody Flux of the Bowels.

VIII. Note. The Root of the Blew flowered, being held in the Mouth, absolutely Cures the Tooth-ach.

CHAP. CCLXXIV.

Of FLEABANE Dwarf.

I. The Name. It is called in Greek κινδύνος in Latin Conyza Puila, Chamaconyza: in English Dwarf Flo- bane.

II. The Kinds. This is the third Species of Fleabane: And it is two fold, viz. 1. Conyza Pa- mila, Conyza minor Frangi, Matthalis, Conyza mini- ma Lobult & Didon, Our Vulgar Dwarf Flea- bane. 2. Conyza minor Rauwoljii, Conyza minor Sy- riaca, Syrian small Fleabane.

III. The Description. The short, or Dwarf Dwarf Fleabane, has a small and Vulneris Root, from whence arifes a branched Stalk, about a foot high, set with small longish Leaves, somewhat roundish pointed, soft and woolly, without any Keave or head of these going before. The Flowers are replen- ished with many yellow Threads, like to the middle part of Camofills Flowers, or those of Tan- lie, and as the former turn into Down, and are carried away with the Wind.

IV. The
V. The Places. They both grow near Water sides, and in Plathy and Wet Grounds, which are not often dry, but being planted in Gardens where there is rich Mould, they prosper very well.

VI. The Times. They both of them flower in August and September, and their Seed is ripe not long after, and is suddenly carried away with the Wind.

VII. The Qualities, Specification, Preparations and Virtues, are the same with those of the Great Fleabane in Chap. 272. a foregoing, to which I refer you.
Salmon's Herbal. Lib. I.

CHAP. CCLXXVI.

OF FLEAWORT.

1. T H E Name. It is called in Arbicke Bizarro Cargoth,Recet Cahrume: in Greek Voluamum: in Latin Pfyllium, Pulturcas, & Pulturcas herba: in English Fleawort. This Name is given to it not because when it is brought green into the Heate, that it drives away Flees, but because the Seed thereof is very like to them.

II. The Kinds. Authors make four kinds of this Plant; but because feeldmore than three come to our hands, we shall only decribe them. 1. The first of this is called Volumam, Pfyllium Vulgare, Pulturcas, Gympf Theophrastus, Common or ordinary Fleawort. 2. Pfyllium major semper Vires: Pfyllium alterum Geirser, Pfyllium parvum, Geirser & Camerarius, Pfyllium Praecox, major radice perenne Lobelii, The great green Fleawort. 3. Pfyllium Indicum sulis Cretensis, Pfyllium Americanum, aureo floribundum foliis verrucosis. The Indian or American Fleawort with dented Leaves. This is Pfyllium primum Angustifolium, and the Pfyllium verum Dictyonitisas as Baumhains thinks.

The leaves which grow forth at the joints, referent to the former, are much longer and much narrower. At the tops of the Stalks and Branches, and at the joints come forth chiefly Tufts, standing upon long foot-Stalks, which are very like to the Ear of the Wheat. The Pfyllium Phalaris, or Caney Seed, is which Heads or Tufts is contained the Seed, which is like the former.

IV. The second, or Great evergreen Fleawort, is a long, hard, and Woody Root, which persifis out, but lives to Winter, putting forth Leaves Green all that Season, whence came its Epithet of Temper virens, or never dying. From this Root spring forth long and tough Branches, of a Woody substance like the former, but that they, as also their Branches are somewhat greater, longer, and harder, and do a little more bow down to the Ground. The Leaves which grow forth at the joints, referent to the former, are much longer and much narrower. At the tops of the Stalks and Branches, and at the joints come forth chiefly Tufts, standing upon long foot-Stalks, which are very like to the Ear of the Wheat. The Pfyllium Phalaris, or Caney Seed, is which Heads or Tufts is contained the Seed, which is like the former.

V. The third, or American Fleawort, is a long Woody Root with some Fibers adjoining, which sends forth a Woody, reddish, rough Stalk, growing to the Ground, growing to be about a foot high, and spreading itself out into divers Branches. The Leaves stand at the joints thereof, and are somewhat long, narrow pointed at the end, and a little dentied in; or rather torn on the edges, and hairy also like the former. The tops of the Branches are more florid with Heads than the former, but of the same bigness and figure, with Flowers growing in the same manner, containing within them shining Seed like to the others.

VI. The Places. The first grows in Italy and Spain, in Fields, and uncultivated places, but with us only in Gardens. The second grows plentifully in Fields, near the Sea-thor or Coast, as also in many of our Gardens. The third is a native of the Indies, and has been found growing in Florida, and in the Southern parts of Carolina: From some parts of which Continent it was brought into the European parts of the World.

VII. The Times. They all flower with us in June and July, but in their native places all the Summer long.

VIII. The Qualities. The Seed of these Plants is that which is chiefly used in Medicine, and that both Galen and Sorinio Eyr, is cold in the second Degree, but temperate in respect to moisture or dryness. It is Emmollient, Lubricative, Anodyne, Pectoral, and a little Cathartic. Some Authors have written that the frequent inward use of this Seed is very dangerous, but it is no otherwise true, than as it falls out in other great cooling Herbs, as Hafelock, Hespera, Liquor, Nightshade, and the like, which are all safe enough, if wisely and fitly applied: but Ignorance, Ranciness, and Indifferency, in the application of Medicaments, has oftentimes done harm, and brought discredit to those Medicaments which (having been free from any dangerous effects) were in all appearance to Wife Physicians of the greatest names and Bradfords, in the Art of Medit- tation. The Fame is to be laid in this use of this Plant, as to its Virtues and Effects. It is an excellent thing, and without any evil Qualities, if applied and used by a Wife and skilful Physician.

IX. The
The Names. It is called in Latin, Sophia, and Sophia Corrugatum, by Gerard, also Pseudonarthuriun sylvestre, and by some Thalictrum or Valerium, (also these two last are Names which more properly belong to Meadow Rye;) some will have it to be Sophia Petrocelli, by which, it is said, he did such Wonders: also Seriphium Germanicum Teige, delphicus Capiulins, Nathurium fylvestre, renouculum denteiun Basius, Erca Gratiae Helian- tum Lobeli: in English, Flixweed.

The Kinds. Authors make two sorts hereof, viz. 1. Sophia engilifolis, Narrow-leaved Flixweed. 2. Sophia latifolia, Broad-leaved Flixweed; which yet Gerard thinks may be both one kind, the Leaf thereof growing taller and larger according to the Richness or Goodness of the Soil. Their Descriptions follow.

Flixweed.

III. The Description. The first, or Narrow-leaved Flixweed, has a Root which is long and woody, perishing every Year; yet if it be suffered to seed, and shed its Seed, it will be wonderfully encreas'd the next Year, from this Root it rises up with a round, smooth, hard, upright stalk, half a yard or two feet high, seldom more, and spreads itself into several Branches, by which it becomes a beautiful (considering the Plant) or pleasant kind of Bath, on which Stalk and Branches do grow many Leaves, of an over-worn greyish green color, finely cut and divided into a number of fine Jags, like unto those of Roman Warrwood, or Emaliat Leaves of Corian- der. The Flowers grow upon the Stalk and Branches, Spike Edition, which are very small, and of a dark yellow color, which being past its way, small, long Pods succeed, containing much Seed, which when ripe, is of a yellow color.

IV. The
XI. The Essence. Drink to two or three Ounces mixed with Red Wine, it has the Virtues of the liquid Juice, besides which, it stops the Bloody-flux, and all other Fluxes of Blood, and Fluxes of the Belly, and is no less powerful than Poisonous or Conjury in the afore-said Cases, as also to confol- lide Blisters which are broken or out of Joint.

XII. The Decotion in Smiths-forge Water, or in Wine. It has all the Virtues of the Juice and Essence, and performs the same Effects, but ought to be given Morning and Evening for some considerable time, and to the quantity of fix or eight Ounces. It may be used as a Diet-drink by all such as have inveterate and putrid Ulcers, running and ill-conditioned Fistula's, for it alters the Habit of the Body, thickness the Juices, and so induces the healing. Formented upon the Piles, it eases the Pain, and diffuses them.

XIII. The Ointment or Balsam. It may be made either of the green Herb or the Juice, and is very beneficial to digest, cleanse, incrust, dry and heal old frett and eating Ulcers, how foul and malign- ant forever they be, and is a good thing to be kept always in a Readiness by rich and able People in the Country, for the Use of their poor Neighbours whenever there may be an occasion.

XIV. The Curative. Being applied to green Wounds or recent Ulcers, it performs all that the Ointment or Balsam can do. It is good to be ap- plied to Fractures and Joints lately dislocated, for it eases the Pain, abates the Inflammation, prevents the Flux of Humors, and strengthens the Part affixed.

XV. The distilled Water. It participates of the Virtues of the Plants, but in a much manner degree, having the Virtues of the Juice, Essence and Deco- tion: but its chief Life is for a Vehicle, to convey those Internals into the Body. It is cooling, drying, balsaming and healing.

XVI. The Seed, or Powder thereof. Given to a Dram in Red Port Wine, or in Smiths-forge Water, it has been found by Experience to be of excellent Life to stop the Bloody-flux, Spitting, Vomiting or Pissing of Blood, as also other Fluxes of the Belly. It is also good against Nauseting and Vomiting.

---

CHAP. CCXVIII.

Of FLOWERING GENTLE Great. or R.

Great VELVET-FLOWER.

---

I. THE Names. It is called in Greek, οὐκεδέ-ρις, in Latin, Amaranthus: in English, Flower-gentle, or Velvet Flower. The Greek is de- rived from οὐκεδέρις, non nauseaem, vel non ne- saete, from its never fading or waxing old.

II. THE Kinds. It is divided into two principal kinds, viz. 1. οὐκεδέρις ροζιος, Amaranthus magnus, The great Flowergentle, of which this Chapter. 2. οὐκεδέρις ροζιος, Amaranthus purpureus, Flowergent- le the least, of which in the following Chapter.

III. Of the greater Flowergentle, there are two sorts, viz. 1. Amaranthus purpureus major, or me- cha gummella purpure, The greater Flower-gentle or Velvet-flower. 2. Amaranthus maximus, coecumin elegans maximus, The greatest Scarlet Flowergentle, or Velvet-flower.
IV. The Description. The chief, or Greater kind, has a Root which is a great Ball of Strings, spreading in the Ground, whereby it is strongly rooted, yet perishes every Year after it has given its Seed. From this Root springs forth one thick, tall, claret, brown, red Stalk, four or five feet high, from whence spring many great broad Leaves, like to some of the other following kinds for the Form, but much larger, and redder for the most part, especially the lowest, which branches forth into several parts; from between these Leaves and the Stalks or Branches, as also at the tops of them, stand long spiky, round, and somewhat flat Tuttes, of a more reddish purple color than the full of the following Chapter; and divided also into divers parts, whereby, when they are full ripe, are to be seen an immeasurable company of white Seeds, standing out among the short Thums, and do softly fall away with a littleouching. Every one of these white Seeds has, as it were, a hole half bored thro' therein.

V. The second, or Greatest Scarlet Floweringendy, has a pretty thick long Root, with some Vines adjoining to it, which sends up one or more very great, thick, round, tall Stalk, rather higher and greater than the most ordinary great Red Floweringendy, with an large great Leaves on it, or rather greater, but both the Stalks and they are of a fresh yellowish pale green color, with little or no Redness in them at all, (and this is one proper Mark to know this sort from others, before it comes to flower.) The Flowers stand at the tops of the Stalks and Branches, more spread at the bottom into several parts, the middle being longest; and commonly when it is in the Perfection, hanging down like a Taffel; the other parts, like smaller Spikes, compassing it round, which even for the Proportion, is very beautiful, but much more for the color, which is of a more excellent bright, scarlet red, and which being grafted in the prime, will hold the color a great while before it decays, especially if it is kept from the Sun and Wind. The Seed enclosed in these Tuttes, is almost as white and small as the former, yet a little redder, whereby the Difference may be known.

VI. The Places. Both these were brought to us first out of the West India, the latter from Brazil, or some other parts of America, where they both are much used, especially the Seed. They are all sowed up with us in Gardens, but in backward or cold Years they do not so well thrive, because they love much Heat, yet for the most part they give us every Year ripe Seed.

VII. The Time. They bear their Spiky Flowers in July and August, and yield their ripe Seed in August or September.

VIII. The Qualities. They are temperate in respect to Heat or Cold, and dry in the first Degree, Digestive, Reproductive, Hydrick, astrin& and Antemenagetical.

IX. The Specification. They are peculiar for stopping all sorts of Fluxes, especially Fluxes of Blood.

X. The Preparations. You may have therefrom,
1. A Juice or Essence. 2. A Decoction in Red Port Wine. 3. The Seed, or Powder thereof. 4. A Confection of the Leaves.

The Virtues.

XI. The Liquid Juice of the Leaves, or Essence of the Same. I have made many Experiments of the Virtues of this Plant upon several of my Patients, who have been troubled with Fluxes of the Bowels, Bloody-fluxes, Spitting and Vomiting of Blood, as also the overworking of the Heart. I have given the Juice or Essence of the same to three or four Spoonfulls at a time in a Glass of Red Port, or some other proper Vehicle, as Smith's Torsor Water, &c. and have found it abundantly to answer my Expectation in the Cure of the aforesaid Diffences. I am satisfied, that sometimes, and upon some Patients, it has done as much as any Vegetable can do: but I gave it Morning and Night, and sometimes also at Noon, and continued the Use thereof for several days.

XII. The Decoction in Red Port Wine. It has all the Virtues of the liquid Juice and Essence, but is not full of its efficacities, yet it is somewhat more pleasant to be taken, and may be given from three to five Ounces at a time, Morning, Noon and Night.

XIII. Given Clysterwise in any medium Flux of the Belly, as also in a Bloody-Flux, and in a Typhus, it stops the same, heals the Guts, and strengthens the Part afflicted, but it ought to be several times repeated, according as the Necessity or Occasion may require.

XIV. The Seed, or Powder thereof. It may be given from half a Dram to a Dram at a time, in a Glass of Wine, Morning and Night, against Nausea, vomiting, Weakness of the Bowels, Bloody-flux, Hepatic-flux, and all other sorts of Fluxes. If there is any Correction of the Guts, it heals it, stops the Flux of Humors to the Part, and reduces the Tone thereof, if hurt or depri tede.

XV. The Confection of the Leaves. It repercus ses Humors, stops Fluxions to any Part, eases Pains, and prevalishes much against the Gout: but in this last Case it will be far much the better, if an equal quantity of green Cowgery Roots be added and be taken with it.
CHAP. CCLXXIX.

OF FLOWER GENTLE Small, O R,

The Lesser VELVET-FLOWER.

I. The Name. It is called in Greek, Αμαράνττον, in Latin, Amaranthus purpureus; and in English, The lesser Flower gentle, or Lesser Velvet-Flower.

II. The Kinds. Authors make four sorts of this lesser kind, viz. 1. Amaranthus purpureus minor, The lesser purple Flower gentle, or Velvet-flower: some do think this to be Flóx, vel Flóamus Theophrasti. 2. Amaranthus Coccineus minor, The lesser Scarlet Flower gentle. 3. Amaranthus Tricolor, Grevia, vel Gēlēsis Trāce, Variable Flowergentle: this kind, as Spægæus, think to be Sophonis Plante, otherwise that it is Theophrastus Plant, but these Suppositions are doubtful. 4. Amaranthus Spicæ Carminii, Carmen Flower gentle, or Velvet-flower.

III. The Descriptions. The first, or Lesser purple Flower gentle, has a Root consisting of a few thick White Stems, which are purplish at the whole Plant first, at the first approach of Winter. From this Root a crustless stalk rises up, two feet or more high, purplish at the bottom, but green to the top, which spreads at first forth into many Branches. The Leaves on the Stalk and Branches are somewhat round at bottom, and sharp-pointed, of a full green color, and sometimes a little dullish within, like in Form into the Leaves of Roses (of which this and the Cott are accounted Species) or Small Bees. The Flowers are long, growing in Spike fashion, soft, and as it were gentle Tufts of Elbows, many growing in a manner together, bound at the bottom, and stand up at the top, Pyramids of Street fashion, of so excellent a shining deep purple color, tending to a Murry, that in the most excellent colored Velve a more orient or bright color cannot be seen; and I suppose from this Respect it is that the French give it the Name of out-paling Velvet. It has no Smell at all, but being bruised, gives the same admirable purple color on Paper, and being gathered in its full Strength and Beauty, will make a great white (it it is kept in a dry place, out of Wind and Sun) in its full Beauty and Fineness. In these Tufts lye the Seed, scattered up and down, which is small, very black and shining.

IV. The second, or Lesser Scarlet Flower gentle, has a tender, or small fibrous Root, which perfumes the flower, because it is the more tender. The Leaves of this Plant are longer, and somewhat narrower than the former: the Stalk grows something higher, bearing its long Tufts at several Leaves, as also at the tops of the Stalk and Branches, many being set together, but separate one from another, and each bowing or bending down its Head, like unto a Feather, such as are worn in Gentlemen's Caps and Hats, of an excellent Blood-Scarlet color. In these Tufts or Heads is contained the Seed, which is black and bright, like the former.

V. The third, or Variable Flower gentle, has a tender, knobby, fibrous and persisting Root, like the foregoing, which sends up a Stalk, but it is making so high as the former, which spreads at first forth into many Branches, even from the Root up to the top thereof. The chiefest Beauty of this Plant consists not in the Flowers, but in the Leaves; the Flowers being small Tufts, growing all along the Stalk, and at the Joints with the Leaves. The Leaves hereof are of the same fashion with the former, and point ed also; but every Leaf is to be seen, purplish green, red and yellow, very oren and fresh, especially if it comes to its full Perfection, which is in hot and dry Weather; yet not divided all alike, but
in some Leaves where the red or yellow is, there will be green, and by waving, it becomes pleasant to behold; the Seed hereof is black and shining, and not to be distinguished from the former.

VI. Gerard said that it far exceeded his Skill to describe the Beauty and Excellency of this Plant, and that a Painter would be at a loss to depict it in proper lively Colors, in few Words (for he every Leaf refembles in color the most fair and beautiful Feathers of a Parrot, having a tone of Red, a line of Yellow, a daft of White, and a Rib of green color, not easily in Words to be set forth, the several mixtures of the Colors, which Nature has bestowed hereon, being so excellent and admirable. Johnson says the Leaves are commonly of three colors, the lower part next the Stalk is green, the middle red, and the end yellow, or else, the bottom being green, the middle part is yellow, and the end red.

VII. The fourth, or Carnation Flower Gentle, (which as more rare than all the rest) has a Root consisting of a great many Fibers or Strings, from which rise up very thick Stalks, crested and streaked, exceeding Jameth, and of a shining red color, which begin at the Ground to divide themselves into Branches, upon which do grow many great large Leaves, of a dark green color, tending to redness, in the like to those of the Red Beet, streaked and daffled here and there with red, mixed with green, the Flowers grow along the Stalks, from the middle there of, even to the top, in form like Panthus, that is, a great number of Chaffie confulted Ears thrust hard together, of a deep purple, or rather of a deep bluish, tending to a Carnation color; the form or shape of this cannot be fo fitly compared to any thing as to the Yellow Head of a Stag, compact of such like soft feeling sub stance, in which is contained the Seed, which is white, round, and bored thro' the middle.

VIII. The Plants. All these Plants are Natives of the Eastern Countries, viz. Persia, Arabia, Syria, Turkey, &c. from whence they have been brought to us, and here are only nurtured in Gardens.

IX. The Time. They Flower, or bear their gallant Tufts or spikes in August, and continue Flowering until September, keeping in some measure their vigor, till Frosts overtakes them, at what time they perish. As for the third, or Variable Flower gentle, it ought to be Sown in a hot Bed of Horse Dung, with some Earth flowered thereon, in the end of March, and so ordered as you do Must Melons, and the like.

X. The Qualities, Specification, Preparations and uses, are the same with those in the former Chapter, to which you are referred.

CHAP. CCLXXX.

Of FLOWER of Constantinople, or R, FLOWER of Bristol.

I. The Name. It is called in Greek Λυκνίς Καλλοδόντια, in Latin Lychnis Chalcedonica, in English Flower of Constantinople, or Bristol Flower.

II. The Kinds. It is one of the Kinds of Lychnis, or Campion, and is twofold, viz. 1. Lychnis Chalcedonica flore simplici minoria, Single Nonefuch, or Flower of Constantinople, or Bristol Flower. 2. Lychnis Chalcedonica flore pleno minoria, Double Nonefuch, or Double Flower of Constantinople, or Bristol Flower.

III. The Description. The first, or Single Nonefuch, has a Root which is very Fibrous or Strings, softening it very strongly in the Ground, whereby it much increases its self, from the absence rising up many broad and long green Leaves, among which rise up several Stalks, round, bavy, jointed Stalks, three Feet high, with two Leaves at every Joint; the Flowers stand at the tops of them, very many together, in a large Tuit or Umble, consisting of five small long Leaves, broad pointed, and notched in the middle, of a bright red Orange color, which being soft, there come in their places small hand white Heads, or Seed Vessels, containing black Seed, like to the Seed of Sweet Williams, and having but a small fmall.

IV. Of this Single Species there are three sorts, which differ chiefly in the Colors of the Flowers, viz. 1. Lychnis Chalcedonica flore simplici albo, Single Bristol Flower with a White Flower. 2. Lychnis Chalcedonica flore simplici Carnos, Single Nonefuch with a Bluff or Flesh Color, without variability. 3. Lychnis Chalcedonica flore simplici Veficulos, Single Nonefuch Variable. This at first is of a pale Red, after a while it grows paler, and at last it becomes wholly white, and all these diversities of Flowers it will have to be seen at one and the same time upon the Stalks.

V. The Second, or Double Nonefuch, has a Root Fibrous, like the former, and increases in like manner, the Leaves and Stalks being broader and high, and the Flowers growing in Tufts, altogether like the first Single Kind, but in this conftis the chief difference, that this bears a larger Umble or Tuit of Flowers on top of the Stalk, each Flower consisting of three or
Salmon's Herbal. Lib. I.

OF F L O W E R D E L U C E

Bulbous Unmatchable.

I. T H E Names. The general Name of all the Plants of this kind is in Archich Afneni jani, & Ariafa, in Greek Iris, in Latin Iris, and in English Flowerdeluce.

II. The Kinds. Of this Plant there are two principal Kinds, viz. 1. Iris SETOSA, Iris bulbosa. The bulbous or Onion like Flowerdeluce. 2. Iris tuberosa, Iris tuberosa, The tuberous or Bulbous Flowerdeluce.

III. Of the Bulbous Kind there are several Species, as 1. Iris bulbosa IMPER, very inapplicable, the unmatchable bulbous Flowerdeluce, of which in this Chapter. 2. Iris bulbosa Anglica, The English bulbous Flowerdeluce, of which in Chap. 286. 3. Iris bulbosa listifolia, The broad Leaved bulbous Flowerdeluce, of which in Chap. 286. 4. Iris bulbosa angustifolia major, The greater narrow Leaved bulbous Flowerdeluce, of which in Chap. 284. 5. Iris bulbosa angustifolia minor, The lesser narrow Leaved bulbous Flowerdeluce, of which in Chap. 286.

V. Of the Tuberous Kind there are the following Species, viz. 1. Iris tuberosa Chichodonia, The Turkish tuberous Orice or Flowerdeluce, of which in Chap. 286. 2. Iris tuberosa alta Florentina, The Florentine white tuberous Orice or Flowerdeluce, of which in Chap. 287. 3. Iris tuberosa listifolia, The broad Leaved tuberous Orice or Flowerdeluce, of which in Chap. 288. 4. Iris tuberosa angustifolia, The narrow Leaved tuberous Orice or Flowerdeluce, of which in Chap. 283, 284. 5. Iris tuberosa panicula major. Chameris' major, The greater Dwarf Orice or Flowerdeluce, of which in Chap. 291. 6. Iris tuberosa panicula minor, Chameris' minor, The lesser Dwarf Orice or Flowerdeluce, of which in Chap. 292. 7. Iris Graminea, The Grass Flowerdeluce, of which in Chap. 292. 8. Iris sagra, Afris, Wild Flowerdeluce, or drinking Gladness, of which in Chap. 292. 9. Iris Palustris, Water Flowerdeluce, or Water Flag, of which we have already Treated in Chap. 266. foregoing.

V. Of the unmatchable Species there are two kinds, viz. 1. Iris bulbosa grana listifolia Clusius Iris his first great bulbous Flowerdeluce. 2. Iris bulbosa PERSEA, The Peruvian bulbous Flowerdeluce.

C H A P. CCXXXII.

OF F L O W E R D E L U C E

Bulbous English.

I. T H E Names. It may be called in Greek Ιρις, in Latin Iris, or Persea, in English Flower deluce, Iris bulbosa Anglica, Iris bulbosa major. Iris bulbosa Anglica cordata, in English Blue English bulbous Flowerdeluce.

II. The Kinds. It is one of the greater Kinds of the broad Leaved bulbous Rooted Plants.

III. The Description. The Root of this Kind is greater and longer than any of the smaller Kinds which
which have narrow Leaves, it is round, or Onion like, covered with divers brown Skins, which seem to be repeat with long Thorns, like Hairs, especially at the round, or Upper end of the Root, which thing you shall not find in any of the smaller Kinds. From this Root the Plant springs up early, sometimes in January, with five or six long Leaves, which are broad, yet narrow in comparison of their length, and in respect to the other Kinds, also of a whitish, green color, cleft or straken on the backside, and half round, being hollow, like a Trough or Gutter, white all along the inside of the Leaf, and blane at the edge, and appear blemish in a thick round Stalk, a Foot and half, or two Feet high, at the top wherefore, out of a skinny husk, comes forth one, and sometimes two Flowers, consisting of nine Leaves apiece, three of which that are turned downwards are larger and broader than the other, having in each of them a yellow spot, about the middle of the Leaf; other three are small, hollow, ridged, or arched, covering the upper part next the Stalk of those flat pointed Leaves, turning up their ends, which are divided into two parts, the other three stand upright, and are very small at the bottom of them, and broader towards the top; the whole flower is of a Fair Blow Color, after the Flowers are put. Heads three square come up, which are somewhat long and lank, or loof, containing within them round yellowish Seed, which when it is ripe, will blast by the King of the Wind in the dry Hucks.

IV. The Places. Label says that this Blew broad Leaf’d bulbous Flowerdeluce grows naturally in the West of England, whether this be true or no, I know not, but of this I am certain, that it grows admirably well in our Climate, and as it is a beautiful Flower, so by much Planting it, it is very much encrease. It grows common in most Country Folks Gardens; it has also been found growing in Spasse, in and France, by such as have Travelled thero.

V. The Time. It Flowers usually in the end of May, or beginning of June, and the Seed is ripe in the end of July, or in August.

VI. Note. Label calls this Plant Hyacinthus Per- evarum more littis, because of its Hyacinth Color, but in reality it is a totally different Plant; it is truly an Iris flowerdeluce, and is called by some Iris bulbosa major, fine latifolia, to difference it from the latter with narrow Leaves.

CHAP. CCLXXIII.

OF FLOWERDELUCE.

Bulb'd broad Leaf'd.

I. The Names. It is called in Greek Λουκόλη Stock of Iris, in Latin Iris bulbosa latifolia, in English Broad Leaf'd bulbous Flowerdeluce.

II. The Kinds. There are various sorts hereof,

v. 1. Iris bulbosa major purpurea & purpurea Violacea, the pale or deeper purple great bulbous Flowerdeluce. 2. Iris bulbosa major purpurea variegata, fine striata, the great purple fringed bulbous Flowerdeluce. 3. Iris bulbosa major flore rubri, the Great Peach colored bulbous Flowerdeluce.

v. 4. Iris bulbosa major, fine latifolia alba, the great white bulbous Flowerdeluce. 5. Iris bulbosa major albo variegata, the Great white fringed bulbous Flowerdeluce. 6. Iris bulbosa major, fine latifolia et colorata, the Great purple fringed bulbous Flowerdeluce. 7. Iris bulbosa major, fine latifolia purpurea, the Great purple fringed bulbous Flowerdeluce. 8. Iris bulbosa major, fine latifolia violacea, the Great violet fringed bulbous Flowerdeluce.

II. The Description. The first, or pale or deeper purple great Balls, has a Bulb like the Engli- sh in the former Chapter, one differs from the other in the Color of the Leaf; the chiefest difference is in the Flowers, which in this are somewhat larger, and in the one of a deep Blow, or Violet Purple Color, in the other of a deep Purple Color, in all other respects it is like to the former English; there is also another, in all things like this, differing, that the Flower is of a pale Blow, or an Ath Color.

IV. The second, or Great Purple Striped, has a purple Flower, but with some Veins or Stripes of a deeper Violet Color, variously running thro' the whole Leaves of the Flower. There is another of this sort, which is of a pale Blow or Ath Color, streaked with Lines and Veins of Purple in the Leaves of the Flower, some more, some less than other. Another of a Confusion Purple Color, like to the first, but that round about the yellow spot in the middle of each of these Falling Leaves is of a pale Blow or Ath Color, the rest of the Leaf remaining Purple, as the other parts of the Flower are.

V. The third, or Great Peach Colored, is more than any of the former, and not differing from them in Root, Leaf, or Flower, but only that the Flower in this is of a pale reddish violet Color, coming something near to the Color of a Peach Blossom.

VI. The fourth, or Great White, has a Bulb differing from the others, but only greater, it springs not up so early out of the Ground as the Blew and Purple do, but about a Month or more after, the Leaves are something larger and broader than the others, the Stalk is thicker and thornie, bearing principally two very large and great Flowers, one opening a little before the other, yet sometimes both in Flower together in the end, and of a pale white Color, which is called a Silver Color while they are in the Bud, and before they are blown open, but then of a purer white, yet with an eye or show of the Silver Color remaining in them; the three Falling Leaves are very large, having that yellow spot in the middle of them, after the Flowers are past, Heads come forth like unto the Blew or Purple Kinds, but larger, containing Seed of a reddish yellow color like them.

VII. The fifth, or Great White Striped, is in Root, Leaf, and Flower, also in its manner of growing, like unto the last Great White Flowerdeluce, but differs only in the marking of the Flower, being various from it, for this has in the White Flower great Veins, Stripes, or Marks, of a Violet Blow, differing from the Leaves of the Flower variously, which adds a superexcellent beauty thereto.

VIII. The sixth, or Great Purple Colored, differs from the last, but in the flower, which is of a subflint color in the three Falling Leaves, having a circle of Ath Color about the yellow spot, the three ridged Leaves being white, but ridged and edged with that Ath Color, and the three upright Leaves of a pale Blow whitish white Color, with some Veins therein of a Blew Purple; there are some of this last sort, in which more Varieties are to be seen than can easily be express'd, or remembered, which variety, it is very probable, might come from the Sowing of the Seed in differing Soils, as has been truly observed in other Plants.

IX. The Place. They are all planted, and grow in our English Gardens, where they thrive very well.

X. The Time. They all flower in the end of May, and in June, and the Seed is ripe in July and August.
CHAP. CCLXXXIV.

OF FLOWERDELUCE

Bulbous narrow Leav'd or.

I. The Names. It is called in Greek, "Iris barbata," in Latin, "Iris bulbosa angustifolia maior," and in English, "The greater narrow Leav'd Bulbous Flowerdeluce." The five kinds are Twenty-five or six species, whose Names and Descriptions follow in order.

III. The Descriptions. 1. Iris bulbosa angustifolia alba bow major, The greater white narrow Leav'd Bulbous Flowerdeluce. This has a Root like to the other Kinds, which is a little bigger and rounder in the middle, and in its best mood its springing up and manner of growing is much like to the fist described in the next Chapter in all its parts, faving, that it is a little larger and higher, both in Leaf, Stalks, and Flower, and much whiter than any of the middling Kind which follow, yet not so white as the small Kind in the next Chapter: in which which folow we shall not make a Leveal and large Description of it, because it would be to make often and many repetitions of one and the same thing, for the fist of them being once described, (which we have already done) we will to all the following add only the especial differences, either in Leaf or Flower, in Magnitude, Color, or Form, wherein they may vary from that fist, or one from another, these being all of the greater Kind.

V. Iris bulbosa angustifolia alba minor, The small white narrow Leav'd Bulbous Flowerdeluce. Its Lifting Leaves have a little bow of yellowed, and so are the middle ridges of the arched Leaves, but the upright Leaves are more white; in Root and Leaf it differs not from the first White.

V. 2. Argentea, The Silver Colored narrow Leav'd Bulbous Flowerdeluce. Its Lifting Leaves are of a yellowish white, like the fist, the arched Leaves are white, and the upright Leaves of a bowwhite, which we call Silver Color, like that of Silver Weed, or Wild Tobacco.

V. 4. Abla, White. The falling Leaves are yellowish, and sometimes with a little edge of white about them, and sometimes without; the upright Leaves are yellowish, as the arched Leaves are, the ridge yellower.

VII. 5. Alba labris lutescens, White with yellow Falls. The falls are yellow, the upright Leaves white, all these Flowers are of the same bigness with the fist.

VIII. 6. Alba angustifolia, The more narrow White. The flower is smaller, and almost as white as the first, the lower Leaves are small, and do it is worse than outward, not having, nor any sall or Article among all, so that the yellow spot seems to be the whole Leaf; the arched Leaves are not half so large as in the former, and the upright Leaves bow themselves in the middle, so that the tops do as it were most together.

IX. 7. Lutea, The Yellow. It is like the former, living, that its falling Leaves are a little more eminence and yellow, with a yellow spot. X. 8. Aurea, five Lutescent Hispanica, The Golden, or Spanish Yellow. It rises up not so high as commonly most of the rest do, and is wholly of a gold yellow Color.

XI. 9. Pallida Lutea, The pale yellow. It usually rises higher than the former yellow, and is wholly of a pale yellow, but deeper as the fifc.

XI. 10. Alba lutea, Pale Strato Color. It is like unto the pale yellow, but that the falling Leaves are whiter than all the rest of the Flower.

XIII. 11. Verdescent Hispanica lutescens labris albissis, The Spanish party colored Blow. Its falling Leaves are white, the arched Leaves of a withhit Silver color, and the upright Leaves of a fine brownish purple.

XIV. 12. Labris Carolina, The Blotched. The falling Leaves will have either an edge of blow, circling the white Leaves, the arched Leaves being a little bow, and the upright Leaves more purple, or the falls will be almost wholly blow, edged with a bow color, the arched Leaves pale blow, and the upright Leaves of a purplish blow. Violet color.

XV. 13. Alba pala, A pale White. The falls are white, the arched Leaves pale white, so also the upright Leaves, some are a fair blow or purple; some of them will also have larger Flowers than others, and in the first fort, and borders of ordinary, seldom bears above one Flower on a Stalk, yet sometimes two: and of the others, same will bear two, and three Flowers, others again but one.

XVII. 14. Carolina purpurea major, The greater Purple. The Stalk is higher, Flower purple, and larger the Stalk of a very red purple color, a little above the Ground, at the foot or bottom of the Leav'd and Stalk of this Flowers with the latter fort of Flowerdeluce.

XVII. 15. Purpurea serotina, The late Purple. The Flower is wholly purple, except the yellow spot, and Flowers later than any of the other Purples.

XIX. 17. Purpurea rubescens labris albis carolinis, The reddish Purple with whitish blow falls. It is of a reddish purple, and its falling Leaves of a whitish blow color, in nothing else differing from the fifc.

XX. 18. Purpurea labris luteis, The Purple with yellow falls. Its falling Leaves are of a fair Gold yellow, without any sall, yet in some there are Veins running thro' the Yellow Leaves, and there have an edge of a fair dark color about them; the upright Leaves in every of these are of a Violet Purple.

XXI. 19. Purpurea labris ex albis carolinis, & luteis mixcis, Party colored Purple with striped yellow falls. This is like the fifc, but that the falling Leaves are of a pale bow and yellow, traversing one the other, and the arched Leaves of a pale purplish color.

XXII. 20. Subpurpurea labris luteis, The pale Purple with yellow falls. Its upright Leaves are of a pale purple, and the falling Leaves yellow. There is another Species of this, a little differing from it, in that the arched Leaves are yellowish.

XXII. 21. Subpurpurea labris luteis, The Party colored bow and yellow. Its upright Leaves are of a pale bow, and the falling Leaves yellow. There is another of this fort, but of a little purplish bow.

XXIV. 22. Cirris coloris eleganter. The fair Hair colored. Its upright Leaves are of a fine brownish yellow, or Hair color, and the falling Leaves yellow.

XXV. 23. Alba obsoletas, The dull Hair colored. It is of the same color with the former, but somewhat dender.

XXVI. 24. Iris bulbosa Africana, The Purple or Marry Dubary bulbous Flowerdeluce. As to Root, Leaf,
Leaves, and Flowers, and for its form, it is in all respects like unto the middle part of the Leaves and Stalk, i.e., about an inch and a half, and the Ground, are of a reddish color, spotted with many spots, and the whole Flower being of a mean size, is of a deep purplish Red, or Mauzy color, excepting the yellow spot in the midst of the three falling Leaves; it is a Flower of much beauty.

XXVII. 57. Purpurcaea robusta fabriis. This is the greatest of all the narrow Leaved Flowerdeluces in all the parts of it, the Root is greater than any of the other, being thick and short, the Leaves are broader and longer, but of the same color, the Stalk is higher and broader than any of them, bearing two or three Flowers, which are larger than any of the rest, the falling Leaves are of a dusky yellow, sometimes with Veins and Borders about the Brims of another don color, having the yellow spot in the middle, the anched Leaves are of a flat pale purplish yellow, the upright Leaves are of a dull or dusky bluish Purple, and the Heads or Horns for Seed are also greater, as is likewise the Seed.

XXVIII. The Places. All these Flowerdeluces came originally out of Spain and Portugal, and with us they are nourish'd up in Gardens, where they properly well.

XXIX. The Time. They Flower in June, and sometimes continue Flowering until July, but Flowers not commonly so early as the Latifolia, or broad Leaved Kind, these are soon spoiled with Wet in Flowering.

C H A P. CCXXXV.

OF FLOWERDELUCE

Bulbous narrow Leaved Small.

I. The Names. It is called in Greek Λυκοτατον, in Latin Iris bulbosa angustifolia minor, in English The leffer narrow Leaved bulbous Flowerdeluce.

II. The Kinds. There are but three several Species of this sort taken notice of by Authors, viz. 1. Iris bulbosa angustifolia alba minor, The small white narrow Leaved bulbous Flowerdeluce. 2. Iris bulbosa angustifolia purpurea minor, The leffer yellow late narrow Leaved bulbous Flowerdeluce of Barbary. 3. Iris bulbosa angustifolia Carnea, and Purpurcaea praecox minor Latifolia, The PortoGal small early Purple, or Blew narrow Leaved Flowerdeluce.

III. The Definitions. The first, or small white narrow Leaved bulbous Flowerdeluce, has a Root which is smaller and shorter than those of the Latifolia, and without any Hairs or Threads, covered with brownish Stems, and more plentiful in yielding an acre area, its Flower is smaller than the first Kind of the former Chapter; it springs out of the Earth always before Winter, which afterwards breaks forth into four or five small and narrow Leaves, a Foot or more long, of a yellowish green on the outside, which is hollow and channelled, and of a bluish green color on the inside, and round within, the Stalk is longer and flender than those of the Latifolia, with some shorter Leaves upon it, at the top whereof, out of short skinny Leaves, come forth one or two Flowers, smaller, shorter, and rounder than the Flowers of the last of the broad Leaved, yet made after the same proportion, with nine Leaves, three falling downwards, with a yellow spot in the middle, other three made long, made like a long arch, which cover the lower part, next the Stalk of three falling Leaves, and turn up at the ends of them, where they are divided into two parts, the other three hand upright, between each of the three falling Leaves, being somewhat long and narrow; the Flower is wholly of a pure white color, (having the yellow spots) yet in some having a flour of some blackness throughout, and in others towards the bottom of the three upright Leaves; after the Flowers are past, so many long Cods or Seed Vellids rise up, as there were Flowers, which are longer and smaller than in the last of the broad Leaved, and a little bending, like a Coronet, with three round Squares, and round pointed allos, which dividing it itself when the Seed is ripe into three parts, do throw fix several Cells or places, wherein is contained one, like round reddish yellow Seeds as those of the last Latifolia, but something smaller.

IV. The second, or leffer yellow late narrow Leaved, is a smaller Plant, or Dwarf Kind, brought from the further parts of Barbary, near the Sea, like unto the yellow greater narrow Leaved, viz. the Ninth and Tenth of the former Chapter, but that this is smaller and lower, and instead of upright Leaves, has small short Leaves like Hairs, it is Flowers very late, after all others have yielded their ripe Seed.

V. The third, or small early Purple Portugal, is smaller in all its parts than the afo. named at Sect. XIII. of the former Chapter, the Stalk is flender, and not so high, bearing at the top one or two small Flowers, all wholly of a fair bluish Purple, with a yellow spot in the middle of every one of the falling Leaves.

VI. The Places. Thefe, also all of them, came first to us from Spain and Portugal, but are here nurish'd up in Gardens, where they thrive very well.

VII. The Time. The first Flowers in June, and sometimes in July, but not so early as the former broad Leaved Kind. The second Flowers very late, after most of the others, and the third usually Flowers very early, even with the first Bulbous Flowerdeluces.

VIII. Note. It is possible that there may be many more Kinds or Differences of these Bulbous Flowerdeluces, which may arise from the different goodness of the Seed, also from the Soil, and the time and manner of Sowing it, as many have observed from their own experience, every Year growing forth some variety which was not seen before.

OF FLOWERDELUCE

Tuberous Great Turky, or

FLAG FLOWERDELUCE.

I. The Names. It is called in Greek Λυκοτατον, in Latin Iris tuberosa Chatcedonia major, in English The great Turky tuberous Flowerdeluce.

II. The
Salmon's Herbal.  Lib. I.

CHAP. CCXXXVII.

OF FLOWERDELUCE

White Florentine, or, FLORENTINE ORRICE.

I. THE NAME. It is called in Greek Ποιονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονονο

III. The Description. The first, or Great Turký Flowerdeluce, has a Root which is brown on the outside, and is very thick and tuberous; so all others of this sort of Garden Kinds are. From this Root spring forth several Heads of long and broad, and soft green Leaves, yet not so broad as many others of this kind, nor is there anything more thick, in Lib. is After contained The yellowish Green Skins, Preparing five thick, and having the Fitter, the Taller Turký Flowerdeluce. This latter, the 'of this kind, or fitter, yet it is only to a respect to the first great Kind, but it is a little or major, in respect of the little Kinds, which hereafter follow.

III. The Descriptions. The first, or Great Turký Flowerdeluce, has a Root which is brown on the outside, and is very thick and tuberous; so all others of this sort of Garden Kinds are. From this Root spring forth several Heads of long and broad, and soft green Leaves, yet not so broad as many others of this kind, nor is there anything more thick, in Lib. is After contained The yellowish Green Skins, Preparing five thick, and having the Fitter, the Taller Turký Flowerdeluce. This latter, the 'of this kind, or fitter, yet it is only to a respect to the first great Kind, but it is a little or major, in respect of the little Kinds, which hereafter follow.

IV. The second, or Lighter Turký Kind, differs little, from the former, the Root is of a more yellowish green color, the Flowers are neither so large nor so fair, nor the Spots and Marks so pernicious, nor the Color of that lively堡垒.

V. The Places. By some part of the Name, it seems that they might first come from Spits in Persia into Turkey, but from Turkey they were first brought to us; they grow and thrive very well in our Gardens.

VI. The Times. They flower mostly in May, before any of the other Species.

VII. As to their Qualities, Specification, Preparations and Verities, see them declared at large in Chap. 588. following: And here it is to be noted that all the Turkey Flowerdeluces (except the Florentine, commonly called Florentine Orrice) more especially those which have the Down or Purple Flowers, have one and the same Virtues, and that our English Edic Flowerdeluce excites them all.
Chap. 288.  English Herbs.

comes from Ilyric in Greece; here we only name it up in Gardens, where it flourishes as well as many of the Iris on Purple Islands.

VII. The Flowers. They flower in April, May, and June, according as cure is taken of them.

VIII. The Receipts. The Ilyric Iris is accounted the bell, but the Roots of both that and the Iletole Iris are used, and the latter being mostly common, bears away the bell in its name. It is hot and dry in the second Degree, ineludes, attenuates, expectorates, digests, opens, mollifies, ablates, and is Pernicious.

IX. The Specification. It is good against Taarous Mustache in the Beff and Lungs, Coughs, Asthmas, Bpecting Breath.

X. The Preparations. You may prepare from the Root (for nothing else of the Plant is used.)

The Virtues.

XL The Powder, commonly called Orice Powder. It is used outwardly in making perfumes, and in sweet Powder for the Hair, also in Compositions of Danish Powders and Syrups Powders. The Root is laid in the Mouth, by fuch who have a Stinking Breath; by which means it draws forth much Rhum, Flegm, and ill digested Humors, which cause the Breath to smell Strong. However the simple Powder is given for the former purposes, from half a Dram to a Dram every Morning falling, and every Night going to Bed, mixed with a sufficient Quantity of double refined Sugar, and fo swallowed, and washed down with a Glass of White Lisbon or Port Wine. It opens obstructions of the Womb, provokes the Terms, expels Wind, eases gripings of the Belly, and pains of the Stomach.

XL Species Diarous simplex, Powder of Orice Root simple. See it in our Pharmacopia Lantinensis, Lib. 4. Chap. 21. Sett. 10. It is good against Asthma's, breathing obstructions, Colds, Coughs, Hoarfnefs, Wheezing, Phthisick, sifted of Breath, Pains of the Stomach, &c. Dose from half a Dram to two Drains.

XIII. The Elettary. It is made of the simple Flowers, Sellt. 11. one part mixed with Clerispea, honey two parts. It has all the Virtues of the Species Diarous simplex aforementioned, besides which, it causes an admirable expectation, and whilst keeps the Body tolerable, it clears the Lungs, and reliefs Ulcers there, expels Wind, gives ease in the Collick, by opening the Bowels, and prevails against a thinking Breath, Dose half an Ounce or more, Morning and Evening, drinking a Glass of White Port Wine after it.

XIV. Diarous Solomonii, Eletary of Orice Root compound. See it in our Pharmacopia Lantinensis, Lib. 4. Chap. 22. Sellt. 57. It is a very good rapi, good, wholesome, good for opening up Wind, Coughs, Colds, Hoarfnefs, Wheezing, Obstructions of the Lungs, Ulcers of the Lungs, putting of Blood and matter; it clears those plagues, whereby they heal. It is good against Collick, Wind, gripings of the Bowels, Worms in Children, pain of the Stomach, weakens thereof, and want of appetite. Dose from half an Ounce to 2 or 3 times a day, drinking a Glass of Hopwine for generous Wine after it.

XV. The Extratul. It is given from half a Dram to a Dram in a Glass of White Port Wine, Conury, Maltoge, Sherry, or Mulled Wine, as also in Malt or Almshin. It has all the Virtues of the Simple and Compound Powders and Eletraries, but is more powerful and effectual to all the purpofes and operations there specified. It warms and comforts a cold moist and depraved Stomach, strengthens the Appetite, caufes a good digeftion, and powerfully opens obstructions of the Lungs, Liver and Spicene.

XVI. The Spirituous Tincture. It refuffles the tone of the Stomach and other Vifeca to a Miracle; and strengthens the Bowels upon the Cure of a Dropie, making them able to reft the return of the Dilatation, and to prevent a Relapse. It is a singular good thing against a Leucopilegmatie, weaknefs of the Body, Laziness, fatting and yowming Fits, and the Scavry in a cold habit of Body. Dose two Drains, to three or more, in any proper and specifick Vehicle, Morning, Noon, and Night.

XVII. The Acid Tincture. It is highly deodrant and antifcorbutick, good against all forts of Fevers which proceed from the corruption of the Juices, and putrefation of the Humors; and therefore is very prevalent against the Plague, and all forts of Pendential and malignant Fevers, for that it fkicks against their Root and Linces. It is well Preservative as Curative; and by reafon, that it strongly refuffles putrefition, and cleanceth, it becomes an extraordinary remedy against athinking Breath, yeaf, that it has been of many years yeafmg. It includes tough Flegm, diilolles it, and expels all the evil juices of the Stomach, and other Vifeca, is good against Stone, Gravel, Sand, and Tarrauros Vifciae in the Reins, Ureeters and Bladder. Dose fo many drops as to make the Liquor pleasantly flat, and may be taken in all that the Patient drinks.

XVIII. The Oily Tincture. Anointed upon the parts affected, it is good against Cramps, Convulsions, Tremblings of the Lims, Numbnefs, Palpites, and all sorts of Pains and Achs proceeding from a Cold caufe. Given Chafffwise to one Dram or more, it gives ease in Collers, Tortures of the Bowels, Stones, &c.

C H A P. CCLXXXVIII.

Of FLOWE R DELUCE

Tuberos broad leaved,

O R,

FLAG FLOWER DELUCE

broad leaved.

I. T H E N a me s. It is called in Grecian w?; in Latin Iris tuberosa,
risoia; and in English Broad leaved Tuberos Flower-
deluce. Some of the Greeks call it Iris, gala, for which reason some have given it the name of Conspicarum, but is rather called Iris a coloris
fanitatis, quam florae ejus representans, from the Rainbow, whose diversity of Colors, the Flow-
ter thereof doth imitate. Some have called it Re-
dox maris, because it is excellent and the
Piles: and some have called it Naronis, from the
River Naron, because by its Banks and Shore it
grows in great plenty. Some have made a dif-
ference between Iris and Iron, according to the Latin
word, Iris purpureum flore gera. Iron alpaz:
making Iris to signifie the Blue Flower deluce; and
from the White Flower deluce, or Florentine Orice,
but this was purely a mistake in the feet: However
D d 4
now, when Physicians write Iris, the Common Blew or Purple Floweredcule is intended, but when Poets, they mean and intend the Florenzine Orrice.

III. The Descriptions. The fifth, or Common blew or purple Floweredcule, has a Tuberous Root, and differs little or nothing from the Great Turky kind, neither in its Root, Leaf or Flower, nor in its manner or form of growing, only that the Leaves of this are not so large as of the kinds above, and the Flower it is of is a deep purple, or violet Color, and sometimes a little declining to redness, in some particular places.

IV. The second, or Various colored, paler Purple, but Flowered of such a pale Purple color, as that they come near unto a Blew, and sometimes it will have Veins or Stripes of a deeper blew or purple, and sometimes of an Alfacolor, running thro' all the higher and lower Leaves.

V. The third, or Blew with Purple falls, is another kind much like unto the former, but this is more purple in the Falls, and more pale in the upper Leaves.

VI. The fourth, or Great Dalmatian, has its Roots and Leaves as large and broad, as any of the Floweredcules whatsoever: Its Stalk and Flower do equal its other parts in proportion, living that the color of the flowers is differing, this being one of a Fair Watchet or pale blew color wholly, with the yellow Throat down the middle of the Flower or Falling Leaves, as before is said to be Common to all Floweredcules. In all its other parts, it differs little, faire only, that it is observed to have a fruit Threw of a purplish red about the bottom of the green Leaves.

VII. The fifth, or Blew Affun, is in largeness of Leaves like unto the Dalmatian, but bears a greater store of Flowers on several Branches, which are of a deeper blew color, and the arched Leaves, whith the fall on the side, and purplish on the Ridges, but in other parts like unto it.

VIII. The sixth, or Purple Affun, is nearly like to the former, but that the Leaves of this are a little narrower, and its Flowers a little more Purple, especially the upper Leaves.

IX. The seventh, or Damascus Floweredcule, is altogether like to the Floweredcule of Asia, excepting that it has some white Veins in its upright Leaves.

X. The eighth, or Portugal double flowering, is very like the first kind of this Chapter, but that it is not so large in its Leaves, nor in its Flowers: It sometimes flowers twice in a Year, viz. in the Spring, and in the Autumn, but this double flowering is not often, unless the Soil in which it grows is very good, the Situation proper, and the Seasons warm and productive: But the Flowers of this have a better and fweeter Smell than the first kind, and they are of a Purple or Violet Color, and come out of a purplish Skin or Husk.

XI. The ninth, or Great variable Purple, has very broad Leaves, like unto the Leaves of the first kind in this Chapter, and is the Flower also, but differing in Color: For the three lower Leaves, are of a deep Purple, tending to redness: The three arched Leaves, are of the color of the upper Leaves, and the three upper Leaves, are of a pale color, tending to yellowness, shadowed over with a Smoaky purplish color, except the ridges of the arched Leaves, which are of a more lively Purple.

XII. The tenth, or lefier variable Purple, differs not in any thing from the last, but only that it has narrower green Leaves, and smaller and narrower Flowers, otherwise it is both compared together, the Colors will not seem to vary at all one from another.

XIII. The eleventh, or other Purple lefs smoaky, comes something near unto the two last Kinds, whose Hanks, from whence the Flowers do floor forth, have purple Veins in them, and do have the falling purplish Leaves; and the three upright Leaves are not so dull or smoaky, yet of a dull purple Color.

XIV. The twelfth, or Blew variable, has its Leaves of the same largeness with the lefier Variable, as at Sect. 12. above, and its Flowers are as diversly marked: For some have the falling Leaves blew at the edges, and whith the at the bottom of the arched Leaves, which are of a yellowish white, and the upright Leaves are of a whithe blew, with yellowish edges. Some again are of a darker blew, with browneish Spots in them. And some are of a pale blew, that it may well be called an Alfacolor. Some also there are whose upright Leaves are of a fair pale blew, with yellowish edges, and the falling Leaves are parted into three colors, sometimes equally in half, each file differing from the other in color, and sometimes one Leaf
Leaves only is in that manner, and sometimes with a various colored. Lift them in the other parts both of Flowers and Leaf, it is like to the old leaf.

XV. The thirteenth, or Yellow Variable, has a Root which grows somewhat more slender and long under ground, and of a darker color than many of the others: This Plant loses its Leaves in Winter, which is contrary to all the former Flowers above, so that its Root remains under Ground, without any appearance of Leaves upon it: But in the beginning of the Spring, it flourishes fair brass Leaves, falling downwards at their points or ends but flatter many times than any of the former, and is like the Stalk in like manner, not rising much above a Foot or fifteen inches high, on which are for two or three large flowers, whole three falling Leaves are of a reddish purple color: The three Leaves which stand upright are of a smoky yellow, the three arched Leaves, having their Kliges of a pale color, inclining to purple, have their fleshes or edges of the former thinly yellow color, with some purplish Veins at the feet or bottoms of all the Leaves.

XVI. The fourteenth, or Yellow, white with pale purple lips, or tails, has its three upright Leaves of a pretty fair yellow, and stand more upright, not bowing down, as most of the others do, the three falling Leaves are purple with pale edges. Some of these have their green Leaves partly colored, white and green, more or less, and to are the husks of the Flowers. The three arched Leaves are yellow, as the upright Leaves are, with purplish Veins at bottom. Some have both upright and arched Leaves, of 10 pale a yellow, that we may in a manner call it a brown color, but yellower at the bottom with purplish Veins, and the filling Leaves are purple, with two purple Spots in them.

XVII. The Places. They are all Nurtur'd, and grown in the Gardens of Florists with us in England, but grow also in many other Nations and Countries, according as their several Titles declare as in Turkey, Hungary, Dalmatia, Illyria, Spain, Portugal, France, &c.

XVIII. The Times. They flower, borne in April, some in May, some in June, and the Seed ripens not many Weeks after.

XIX. The Qualities. These with the Turkey above-mentioned, and all the rest following are said to be of one and the fame Quality, Property and Effect, when green and full of Juice, they are hot and dry almost in the fourth Degree: But when they are dry, they are hot and dry in the third Degree, and will yet in some measure burn the mouth and throat of such as chew them. They are Aperitive, Including, Digestive, Authoritative, and Diuretik, Stomastic, Pectoral, and Hysterick, Cathartic, Emetic, and Emmegagogick. They are said to offend the Stomach, and to cause Blood to be voided, if given in too great a Dose, and to weak Persons. Of all these Plants, the first in this Chapter is thought to be most effectual, and of the same the Root is that which is chiefly used. It is not like to be given to Women with Child, because it forcibly brings down the Courts, and is apt to cause Miscarriage. And when exhibited, it ought to be given with Red Berries, as Mullick, Juice of Liquorice, Ex. tract of Juniper Berries, &c.

XX. The Specification. It is famous in Caring the Scoury, Droplea, Jaundice and Gout.

The Virtues.

XXII. The Liquid Juice. Taken from one to three Spoonfulls (according to Age and Strength,) mixt with a little Honey, and a Glass of Ale or Wine, it purges and cleanceth the Stomach of thick and tough Plegm, and sharp Choler, which are said by Authors to be the causes of Agues and Fevers. It Cures the Jaundice and Droplea also (for which it is a famous thing) by evacuating the Humors which cause thefe Difeases, both upwards and downwards. And because it does sometimes act upon the Stomach, it is not to be given without being corrected with Honey, Spickmord, and aromatick Spices, applied to the Fleshes, it eases them.

XXIII. The Essence. Being taken from one, to three or four Spoonfulls in any proper Vessel, it perfumes all the Liquid Juice can do, besides which, it eases the pains and torments of the Bowels, or gripings of the Belly and Hypochondri, evacuates Melancholy, and takes away the stuffy Furs of Agues, opens obstructions of the Liver, Spleen, and Womb, kills Worms in the Stomach and Intestines, expels the Stone, Gravel, Sand, or Fœtous matter out of the Knees and Bladders, gives ease and redresses in Cams, Convulsions, and Palsies, which come from cold and moist Humors, by its Anodyne and healing property, whereby it warms and comforts the parts afflicted, and prevails against a simple Gonorrhœa: It provokes the Terms in Women, and brings away both Birth and After-Birth.

XXIV. The Infusion in Wine. It has the Virtues of the Juice and Essence, but much inferior in Efficacy: It prevails against the bitings and stings of Venemous Creatures, repellet Vapors in Women, and is good against Fits of the Mother: it opens obstructions of the Vesicles, and cleanses the Stomach.

D d d 2 XXV. The
XXV. The Periwinkle. It is taken to fix Ulcers, it provokes Urine, gives ease in the Colic, produces the Terms, and acts as an Ebirnute, adding to one part of the Decoction, three parts of the liquid Juice, is purges, the head aurally of Flignum, and rough, gibbous Humours; and bathed upon the Harmorrhoids or Piles, it gives much ease and cures them. The Decoction made with Water and Vinegar, and to drink it is remedy against the Bittings of Mad Dogs and Serpents, and the Blisters of Venemous Creatures.

XXVI. The Syrup. It has the Virtues of the Juice, Efflorescence, Intuition, and Decoction, but acts more weekly for its being fo loaded with Sugar, and therefore may be given from one Ounce to two Ounces or more, as a Pelon and Balsamick Welcome, it is more proper, because it causes a better explication, cleansing the Lungs of the Taranaus matter lodging in them. It an Ounce of the Syrup is mixed with four Ounces of the Decoction in Wine, and it is used a Cupple for the Mouse, it cures Ulcers in the Mouth and Throat, and abolishes a Stinking Breath.

XXVII. The Powder. It has the Virtues of the Juice, Efflorescence, Decoction and Syrup, but acts not with so much facility and Speed. Used as an Ebirnute upon the Nipples, it purges and cleanses the Head of Cold, and whitenesses Humours, and cures vomitings and Inveterate Headaches, tho' of many Years standing. Taken inwardly from a Scruple to a Dram or more, according to the Age and Strength, it purges Phlegmus and Water humors out of the Body, both by External and the Internal. Cleanses the Jaundice, Fever, and powerfully evacuates the Morbuscah and Toxemias of the Dropleph, Scorry and Gout. Applied to Ulcers or Wounds, it cleanses, incarnerates, dries, and heals them; and where eating Ulcers have been, which have made the Bone bare of Fleth, it breeds Fleth there, covers the Bone therewith, and causes it to grow up, as to fill the hollows of the Ulcer again. It is also very good to cleanse, to remove the Galls, incontinence, fill up with Fleth, and half Felphag's old malignt Ulcers and Cauncers, which are very difficult and hard to be Cured.

XXVIII. The Eletheria Simple. Take Powder of Blew Periwinkle three Ounces: Juice of the Roots, Clarified Honey, of each two Ounces; mix them. Dose, from two Drams to five or more in the Morning flashing, it works both upwards and downward, and evacuates Flegets, Choler, Meilchoy and Water humors, and by that means purification against the Dropleph in an efficacious manner, and also against the Jaundice, Scorry, Green,Scotties, Kings evil and Gout. It also kills Worms in Stomach and Belly.

XXIX. The Eletheria Compound. It is thus made. Take Powder of the Root four Ounces: Pow¬der of Valanga, Salandets, or Sea bindweed, two Ounces: Powders of Galanga and Zedory, of each one Ounce: Gleece, and Crancom, of each half an Ounce: Juice of the Roots, Clarified Honey, of each twelve Ounces; mix them for an Eletheria. It is used for the Cure of the Dropleph, being taken to fill an Ounce or more every Morning flashing, or according to the strength of the Patient can bear it. It works also upwards and downwards, cleansing the blood, and purging all superficial Humors.

XXX. Oilum Irinum, or the Oil. I do not mean here the Compound Oil, called Oilum Irinum in our Pharmacopoeia Londoniensis, Lib. 2. Chap. 3. and which that is the Oil of the Florentine Or¬ange Root; but I mean an Oil made of the Flowers and Roots of the Blew Periwinkle in this Chapter, which is thus done: Take Roots of the Blew Periwinkle three Pounds, bribe them well: Clarify Oilum, Iridum and Mechanum, Juice of the Roots, Powder three: mix and boil them till they are Gripp, then strain it, take to eight parts, repeat the boiling with from parts in like manner, and repeat it the third time: Strain all out, and add to the Oil Flavours of the Blew Periwinkle a Pound and half, mix and scale, or take in a warm Sand Furnace for eight hours, stirring all with a Spatula once a day, after which, drain out the clear Oil, by a gentle Expression, and keep it for use. It is an effectual thing to warm and comfort liable and weakened parts, Joints, Nerves, Tendons, and Muslules afflicted with Cold and moist Humors, fetters hard Tumors, and gives ease in the Gout and Sciatica: It diffuses, dif¬foles and washes hard and Kennyed swellings in any part of the Body tho' Scrophulous, or proceeding from the Kings Evil; it softens the hardset of the Spleen and Womb; resolves Cramps and Convulsions of the Nerves and Tendons, warming, commor¬ting and helping their Extension: The hinder parts of the Head and Vertebre of the Neck being anchored therewith, it prevails against Cancer: it and the Foramen and Temples of the Heart being anchored therewith, it cures Megrims and Fains of the Head proceeding from a cold Caufe. And drops into the Ears, it helps against pains and noise in them, and anointed two, three or four days upon the Fundamental and Hemorrhoidal Veins, it gives present ease and relief as to the Piles.

XXXI. The Balsam. It has all the Virtues of the Oileum, except that itaben the Humours. Wounds, old Ulcers and Felphag's: For it powerfully digests, cleanses, incarnerates, dries and heals, and raises up Fleth after a very admirable manner in Ulcer that are very hollow. Applied to the Gout, it presently gives ease, and in a short time after cures it, and after a singular manner softens hard Tumors which happen in the fleshly parts.

XXXII. The Caraphe. It, if made of the green Roots (being beaten, and applied) gives ease in the Gout and Sciatica, and in some few applications to aid to Cure them. Another Caraphe, Take of the Powder of the Root two Ounces, Nut¬megs, Half Seed in Powder, of each one Ounce: Saff¬ron two Drums: Distill of Juniper Berries, a¬mologist to make it into a Caraphe. This applied to the Scrotum or Testicles, they vehemently Thum¬milled or swelled by a diffusion of Humors, gives present ease to the Pain, and in a short time difficul¬tes the Tumor. A Caraphe of the Simple green Root, being applied to the Face or other parts of the Skin, as Neck, Arms, Hands, &c. which are Tans¬ted or Sun burnt, or are affected with Scurf, Mor¬phew, black or blew Marks, or Scarrs, or other de¬formities, it takes them away, and cleans the Skin: but who use it had need to take heed, that they use it not too strong, nor let it lie on too long, but rather wash it off again with fair Water, within two or three hours after it is applied: But it is better after the Root is beaten to a Pulp, to tie it up in a fine thin Linen Cloth, and to lay it for a day and a night in fair Water, or Damask Rose Water, and then with this Water, you may wet or moisten the Skin of the Face, Neck, Breaths and Hands, which are deformed as aforesaid, which is to be applied to long as need requires, but this Water you must also take heed of, that you use it not too strong, &c.

XXXIII. The Fesory. It is made either of the Ayd green Root, or the Root beaten to a Malt, and to be made up with Honey. This being put into the Womb or Body, brings forth the Dead Child, much more does it facilitate the Birth, and forcibly draws forth the Afterbirth.

XXXIV. The
Chap. 289. English Herbs.

XXXIV. The Spirituous Tincture. It expels Wind and is good against the Colick, gripings of the Guts, and obstructions of the Vifcers. It produces the Term in Women, strengthens the Stomach and Womb, and corrects cholick and crude Juices which breed the Scary, Gout, Jaundice, and King's Evil: Dose, one spoonful or two, in the Morning Lifting, and after Night, in a Glass of White Port Wine.

XXXV. The Acid Tincture. It strengthens the Stomach, causes a good Appetite and Digestion, and powerfully opens all manner of Obstructions whatsoever. It Cures the Scary radically, and as it opens in a special manner the Urinary Passages, so it carries off the Morbidfick Caufe of the Dropfe by Urine: Dose, so much as to make the Liquor pleasantly sharp, three, four, or more times a day.

XXXVI. The Oily Tincture. Given to thirty or forty Drops in a large Glass of White Port or Lif-fore Wine, to a Woman in Labour, it not only helps, but facilitates the Delivery. Outwardly anointed Morning and Night upon any parts affected with Rheumatic Pains from a cold Caufe, or with a Numfoc, Trembling, Palms, Cramps, or Convolutions, it gives relief in a short time, and in some reasonable time afterwards a Cure. It is also good against the itch, Tetters, King-worms and the like.

XXXVII. The Saline Tincture. Its use is wholly External, and is applied to Scarcif, Morphew, Le-protile, Sunburnings, Turnings, Freckles, Lentils, Pimpls, yellowness of the Skin, and other like defcriptions thereon, being applied Morning and Evening for some considerable time.

CHAP. CCXXXIX.

Of FLOWERDELUCE

Tuberous Narrow-leav'd, Greater.

I. The Names. It is called in Greek, Ταυ τε-
κυλον τουβερον πολυν; in Latin, Iris tuberosa
angustifolia major in English, The greater narrow-leav'd Tuberous Flowerdeluce.

II. The Kinds. There are four kinds hereof, viz.:
1. Iris angustifolia aurea Tripolitana, The Tripoli golden or yellow narrow-leav'd Flowerdeluce.
2. Iris angustifolia carnea major, The greater blow narrow-leav'd. 3. Iris angustifolia purpurea marina, The Sea purple narrow-leav'd. 4. Iris angustifolia purpurea varicolor, The variable purple narrow-leav'd.

III. The Descriptions. The first, or Tripoli golden narrow-leav'd, has a Root which is long and blackish, like unto the root which follows, but greater and fuller; from whence fpring up Leaves a Yard long, or thereabouts, and an inch or more broad, of a fhit green color, but not thinning. The Stalk rises up to be four or five feet high, being round and frong, but not very thick, bearing at the top two or three long and narrow Gold-yellow colored Flowers, of the fallition of the Bathus Flowerdeluces, as the next to be defcribed is, without any Mixture or Variation therein. The Heads for Seed are three-square, containing within them many flat cornered Seeds. The Length of the Leaves of this Plant, compared with their Breadth, makes me call it a Narrow-leav'd Flowerdeluce, and yet, as it is broader than some of the foregoing Broad-leav'd, and broader than any of the following Narrow-leav'd, the Length of them makes them from narrow, for which Reason I thought good to let its place be in the firit of this Class.

Flowerdeluce Tuberous narrow-leav'd Greater.

IV. The second, or Greater blow Narrow-leav'd, has a small tuberous Root, blackish and hard, fpringing into many long Heads, and more chiefly growing or matting together; from which arise Leaves which are very long and narrow, of a whitifh green color, but neither so long nor so broad as the Root, yet broader, thicker and fuffer than any of the root with narrow Leaves which follow. The Stalk rises sometimes no higher than the Leaves, and sometimes a little higher, bearing at its top divers Flowers, successively flowering one after another, and are like unto the Flowers of the Bathus Flowerdeluces, but of a lighter blow color, and sometimes deeper. After the Flowers are past, fix cornered Heads rise up, which open into three parts, in which is contained almost round brown Seed.

V. The third, or Sea purple Narrow-leav'd, has its Root and Seed like the former; from which fpring up many narrow hand Leaves, as long as the Sea, and of a dark green color, which find a little Strong. The Stalk bears two or three Flowers, like the former, but somewhat less, and of a dark purple or Violet color.

VI. The fourth, or Variable purple Narrow-leav'd, has Roots and Seed not differing from the former Sea purple. The Leaves of this are also like thefie of that Sea kind, and do fwell a little strong, like them. The Flowers are differing, in that the upper Leaves are wholly Purple or Violet, and the lower Leaves have white Veins and purple, running one among another.

VII. The Places. The Names shew their several places of Growth, but with us they are only auib up in Gardens: the Sea kind is found originally in Spain.

VIII. The Times. They flower in April and May.
Salmon's Herbal. Lib. I.

May, and the Seed ripens some Months after.

II. Of FLOWERDELUCE Tuberous Narrow-leav'd, Smaller.

I. The Name. It is called in Greek, Λυσίτοδος, in Latin, Iris tuberosa angustifolia minor; in English, The lesser narrow-leav'd Tuberous Flowerdeluce.

II. The Kinds. There are several Species hereof; viz. 1. Iris angustifolia minor Fontanus, variegata Girof. The Hungarian small variable Flowerdeluce of Calvina. 2. Iris tuberosa flore duplum Carolus. The blew double-flowered narrow-leav'd Flowerdeluce. 3. Iris angustifolia albo minor Clus. The Hungarian small white Flowerdeluce.

III. Of the Description. The first, or Hungarian small Variable, has a Root which is black and small, growing thicker and closer together than any other, and strongly furnished in the Ground, with a number of hard fibrous Roots. It fitts up with several small Tufts of Leaves, very long, narrow and green, growing thick together, especially if it abides any time in a place: among which rise up many long round Stalks, higher than the Leaves, bearing two, three or four small Flowers, one above another, like the former, but smaller, and of great Beauty. The lower Leaves are variably strip'd with white and purple, without any Thrum or Fringe at all. The upper Leaves are of a fine blowith purple or Violet color; and of the same color are the arched Leaves, yet having the edges a little paler. The Heads for Seed are smaller, and not so corner'd as others, but contain Seed much like to them, which are also smaller.

IV. The second, or Blew double-flowered, differs not in Root or Leaf from the Greater blow Double-flowered, but both, as well striking, but only in this, that the Leaves of this grow thicker together, and that the Flowers of this kind are as it were double, with many Leaves confusly set together, without any distinct parts of a Flowerdeluce, and of a fair blow color, with many white Vines and Lines or Stripes running in the Leaves. Often times the Stalk of Flowers has but two or three small Flowers, distinctly set together, riling as it were out of one Husk.

V. The third, or Hungarian small White, differs but little from the first of this Chapter, save, that the Leaf is of a little paler green, and the Flower is of a fair whitish color, with some purple, which also falls only at the bottom of the Leaves.

VI. The Places. The original Place of these is Hungary: with us, they are only nurrit up in Gardens.

VII. The Times. They all flower in the Spring, and the Seed is ripe in the Summer Months.

VIII. The Qualities, Specification, Preparations and Virtues of these, are the same with those of the Broad-leav'd Tuberous Flowerdeluce in Chap. 266. along with.
Chap. 292. English Herbs.

CHAP. CCXCI.

OF FLOWERDELUCE.

Dwarf Leifer.

I. The Name. It is called in Greek, Xas\(\text{\textacute{e}}\)l\(\text{\textacute{a}}\).

II. The Kinds. There are several kinds of these aerial plants, viz. 1. Chameris latifolia falsa minor, the leifer white broad-leaved Dwarf Flowerdeluce. 2. Chameris latifolia minor Stramineus, the leifer Straw-colored Dwarf. 3. Chameris latifolia minor purpurea, the leifer purple Dwarf. 4. Chameris latifolia minor, the leifer blatt- or colored Dwarf. 5. Chameris latifolia minor lutes verficolor, The leifer yellow variable Dwarf. 6. Chameris latifolia minor car nau verficolor, The leifer blew variable Dwarf. 7. Chameris latifolia purpurea, the purple Sea Dwarf Flowerdeluce.

III. The Descriptions. The first, or Leifer white Dwarf, has a small tuberous Root, from which grow the principal parts of the plant, narrower and shorter than the former, springing forth. The Stalk with its Flowers upon it rarely rises up above the Leaves, so that in most of them it may rather be called a Footstalk, (such as the Saffron-Flowers have,) and therefore may be said to be annual, without Stalks. The Flowers are like unto the first described in the last Chapter, of a whitish color, with few purplish Lines at the bottom of the upper Leaves, with a Lift of Green in the falling Leaves.

V. The second, or Leifer Straw-colored Dwarf, is in Roots, Leaves, Stalks, Flowers, and Manner of Growing very like the leifer, excepting, that the Flowers thereof are of a pale yellow, called a Straw color, with whitish Stipes and Veins in the falling Leaves, and purplish Lines at the bottom of the upper Leaves.

W. The third, or Leifer purple, differs not much from the leifer in its Form, Subtance and Manner of Growing; the chief Difference consists in the Color of the Flowers, which is of a Deep Violet pur- ple, sometimes paler, and sometimes so dark, that it seems almost black; and sometimes the falling Leaves are purplish and the upper Leaves blue, and some of their have a faint Smell, and some have none: also some of them are of a fine pale blue color throughout the whole Flower.

VI. The fourth, or Leifer blatt-color'd, has its falling Leaves of a reddish color, and the Thorns blue; the upper and arched Leaves, of a fine pale red, or Flies color, called a blatt color; in all other things it differs nothing, and smells very little, or not at all.

VII. The fifth, or Leifer yellow Variable, has its falling Leaves yellowish, with purplish Lines from the middle downwards; sometimes of a deeper, and some- times of a paler color, and white Thorns in the middle; the Flowers, which is of a pale yellow color, with purplish Lines in them; sometimes the yellow color is paler, and the Lines in both the upper and lower Leaves of a dull or dead purple color.

VIII. The sixth, or Leifer blew Variable, has its upper Leaves of its Flower, of a bleuful yellow, spotted with purple in the broad part, and at the bottom very narrow. The falling Leaves are spread over with pale purplish Lines, and a small bow of blow about the brims or edges. The Thorns is yellow at the bottom, and bleuful above. The arched Leaves are of a bleuful white, being a little deeper on the side; sometimes the upper Leaves are of a pale blue, rather whitish, with the yellow, and both these have no Smell at all.

X. The Places. They are only nere or in the Gardens. The Sea kind have been found originally in Spaine, France and other southern Shores.

XI. The Times. They flower in April and May, and the Seed is ripe in July.

XII. The Qualities, Specification, Preparations and Uses, are the same with the Blew Flowerdeluce in Chap. 288. following.

CHAP. CCXCIII.

OF FLOWERDELUCE.

Grafs, or Narrow-leaved.

I. The Name. It is called in Greek, Xas\(\text{\textacute{e}}\)l\(\text{\textacute{a}}\).}

II. The Kinds. There are two special kinds hereof, viz. 1. Chameris angustifolia major, The greater Narrow-leaved or Graf Flowerdeluce. 2. Chameris angustifolia minor, The leifer Narrow-leaved or Graf Flowerdeluce.

III. The Descriptions. The first, or Greater Graf or Narrow-leaved, has Roots small, black and hard, growing thick together, stuffed in the Ground, with small blackish hard, Fibres or Strings, which scarcely foot again, if the Root is removed. From this Root spring forth many long and narrow dark green Leaves, so to stiff as some of the former Smaller Dwarfs in the last Chapter, but pliant, and bending their ends down again; from among which rise up several Stalks, bearing at the top two or three sweet Flowers, as small as any of them set down before, of a reddish purple color, with white yellow and purple Stripes down the middle of the falling Leaves. The arched Leaves are of a Horde Flies color all along the edges, and purple on the ridges and tips which turn up again. Under there appear three brown Agles, like unto Birds Tongues. The three upper Leaves are small and narrow, of a perfect Purple or Violet color. The Heads for Seed have sharper and harder corners than the former, and the Seeds are something greater, like those in the last Chapter.

IV. The second, or Leifer Graf or Narrow-leaved, is in Roots, Leaves and Flowers so like the first described, that it is not to be distinguished therefrom, but only by its Smallest and Lowest, in which it is considerably lefter, and by which it only differs.

V. The Places. These grow in several Southern Climates of the World, but are only Garden Plants with us.

VI. The Times. They flower sometimes in April, and
and sometimes in May, answering to the Warmth or Coldness of the Season.

VII. The Quadratures, Specification, Preparations and Virtues, are the same with those of the flowe Flowerdeluce in Chap. 288. stoting, to which you are referred.

C H A P. CCXCIV.

OF FLOWERDELUCE Wild, or, Stinking GLADWIN.

I. T H E Names. It is called in Greek, Λέοντας, & Λεοντική, in Latin, Xyris, Iris a-grafa, Spatula, or Spatulata Farida, (for Spatula is taken for Gladston, a Sword.) In English, Gladion, Gladdeon, Gladdeon, and Stinking Gladion and Stinking Gladion.

II. T H E Kind. It is the last kind of the Flowers, being the Wild sort, and a singular Species, called by the Arabians, Cataris, by Theophrastes, Xyris a-grafa, Iris a-gra, and in the Gladston Trog, but so called by a Milthake, unless he had said Glad-deon Farida.

Flowerdeluce Wild, or Stinking Gladion

III. T H E Description. The Root, while it is young, is but small, and full of Strings, but being grown older, it grows greater, and in form like many a Flowerdeluce Root, but reddish without, and white within, very sharp and hot in Taste, and of an all a Smell at the Leaves. From this Root rise up several Leaves, very like those of an Iris or Flower-deluce, but that they are thump-edged on both sides, and thicker in the middle, of a deeper green color, narrower, thump-pointed, and of a strong ill Scent, if they are bruised between the Fingers. In the middle rises up a pretty strong Stalk, three Feet high at least, bearing three or four Flowers at the top, made somewhat like the Flowers of the Iris or Flowerdeluce, with three upright Leaves, of a dead purplish Ast color, having some Veins discolored in them, tho' other three do not fall down, nor are the other three small ones so arched, nor do they cover the lower Leaves as those of the Garden flower-deluce do, but fluted loose or all but them. The Flowers being pale, there come up hard Coeds or Husks, three-square, opening wide into three parts when they are ripe; in which are contained reddish Seed, which being perfectly ripe and dry, become black.

IV. T H E Places. It grows in upland Grounds, as well as in moil places, in Woods and shadowy Groves, as also by the Sea side in many places of this Land, and it is also nourish'd in many Countries in Gardens.

V. T H E Times. It flowers not until July, and sometimes in August, and the Seed is ripe in August or September; yet the Husks, after they are ripe, and do open themselves, will hold their Seeds within them for two or three Months, and not shed them.

VI. T H E Qualities. The Root is chiefly used, and it is hot and dry in the third Degree: It is Aperitive, Althevive and Allihent, Hysteric, Pu-tmick, Emmenagogick and Cathartic.

VII. T H E Specification. It is particularly effectual against the Strangury, Obliteration of the COURSES, and Kings-evil.

The Virtues.

IX. T H E Juice of the Root. It purges Choler and Flegm, both upwards and downwards in weak Stomachs and ill Habits of Body, cleansing those Parts very well. Smitted up the Nafe, it causeth Sweating, and clears the Head from much Vicious Water, Flegm and Fufs. Robbed upon places troubled with the Ich, it is fast to cure it.

X. T H E Effence. It has the Virtues of the liquid Juice, but more powerful, and given inwardly two or three Spoonfuls in a Glass of White Lieon Wine, it provokes the Terms in Women, but it ought not to be given to such as are with Child, for fear of causing Abortion or Miscarriage.

XI. T H E Decotion in Water. It purges Choler and Flegm, as the Juice and Effence do, provokes the Terms, and has all the other Properities, but operes much more weakly, and therefore is more fit for the weaker Constitutions. It is good for such as are troubled with Cramps or Convulsions, Gout, Scarcities, and the like; and gives cufe to such as are troubled with the Colick, Gripling of the Guts, 

XII. T H E Infusion in White Port Wine or Ale. It has the Virtues of the Juice and Effence, but works much more weakly. It is good against Grippings of the Bowels, Colick, Strangury, and all sorts of Obstructions of Urine, occasioned from Sand, Gravel, Scurvy Matter obstructing the Bladder and Bladder.

XIII. T H E Pajery. Taken to four or six Ounces or
or more, it is genly Emetic, and cures Agues, FEVERS, Spleen, &c.

XIV. The Powder of the Root. Sniffed up the Nose, it is a very good Emetic to purge the Head and Brain of cold, molit and pitiosous Humors, drawing them from thence in great quantities. Taken inwardly to one Dram in White Port or Liquor Wine, it helps such as are troubled with Cramp and Convolvulsions, GOUT, Scurlic, gripping Pains in the Belly, Strangury, Heat, Pain and Stoppage of Urine. It is given with much profit to such as have holl long Fluxes thro’ the Anatomy of ill Humors, which it stays, after it has first purged and cleansed the Bowels.

XV. The Powder of the Seed. Given from half a Dram to a Dram in White Port Wine, it helps the Stomach, and cures them to Pox preferably, which before could not. If it is taken with Vinegar, it diffuses the Hardness and Swelling of the Spleen, and prevails against Hypochondriack Melancholy.

XVI. The Cataplas. If it is made up into a Poultice with Great Century Root, Honey and Verdrgril, and applied, it is good against all Wounds of the Head, and draws forth Splinters, Thorns, broken Bones, or any other thing Bicking in the Flesh, and that without pain. If the Root is made into a Cataplas in boilling in Vinegar, and be laid upon any Wound or Swelling, it very effectually diffuses or coagulizes it, yet even those Tumors of the Neck and Throat called the King’s Evil.

XVII. The Juice of the Leaves. It is good against Sore, itch, Tettars, Ringworms, Scurf, Morphea, Nymphaing, Sunburning, Yellowish of the Skin, Leprosie, and other like deformities thereof.

XVIII. The Pellers. Being made of the Root, or of the Juice and Powder of the Root, and put up into the Womb, it brings down the Terms in Women who have been long Rupt; but you must have a care that it be not used to a Woman with Child, because it causeth Abortion.

CHAP. CCXCV.  

OF FLUELIN,

OR,

Female SPEEDWELL.

I. The Name. It is called in Greek Φυλέλιν: by the Arabians, Αλυνία: in Latin, Elatina, Veronica, Famina, Culthi, Matthioli, Camerarius, Dobrani, Labellis, Lecchi: in English, Fluellin, or Female Speedwell.

II. The Kinds. It is one of the sorts of Speedwell, and the female Species thereof, of which there are these three following kinds, viz. 1. Elatina folio subrotundo, Veronica Famina folio subrotundo, Round leaved Fluellin. 2. Elatina foliis Veronica Famina foliis acutissimis, Fluellin with corner’d Leaves. 3. Elatina foliis Veronica Famina foliis curvatis foliis squamosis, Fluellin with round Flowers.

III. The Descriptions. The Self, or round leaved Fluellin, has a Root which is small and Threadly, growing every Year, and raiseth it self again of its own Scouring. From whence shoot forth many long Branches, partly lying upon the Ground, and partly standing upright, for with almost round Leaves, yet a little pointed at the ends, and sometimes more long than round, without order thereon, being somewhat hoary, and of an ill greenish white color. At the joints all along the Stalks, and with the Leaves, come forth small Flowers, one at a place, upon a very small Fodikalk, guring something like those of Snapdragons, or rather Fluenoel, whose upper jaw is of a yellow color, and the lower of a purplish, with a small seed or four behind, as the Latin has. The Flowers being gone, small round Heads come forth, which contain small black Seeds.

IV. The second, or Cornered leaved Fluellin, has a Root which is small and Threadly like the other, producing every Year, from which comes forth longer Branches, wholly mulling upon the Ground two or three Feet in length, and sometimes more fully, sometimes more thinly set with Leaves thereon, upon small or short footstalks, which are a little larger, and somewhat round, and cut in or cornered for the most part on the edges in some places: But the lower end or bottom of them, being the broadest part of the Leaf, has on each side a small production, making it feem as if they were Ears, a little hairy withall, but not hairy, and of a better green color than the former. The Flowers come forth at the Joints with the Leaves, upon little long Footstalks, every one by itself, one above another, in form very like unto the other, but the Colors therein are more white than yellow, and the purple is not so fair. It is a larger Flower, and so is the Seed, and Seed Vessels.

V. The third, or Cornered Fluellin with blow Flowers, has a Root which is small and threadly, taking hold of the upper surface of the Earth, where it spreads it self, from whence rise Stalks or Branches, with Leaves thereof which differ but little from the last, but that the Leaves are not so much corner’d about the edges, and less pointed.
also, at the foot or lowest part of them; the flowers are almost all blow, with long small matter of White in them, which being put away, small pouches or Seed Vessels succeed, not unlike the former.

**Fluellen with cornered leaves.**

VI. The Place. They grow upon Banks and Borders of Fields, in Sandy Grounds and Woods almost everywhere, as also in Cornfields, and in Borders about them, and in other fertile grounds, as about Southwell in Kent, in great abundance; at Backworth afo, Humberton and Richmond, in Huntingdonshire, and in several other places, both there and elsewhere.

VII. The Times. They all flower about May, June and July, and the whole Plant is Withered by the beginning of September.

VIII. The Qualities. Fluellen is Temperate in respect to heat or coldness, dryness or moisture; is Cleansing, Affluting, Incarnating, Vulnerary, Stomastic, Hepatic, Alexipharmick and Retorative.

IX. The Specification. It stirs fluxes of all sorts, whether of the Blood or Humors, whether of the Bowels, or defluxions upon any part; it heals also old Ulcers, cutting, Canker, Pocky eruptions and the like.

X. The Preparations. You may prepare from this herb, 1. A Liquid Juice. 2. An Efficacy. 3. A Decoction in Water or Wine. 4. A Balsam. 5. A Cataplasm.

The Virtues.

XI. The Liquid Juice. Given to three or four Spoonfuls at a time Morning and Evening in a Glass of Red Port Wine, it stirs defluxions from the Head, also other defluxions upon any particular part, all fluxes of Blood or Humours, as a Distemper, Dysentery, Lumbra, Hepatic Flux, and the overthrowing of the Courteous in Women.

XII. The Efficacy. It has all the former Virtues, but more efficacious: it stirs all sorts of Bleeding, whether at the Nose, or Spitting, Vomitting or Puffing of Blood; all fluxes of Blood from any other parts, caused by the cutting or breaking of a Vein; and is a fragrant good thing against Contumacies whether inward or outward, strengthening and consolidating the parts which are hurt; and it is no less effectual being used Dietetically to cleanse, dry, and heal old Ulcers which are foul, fretting and eating, and outwardly being applied to dry, conglutinate and heal any simple green Wound. It is of singular use against the French Pox, and all fretting and eating. Cankers proceeding from the same, so that scarcely any other Vegetable comes up to the height of its excellency in this Cafe. Pero gives a relation of one whole Nose was almost consumed with an eating Canker (I suppose proceeding from the French Pox) which was by the Physicians order to have been cut off, to preserve the rest of his Face and Body, now ready to fall into a [Pocky] Leprose; a simple Barber being in Company, and hearing of it, defined that he might first make dryal of an Herb which he had seen his Mother use in Like Cafe, it was granted, and he used only the Juice and Decoction of this Herb, giving of them inwardly, and applied the Herb outwardly; by this only means he recovered the Patient, and not only Cured the [Pocky] eating Ulcer of his Nose, but also the [Pocky] Scabinefs or Leprose of his whole Body, which he was now fallen into; and by this alone means became perfectly well.

XIII. The Decoction in Wine or Water. It has all the Virtues of the Juice and Efficacy, but less efficacious, and therefore ought to be given in triple or quadruple quantity, two or three times a day.

XIV. The Balsam. It is no ways inferior to any Balsam made of any of the Vulgarity Herbs; it digests, cleanses, incarnates, dries, and heals old Ulcers, pustul, fretting and eating Sores, and Cures at once or twice dressing any simple green Wound, in what part of the Body so ever.

XV. The Cataplasm. It is made of the green Herb, bruised and mixed with Bursy Flowers being applied to watering Eyes, occasioned by defluxions from the Heads, where there is Heat and Inflammation within, it very much helps them, and stirs all other Defluxions of Humors, upon any other part whatsoever, wherefore there is Pain, Dilation, Weakness, Wound, or Ulcer, &c.
VI. The fourth, or Fly Orchis or Fly Stones, is in its Root and Leaf like to the last described, the difference is chiefly in its Flower, which is neither so long as the Great Orchis, nor so great as the Bee Orchis, but the upper part of the Fly is black, with a kind of Altncher croffing the Back, with a fhew of Legs hanging at it. The natural Fly seems to be fo in long with it, that you fhall seldom come in the hew of the day, but you fhall find one fir- ing thereon.

VII. The Places. All these grow in many places of England, some in Woods, as the Butterfly, others on dry Banks and barren Places in Kent, and feveral other Shires.

VIII. The Times. They Flower for the most part in the beginning or middle of May, seldom later.

IX. The Qualities, Specification, Preparations, and Virtues, are the fame with fhole of the Cyno-
Orchis, or Dog-Rones in Chap. 226. foregoing, fo that we fhall try no more thereof in this place.

C H A P. CCXLIX.

I. T H E Name. It is called in "Orchis morio, Orchis morio, fTe-
ricus morio: in English Fool-Rones.

FOOLSTONES.
Salmon's Herbal. Lib. I.

III. The Descriptions. The fifth, or greater Male Fool-flotes, has a double roundellerous Root like a pair of Man's flotes, from whence rise up five or six broad and fomewhat long Leaves, as to thyth of Leaves, and a black Spots on their upper fides. The Skalk also has fome thoreum, which compafs it at bottom, but fmalier: The Flowers grow in a Spike, which are small and purple, each of them having an open hood, or helmet high, with two fmall Leaves like Fans, fanding upright at the fides of them; the Belly which is lowerd is whiter, hav- ing on the backide a crooked heel or Horn. The whole Flower is Sweet, and very pleafant to be hold.

IV. The fecond, or Other Fool-flotes with fpofted Leaves, has fefeliefe like the other, but not fo large, nor fo round, from whence fpringing up five, six, or more Leaves, not altogther fo large as the former, but lying on the Ground, and fpofted in the fame manner, but fomewhat rounder pointed. The Skalk of this grows bigger than the other; and the Flowers are not unlike the fame for the form, but of a more blew purple color, with a fpur behind.

V. The third, or Male Fool-flotes not fpofted, has a pair of Tefticles like fhoes beforefagen, from whence fpringing up a Stalk and Leaves which are large, and very like the fhaft, but not fpotted. The Flowers are either of a deeper, or of a pales purple color, or somewhat Blufh, or altogether White. The Belly which hangs down, is fometimes fpotted with purple Spots, and fometimes it has none, more especially in their Flowers which are all White.

VI. The fourth, or Female Fool-flotes, has a dou- ble Tefculchus Root, from whence fpringing up five or fomewhile Leaves, which are leffer and narrower than those of the Male kind, and Ribbed about like unto Ribwort Plantain, lying on the Ground, and fome of them lifting themselves up higher, encompass- ing the Skalk, which is lower then those of the Male kind, have gaping or open hoids like the former, but the Fars on each side form not uprights, but lie fo close together, that they are hardly difcerned, with a heed behind them as the others have. This is either of a dark Violet purple color, the middle part whiter and fpotted, or of a pale Red, whole Skalk is shorter, and Leaves leffer, or fcarce a fcarlet Red, the fcarlet Head being thift and fhort, and the Flowers smaller.

VII. The fifth, or Small Fool-flotes with fpotto- ted Leaves, has a doule Tefculchus Root like the other, and when fpringing up two or three small, long fpotted Leaves, with a Skalk in the middle of them, which they feem to encompass, though higher being much smaller than thefe. The flow- ers are purple, fpotted, and very finely flriped.

VIII. The fixth, or Male Neapolitan Fool-flotes, has a pair of Tefticles which are round, but much longer than the other kinds, from which fpringing up five, four or more Leaves, the length of ones Hard, and an inch broad, of a pale fresh green Color, covered about the edges, and at their bottom encom- passing the Skalk. The Skalk is about a Foot high, much to the left, and at its top has a fpotted bafh of Flowers, which are Red before they open, and of a fair blufh color being fpotted. They are in form like to the others before the hood or helmet opens, having Leaves like Fans on the fides, with ftout Armes as it were hanging down by the Body, the lower parts of which are fmaller as it were with Thights and Legs, the Root being cut off: From the form of the Flowers being fo much in the shape of a Man, came the Name Anthropo- phora.

IX. Of this left fort there is often a female kind, which has a like Root and Skalk, fave that it is higher. The Leaves are larger but not broader than the leaf, fpread on the Ground, with fome smaller on the Skalk. The Spike of Flowers is not fo great, nor fo thick; but the Flower it felf is like the leaf in fhape, but of a pale color, fpotted very thick, as small as Sand, having the hood greenith with purple edges.

X. The Places. The fifth live grow for the moft part in Fields, and by Wood fides in many places of England; but the two laft are Natives of Italy; however they are all of them maffed up here with us in Gardens.

XI. The Times. The lift flower in May, as the reft of the Orchides do.

XII. The Qualities, Specification, Preparations, and Virtues, are the fame to thofe of Cynorrhiz or Dog-flotes in Chap. 226. alfo going, to which we shall refert you.

C H A P. C C X V I I I .

OF FOX STONES.

I. T H E Names. This Plant is called in Greek Ophus Fructus, in Latin Orchi Serapia, Tefculchus Valpium, and in English Fox Stones.

II. The Kinds. There are many farts of Fox Stones, as 1. Orchis Serapia Biglina hauftina, The greatest Twabide Fox Stones. 2. Orchis Serapia latifolia altera, Hungarian Twabide Fox Stones. 3. Orchis Sphegodes major, The great Bumble Bee Orchis on Fox Stones. 4. Orchis Bifper, The great Fever Fly Fox Stone. 5. Orchis Dactylus, Frog Orchis on Frog Flower. 6. Orchis A rachnites, The Spider Flower. 7. Orchis Eystodes Herbae coloris, The green Butterly Orchis. 8. Or- chis Quinquiflora folo maafta, The White or Purple Birds Fox. 9. Orchis Macrophylus Columna, Long Leav'd Fox Stones of Column. There are many other Kinds of Fox Stones, but these are the chief.

III. The Descriptions. The fifth, or greatest Twabide Fox Stone, but Roots or Tefticles which are great, and fomewhat long, like some length Turn- efs, from whence every leaf only fpringing up, not much less than thoſe of the White Hellebore, with feveral Veins running through them, green on the upper fide and paler underneath, but finning withal; the Stalk fides to be a Foot and half high, five ftquare, with a few Leaves or Skins thereon, closing it as it were about; the Flowers grow in a fpotted Head, like unto others, but great and large, being either Purple, fpotted with White, or wholly White.

IV. The fecond, or Hungarian Twabide Fox Stones, thefe in its Roots, Stalks, Leaves, and Flowers, is ou- tly like the former, but fo much lower, and leffer, in Leaves, Stalks, and Flowers, which are fometimes both Purple and fpotted, and fometime White, as the former is.

V. The third, or Great Bumble Bee Orchis or Fox Stones. This has Tefticles lefter than the former, and rounder, from whence fpringing five or fix long nor- mal Leaves, Ribbed, like Ribwort Pflamme, yet a little leffer, the Skalk is about Nine or Ten inches high, bearing five or fix Flowers at the head thereof, the form of which is fomewhat like to a Bumble Bee, or Drone Bee, as it is commonly called, hav-
Ving some few small whitish Purple Leaves, like Wings, above, and a brownish Belly or Body below.

Bumble Bee.

Fox Stones.

VI. The fourth, or Greater Fleeth Fly Fox Stones, has Tehicles like the other Kinds, from whence springing up three or four Somewhat broad and long smooth green Leaves next the Ground, the Stalk rises about five or fix inches high, with a few large Flowers set at top, resembling a great Fleeth Fly, made of four Leaves, three above, and one long one below.

VII. The fifth, or Frog Orchis, or Fox Stones, has a pair of Tehicles large, and something long, with a String or String a t he bottom part thereof, from this root springing two or more broad and short Leaves below, but narrower and longer as they grow up higher on the Stalk, at the top of which grow several yellowish Flowers, resembling the Bodies of Frogs, with the Head and fore parts greenish, from whence it took the Appellation.

VIII. Johnf on Gerhard gives us another of the Frog Kind, which he calls Serapis Batracoltas altera, or another Frog Orchid; this has a Root shaped between the Orchis rotunda and Palmata, it grows to the height of the former, with short Leaves encircling the Stalk as their setting on, the Flowers grow on a Spiked Head, and resemble a Frogs with their long Leaves, but if you look upon them in another manner, they will then something resembl ing little Flies, for which reason Lobel calls it as well Atropa as Batracoltas altera.

IX. The sixth, or Spider Flower, has for its Root a pair of round Tehicles, from whence springs forth a Stalk much about the height of the Frog Orchis; upon which grow fix, eight or more Leaves, being more in number than grow upon the Stalk of the Frog kind, they are also narrower and longer. At the top of the Stalk come forth three or four Flowers, resembling a Spider in the round Belly, and the small Neck or partition, between it and the top Wings.

X. The seventh, or Green Butterfly, has lasted Tehicles a little pointed at bottom, from whence springing up several large, smooth, green Leaves next the Ground, and others smaller and longer upon the Stalk. The Flowers are many and great, resembling Butterflies, with their Wings spread abroad, of a kind of Grass green color, with a Spur behind.

White purple Birds Flower, or

Greater Fox stones.

XI. The eighth, or White or Purple Birds Flower, has a large pair of round Tehicles, but a little pointed at bottom, from whence springing up four, six or more Leaves, which are something large, and for the most part Chequered or Spotted (for there is much diversity herein, some having broad, large and pointed, others narrower, liffers, and rounder pointed Leaves;) there are several other Leaves which grow upon the Stalk, which seem to enclose or embrace it; being long, spotted all over and sharp pointed. The Flowers grow towards the top of the Stalk, Spike fashion, which are large, and like the raft, with a Spur all behind them; some of them are all White, others are Purple, and some between both, of a purplish White.

XII. The ninth, or Long leaved Fox-flones, has usually but one pair of Tehicles (the other as it may seem, being decayed and gone) with some Virescent bulb at head, and on the side, which is not usual in any of the other Orchids. From this Root rises up a Stalk about three Feet high, having two very long Leaves at bottom, but of an unequal length, those which grow next on the Stalk are much longer, force being a Foot and half long, and very narrow, but those on higher are shorter and broader. At the top of the Stalk grow the flowers Spike fashion for a Foot in length, each of which stands like a crofs hollow Pipe, having a broad and long beard theretofore, of a fine Sudan Color, with a more purplish Leaf like a Tongue, hanging down, broad above, and small below.

XIII. The Eleventh. These grow not all of them in one kind of Soil or Ground, for some are found in...
Salmon's Herbal.

Lib. 1.

Salmon's Herbal.

Of FOXGLOVE Garden, or, FOX FINGER, Garden.

I. THE Names. This Plant was wholly unknown to the Ancient Greeks and Latins, so far as we know, for which reason it has no Greek Name, nor yet any Latin Name but what is very Modern and novel. Some of the later Writers have called it Digitalis, which is the most common Name, and still so called as form think by Pachius; others call it Alcina, and Dimosthenis; Trogus calls it Companda Synethrion: Dalcambro upon Pliny, thinks it to be Viole Calabria Planta: In English it is called Fox Glove, and Fox Finger; also Fingerwort.

II. The Kinds. There are two general kinds, viz. 1. Digitalis Hortensis, Digitalis sarae, Garden Fox Glove, of which we treat (God willing) in this Chapter. 2. Digitalis Synethrion, Digitalis a griffis, Digitalis vulgaris, Common Field Fox Glove, or Fingerwort, of which in the next Chapter.

III. Of the Garden kind there are seven (properly but six) several Species, viz. 1. Digitalis majoris Fernagnon, Dunn or Ruff colored Fox Glove, or Fingerwort. 2. Digitalis majoris flore cario, Bluth colored Fox Glove. 3. Digitalis media flore late rubens, Orange-tawney Fox Glove. 4. Digitalis florer alba, The greater white Fox Glove. 5. Digitalis minor alba, The lesser white Fox Glove. 6. Digitalis majoris flore brevissimo, The greater brown Fox Glove. 7. Digitalis minor flore brevissimo, The small pale yellow Fox Glove.

IV. The Descriptions. The deaf, or Dunn or Ruff colored Fox Glove, has a Root which is fibrous or stringy, (like that of the Common or Field kind) which does usually perish, or seldom out-live its growing Seed. From this Root spring up Leaves which are long and large, of a greyish green color, finely cut or dentated about the edges. Among which it comes up a tall brown Stalk, which, when it is full grown, and with ripe Seed thereon, has been found to be seven Feet at least in height, on which grow almost an immeasurable company (reflecting the great abundance) of Flowers, nothing so large as the Common or Field kind, and of a brown or yellowish dun color, with a long Lip at every Flower. They being puffed away, then comes the Seed, much like the Common kind, but in smaller Heads.

V. The second, or Bluth-colored, has Roots, Stalks, Leaves and Flowers, much like to the Common Field kind, but all left. The Leaves are reasonable large, but not full out so large as the Common. The flowers are also considerably smaller than the Field sort, and of a much color.

VI. The third, or Orange Tawney, has a fibrous Root, which penetrates slowly after bearing Seed, which is usually the second Year of its springing up. This Fox-glove is none of the Grand kind, nor yet is it one of the Smallest, but a Medium between both. Its Leaves are in some Proportion correspondent to the Lesser yellow, but not so large as the Lesser white. The Flowers are long and narrow, almost as large as the half White, but nothing to large as the half White, and of a fair yellowish brown color, as if the yellow was overlaided with a reddish color, and is that we usually call an Orange-tawney color. The Seed of this is very like the former.

VII. The fourth, or Greater White Fox-Glove, is in Root, Stalk, Leaves, Flowers, and Seed, as of the Common Field Kind, that it can scarcely be distinguished from it, except in the ruther greener and larger of the Leaves, the Flowers are as large as those of the third Common Kind, but they differ in Color, for as those are Purple, these are wholly White, without any spot in them; in the Seed and all other things they agree.

VIII. The fifth, or Lesser White, has a Root which is greater at the Head, and more Woody than any of the rest, with many slender Fibers, spreading themselves in the ground, and abides almost as well in our Common Purple Kind, the Leaves of this are in form somewhat like unto the Common Kind, but not altogether so large, the Stalk grows to three or four Feet high, on which grow many long, hollow, pendulous Flowers, in plaits alike unto the Common Field Purple, but somewhat shorter, and more large and open at the brims, of a fair yellow Color, in which are long Threads, as in the others.

X. The seventh, or Small pale Yellow, has a Root which is fibrous, or Stringy, but durable, and colored with the brown of the extremest Kind, it has somewhat short, broad, smooth, and dark green Leaves, few or dentated about the edges very finely; the Stalk is two Feet high, befit with such Like Leaves, but lesser; the Flowers are about as much in number as in any of the rest, except the first and greatest, and grow along the upper part of the Stalk, being long and hollow, like the other, but very small, and of a pale yellow Color, almost white.

XI. The Places. All these, except the fourth, or Greater White, are Streanger to us, but are all of them cherished in our Gardens, the Field Greater White Kind has been often found growing wild in many places of England, and generally among, or hard by the Common Field Purple Kind in the next Chapter.

XII. The Times. They flower in June and July, and some in August; the Seed becoming ripe quickly after.

XIII. The Qualities, Specification, Preparations, and Virtues, are the Same with the Common Field purple Kind in Chap. 304, next following, to which you are referred.
English Herbs.

CHAP. CCC.

of Fox Glove Common, or Field.

or,

FINGER-WORT Wild or Ordinary.

I. The Name. It has no Greek Name as aforesaid; nor any ancient Latin Name, as being unknown to any of the ancient Greeks or Latins: But our modern Authors have called it Digitalis, which we render in English, Fox Glove, or Fox Finger, or Finger Worts.

II. The Kinds. This is the second Species, being the common ordinary, or Field kind. Carathion calls it Virga Regia major flore purpureo, also Digitalis purpurea, &c. Digitalis purpurea, &c. digitalis purpurea, and it is generally called Digitalis purpurea Vulgaris, Common purple Fox Glove.

III. The Description. Its Root consists of many small, bushy Fibres, and some greater Strings among them; from whence spring up many long and broad Leaves, lying upon the Ground, covered about the edges, a little felt or Woolly, and of a kind of honey green color: Among which rise several Stalks sometimes, and very often but one; bearing such Leaves thence from the bottom to the middle, from whence to the top it is explanated with large, and long, hollow, reddish purple Flowers, a little more long and eminent at the lower Edge, with some white Spots within them, one above another and with some small green Leaves at every one; but all of them turning their Heads one way, and hanging downwards, having some Threads also in the middle; Iron whence rise round Heads, pointed sharp at the ends, which contain within itself little brown Seed. The Flower has no smell, but the Leaves have a bitter hot taste.

IV. The Place. It grows in dry Sandy Ground for the most part, and as well on the higher as lower places, under hedge fides, almost in every County of this Kingdom. There is also a White Wild Fox Glove, described in the former Chapter at Sei VII. which does grow naturally about Landside and Cowan, in a Field called Cragge Cofe in the North of England; also by Colehanger in Essex, and near Exeter in the West of England, and in several other places: Yet this Wild White kind is also plentiful up in Gardens, as in the former Chapter we have declared.

V. The Time. They Flower and Flourish in June and July, but seldom before July, and the Seed is ripe in August.

VI. The Qualities. Fox Glove is hot and dry at first in the second Degree, Sulphurous and Saline, Aperitive, Adstringent, Digestive, and Vulnerary: Petechial, Hepatick and Arthritic, Emetic, Cathartic, and Anemic.

VII. The Specification. It Cures Contumacities, King's Evil, Green-Skneds, and Falling-Skin's, also Wounds, old Sores and running Ulcers.

VIII. The Preparation. You may have there from: 1. A Liquid Juice. 2. An Essence. 3. A Syrup. 4. A Decoction or Infusion. 5. An Ointment or Balm. 6. A Cataplasm.

The Virtues.

IX. The Liquid Juice. It purges and cleanses the Lungs, Stomach, and Bowels, but ought not to be given not in too great a Quantity, because of its violent Operation. It may be given from three Spoonfuls to Six, in Mead or White Pore Wine, according to Age and Strength; it works strongly both upwards and downwards, and prevails against the Scoriy, Drople, Jaundice, Gout, and Rheumatism, and is found by experience to be an excellent thing against the King's Evil. Outwardly applied, it heals any fresh or green Wound, the Leaves being bruised and applied thereto also. It is frequently used in old and purulent Sores to cleanse them, dry up their moistness, and cause a speedy healing.

X. The Essence. It has all the Virtues of the Juice, and more excellent for the same purposes and intentions; beliches which it remains or attains thick tough Flegm, and vitious Humors, affecting the Lungs, Brest and Stomach: It cleanses and purges the Body both upwards and downwards, freeing it both from Viscious and Watery Humors; It opens Obstructions of Liver, Spolen, Gall and Womb, and refits those Dileases occasioned thereby. And by late Experience, it has been found effectual against the Falling-Sknef, for that divers have been absolutely Cured thereby. Dose from two to six Spoonfuls or more, according to Age and Strength in the Morning fasting, to be given in any proper Vehicle.

XI. The Syrup. Or Bob of the Juice of the Herb and Flowers made with Honey. It is a Specific which transmits all other Vegetable Medicaments for the Cure of Contumacities, cleansing and healing after an admirable manner Ulcers of the Lungs. It opens the Obstructions of all the Viscous, cleanses, carries off, or expels the remanents of the Humors, by which means the daily Nutritive may be conveyed
Chap. Ccli.
Of Foxtail, or, Foxtail-Grass.

The Names. It is called in Greek, *Alopecuros*; in Latin, *Alopecurus, Caudo vulpis*; Lagdunensis calls it Gramen longum *Alopecurus vera Plini* and *Theophrasti*: in English, Foxtail-grass.

True Foxtail-grass.

III. The Descriptions. The fifth, or True Foxtail-grass, has a small Root made of a few Fibres, which perishes every Year. This Root feeds up two or three, or more, soft, hollow Stalks, about a Foot high, with small, long, and narrow, soft Leaves on them, as hollow as the Stalks, on which hard, tough, woody or hoary Heads, somewhat long and round, best round with Soft Hairs, of a pale straw color, resembling a Foxtail Stem, from whence it took its Name.

IV. The second, or Other Foxtail-grass, has much more fibrous Roots, with Stalks and Leaves much like to the former, faying, that they are longer, the Stalks growing higher. The Heads 256 are shorter and...
and rounder, and nothing so woolly or hoary as the other are.

Great English Fox tails Grass

V. The third, or Greatest English Foxtail-grass, has a fibrous Root, from whence spring up Stalks about half a Yard or two Feet high, having sometimes fair large Leaves, like unto Wheat, but larger, set at the joints, and bearing at their tops great, large, fall, felt and woody Heads, like the first, but that they are much greater and longer, and this is, when the stalk is higher or lower.

VI. The Places. The first grows naturally in several places about Monmouth; but we have it in our Gardens only for Curiosity. The second Label found growing wild in both England and Flanders. The third Label found in the West of England, between Persimmon and the Isle of Wight.

VII. The Times. They flourish with their Heads in June, July and August.

VIII. As to their Qualities, &c. this is said by Authors, That no Medical Property or Virtue has been found in any of them, but they are many times used to be worn as an Ornament or Toy on Women's Hats, Hair, or Heads.

CHAP. CCCII.

OF FROG-BIT, OR, Smallest Water Lilly.

The Name. It is called in Greek, Νυμφάες; in Latin, Nymphæa, and Nympha minima, and alba minima; in English, Frog-bit, and Smallest Water Lily.

II. The Kind. It is a singular Plant, and the very leafst of the White Water Lilies. Some would have it to be one of the Kinds of Pondweed, but it is no such thing, but of the Kind of Water Lilies.

III. The Description. Frog-bit has a Root which is long and creeping, full of Joints, sending down from the said Joints several long Fibres or Strings, and by the encroaching of those Joints, it multiplies itself. From the Joints of this Root, or Heads of those Strings, spring forth several small round Leaves, thick and full of Juice, very like to the Lesser White Water Lily, but much lesser, or the Leaves of Wall Pennywort: from among which rise other Stalks, bearing on each Head one small white Flower, conflitling of three small and round pointed Leaves, with a certain yellow Thread or Threads in the middle. This in all its parts more nearly resembles the Lesser White Water Lily than any Pondweed, of which some have made it a Species.

IV. The Places. Gerard says it is found floating or swimming almost in every Ditch, Pond, Pool, or standing Water; in all the Ditches about St. George's Fields, and in the Ditches by the Thames side near Lambeth Marsh, and in ten thousand other places of this Land.

V. The Times. It flourisheth and flowers the most part of all the Year; but it commonly begins to flower in May, and so continues on for some Months, and the Seed is ripening in the mean Season.

VI. The Qualities. It is cold and moist in the second Degree; Anodyne, Relaxative and Arthritick.

VII. The Specification. It is peculiar against Rheumatism, Inflammations, and the Gout in a hot Constitution of Body.

VIII. The Preparations. You may have therefrom, 1. A liquid Juice. 2. An Essence. 3. An Ointment. 4. A Cataplasm.

The Virtues.

IX. The liquid Juice. It is very cooling, and abates Inflammations. Bathed upon an Erythema, PRF and
Salmon's Herbal. Lib. I.

SALMONS. The Glafs alfo its in healing. The Lib. The Root pall, alfo Arif have violent Root little It 'Aeiraesv, called Friers FRIERS alfo: twofold, has fqlium. Sharpnefs meafure recent ders Afflux Ihort the Backbone, hot in Part quid Deformities. Tanning, binds, cares 'Tragus Milk ver. I as white, with and riling (which which XVII. II. III. X. the two the king Arons, is somewhat thicker than thicker fome leaves, aro. Leans, whose middle Rib on the upper side, as alfo fome other of the Veins, are sometimes white, and fomewhat thicker and rufter-painted than rufe of all. The middle Stalk bearing the Flower (which is a crooked or bending Hole at the top, with a small crooked whitift Pefle in the middle, riling out of it) is spotted with red Spots, and rife not fully fo high as the Leaves, which are nothing fo tharp in Tulle as thofe of Aron or Wake Robin, and do always furging up in the end of Autumn, alfo changing green all the Winter. After the Husk or Flower is pull, and the green Leaves withered and gone, which will be in the Summer, then the Berries do appear on the tops of the Stalks, green at the firft, and of a yellowish red when they are ripe, which abide until the Frosts caufe them to wither, and the green Leaves begin again to appear.

CHAP. CCIII.

OF FRIERS COWLE.

O.R.

WAKE ROBIN Hooded.

I. THE Name. It is called in Greek, Αρηνος, or Arnuos; in Latin, Arifrum, Arifaris, and Arif in English, Friers Cowle, Hooded Aron, or Hooded Cowlepoint, or Wake Robin.

II. The kind. It is of the Family or Stock of the Arons, and is twofold, viz. 1. Arifrum latifolium, Broad-lea'd Friers Cowle. 2. Arifrum longifolium, or angulofolium, Long-lea'd or Narrow-lea'd Friers Cowle. Dalechampius upon Flory calls the Latifolium, Culta alterum genus Plinii, but Pliny thinks it to be rather the Arum Disforia, which is indeed a Milkte.

III. The Description. The firft, or Broad-lea'd, has a Root which is somewhat round and white, and is covered moftly by Offsets. It grows in all thongs like unto the Aron, having divors fair green Leaves, whose middle Rib on the upper side, as alfo fome other of the Veins, are sometimes white, and fomewhat thicker and rufter-painted than rufe of all. The middle Stalk bearing the Flower (which is a crooked or bending Hole at the top, with a small crooked whitift Pefle in the middle, riling out of it) is spotted with red Spots, and rife
and very narrow, not rising so high as the former, but rather lying on the ground. It seldom bears a fruit or hole; but when it does, it is whitish, trifoliate, and long, with a very long and small reddish fettle in the middle, like unto a long Worm, scarce rising above the ground, and the berries which follow are white, and not red.

V. The Places. These Plants are Natives of Ireland, and are found especially in Tuscany, about Rome, and in Dalmatia, as Angullaria says: they also grow in Spain and Portugal; but in England they are only nurtured in Gardens, where they thrive very well.

VI. The Times. They both flower forth their green leaves in Autumn, preferably after the first have pulled down the stalks with the fruit, and abide green all the Winter, withering in Summer, before which their husks appear.

VII. The Qualities, Speciation, Preparations and Virtues, are the same with those of the Dragon or Dragon-nurs or in Chap. 292. aforesaid, so that we need say no more thereof here.

CHAP. CCCIV.

OF FUMITORY Common.

The Name. It is called in Greek, 

Karrhio, Fumaria, 

et cetera, Fumaria, Viper, Nidor, from whence the Latins called it, Fumaria and Fumus Terre: in English, Fumitory and Fumitory. The Arabians call it, Scheiteregi. This Herb being of a whitish blew color, as Smoak is, it appears to those who behold it at a distance, as if the Earth was all in a Fume or Smoak, and from hence (as it is supposed) came the Name.

Broad-leaved Common Fumitory.

IV. The Descriptions. The first, or Common purple Fumitory, has a root which is yellow, small, and not very long, full of juice while it is green, but quickly perishing after it has grown ripe seed. This Plant is a tender fleshy Herb, having stalks which are square, flesher and weak, with many little knots or joints, from whence many branches spring forth, two or three feet long, leaning downwards on all sides, so that they feebly grow up from the ground, without propping, but for the most part grow headlong. The leaves grow from the branches upon long foot-haliks, which are tender and brittle, and are finely cut or jagged, somewhat like to those of Coriander, being of a whitish, or rather blew with Sea-green color. At the tops of the branches stand many small flowers, as it were, in a long Spike, one above another, as it were, in Clusters, made like little Birds, of a reddish purplish color, with white Buffles: after which come small round husks, containing small blackish seed. Note,

Fumitory Common.

Common Purple Fumitory.
Salmon's Herbal. Lib. I.

That in the Corn-fields of Cornwall this plant bears white Flowers. And Johnson upon Gerard says, That it is sometimes found with purple-colored Flowers. There is also a Broader-leaved of this kind, not differing from the former Description. See the full Figure in this Chapter.

V. The second, or Fine-leaved Fumitory, has a Root small and white, but like the former, from whence spring forth Stalks or Branches, not so long as the first, but standing more upright, being thinner and square. The lower Leaves are very like to those of the other Fumitory, and of the same color, but smaller, but those which grow above upon the Stalks are smaller, and finer cut in, and the higher, the root and smaller, the highest being as small as Fennel, or Southernwood, or Common Leaves. The Flowers grow in the same manner which the other do, but rarer in greater plenty, or more together, of a deeper reddish purple, mixed with white and yellow, which being pelled away, Husks or Cods succeed, containing the Seed, which is much like that of the Common or Purple kind.

VI. The third, or White Broad-leaved, has a Root which is small and long, white, and growing deep into the Ground, obliterating all the Winter, and shooting forth new Branches (after the old are perished) every Year. From this Root rise up small slender Stalks, not strong enough to sustain themselves, but catching hold by certain Tendrels which it sends forth at the ends of the slender Branches of any thing which stands nigh unto it, whether Hedges, Shrubs or large Strong Herbs, it climbs up, and spreads it self out many ways, with spiny Stalks of small Leaves, set two or three, or more together, not divided or divided on the edges at all, but sharp-pointed at their ends, of a blearish green color, very like unto the Common Fumitory. At the tops like-wise of the small Branches come forth many small white flower, Flowers, tips with bluish, for together, but nothing like the former, made like small, long, hollow Husks or Bell-flowers, ending in fix small

VII. The fourth, or Yellow or Mountain Fumitory, has a Root which is composed of many white, slender, long Fibres or Strings, buffalo thick together, which perishes not as the Roots of the Common Fumitory do, but abides many Years, shooting forth new Stalks every Season, after the old ones are perished. This yellow kind grows like the other Fumitories,
motley, about a Foot and half high, with many Leaves, like unto the Common purple kind, or like to those of Oswego Balsam, or Radix cava, or Homo-
biscut, but smaller, and of the firmest and greener
colour with them. The Flowers are yellow, and in
some places white, and grow at the tops of the
Branches, like the other, in form of little Birds, as
Matthiolus feys them forth, both by his Description,
and Figures; but Lobel and Langweilfe say they are
Star-baffion, like unto the Chelidonium minor, or
Pilewort, and yet both of them give Matthiolus
his Figure, with the Flowers of Common Eunony-
my, like little Birds, and not Star-baffions in the
chofe of Pilewort. After the Flowers are puff, small Hone-
comes forth, or long Pods or Pods, like to the
Chelidonium major or Radix cava, but lefser in which
are contained fmall, whitith green Seed, round and harth.

VIII. The Places. The firft grows as well in
Corn-fields, almost every where, as in Gardens alfo;
with the white kind in the Corn-fields in Con-
corn: it grows in Barley-fields, and among oth-
er Grain alfo; as also in Vineyards, and other manufa-
cted places. The second grows in many Places in Spain,
and about Napier and other places of France.
The third grows by Hidge-fides, and among Bulbs
in several places of Brabant in the Low Countries,
and about Pommogam and Mommep in France;
which is found about Naples, and other Places in
Italy. It is also fmall, and of a yellow Flower, as
form report: and Gerard fays thefe third kind
and third kinds grow Wild in a Corn-field between
Charlerton and Greenwich, and very probably may
be found in several other parts of this Kingdom.
The fourth grows in hilly and mountainous places in
Italy, as on the Hills of Apulia and Calabria, in
the Kingdom of Naples, and in Gérica, and several
other places; but with a yellow leaf.

IX. The Times. The fifth true flower from the
beginning of May, and continue flowering thro' all
the Summer Months, and their Seed ripens in the
mean Seafon. But the fourth or Yellow kind begins
to flower much later, nay, not till Auguft, and its
Seed ripens quickly after. This is alfo to be noted,
That if you would gather Eunony to dry or diftil,
it ought to be done whilst it is in flowering, and
all the principal noife and fragrance of the

X. The Qualities. Eunony is cold and dry in
the firft Degree; Aperitive, Aftiffive, Cofmetick
and Diureticck, Peforal, Hepatick, Splenetick and
Nephtick; a little Charkriick and Alexandri-
ck.

XI. The Specification. It is fingular against all
forts of Scabs,ITCH, Wheetis, Pimplies, Pufhes,
Scarify, Morphew, Tetters, Ringworms, Herpes and
other Deftinations of the Skin, arifing from falt
and sharp Humors. It provokes Urine, helps the
Spleen, and opens all Obftructions of the Vit-
cera.

XII. The Preparations. You may have there-
from. 1. A leafe Juice. 2. An Effence. 3. A
Syrop. 4. A Decotion in Water or Wine. 5. A
Powder of the dried Herb. 6. A Collyrium. 7. A
C葡萄酒. 8. A Diluted Water. 9. A Spiritual
Tincture. 10. An Acid Tincture. 11. A Sulphur

The Virtues.

Stomach, Liver, Splen, Reins and Wombe; pur-
ifies the blood from falt, cholerick or viifous Hu-
mors, which are the caufe of Pimplies, Wheetis,
Pufhes, Tetters, Ringworms, Scarify, Morphew,
Scabs, itch, Leproflc, and the like Breakings out.
After purging, it strengthens all the Vitcera, not
leaving any evil Quality behind it.

XIV. The Syrop. W[h]ether made of the Juice or
green Herb, has all the Virtues of the Juice and Ef-
fence, but is weaker in Operation, and therefore
ought to be given mixt with a fufficient quantity of
Syrop of Damask Roses, or Syrop of Peach Blo-
foms, or Tincture of Sena, &c. So given, it not
only opens all Obftructions, but is very effectual a-
gainft the Jaundice, Dropsy and Gout, and effefa-
and is a very proper thing against Hypochondriack
Morbidity in any Perfon whatsoever.

XV. The Diftribution in Water or Wine. It has
the Virtues of all the former Preparations, but is
much weaker, and may be given in a Morning dif-
fining to fix or eight Ounces. If the Stomach is cold
and weak, the Decotion ought to be made in Wine.
It is an excellent thing against the Strangury, whe-
ther in Old or Young, and effectually cleanses the
Reins and Urinary Parts.

XVI. The Powder of the dried Herb. A Draught
of it being mixed with half a Draught of Powder
of Hefa Root, and given in five or fix Spoonsfuls
of the Effence or Juice, caufes Vomiting and cleanses
the Stomach and Bowels, both upwards and down-
wards, of cold, viifous and rough Humors; and
effectually carries off watery Humors from all Parts
of the Body, and has been found very effectual a-
gainft the Dropsy, Scarify, Jaundice, Gout and
Rheumatifts; but because this Medicine fits up
much Wind, it may be good to correet it with a
few drops of Oil of Anife or Fennel Seed, or with
the Powder of the fame.

XVII. The Collyrium. Take of the Juice or
Effence of Eunony three Ounces, diftill Water of
Fumitory, Honey, of each one Ounce, mix't it.
It is an excellent thing against fore, inflamed, running
and watery Eyes. A fore Mouch and Throat alfo
being gartled therewith, it heals them. Drop in-
to the Eyes, it clears the Sight, and takes away the
Redness and other Defeases in them. If the Juice is
mixed in equal parts with Juice of Sharp-pointed
Dockes and Wine Vinegar, and a contaminated Skin
be washed therein, it cures it of all forts of Scabs,
ITCH, Wheetis, Pimplies, Pufhes, Scarify, Morphew,
&c. whether in the Face or Hands, or in any other
Part of the Body.

XIX. The Capsulas. It is an excellent thing
being applied to fimple and recent Corruptions, dif-
cuting the Tumor, and hindering a further Affluf
of Humors to the Part: and being applied to any
Defultation of the Skin, it cleanses it, removes it,
and quickly cures the fame. Applied to the Great
in Hands or Feet, it cures the Pain, and hinders the
farther Affluf of Humors to the Part.

XX. The diftributed Water. It has the Virtues of
the Juice, &c. but very much weaker, and may be
used as a Vehiculum, to convey any of the other
Preparations in, down into the Body. Trages fays
it prepares much against the Plague, being taken
with
Salmon's Herbal.  Lib. 1.

with good Venice Treacle, driving forth the Malig-
nity by Sweats. If the distilled Water be thus good in this Cafe, doubtless the Efficacy must much
transcend it.

XXI. The Spirituous Tincture. It is good against
the Plague or Pesteances, as alfo against all malignant
and pestiferous Fevers, as Spotted Fever, Purrules-
cence, &c.; and is an excellent thing against the
Colick and Griping of the Stomach, whether in Young
or Old. Dose two or three Drains in Canury or oth-
er in Vehicle.

XXII. The Acid Tincture. It is an excellent
Antiseptic, good against Vapors, Fins of the
Mother, Hypochondriack Melancholy, and all those
ailings and thorny Humors which cause fuch Eruptions
in the Skin. It corrects Crultrities, throughs the
Stomach, caules a good Appetite and a strong Dig-
getion. It is to be given in all the Paitent drinks,
thoever Ale, Beer or Wine, fo many drops at a
time as may give the Liquor a grateful or pleafant
Ailimony; and fo to be continued for some time.

XXIII. The Saline Tincture. It cures Scabs,
itch, Pimples, Scarf, Morfehop, Lepofy, and
other like fprinklings out in the Skin, only by bathing
or well wafhing the Parts affected therewith, as hot
as can be conveniently endured, and continuing the
Lotion for fome conufiderable time.

XXIV. The Powder of the Seed. It is ftronger
than the Powder of the Herb, and is prevalent
against the Dropfy, being given daily with about ten
or twelve Grams of Sacrament in Powder: but the
simple Powder of the Seed being given to a Dram
at a time for a Month together, every Morning
fitting, and half at Night going to Bed, (in any fit
Vehicle) it is flid to cure fuch as are Melancholy.
I believe, being given in an Inflution of Sene, it may
do Wonders of that kind.

C H A P. CCC.

OF FUMITORY American.

I. The Names. It is called in Greek, Ραμμο
Tubera; in Latin, Fumaria Indica, Fumaris
Americana: in English, American Fumitory.

II. The Kinds. It is the second general Species
of Fumitory, and contains the two following kinds, to
1. Fumaria filippo Americanis, Fumaris fem-
per coronas Americanis, Indian or American Fumitory
Coddled.
2. Fumaria tuberosa Americanis, Indian
or American tuberosus Fumitory.

III. The Descriptions. The fift, or Coddled In-
dian, has a Root which is thick and fibrous, from
which rife up a Stalk to be about a Foot high or
more; the Leaves are like the Common purple kind
in the former Chapter, but larger, and enduring
green all the Winter. The Flowers grow Spike-
form on the top of the Stalk, formed like to
those of the Radix cana or Hollow-root, whole Bel-
ies are Bluft, and Mounts of a Gold color or paler
yellow, which being pulfed away, long Rods or
Cods come forth, which are almost round, and in
which is contained the Suid, which is round, flat-
tish and yellowish.

IV. The fcond, or Tuberos American, has a
Root which confists of two foid round parts, like
Tefticles, with feveral small Fibres springing thence-
from, as well from their tops as fides and bottoms.
From between these Tubers of Tefticles rife up a
Stalk, which spreads it felf out into feveral winged
Leaves, two for together at a Joint, and variably
divided, and finally, that they almoft resemble
Teafer Leaves, of a beaufiy green color. The
Flowers have feveral colors in them, but fupposed
of fome to be but white: and the whole Plant is
almost without either Taffe or Smell.

V. The Places. The fift grows in Virginia, and
the back-parts thereof, called Canada: I found it
alfo in feveral parts of South Carolina. The fcond
grows in America, in the Southern Provinces of Car-
olina, in the up-land Countries towards the Moun-
tains.

VI. The Times. They flower from May during
moft of the Summer Months, and the Seed ripens
in the mean Season.

VII. The Qualities, Specification, Preparations and
Formula, are the fame with the Common purple Fumi-
tory in the former Chapter, to which I refer you:
but this is to be noted, That of thefe American
kinds, the fift is by much the more powerful;
and as the whole Plant of this fift American fort is
much bitterer than the fift or Common purple kind
in the former Chapter, or indeed any of the
other forts there defcribed, fo it is alfo by much the
more effectual.

C H A P. CCCVI.

OF FUSS-BALLS, OR
P U C K-F I S T S.

I. The Names. It is called in Greek, Ραμμο,
Tubera; in Latin, Caput, pl. Captis Tuber, Tuber, pl. Tubera
Terra,
The Cracking-Eufs-balls and also new 4°7

The July third is cured, this.

Allium several Moly, which, but also and j
Angular Fields called Scorodoprajam

III. The Description. They are round Balls, growing in the Ground, without any Appearance of Root or Stem, and are of several sorts, some of the Begnafs of a Ball or Balloon, some as big as a large Cannon Shot, or a young Child's Head, more or less; they seem to be very round, smooth and whiffat at their first rising, but grow in time to be of a dusky color, cracking in several places on the outside. Thence, while they are young and white, Children and School-boys, commonly in Sport, ring one at another; but when they come to their full Rigoros and Riperofs, they contain within their Skin nothing but a fine, soft, brown, dry Duff or Pouder, which, upon breaking of the Ball, is apt to fly all about.

IV. The Places. They grow in Vineyards plentifully, and in many dry Meadows and Fields, in several parts of this Kingdom; I have formerly found them in several Fields between White Chappel and Broadway, allé in Fields near to Stepney, and other places adjacent.

V. The Times. Their growing time is in March, April and May, and they come to their full Magnitude and Maturity in June, July and August; after which, with much Wet, they rot and decay.

VI. The Qualities. It seems to be temperate in respect to Heat or Coldness, and dry in the second Degree.

VIII. The Preparations. You may have therefrom, 1. A Pouder. 2. Pledge made of the Balls.

The Virtues.

IX. The Pouder. Being stove up thick and in good quantity upon any bleeding Wound, it stops the Blood instantly; and being thrown upon any old Moll or running Ulcer, it drives up the Humidities of the said Moll or Ulcer and being used for some time, it stops the Defluxion. If any of it should get into the Eyes, it would vehemently molest them, and possibly endanger the making the Party Blind: it cures also Gallings and Ribbed Heifs.

Χ. Pledge made of the Balls. It is to be tyed round with Thread, and then pressed hard together in a Screw-Puff, letting it be there for some few days. This, when it comes to be impo'd upon a Wound, it again dries it still, and parts a stop to the Hemorrhage or Flux of Blood. Thus this there is scarcely any thing to be named which can more powerfully and certainly do it, for it being of a Nature extremely dry and drying, as it will no way admit of the Flowing forth of the Blood, (which those Medicaments do which are naturally moll, and therefore are left useful in branching of Blood) so it will likewise drybiff and lick fall in the Vefels. Applied also to moll and running Moles, and to Ulcers with an Afflux of Humors, it drives up the Humidity, and in a short time puts a stop to the Fluxion.
top of which does grow, a Tall of purpleli Flow- 
nect, or rather little wth Onions or Leeks, cov- 
erved with a white Skin, in which being broken, 
when it is Ripe, there is found round, black Seed, 
lke to that of Leeks.

V. The second, or lettter Garden kind, in its Root, 
as to its Choes and its Sixth. Leaves, and manner 
of growing, is much resembels the former great- 
kind: But the Coves of the Roots are smaller and 
redder, and the Flower is of a more dark or dusky 
Color than the first above described.

VI. The Places. They both grow in Gardens with 
us in England: But the latter has been found to 
grow Wild in some places of France and Germa- 
y.

VII. The Times. They are seldom towns of Seed, 
but the Choes are planted in November and Decem- 
ber, and sometimes in February and March. They 
Flower in the Summer Months, as June and July, 
and the Seed is ripe in August, or some short time 
after the flowerina.

VIII. The Qualities. It is hot and dry in the 
fourth Degree: Aperitive, Abluutive, Atractive, 
Cumarative, Digestive, Defitutive, Audone, and 
Suppurative. It is Stemmatic, Pethoral, Nephr- 
tick and Artthritic: Permnick, Emmenagogick, 
Sudorick, and Alcipharmick.

IX. The Specification. It is good against Plague, 
Poyfon, and biting of all sorts of venemous Crea- 
tures: It Cures Coughs, Asthma's, Strangury, Drop- 
fill, and Gout, and powerfully provokes the Terms 
in the Woman.

X. The Preparations. You may prepare there- 
from, 1. A Liquid Juice. 2. An Eflence. 3. An 
Infolution. 4. A Broth. 5. A Oyl by Culled or Infla- 
tion. 5. An Ointment. 6. A Supplication. 7. A dilut- 
ed Water. 8. An Acid Tincture. 9. A fiilver Tin-
cury. 10. An Oyl Tincture. 11. A Spirit. 12. An 
Elixir.

XI. The Liquid Juice. Being full up the No- 
 głównie, it is an excellent Emulsion, and purges 
the Head and Brain admirably, forcing it from cold, 
raw, pithous and voricious Humors, is good against 
the Leathury, and cures all pains of the Head 
proceeding from a cold and moist Caufe. A Spoonful 
or two, being taken inwardly in a Glass of White 
Port Wine, it kills Worms in the Bodies of Man, 
Women or Child. Drop into the Ears, it cures 
their Pains, and ripens and breaks Apothifions 
therein.

XII. The Eflence. It has all the Virtues of the 
Liquid Juice, besides which, it provokes Urine, and 
the Terms in Women, and being given to two or 
three Spoonfuls in a Glass of Wine, or fame of its 
own distilled Water, it prevails against the bitings 
of Mad Dogs, Rattle Snakes, Vipers, Spiders, the 
biting of Scorpions, &c. fortifying the Heart a- 
gainst the Poyfon, and expelling it by Sweating. 
It expels gross, raw, tough and voricious Humors out 
of the Stomach, Lungs, Bowels and other Vifera: 
It expels wind, opens all Obftifations of Lungs, 
Liver, Spleen, Womb and Reins, provokes Urine 
powerfully, helps against the Strangury, carries of 
the Watery Humors which caufe them. It expels 
Poyfon which has been taken inwardly in Meat, 
Drink or Wine, for in its own nature, it refids all 
manner of Poyfons. It clears the Voice, takes away 
Houfefeels, Cures an old Cough, and is of excellent 
ife against Asthma's, Throats of Breath, dif- 
culty of breathing, caufing an expelation or the 
Nose and Mouth. Held in the Mouth, it is good 
against the Toothach, and drop into the Ears, it 
helps against Deafhe in, and difficulty of hearing. 
It is good against the Plague, Pefilence, Spotted, 
and all other Maligins or Pefilential Diathises: 
Fatiuates the delivery of Women in Child-birth, 
forces away the Dead Child, and drives forth the 
After-birth.

XIII. The Infolution or Decotion, in Wine, Water, 
Brith or Allde. It has all the former Virtues both 
of Juice and Eflence, but leis efficacious or pow- 
erful, and therefore ought to be given to five, fix, 
or eight Ounces at a time, and that two or three 
times a day, according as you fee the occasion may 
require.

XIV. The Oyl by Culion. It is healing and com- 
forting, and therefore may be applied to all cold and 
motf affections of any part, as Pains, Aches, Lume- 
fe, Nervous, Neuralies, &c. and in all Obftifations or 
Obftructions the Faue of the part, making it able 
refils any Fluxion of humors: Anointed on the 
Head in a Mepur or Cephalae, from a cold Caufe, 
it gives much relief.

XV. The Ointment. It has all the Virtues of the 
former Oyl, and being mixed with Sulphur and 
Roffia in fine Powder, and applied to putrid and 
corrupt Ulcers which brea Water, it kills them, it 
dilates ftomachs, draws forth the evil humors in 
Fihula's, and caufes them to heal, and 
anointed upon Loofe Heads, it kills Lice and Nits, 
and it affixtith with a Scab or Scald, it drives up the 
moif Humors, and in a little time heals it: It is 
also good against Scurf, Dandruff, and falling of the 
Hair, cufes Pains from a cold Caufe, and 
gives relief in the Gout.

XVI. The Cataplasme made of the green Root. 
Being immediately applied to the biting of a Mad 
Dog's or of a Rattle Shake, Vipers, Slow worm, or 
other Serpent, the biting of Scorpions, or of any 
Venemous Creature, it infallably attracts to, and 
draws forth all the Poyfon or Venom, and this it
does...
Chap. 307. English Herbs. 409

does so, powerfully by reason of its Vegetative attractive force, that it perfectly cures the Patient from all manner of Aches. But this will be the more effectually done, if at the same time, the Patient being laid in his Bed takes also a large Dose of the Juice or Essence, and lo Sweets upon it. Laid upon a Gout or Sciatica, taken when Cause fever, and often renewed, as occasion requires, it draws forth the whole Morbidinch Cauze and Essence of the Difease, in which Dilemplers it performs more than most other Vegetables, reputed the most efficaces; it not only eases the Pain at present, but if it has made any steps to the Stomach, or has indeed affected it, it recalls back the Humor, and draws it forth thro' the Pores of the Skin. Applied to any place in which there is anyrick, Splinter, Thorn, Bullet, Shot, bits of broken Bones, it powerfully loosens them, attracts and draws them forth. Being applied to any Plague Sore, Bubo, Phlegmon, or any Tanner which is possible to come to Suppression, it adds Heat, bringing on the Maturation of Admiration, and after it is broken, being yet applied, it draws forth all the Malady and Poison of the Plague in a Petechial Bubo, and in other Affections, the puridy and other offending Matter which replenishes them.

XVIII. The distilled Water. It has the Virtues of the Juice, Essence and Decoction, but a much greater intensity degree, and therefore may be used as a Vegetable to convey those Medicines in, to such Persons, and in such Constitutions where Wine would be too hot. But as this Water is drawn off from a very hot, fruitful and Spirituous Root full of a volatile Sale, so it contains more of Life, Flame and Spirit in it, than in most other simple and cold distilled Waters.

XVIII. The Acid Tincture. This is more powerfully against the Plague and all petechial and contagious Dilemplers than any of the former internal Preparations; for this destroys the Essence of the Poison and Spirit, and for the most part in its Socket, and is of great Force and Efficacy against the Bittings of Serpents, mad Dogs, and other venomous Creatures. Dooe fifty Drops at a time, two or three times a day, in any proper Case.

XIX. The Oily Tincture. Anointed upon any Part full of Aches or Pains from a cold and moist Cauze, it prevents the Growth of them, and is also good against the Wounds or Punishments of the Nerves and Tendons, for by this it directly eases the Pain, prevents Convolutions, and induces a speedy Cure. Anointed down the Back-bone, and upon the Parts affected with Trembling, Numbedness, Palsy and Convulsions, it suddenly gives Relief, and in a short time after a perfect Cure, if the Medicine is well rubbed into the Parts afflicted for almost half an hour, twice a day, and is continued in like manner for some considerable time, provided the Invergency of the Dilemplers, Weakened, and great Age of the Patient hinders not.

XX. The Saline Tincture. It is good against Worms in the Skin, Lepers, Freckles, Pimples, and other Breakings out; it kills Lice and Nits in the Head and Hair, and is singular against Tettars, Ringworms, Herpes, Scabiblins, Scurf, Mottledness, Black and Blewiness of the Skin left after Contamina
tions, the Lepreous, running over the Head, commonly called a Scald Head, and all other Maggyness whatsoever, the Parts affected being well bathed thereafter twice a day.

XXI. The Spirit. It is very fitably and full of volatile Particles, of extraordinary Life against itning; and frowning Hysterick Fits, Vapors, Obstructions of the Lungs, Coughs, Cold, Startlings, Coldness and Convulsions of the Bowels: it expels Wind, eases Gripping, heals Excoriations of the Guts, and very much facilitates the Delivery of Women in Labor, forcing away both Birth and After-birth. Dose from two Drums to four in any fit Vehicle.

XXII. The Elixir. It has all the Virtues of the Spirit, but more fitably and powerful to all the time Intentions; and may be given twice a day, six Morning and Night, or thrice a day, according as the Cafe may require. Dose half an Ounce, more or less, in any proper Vehicle. It is faid to be a Specific against Jaundice and Dropsy; as also a great Inverter of Wheezing and Hournefits.

CHAP. CCCVIII.

Of GARLICK Vipers.

I. THE Names. It is called in Greek, Δορικόν, & Ορμήδος, in Latin, Olibrophorum, Allium Aegyninum, Allium Viperinum: in English, Garlick, Vipers Garlick.

II. The Kinds. It is the second Species of Garlick, and is a Singular Plant of the kind; called by some Authors, Scorodophrum pourculat Capita, Lekk Garlick, with a bulbed and swelling Head.

III. The Description. It has a great and white Root, containing of many Clovers, much like to Garden Garlick, which says left from than Garlick, or gathering somewhat of Leeks, and is called the latter Name of Scorodophrum, or Diostorides says. From this Root springing up a Stalk, three or four Feet high, and sometimes higher, according as the Soil is in Goodness; it has also many Leaves, larger much than those of Common Garden Garlick, and almost like those of Leeks, which grow from the bottom of the Stalk to the middle thereof, having a Smell between that of Leeks and that of Garlick. The Neft of the Stalk is naked, green, smooth and almost finning, having at the top thereof a large Head, composed of many Bulbs, (not much unlike to the Indian Holy) covered with a whitish thin Skin, ending in a plain green Pole, which grows above it, growing smaller and smaller to the end: which, by the Growth of the Bulbs, being broken, they fhew themselves at the fift of a purplish color, but afterwards, as they grow ripe, of a whitish color, among which are alfo fome Flowers. The Head, with the top of the Stalk, at the firt, does wind or twine it felt fo, that in fome fort it repreffes a Viper, Snake or Serpent, which, when the Bulbs grow to Ripeness, does by little and little unwraps it felf again, and bears its Head upright.

IV. The Places. It grows with us only in Gardens, and is the Allium Sativum vel Hortenfe Dias
cordus, and the Scorodophrum secularum Quiltoe: it is more ready to part into Cloves than the Common Garden Garlick, and by planting the Time, it is encreased.

V. The Times. It flowers in June and July, and the Seed ripens not long after.

VI. The Qualities, Specification, Preparations and Virtues, are the fame with thofe of the Common Garlick.

GEE CHAP.
C H A P. CCCX.

Of GARLICK Leek, or Turkey or Mountain GARLICK.

I. The Name. It is called in Greek, Ἀλλιον; in Latin, Scorodopraium; and in English, Leek Garlic, Turkey Garlic, and Mountain Garlic.

II. The Kinds. There are three sorts hereof, viz.
1. Scorodopraium majus, Greater Leek Garlic, or Turkish Garlic. 5. Scorodopraium minium, Purple Garlic. 6. Scorodopraium minorn, The lesser Leek-leafed Garlic; but this is called by Parthenon, Great Turkey Garlic.

Greater Leek-Garlic:

III. The Descriptions. The first, or Greater Leek Garlic, has a bulbous Root, of the Bigness of a great Onion; from whence rife long and broad Leaves, like those of Leeks, but much greater and longer, encasing or covering about a great thick Stalk, soft and full of Flowers, bigger than a Nun's Finger, and bare towards the top, upon which is set a great Head, larger than a Tennis-Ball, covered with a Skin, after the manner of an Onion. This Skin, when it comes to Pericition, breaks and discloses a great multitude of Flowers, which are white; they being palf, black Seeds follow, enclosed in a triangular Husk. The whole Plant smells very strong, like unto Garlic, and is in flour a Leek, upon which it was called Scorodopraium, Garlic Leek, or Leek Garlic, participating both of the Garlic and Leek, or rather a degenerate Garlic, grown out of Fern.

W. The second, or Great Leek Garlic, has a great white bulbous Root, and almost transparent, at least fining, seldom growing Out of Seeds. From this Root shoot forth several great long Leaves, much bigger than the Common Garlic, and after several Years abiding, there springs up a great long Stalk, three or four Feet high, with some fewer Leaves thereon, and is naked from the middle up to the top, where it bears a large Tuft of Flowers, enclosed as if in a thin Skin, and of a paler color than those of Homer's Moly, or rather whitish: which being pulled away, three-square Husks, with blackish Seed, like the other, succeed.

V. The third, or Lesser Leek Garlic, has a Root which is fit about with longer and slenderer Bulbs, which are enclosed in brownish Skins, longer and more solid. The Leaves and Flowers are alike, yet smaller than Leek; and the whole Plant is leffer in all the parts than the former.

VI. The Places. They are Natives of Turkey, and grown about Constantinople; but with us they grow and are natural in Gardens only.

VII. The Times. They flower in June and July, and perfect their Seed not long after, or in August.

VIII. The Qualities, Specification, Preparations and Virtues of these Plants, are the same with those of Garlic in Chap. 207. foregoing, but they are much less efficacious than Garlic, as being in a middle degree between Garlic and Leeks, and so partake of both their Tempers and Qualities: they attend and incite grofs and rough Flegm, and other vitious Humors, and thereby cause easy Expectoration.

C H A P. CCCX.

Of GARLICK Crows, or Wild GARLICK.

I. The Name. It is called in Greek, Λίβιον, or λιβίον λιβίον: in Latin, Allium sophia, and Allium sylvestre, Allium sylvestre tenaxfolium: in English, Wild Garlic, and Crow Garlic.

III. The Descriptions. The first, or Hard-leaf'd, has a Root with a small Bulb or round Head, long mitral, and covered with three several Coats of Fleece, being white on the outside, not bigger than a small Halfpenny, without any Coles at all, having at the bottom thereof a Root of fibres or Siring, from this Root springing up small, hard, rough Leaves, almost like unto Raphis, smooth and hollow within, among which grows up a naked Stalk, round, solid, hard and flippery or smooth, bearing on the top thereof a Tuft of purplish Flowers, which being gone, small blackish Seed follow, made up in a round Cluster, like small Kernels, having the Small and Taffe of Garlic.

IV. The second, or Soft-leaf'd, has a long round Root,
Chap. 311. English Herbs.

Great FELWORT.

I. The Names. This Plant is called in Arbei<in>, Gentianae seu Gentiana: in Greek, Gentieon; in Latin, Gentiana, and in English, Bald-oven, Balduyne, Betterwort, Bitterwort, and Gentian.

It was called Gentian from Gentius, King of Illyria, who was the first Finder of it out, and the first who used it in Phthesis, and so called it Gentiana after his own name.

II. The Kinds. There are two generic Species of this Plant, viz. 1. Gentiana vulgaris, Gentia<to> magus, Gentiana major, the great or Greater Gentian, of which in this Chapter. 2. Gentiana schizantha, Gentiana minor, the Lesser Gentian, of which in the next Chapter.

III. The Kinds of the Greater. It is, 1. Gentiana major, the great or Greater Gentian. 2. Gentiana schizantha, the Lesser Gentian with a yellow Flower. 3. Gentiana major, the Great Swallow-wort Gentian. 4. Gentiana major, the Great Concarvate, Great Concarvate or hollow Gentian, or English Gentian. There are three other Species of Great Gentians, as, Flore alba, White-flowered; Flore pallida purpurea, Pale yellow-spotte<to>; Flore caulina, Blow-flowered, all which differ nothing in Root, Stalk, Leaf, Magnitude or Manner of Growing from the first Purple kind, but only in the Color of the Flowers, but by reason they are not so finely found in our Gardens as the other kinds, we shall lay no more of them in this Place.

Greater Purple Gentian, A ND
Greater Yellow Gentian.

IV. The Description. The first, or Great purple Gentian, is very like to the next great yellow Gentian in most things, having a great, thick, brownish yellow Root, divided into two or three great Branches, with great Fibres adjoining to them, but a little more hard and woody, of a very bitter Taffe, like the other Gentians, which sends forth at the several Heads thereof many fair, broad, three-ribbed, dark, green, shining Leaves, so like unto the following: that it is somewhat hard to distinguish them: many of these Heads among the Leaves shoot forth thick and strong Stalks, three or four Feet high, with several Leaves on them, and two Leaves at them, one against another: towards the tops whereof come forth the Flowers, encompassing the Stalks at two or three of the uppermost Joints, with two Leaves apiece under them, like as in the following, which are not laid open Scarfashion, like the Yellow, but keep close and hollow, the brims being only divided into six or more round parts, of a purple color, but paler at the bottom, where they are spotted with purple Spots on the inside, having to many yellowish Threads in the middle as the Flowers: this sort is called the Great purple Gentian, and contains therein seeds like flat brownish Neal as in the yellow kind, but somewhat less.

G g g 2 V. The
V. The fourth, or Great Gentian, with a yellow
Flower, has a Root which is great, thick and long,
yellow, and very bitter. From this Root rises up at
first a long, round and pointed Head of Leaves, clos-
ing one another, which, after opening themselves,
are upon the Ground, and are fair, long and broad,
seemingly pointed or ribbed, to the Leaves of the
White Hellebor, but not so finely or closely plait-
ed, nor so stiff, but rather resembling the Leaves
of a Great Plantain; from among which rises up a
round Stock, three feet or more high, and full
of Joints, having two such Leaves, but narrower,
and smaller at every Joint, to encompassing the
Stock at their lower end, that they will almost
hold Water, if it falls upon them. From the mid-
dle of the Stock to the top it is garnished with ma-
ny Cæsarea or Randles of Flowers, with two or
three green Leaves likewise at every Joint, and wherein
the Flowers do stand, which are yellow, and when
fall open like Stars, rising out of small green
Husks, with some Threads in their middle, but hav-
ing no Smell at all, yet stately to behold, as well
for the Order as for the Height and Proportion of
the Plant. The Seed is brown and flat, contained
in round Heads, somewhat like unto the Seed of
the Bistort or Chequered Diffidell, but browner.

Swallow-wort Gentian.

VI. The third, or Great Swallow-wort Gentian,
has Roots, but they are nothing so large as the for-
ners, but are yellow, small and long, of the Dignity
of a Man's Thumb; from this Root spring forth man-
ny Stalks, about two Feet high, on which grow many
fair, pale, green Leaves, jointed, with three
Ribs in every one of them, resembling somewhat the
Leaves of Alceps or Swallow-wort, which is broad
at bottom and flinty at the point. The Flowers grow
at the several Joints of the Stalks from the middle
upwards, two or three together, which are long
and hollow, like unto a Bell-flower, ending in five
Corums, surrounded Leaves, and folded before they
are open, as the Flowers of the bindwards are, of
a fair blew color, sometimes deeper, and sometimes
paler. The Heads of Seed-Velvets have two Points
or Horns at the top, and contain within them flat
greeny Seed, like unto the former, but better.

VII. The fourth, or Great Concaev Gentian, or
English Gentian, has many long tough Roots, dispers-
ed bitter and bitter under the upper Crust of the
Earth, with some few Fibres adhering thereto: from
which spryng immediately a fat thick Stalk, jointed
or knotted by certain Divisions, at every Joint or
Joint with one Leaf, and sometimes more, keeping
no certain number: which Leaves do at the first en-
close the Stocks round about; being one whole and
entire Leaf, without any Indivision at all, as it were
a hollow Trunk, which, after it comes to its full
Growth, breaks on one side or other, where it is
thinned, tenderest and weakest, and becomes a flat
ribbed Leaf, like unto the Great yellow Gentian or
Plantain foregoing. The Flowers come forth from
the bottoms of the upper Leaves, at first tender
Foot-flaxes, in flax-like thothes of the Small Bind-
wort, or rather Flowers of Soapwort, of a whit-
ful color, and touch to the brains with a little
light Carnation, which being pippd away, the Seed
follows, contained in little Cases or Seed-Velvet.

 VIII. The Places. The first three grow on moun-
tainous places in Germany, but with us, are only
markt up in Gardens; of which the second or Yellow-
flowered is the most usual or common. The fourth
or English kind, Gerard says he found in a small
Grove in a Wood, called the Spinne, near to Lich-
hurst, a small Village in Northamptonshire.

IX. The Times. All the first three flower for the
most part in June, and in part of July, bringing
forth their Seed in August. The fourth springs out
of the Ground in April, the flowers in the end of July
and beginning of August, and perfects its Seed in
the end of that Month, or beginning of Sep-
tember.

X. The Qualities, Specification, Preparations and
Virtues, are the same with those of the Small Gen-
tians in the next Chapter, and thither we refer
you.

CHAP. CCCXII.

Of GENTIAN Small,
or
Small FELWORT.

I. THE Names. It is called in Greek, Ποντιαίον; in Latin, Gentiana minor, five Gen-
tianella, and in English, Small or Lesser Gentian,
or the Lesser Felwort.

II. The Kinds. Here are three generic kinds
hereof, viz. 1. Gentiana verna, or the Spring Gentian. 2. Gentiana minor, Small Gentian. 3.
Gentiana major, or the Summer Gentian. Of each of these three generic
kinds, there are several Species, all of which, it is
not our Business to declare in this Work, and there-
fore we shall only discourse of so many of them as
either grow Wild with us, or are to be natural in
our Gardens, and that in the following order.

III. The various Species. Of the first or Spring
kind, we have these, viz. 1. Gentiana verna longifolia, Broad-leaved Gentian of the Species. 2. Gent-
iana verna angustifolia, Narrow-leaved Gentian of the
Chap. 312. English Herbs.

the Spring. 3. Gentianella minor Verna, The smaller Spring Gentian. Of the Summer Kind we have three, viz. 4. Gentiana minor Cruenta, also Cruenta, Croswort, of the lesser Croswort Gentian. 5. Gentiana minor, seu Gentianella coriacea punicea Penn. Pennys blew spotted Gentian. 6. Gentiana Anglica purpuroa punicea dydima, An English Gentian, which being pluckt among the Greater Gentians, thev' Chaffes has enumerated it among the Greater Gentians, but according to its magnitude, it cannot be said to be either a Great or a Small Gentian, but a medium between both, as is also of Pen- ne, but being both Summer Gentians, we thought good to put them both in this Class. Of the Autumn Kinds we have three, viz. 7. Pneumonanta, Gentiana Autumnalis, Calanthenia Violet, or Autumn Gentian. 8. Gentianella Autumnalis Gentianae minoris folia, Gentianella magus minor Gerardi, Autumn Gentian with Small Century Leaves, Baffard or Dwarf Autumn Gentian of Gerard. 9. Gentiana Jacob's Cuff, Gentiana Jacobae Cuff, Small Autumn Gentian, simply so called.

IV. The Descriptions. The first, or Broad Leaved Gentian of the Spring, has a small yellow creeping fibrous Root, from which spring up Leaves pretty large and green, broader than those of the Third Kind following, being about two inches long, and six Inch broad, and somewhat round pointed, with three Veins or Ribs running through them, as the others have; the Stalk rising from the middle of thefe Leaves grows about four Inches high, or something better, with a small Leaf or two thereon, beating at the head of the central Head, and two or three, being about four Inches, from the middle of which Stalks forth a very large and great hollow blowed Flower, ending in five small points.

V. The second, or Narrow Leaved Spring Gentian, has a Root which is long and slender, spreading it itself much under the Ground, and of a yellowish color, from which spring many Heads of several small, long, and slender Leaves set together, somewhat longer than the next which follows, from some of these Heads, which Flower not in one and the same Year, tho' flowering the Year following which flowered not the Year before, and those which flowered the Year before (not flowering again the next Year after) rises up a small slender Stalk, somewhat higher than the former, bearing thereon two or three like small Leaves at a Joint, and at the top one Flower, for the most part, (feldom more, unless the Stalk is branched) much smaller than the left, narrow, long, and hollow, like a Hone of Hone, of one entire Leaf at the lower part, but ending above in five Comers, or small pointed Leaves, laid open like a Star, having small pieces of Leaves, like, as it were, Ears, far at the bottom of the division of them, both of them of a perfect blue color, but not so deep as the former, having a white Line in the middle of each of them, and the Ground, or bottom of the Flower, white also, with a few threads standing about a small half, not to be seen until the Flower be abloom or fully pait, unless one open it, which, after it is ripe, or fall blown, is small and long, containing very small brownish Seed.

VI. The third, or Smaller Spring Gentian, has a Root consisting of small, long, pale, yellow Strings, which being burnt by the heat of the Sun, it has the heads of Leaves, and thereby increases reasonably well, if it grows in a fit place, or is nurtur'd in good Ground, (otherwise it will scarcely grow with all the Care and Diligence in the world.) From this Root spring several small hard green Leaves, lying upon the Ground, as it were in Heads or Tufts, somewhat broad below, and pointed at the end, with five Veins or Ribs therein, as conspicuous as in the former Gentians; among which rises up a small stout Stalk, with some smaller Leaves thereon, at the top wherein stands one far, large, hollow Flower, made Bell fashion, with wide open Brims, and ending in five Corners or Divisions, of the most excellent deep blue color that can be seen in any Flower, with four white spots in the bottom on the Inside; after the Flower is past, long and round Pods or Cores do appear, in which are contained small blackish Seed, the whole Plant is bitter, but not so strong by much as the former.

VII. The fourth, or Croswort Gentian, has Roots which are small and white, offering themselves many ways in the Ground, of a bitter taste about the root. From this Root rises up many Branches, which lie upon the Earth, carelessly lifting themselves upright, and are full of Joints, at which grow usually two Leaves, one opposite unto another, in manner of a Cross, from whence it took its Name, in shape very like unto Saponaria, or Soapwort, but florer, and of a darker green color, at the tops of the Stalks stand many Flowers thick thrufled together, almost like Swet Williams, and likewise at the next Joint underneath, every one of them standing in a dark green Husk, and consisting of five small Leaves, the points or ends of which only appear above the Husks in which they stand, and are hardly to be seen, but that they are of a fine pale blue color, and that many grow together; the Seed is small and brown, hard, and somewhat like unto the Seed of the Marian Violet, or Girose Bell.

VIII. The fifth, or Pennys Blown spotted Gentian, has a Root which is small and yellow, with many Fibres adjoining to it, from which springs up a jointed Stalk about half a yard high, forming several reddish branches to the bottom next to the Root, with two Leaves, like to the Great Gentian, set at each Joint, but much smaller, and with more Veins or Ribs thereon than it, flowing up into several white spots, one above, where they do in a manner encompass the Stalk. From the middle of the Stalk upwards come forth the Flowers at the Joints, with the Leaves, in the Spring.
on both sides of the Stalk; three for the most part standing together, except the uppermost of all, where they stand five together, each of them with a short Footstalk under them; confiding of five small sharp pointed Leaves, spread like a Star, of a pale blue color, finely spotted, with many small black specks on the Inks, having a small unborne in the middle, and the small Threads tipp'd with yellow standing about it, the Seed, which follows the Flowers, is small, and enclosed in such Heads or Husks as the Gentius usually have.

**English Gentian Small.**

**Small Autumn Gentian,**

**Calabian Violet,**

**Or**

**Autumn Bell Flower.**

**Salmon's Herbal.**

Lib. I.

**IX.** The sixth, or English Gentian, has, according to Chaffers, a small Root, expatuated with a few Fibres or Strings, of a yellowish color, from which rises up a round stiff Stalk, or Stalks, firm and solid, somewhat reddish at bottom, and pointed or hooded somewhat like unto Calabrian Gentian, the Leaves are broad, smooth, and full of Ribs or Sinews, fat about the Stalk by couples, one opposite against another, the Flowers grow upon small flender Stalks, composed of five flender blue with Leaves, very curiously spotted, with many black Spots and small little Lines, having in the midst five small Chives, which falling away, give Seed small like Sand.

X. The seventh, or Autumn Gentian, called the Calabrian Violet, has a Root which is small, long, and manifold, running down for the most part deeper into the Ground than most of the former, which Gerard says, perishing after it has perfected its Seed, rising up again from the setting of its Seed, which is a mislike, and is relished by Parkinson, for the Root is truly a String, and somewhat creeping, (the deep in the Earth) and rising Root, rising after Seed time, and not perishing at the root, it rises up sometimes with more and sometimes with fewer Stalks, sometimes they also rise higher, as to be two feet high, and sometimes not, above a Foot high, according to the Fertility of the Soil, of a brownish green color, having many long and narrow dark green Leaves, by couples on them up to the tops, which seldom branch forth, but bear every one of them a reasonable large Flower, which is hollow, and larger than any other of the Autumnal, and is in most of a very deep blue with purple color, but in some a little paler, and ending in five points or corners.

**XI.** The eighth, or Autumn Gentian with small Century Leaves, has a Root which is small, striking down into the Ground, with several Fibres adjoining to it, from which rising up several Stalks, not a foot high, divided into several small Branches, on which stand two small Leaves together, as is usual in all the Gentians, very like unto those of the Lesser Century, which are not so long as the former, a little broader, and of a softer green color, at the tops of the Stalks and Branches grow several Orient Blew Flowers, not so large as those of the last described, but in small long Husks, half way rising up above the tops of them, after which comes small Seed in long horned Coats or Velvets.

**XII.** The ninth, or Small Autumn Gentian, simply so called, has a Root like the former, but a little larger, which sends up a pretty stiff round Stalk, of a Span high, or something more, which at certain spaces is set with such Leaves as the last described, but larger, and out of the bottoms of these Leaves, from the bottom to the top of the Stalk, spring forth little Footstalks, which usually carry three Flowers apiece, two let one against another, and the third upon a Stalk somewhat higher, and sometimes there comes forth a single Flower at the Root of these Footstalks, the Flowers in their shape or form, magnitude, and color, are like to those in the last described, as also their Seed and Seed Velvets; the manner of the growing of this is very well represented by the Gentiana major Flori caeruleo, mentioned in Chap. 111. Sect. 2. after going, having that that is very large, and this is very small, and of the perishing kind.
XVIII. The Places. The first grown upon the Alps, near Switzerland, as Bauhine says, the second, and most of the same kind, grow in England, being only diffus'd in Gardens, the third grows upon the Hills of Austria and Hungary, Gerard says he found it on Salisbury Plain, as also in some places in Suffolk, and likewise in the North of England, and near Longfield, in Kent, and the Albans, and near Calais, in the Flanders, and near the Alps, and in several places of Switzerland, and in several places, the materials with which it is chiefly used are: The fourth, is an English Plant, which was found by Mr. Hucber, (a Gentleman very skilful in Botany) in the North parts of England, viz. in Lancashire, but the exact place where he met with it is not named: The fifth, or Caucasian Violet, grows in many places of Germany, and other parts beyond the Seas, it grows also in several places of England, as near Leith, by Gravesend, near Greenhithe and Cibham in Kent, and in the Fields belonging to the House formerly Sir Percival Harde, at Legbourne in Kent, and the Albans Park, near Harrow in Middlesex, and near the Alps, and in several places of Switzerland, and in several places, and that as well in west Grounds as dry, Johnson upon Gerard says, that he found it only in the open Grounds, as also in ten Miles on this Side of London, on a Place called Newfield, in a place called Nettleton More, in Lincolnshire: The eighth, or Autumn Gentian, with Small Century Leaves, grows in Kent in several places, on the Longdown, as also upon Barton Hills in Bedfordshire, upon a piece of water Chalky Ground, as you go out of Dunstable way towards Goulburn, and near the old Town, near Albans: The ninth is found at the Chalk Dale near Dartford in Kent, in Waterdown Forest, in Suffolk, in the way leading from Charolow's Lodge to the Lord Rayne's House, called Eridge House, by a Brook side there, also on a Heath by Calnebrock, near London, and in the way running off from Salisbury Plain to the Earl of Pembroke's House at Wiltton, and upon Chalky Bank between Cadbury and St. Albans.

XIV. The Times. As to the times of Flowering, they are in part declared in the Section of the Kin's, the second and third Flower in April, and the third in May, if the Flowers are at any time in bad order; and the fourth not flowering, and their Leaves abiding green all the Winter, they increase at the Root, and may be easily parted; the fourth Flowers in June and July, the fifth Flowers in July and August, and not before, the Seed growing ripe soon after, which shedding themselves continue their Kinds, but will scarcely endure Transplantation, or fife of the Seed from in the Garden, as Camomille and others have observed, the seventh Flowers not until about the end of August, and in September, in which time this Noble Flower is in all its beauty: The eighth and ninth Flower also from the end of August, and continue flowering to the latter end of November.

XIV. The Qualities. All the Gentian's, both the Greater and the Smaller, are said to be of one Property, and to have the same Qualities and Virtues, but the Smaller, if given in Phlegmick, are less than the Smaller, but in places where the Greater are not to be gotten, and where the Smaller are in plenty, the Leifer may very well be used in their stead, and is of as good a quality, and is as good for disorders of the Stomach, common to those who cannot afford to defilth, and to digest the greater, in that the Gentian, which is both effectual, and a digestif, it is good likewise against piercing pains of the Sides, Stitches, or the like, it is good for such who are bruised by Blows or Falls, dislodging the coagulated Blood, and eating the pains, the pain is also very effectual against all sorts of Agues, being taken to three or four Times, three Hours before the coming of the Fit, in a Decoction of the same Root, it opens Obstructions of the Womb, provokes the Terms, stimulates the Delivery of Women in Travail, and brings away the Afterbirth, it is effectual against the Stammer, and brings away Sand, Gravel, or Tartarous Matter obstructing the Urinary Passages, and is said
Salmon's Herbal. Lib. I.

416

to be very good for such as have a Rupture, or are
Burthened all over with Coughs, Colds, Hoarse-
nesses, Wheezing, throatfuls of Breath, or any difficul-
ty of Breathing, being made into a Strip with Bo-
nary, and to take it, it is good against the Yellow
Jaundice, expels Wind, and is available against all
Diseases proceeding of Cold, whether inward or
outward, and as Gouty fluxes, it is most effectual
where there is any need to evacuate or make thin
thick Flumen, or prove and curative Humors, it
cleaves mithy running Sores, and purifies Ulcers, cut-
ing off the preface Humors, and freeing the parts
affected from any Distresses affecting them, drop in
the Eyes it takes away inflammation and redness,
and clears them from Films growing on them.

XXI. The Infusion of the Herb or Root. It has
the former Virtues, but much weaker, and may be given
Morning and Night for the same purposes from four
Ounces to eight, sweetened with Sugar or Honey; it
is a very good thing for those sorts of Aques which
come by dissections of Humors, or putridation of the
Blood.

XXII. The Decoction of the Root in Wine or Water.
It has all the Virtues of the Juice and Essence, but
much less effectual, and may be given from three
Ounces to fix Morning and Night, being used Di-
vertically for some time, in the Cure of old running
Sores, purifies Ulcers, and taints of rebellious Fi-
thals, &c. It is more powerful for the Cure of Acnes
than the Infusion of the Herb, tho' leis power-
f ul than the Essence, it heals all Wounds which
are fresh, by washing them therewith, and this more
especially, it is made with Wine, it is good alfo
to wash therewith all sorts of foul, purifies or rotten
Ulcers, yea, tho' they be hollow, or Fichlous, run-
ning, and herting, or Cereuses, for it mightily
cleanses and dries, and heals also, and taken in-
wardly for some time, it very much prevails a-
gainst the Kings-Evil, freely and certainly healing
those Ulcers up.

XXIII. The Powder of the Root. It has all the
Virtues of Juice, Essence, and Decoction, but oper-
ates not with that celebrity or power which they do,
may be given from half a Dram to a Dram every
Morning and Night, and every Night at Bed time,
in some convenient Vehicle, and to be continued for
some considerable time, as the reason of the thing,
or occasion may require, if it is taken, with a small
application of Myrrh, or Ras, or Pepper, it is the
more powerful against the Stinging of Scorpionis, or
Bittings of Serpents or Mad Dogs, the Wound being
kept open with Vinegar and Salt Water, and dafed
with the application of Garlick, which draws the
Venom or Poison out the more powerfully of all Ve-
gerables: Outwardly applied to foul, purifies, or
rotten Sores and Ulcers, it powerfully cures, or
cleanses, and dries them, causing them specially to
heal: Mixt with Honey, and taken in the Morning
Filling, and at the usual Medical Hours, it opens
Obstructions of the Lungs, and causes eafe expec-
tation of thick tough Flegm, and other gross Hu-
moses, it provokes the Terms, and expels the Dead
Child and Afterbirth, and is indeed a singular thing
for killing Worms in the Belly and Stomach.

XXIV. The Powder. It is made of the solid Root,
either green or dry: Being put up into the Womb,
and kept there, it induces a flux of the Terms, by
opening the Mouth of the Womb, it also attracts
and brings away the Child, whether alive or Dead, and also clears the Womb of the Af-
fterbirth.

XXV. The Distilled Water of Herb and Root. It
has the Virtues of the Infusion or Decoction, but not
so efficacious or powerful: Authors say, that being
drank, it has been often proved to cure in a won-
derful manner all sorts of Aques generated of the
putridation of the Blood and Humors, to kill Worms
in the Belly, and to cleanse the Skin from all sorts
of Sores, Fichlous, Flecks, Morphin, and other Defe-
clions whatsoever, it being often, twice, or five or
six times a day bathed therewith.

XXVI. The Spirituous Tincture of the Root: It
is proretable against the Yellow Jaundice, strengthens
and fortifies the Stomach, provokes the Co-
lick, and other praiseworthy and vehement pains of
the Stomach and Belly, it warsms, comforts, and strengthen
a cold and moist Liver, occasioned by long Sickness,
or bad Diet, and is of good use for such who
are in a pinning Contumapt, the Harmoniows or
Files being heated hereby it comforts the parts,
gives ease in the pain, and diffuces the Tumor or
Swelling; it is good against Cramps and Convulsivi-
ons, being often bathed upon the part affected, and
provokes against Paintings and Sweating Furs, being
inwardly given in any fit Vehicle from one Dram to
three, at time of the Paroxysm.

XXVII. The Acid Tincture. It is one of the great
Stomackicks in Beren. Natura, for it is the
Obstrufions of the Stomach, incides and dis-
folves Flumen, and all sorts of thick, tough, vicious
and tarantous Humors adhering to the Tunics thereof,
cleanseth all the evil Paroxysms, warms and
comforts it, restores its Tone, being hurt or depre-
ated, and after a fquill manner causeth a good Ap-
petite and a strong Digestion, and being constantly
given, it is one of the most absolute Cures when it is
for the Rickets in Children, it cures Althema's, caus-
ing a free respiration or breathing, and takes away
Heartenfes, Wheezings, &c. Dole is so many drops
as to make the Vehicle pleasantly sharp, and it is
indeed to be given in all that the Patient drinks, whether
Air, Beer, or Wine, and that while they luf it they
ought to drink nothing without it.

XXVIII. The Only Tincture. Inwardly taken from
ten drops to twenty or thirty, first drop into Sugar,
and then mixt with any fit Vehicle, it is of excellent
use against the Collick, and pains in the Stomach,
proceeding from Wind, it opens Obstrufions of the
Kins and Ureters, and expells small Stones, Gra-
vel, Sand, and other Tamarind Substances, which
cause the Strangury: It is a singular thing against
Putridity and convulsions of the Villers, he Paits,
runs, and convulsions, expelling the Exceses
inwardly taken as astringent, and morning and night
moant well upon the parts affected, as also along
down the Back Bone: It is good also against numb-
eroks of Limbs, Trembling of any of the parts of
the Body, weaksness of the Joints, and the Gout it
self proceeding from a cold Caufe.

XXIX. The Saline Tincture. Being bathed upon
the place, it is good against the bittings and stings of
Venomous creatures, for it attracts the Poison out
of the Part: it caues the pain of the Gout after a
figurall manner; opens the Pores of the Skin, dif-
cusses contusions, being applied hot, by way of
Firstment, and cleanses the face, hands and other
parts from spots, Fichlous, Tannings, Sun burn-
ing, yelloweows, black and bluenes occassioned
by Blows, as also hurt, morphen, and other like de-
structions of the Cats and Catuica.

XXX. The Ointment or Balsam. It is an ex-
traordinary Vulary, healing simple Wounds at once
without burning, it also heals Wounds and Pun-
chees of the Nerves and Tendons. It is likewi-
ses an excellent thing against all running Sores, old
and inveterate Ulcers, putrid or maligio Fultus's, for in
those cases where one is provently digests, cleanses,
and incarcerates it need be, dries and admirably heals;
in the other it takes away the Callous, &c. and in both strengthen
eth the parts, being much weakened through the
luggage or continuance of the Disease.

CHAP
Chap. 313. English Herbs. 417

CHAP. CCCXIII.

Of GERMANDER Garden.

The Name. It is called in Arabick, Chamferiad, Damesries and Kemadryt; in Greek, Xaqeyn, as Digestors fays: in Latin, Tromago, Triffaga, Herba Febrifuga, Febrifuga; (from the Edelcy) and Chamadrys, Quercula minor, quafi humila ut parum quaerere, a foliturn fimilitudines: in English, Germaner.

II. The Kinds. There are many Varieties of this Plant, most of which grow in other Countries, and are unknown in England: we make only four genuine kinds, viz. 1. Xaqeyn ite, Chamadrys fistula, Garden Germaner, of which in this Chapter. 2. Xaqeyn eres, Chamadrys fistula, Wild Germaner, of which in Chap. 314. 3. Xaqeyn eres, nus, 1. Xaqeyn, Scirpium, Chamadrys aquatica, Water Germaner, of which in Chap. 316. Following.

III. The Garden kinds. Of this there are many Species described in Antiquity, we shall only enumerate two, which are common with us in our Gardens, viz. 1. Chamadrys fistula vulgaris, Chamadrys acetosa, and Chamadrys fistula, and Chamadrys mas, Veftrage, Trijago, and Trijago major. The common Germaner, or Lesser Garden Germaner. 2. Chamadrys major, Trijago, and Trijago major. The greater Germaner.

IV. The Descriptions. The fifth, or Small Garden Gernander, but a Root composed of slender Sprigs, and variously diffus'd with many Strings, floating forth a great way round about, and quickly overspreading a Ground, springing up again in many Places. From this Root rises up a little Straight Stalk, about a Span long, and sometimes longer, nearly a Foot in Height; (but Parkinson says it
Salmon's

helps those who are Liling into Droopy, being taken in the morning or at the Dusk. Dose two, three or four Spoonsfuls Morning and Night.

XXII. The Elixirs. It has all the former Virtues besides which, it opens Obstructions of the Stomach, Liver, Spleen, Kidneys and Womb; provokes the Terms in Women, and helps to expel the dead Child, and the After-birth. If it is mixt with Vinegar, and for taken, it does wash or confume the Spleen, and is very effectual against all sorts of Piles, chiefly the Bitings of Serpents and mad Dogs. Used outwardly with Honey, it cleanses old and running Sores and putrid Ulcers, hindering their spreading and curing; and so mixed with Honey and put into the Eyes, it helps their running and watering, and removes the Discharges of Sight. Taken inwardly, three or four Spoonsfuls at a time, it is good against Pains and Sicknesses of the Side, Collicks, and other the like Disturbances. It cures all so Torpor and Spasms of the Fingers, being taken every day in the morning fasting, and on the day of the fast, three hours before the Fire comes; and Experience has found it a most effectual Remedy against the Plague it itself.

XIV. The Infusion. It has the Virtues of the Juice and Essence, but not full out so effectual: it prevails against Dificables of the Brain, continual Pains of the Head, Malarialcholy, Epilepsy, Carus, Lethargy and Dullness of Spites, Palpitations, Convulsions, etc. Dose for Ounces Morning, Noon and Night.

XV. The Decoction. It has the Virtues of the Juice, Essence and Infusion, but is something more efficacious than the Infusion, but not so pleasing to be drank by the Patient, because it tastes stronger; yet it may be given to mix Ounces or more, as the Infusion before is given. Put into the Pans, it kills Worms in them, and also kills Worms in the Belly, so also the Juice and Essence. A Decoction of the Herb or Root rather, made in Wine, and taken for sixty days continually, four hours before Meal, it is a certain Remedy for the Gout.

XVI. The Syrup. Dose undo makes a Syrup for the Spleen after this manner: Take Germamide, Ground Mace, Ginger, Mucilag, of each a Handful; Raisins, flour'd on Ounces, Batch of Gerard-roots, Root of Knollage, Eel-cumants, new Flowered dulse, Orich, Liquorice, of each half an Ounce; Batch of Tomato-roots, Gypper, Seeds of Anise, Fennel, Salladage, of each two Drums; and all in a sufficient quantity of a Mixture of equal parts of Wine and Vinegar: then Drain, and with a sufficient quantity of Honey, make a Syrup, aromatising with fice or fice Ounces of strong German-sower. The Dose is four Ounces every Morning fasting. It is good also against Coughs, Colds, Altham's and other Diffidures of the Lungs; as also against the Colick, Sickness in the Side, etc.

XVII. The Powder of the Herb. It has the Virtues of the Juice, but more attaining, being very good to stop all manner of Fluxes, whether of the Belly or of Blood, as also the Courses in Women, and to stop Vomiting, being given from half a Drum to a Drum and half, in Vinegar or any other proper Vehicle.

XVIII. The Powder of the Seed. It may be given from half a Drum to a Drum and half in a Glass of White Port Wine, for some days; and so taken, it expels Cholera by the Urinary Passages, and is profed to aga against the Yellow Jaundice: it also comports the Stomach, and strengthens all the Vices, tho' under long Weakening.

XIX. The Quarters or Salson. It heals fimples green Wounds in a short time, and being applied to inflamed Sores, and old putrid Ulcers, it di-
gels them, clentes, incandates, dries, and quickly heals them up. Applied to the Gout, it ealls the Pain in twenty four hours time, and by the con-
tent Use of it afterwards, in a short time cures it, and that to perfectly, as to return no more again upon that Ruff.

XX. The Cataplasm. Being beaten and boiled in Vinegar, and brought to a Confinence with a little Leaven, and so applied to the Stomach, it stops and cures all those Vomittings which arise from hot and cholick Cautes; and applied to the Forehead and Temples in cafe of an Hemorrahage or Bleeding at Nose, it presently stops it.

XXI. The Spirituous Wash. Warming and comfort a cold Stomach, and so strengthens it, as to cause a good Appetite and a Strong Digestion. It is cordial and excellent good against Eacting and Fwooning Fits, Fits of the Mother, and a vehement Sicknes at Heart, which it ealls almost in a moment. It expels Wind powerfully, and gives safe victual to the Colick: and is a singular thing in putting e-
ven the Violence of Convolutions. Dose two Drums.

XXII. The Acid Wash. It is fo powerful an Opeener of all Obstructions of the Stomach and other Vices, that there are but few other things which equal it. It cures and prevents the Rickets in Children, is powerful against a Cachexia in Virgins and other very Young People, and a singular thing in the Green-sicknes in young Women. It excites a good Appetite where it is languid or is wanting, includes, diffolves and expels thick, thick, viscid Phlegm, and other tenacious Humours, in the Stomach and Bowels; causing Torpor, Gripings, Collicks, etc. Yet it is given Diuretrically in all that the Patient drinks, whether Ale, Beer or Wine, for many Drops at a time, as may give the Vehicle a pleasant Acting, continuing its Life as long as need requires.

XXIII. The Oily Wash. Outwardly bathed upon any Part, or Parts affected with Lamenters, Numbness, Troubling, Pely, Convulsions, Carpins, from a cold Climate, as also upon Plurites of the Nerves or Tamours, it in a short time gives cale,

and by a Contribution of the Same, (doing it Morning and Night,) in no long time a perfect Cure. It ealls Pains upon the Skin-bones, as also Pains in the Joints, the Gout and Rheumatism, and in an excellent thing to be bathed upon any Part which has contracted any Weakness by the same Continuance of any Disease: Barely Palsies and Convulsions it is to be noted. That the Backbone itself also be arrmated with the force in like manner, twice a day, nothing it very well in.

XXIV. The Saline Wash. Inwardly given from one Drum to two in a Glass of White Port Wine, it opens Obstructions of the Urinary Passages, and provokes Urine powerfully, expelling Gravel, Sand, and slimy or viscid Matter, which hogs the Urine and causes Pain. Bathed upon a recent and simple Contusion, it hinders the Aggregation of Hu-

mors, diffolves those which are present, and quick-
ly ealls the Urine, taking away also the Blackness and Blood therefrom. It is also good against Pains, Troubles, Sun-burnt, Tannings, Yellowewews, Scurf, Morpheus, and other like Breakings out of the Skin.

XXV. The Spirits from the Herb. It is highly Stimutable and Cordial, good against all Diseases of the Head, Brain, Nerves, Heart and Vitals, com-
forting the Parts affected, ruffling the malignant Va-

pors which oppress the Spirits, and reviving the in-
iument Man. Dose from one to two Drums, e-
ther alone or in a Glass of choice and generous Wine, as oft as occasion requires, viz. in fainting,

Swooning, etc.

C H A P.
CHAP. CCCXIV.

OF GERMANDER WILD.

I. THE NAMES. It is called in Greek, Χαμάδρυς, in Latin, Teucrium syriaca, in English, Wild Germander.

II. THE KINDS. This is twofold, viz. 1. Teucrium syriaca Chatzi, Chamedrys spuria syriaca, Chamedrys vulgaris frutescens, Turcurs, Lami- ceri, Lentinus, Pseudoamomum Thalii, Teucrium praëstefte Lobelia, Common Wild Germander. 2. Chamedrys angustifolia, Chamedrys spuria minor, angustifolia Bauhini, who takes it to be the third Variety of the fourth kind of Clusius, his Teucrium Narrow-leaved Wild Germander.

Upon the Stalks, are shorter and narrower pointed also at the ends, and shht about the edges. The Flowers grow towards the tops of the Stalks, Spike-like, being either of a pale blue color or close, made of four Leaves, like the other; having also like Heads and Seed.

V. THE PLACES. The first grows almost in every Meadow thro' the Land, as also by Ditches and Hedge sides: Gerard says it grows in many places about London, in Meadows and fertile Fields, and in every place wheresoever I have travelled (says he) in England. The other grows in like places, but is nothing near so common.

VI. THE TIMES. They flower and fruit from the end of May to the latter end of August.

VII. THE QUALITIES, SPECIFICATIONS, PREPARATIONS, AND VIRTUES, are the same with those of the Common Garden Germander in the former Chapter, and thither I refer you.

CHAP. CCCXV.

OF GERMANDER TREE.

I. THE NAMES. It is called in Greek, Τευκρίμων; in Latin, Teucrium, (a Teucri inventor, trite Plinio) also Lacerula major; and in English, Tree Germander.

III. THE DESCRIPTIONS. The first, or Common Wild Germander, has a Root which is small and thready, which sends forth several square upright Stalks, yet sometimes a little bending, having two Leaves set at each Joint, one against another, the lower ones somewhat large, and almost round, yet pointed at the ends, and dented about the edges, but smaller as they grow up higher. The tops of the Stalks are spiked with several blue Flowers, set about them, made of four small round Leaves a-piece, with a little white Eye in the middle, small-pointed, and some Throats also; after which succeed small flat Pouches, containing small Seed.

IV. The second, or Narrow-leaved Wild Germander, has a Root which is blackish, hard and fibrous or stringy; from which spring several round reddish Stalks, somewhat rough, hard and hairy, about an Hand Breadth, or something more high, and bending downwards, whose lower Leaves are somewhat long and broad, round at the ends, and not dented at all about the edges, but those which grow up higher

III. THE DESCRIPTIONS. The first, or Common Wild Germander, has a Root which is small and thready, which sends forth several square upright Stalks, yet sometimes a little bending, having two Leaves set at each Joint, one against another, the lower ones somewhat large, and almost round, yet pointed at the ends, and dented about the edges, but smaller as they grow up higher. The tops of the Stalks are spiked with several blue Flowers, set about them, made of four small round Leaves a-piece, with a little white Eye in the middle, small-pointed, and some Throats also; after which succeed small flat Pouches, containing small Seed.

IV. The second, or Narrow-leaved Wild Germander, has a Root which is blackish, hard and fibrous or stringy; from which spring several round reddish Stalks, somewhat rough, hard and hairy, about an Hand Breadth, or something more high, and bending downwards, whose lower Leaves are somewhat long and broad, round at the ends, and not dented at all about the edges, but those which grow up higher
III. The Description. The first, or Common Tree Germander, has a Root which is somewhat woody, spreading it about, with many Strings and blackish Vines adorning it. From this Root springing up hard, woody, brittle Stalks, (growing much like a little Shrub) a Root or two, and sometimes a Root high, where Care is taken of it, and it is preserved and defended from the Injuries of the Winters. These Stalks branch themselves forth on all sides, from the very bottom, bearing always Leaves by couples, smaller, smoother and thicker than those of Germander, of a dark shining green color on the upper side, and greyish underneath, and dented all about the edges, like them. The Flowers which are gaping, stand about the tops of the Branches, Spike-likelike, one above another, of a pale whitish color, as Chrysus says, but of a purple, as Label says, of both which colors it has been oft seen bearing, but the Flowers are somewhat larger than those of Germander, and without any Hood above, having a few Threading standing forth. The Seed is small, blackish and round, contained in small round, but pointed Hoods. The whole Plant is of a rude pleathing, but needs Small, yet somewhat stronger, if it is a little bruised, holding the Stalks and green Leaves continually, if it is not exposed to the Sharpen of the Winter Season.

IV. The second, or Crest Tree Germander, has a Root like the former, and springs up and grows like a little Shrub; it rises up with such like woody Stalks, and brittle, as the other, but somewhat smaller and whiter, on which do grow such like Leaves, and in the same manner, but something lesser, less green and shining above, and more hoary underneath; two always set at a Joint, one opposite to the other; with the Leaves towards the tops, come forth five or six Flowers, standing in a Head, like unto the other, but a little les, and of a purple color, which being past away, small round Seed follows like to the former. The whole Plant is a little freeter than that first described.

V. The third, or Sparrth Tree Germander, has a woody Root, branching it self forth under Ground, with many Fibers adjoining to it, from whence rises up a slender Plant, growing sometimes to be three or four Feet high, and many times longer. It rises up for the most part but with one woody Stalk, which is of a greyish color, and divides it self into several Arms or Branches, but sooner than that of Candy, two always set at a Joint. The Leaves likewise stand two together, something greater, and waved a little at the edges, of a dark green color above, but not shining, and more hoary underneath. The Flowers stand at the Joints with the Leaves, towards the tops of the Stalks, of a white color, without any Hood above, and with several Threading in the middle, the lower Leaves hanging downwards. The Scramble hereof is less odoriferous or sweet, and the Taste is more bitter than the former, but abides with his Stalks and Leaves thence, green, like the rest, but requires a little more Care for its Winter Security in our Country.

VI. The Places. They all grow with us in Gardens, where they flourish very well, and delight to grow in rough stony places, which are mountainous and exposed to the Air and Sun. The second was brought to us from Candia, the third from Spain and therefore are not so hardy Plants as the first of them.

VII. The Times. These Tree Germanders Flower somewhat later than the other Germanders do, viz. in July and August, and the Seed is ripe in some little time after.

VIII. The Qualities, Specifications, Preparations and Virtues, are the same with those of the Common Germander in Chap. 312: following, to which we refer you.

IX. An Observation. It is to be noted, That Galen makes Tree Germander to be hot in the second Degree, and dry in the third, to be of thin parts, and inclining, also, whereby, he says, it is helpful for the Spleen. Descarter says it is used either green or dry, and is good to consume the Spleen, being inwardly and outwardly applied; it is also used against the Stingling or Biting of poisonous Creatures.

C H A P. CCCXVI.

Of, GERMANDER Water, or
SCORDIUM.

I. T H E Name. It is called in Greek, Τευκρίδης, some call it Ριφέλις, (from the Strong Small,) and it may also be called Αράτης, Τριζήγονον, Τριζήγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγονον, Τρίζηγο

The True Scordium, or Water Germander.

II. T H E Kinds. C bypherontium makes two kinds hereof, viz. a Lesser and a Greater. 1. Scordium leguminosum, Scordium minus, Scordium versum, Triago palustris minor, The lesser Scordium, The true Scordium, or Water Germander. 2. Scordium major,
Chap. 316. English Herbs.

majus, Scorodontis Plinii, Scorodion alburn, Scorodotis leguminos Plantii. The Greater Scordium, having
Leaves almost as large as Tansum. I know that John-
son and Parkinson will freely allow of this Greater
kind, and make no Difference between them, but
only in respect to the place of its Growth, making
it to be either Greater or Lesser, according as the
Soil is either richer and fatter, or poorer and more
than, but doubtless they were mistaken, for the
two differing Species are unlike.

III. The Descriptions. The first, which is the
Smaller kind, and is the True Scordium or Watcr
Germander, has a small Root, full of white Strings
or Fibres, spreading in the Ground, and creeping
round about; from whence grow forth several weak,
square, hairy Branches, which take Root in several
places, as they dry, and spread out, by which means it
much increases. Upon these Stalks or Branches
grow many Leaves, two always at a Joint, which are
something larger and longer than the Leaves of
Garden Germander, of a fad or dark green color,
whereas there is yet in there of Heart's, somewhat
short in handling, full of Veins, and dened about
the edges, of a Scent somewhat strong, and refembling
Germick, whence came the Greek and Latin
Name. The Flowers are small, red and gaping, or
of a purple color, like the Flowers of dead Netfcrs,
and third at the Joints with the Leaves, towards the
tops of the Branches.

Water Germander the Greater.

W. The second, or Greater Scordium, or Water
Germander, has a small long Root, and very fibrous,
creeping deep into the Ground, and far about, abiding
long, and not persifying every Year, by which me-
ny square, white, hairy Stalks or Branches spring
forth, some rising up higher, and others down; like,
keeping nearer the Ground. Upon these Stalks or
Branches grow Leaves, two at a Joint, broader and
rounder than the former Scordian, and all of a bo-
ny white, being somewhat like unto the Leaves of
Horehound or Water-A Knee, and almost as large as
those of Bason. From the middle of the Stalks up-
wards, towards their tops, come forth the Flowers,
being as it were in a long spiky Head, with
Leaves at the bottoms of Husks or short Foot-stalks.
The Flowers are of a pale purplish color, almost
white, like unto Horehound, gaping, and very like
to those of dead Netfcrs, which being pulled away,
there follows small, round, black Seed. The whole
Plant finds of Germick as much as the former,
or True Scordium, and thereby it is known to be of
the kind, tho' the Leaves, by being larger, do some-
what differ.

V. The Places. The first grows in many wet
Grounds, and by Water-side in many places of
England. Disporiferus Saya, That it grows as well
on Hills as by Water-sides, and it will flourish well,
if it is transplanted into a Garden: Concretum Saya,
That it is found to be stronger and sharper which
grows on high Grounds, than that which grows on
low and moist places. It grows near to Oxford,
by Reading, on both sides of the Water color, in a
Meadow by Abingdon, called Neftcr: also in
great plenty in the Isle of Ely, and in a Meadow by
Harwood in Lancashire, and in several other places.
The other grows also in low and moist places. This
is not so generally to be found as the first is: in
Condia the People gather it promiscuously with the
first kind.

VI. The Times. They flower in June, July and
August, in which Months it is best to gather it and
keep it dry; it perishes not in Winter, but only
loses the Stalks, the Root standing up fresh again in
Summer.

VII. The Qualities. Germander is hot and dry
in the second Degree: it is Aperitive, Absturive,
Astringent, Carminative, Digestive, Diuretic, Ano-
dyne and Traumatick; Cephalic, Nervous, Stom-
atick, Cordial, Hepatick, Nephatick, Sublimatek
and Alephenpick.

VIII. The Specification. It is a counter Poifon
against all Poisons and Injections of Contagious
and Epidemick Diseases, as Stings or Bites of Ser-
Dents, mad Dogs, etc. all Sorts of Maligcdn Fevers,
the Meats, Small-Pox, Purple, Spotted Fever and
Calenture, as also the Plague or Pestilence it elfe:
It is an excellent Help against the Strangury, and
provokes the Terms in Women.

IX. The Preparations. You may prepare here-
of, viz. 1. A Liquid Juice. 2. An Essence. 3. An
Infusion in Water, or Distillation. 4. A Syrup. 5.
An Ointment or Balsam. 9. A Cataplasm. 10. A
distilled Water. 11. A Spiritueous Tincture. 12.
Spirit. 15. An Elbeur. The Herb is only used.

The Virtues.

X. The liquid Juice. It is a little sharp and
percuting, and so is effectual to provoke Urine, and
give cafe in the Strangury. It opens Obstructions
of the Womb, and provokes the Terms in Women,
facilitates the Birth, and brings away the After-Birth.
It is good against the Bittings or Stings of Vipers,
Rattle Snakes, and other Serpents, mad Dogs, Scor-
don, Hornet, Gc. and relieves all other deadly Po-
isons. Doe two, three or Four Spoonsfulls in the
distilled Water of the same, or in any other fit for
proper Vehicle, Morning and Night, to be continued
for some time.

XI. The Essence. It has all the former Virtues;
and may be given in like manner in the same Doe:
and as it is a counter Poifon, so it relieves all con-
scious
gious and infectious Difficulties, even when Epidemical, as Measles, Small-Pox, Spotted Fever, Purgations, the Plague itself, and all Pestilential Discontents. It is given with good Success before the Fits of Ague, to divert or hinder the Access, and to drive them away; in this Case it may be given to four, five, or six Ounces. It is a most certain Remedy to kill Worms in Old or Young, whether in the Stomach or Belly. And by reason of its Adhesive and Sensitive Properties, it is an excellent thing to be applied directly against the Poison and Malady of the French-Pox, and to clear the Patient of the Reliques of the same. It powerfully provokes Sweat, and therefore is good against the Plague, digests Humours, diffuses and drives Scabs, and is an excellent thing for such who are hurt by Blows, Falls or Bruises, where some inward Vellum may be broken, to dissolve, disappear and expel the corporal Blood, and to consolidate the Vellum, and beaddate of its Concomitants Property, it is good for such as are troubled with any Rupture or Bruittanes, this being daily drunk inwardly, and the Herb applied externally.

XII. The Infusion in Wine, or Decotion. These have both of them the Virtues of the Juice and Essence, but in a much less degree, for which reason they cannot be taken in a much larger Dose, and to be officer repeated. They are good against the numbing Pains of the Stomach, as also Pains of the Sides and Pleura: and if they are made in Red Wine, it is very probable against the bloody-flux, and all other Fluxes of the Belly.

XIII. The Syrup. It has the Virtues of the Infusion and Decotion, and is available against an old Cough, Heartburn, Wheezing and Shortness of Breath: it opens Obstructions of the Lungs, and helps to expel obstructive tough Phlegm and other vicious Humors out of those Parts. Melt with the Powder of Scordium, and applied to foot and parted Ulcers, it abateth them, dries, and very much contributeth to their healing.

XIV. The Powder. It has the Virtues of the Juice, Essence, Infusion and Decotion, but operates not so speedily, and may be given in any convenient Vehicle, as in the distilled Water, Infusion, Decotion or Syrup of the same Herb. From half a Dram of this to a Dram, and it facilates the Labor, provokes the Terms, opens Obstructions of the Urinary Vessels, is good against Ruptures, is an excellent coumarion, kills Worms, and prevents powerfully a-against the bloody-flux, more especially if it is mixed with Powder of Tarentilii-woods a third part. It is very good for very mortifying Sores and Ulcers in the Legs or other Parts, to cleanse and dry them, and cause them speedily to heal.

XV. The Elecuci. It is made of the Powder of Scordium a Pound, mixed with three Pounds of the Rub of three Ounces made with Honey, adding at the end, Roots to fine Powder half a Pound. It is a noble Electuary for the Lungs, it not only cures Asthma's, Coughs, Colds, Wheezing, &c. but also heals Ulcers of the Lungs, helping to expel the gouten and putrid Matter from thence. Dose one Ounce Morning and Night.

XVI. Pocurcard. It is a compound Confect or Electuary in our Pharmacopoea Lichenum, lib. 4. cap. 22, p. 410. It was composed by Vrihacurzon, and infused there for its great Virtues and general Use. It is given against the Plague, Poison, malignant Fevers, spitting of blood, the Fusses, the Vomiting, Coups, Wheezing, Asthma's, Plague, Consumptions, Whites and Redds in Women, &c. Dose from one to two Drums at Night going to bed, and as much in the Morning going to bed. The effect of this Coction may require: and it may be given to Children from a Scurple to half a Dram, in any convenient Vehicle.

It is thus made: Take Scordium in fine powder one Ounce, fine Dole an Ounce and half, Terra Lemanis, Biffor, Cinnamon, Ceramic Lignia,_Dinty of Creed, Gentian, Tarentilii, (all these in fine powder) Gun Arachis, Golbanum, Soreen Camilla, of which body an Ounce, Ginger, Iron Pepper, Seeds of Soreel, of each two Drums in fine powder, Opium a Dram and half, Corona eight Ounces, Sugar of Rofes a Pound, clarified Honey two Pounds and half - mix and make an Electuary according to Art. The Opium in this Precipt is much too little, being to the whole Composition only as 1 to 59, which is an inconsiderable Proportion. Should Opium one Ounce be the Proportion, it would yet be but as 1 to 58, which is still considerably too little, where any Effects from the Opium are expected.

XVII. The Dinty or Hilo. They are excellent Wound-Medicaments, and cure simple green Wounds at two or three times dealing. If to every Pound of the Balsam three Ounces of the Powder of Scordium be added, and one Ounce of Powder of Tobaccon, it will be one of the best Topicks for dissembling, cleansing, incrusting, drying and healing any running old Soce, putrid Ulcer or Fuffia, in what Part of the Body forever.

XVIII. The Cateplin. It is made of the dryiet Herb mixed with Honey, and applied to simple green Wounds, it heals them. If it is applied to deep and putrid Ulcers, it cleanses, and cures them. If it is applied to Excrescencies in the Flesh, as Wens, and the like, it repercusses the Matter, hides them from encreafing, and prevalent against them so as to diffuse or dilute them. Applied to the Gout, it cures the Pains thereof.

XIX. The diginfled Water. It is Cordial and Antispasmick, and is good against fainting and Shrouding Fits, Sicknes at Heart, caused by any malignt or pestilential Miasma or Vapors, &c. but it is chiefly used as a Vehicle, to convey the other Preparations of this Herb into the Body.

XX. The Spirituif Temple. It is highly Cordial, good against all the Deliquiums of the Spirits, Painting, cold Sweats, Weakness, Palpitations and phlegmous Vapors, Sicknes at Heart, Agues, &c. and has all the Virtues of this Powder, being given as a Warming全面落实 to be given in a much lesser Dose, viz. from one to three Drums, in some fi. Vehicle.

XXI. The Acid Temple. There are but few things in the whole Republick of Medicine, which are so powerful against the Plague and all Pestilential Poisons, as this Medicament is, because it strikes at the Root of the Malignity and Venom, undoing it in its Principle and Effect. It not only counteracts the Plague and all Pestilential Discontents, but it is also a noble Prophylactic, or Prelevar from the Contagion and Infection. I commend it against the Spotted Fever, the Purgatives, Calamine, all burning and maligns Ewers, the Biting of mad Dogs, Serpents, Vipers, Rattles Nakes, Stingeing Scorpions, because, if widely given, and in a due or fit Dose, it will do more in an Hour than many other Medicines will do in a Week: it is to be given in all that the Patient drinks, whether Ale, Beer, Wine, Poffedrink, Grewel or Brandy, and those Drops at a time as to make it pleasantly sharp, refreshing the Acidity of a Limon. It is a noble Medicine, and ought to be kept always in a Readiness by one.

XXII. The Oily Temple. Amongst on the Back-Bone, and upon the Parts affected. Morning and Night, it is an excellent thing against Numbness, Trembling of the Limbs, Palsies, Contraction, &c. it is also of extraordinary Life, being applied to the Brain, and in the disasters of the Nerves the Occasion may require: and it may be given to Children from a
Chap. 317. English Herbs.

GILLIFLOWER, the Greater, or Carnation GILLIFLOWER.

The Name. This Plant, as it was unknown to the Greeks, so it has no Greek Name allotted it; but it is called in Latin, Caryophyllus bortenss, the Epithet being added from Caryophyllus indicus, the Indian Spice called Clove, these in the Garden being so called in some respect from their smell, in some measure being like to that of the Indian Spice, and in another respect from the form, the flower is flat, in its lower part, being very like to the Indian Clove; in English we call it, Gillyflower, (spice-fall-flower, from its flowering in the Month of July) but if we will align it a Greek Name, we may call it Caryophyllus bortenss, Caryophyllus bortenss, and so it distinguishes from Caryophyllus indicus, The Indian Clove or Spice.

The Kinds. Of the Gillyflowers there are three generick kinds, viz. 1. Caryophyllus bortenss rotbrom, The deep red Tea Clove-Gillyflower, of which we have already treated in Chap. 139, foregoing. 2. Caryophyllus bortenss mahonis, The greater Gillyflower, of the common Carnation Plant, of which in this Chapter. 3. Caryophyllus bortenss major, The greater Gillyflower, called simply by the Name of Gillyflower, of which there are several Species, which have been treated of (God willing) in Chap. 318, following. The generick Description of these two latter, see in Chap. 139, sect. 5 and 6.

The Kinds of Carnations. Of the Greater Gillyflower or Carnations, there are many kinds, Authors account about twenty several Species, which, because of the immediate Repetition, we shall forbear to name here, but give you them each in their own order, as we shall now describe them.

Gillyflower Greatest.

IV. The Descriptions. 1. Caryophyllus maximus, didelus, Hulo rubro varianus, The grey Halo. It has as great Leaves as the Old Carnation, (described in Cap. 139, sect. 5.) and as deeply jagged on the edges, it has a great high stalk, whereas Rand the Flowers, of a deep red color, tipped and speckled very close together, with a darkish white color.

V. 2. Caryophyllus maximus, i.e. Hulo ruber adenocaractus, The red Halo. It is a fair large Flower, of a Stamel color, deeply jagged, as the former, and grows very gallantly, without any spot all in all, so that it seems to be but a Stamel Gillyflower, saving, that it is much greater.

VI. 3. Caryophyllus maximus didelus Hulo eremita purpurea, The new Halo. It is a goodly fair Flower, being of a fair purplish Murry color, admirably Marbled with White, but so finely to be affected, that it seems only Purple, it has so much the Majesty in it, it resembles the Brasil, but that it is much bigger.

VII. 4. Caryophyllus maximus didelus Grinella, five Pence, The Gronella, or Prince. It is a fair Flowers also, as large as any Crystal, or larger, being of a fair Crimdon Color, equally for the most part fringed with White, or rather more White than Red, the every Leaf from the bottom, and grows beautifully.

VIII. 5. Caryophyllus maximus incarnatissimus Albus, The White Carnation, or Delicate. It is a goodly delightful fair Flower when in its Pride and Perfection, that is, when it is both Marbled and Figked, or tipped and speckled with White, upon an Incarnate Crimdon Color, being a very sweet and delicate Flower, but abides not constant, changing oftentimes to have no Hales or Streaks of White, but Marbled or Speckled wholly.

IX. 6.
Salmon's Herbal. Lib. 1.

Chapter CCCXVIII.

Of GILLIFLOWER the greater, or, GILLIFLOWER simply so called.

1. THE Name. As we did of the Great Carnation Gillyflower in the last Chapter, so we may now say of this, that it was a Plant wholly unknown to the Greeks, though from the Latin Name a Greek Name, (and very proper in the Language) may easily be derived, we call it in Latin Caryophyllus Hortensis major, I know that in Chap. 139. Sect. 3. in this manner we have called this Gillyflower Caryophyllus minor, that is, accounting the Great Carnation in the last Chapter to be, and this is the true Caryophyllus Hortensis major, it follows from the reason of the Name, that this being a lesser Gillyflower.

IX. 6. Caryophyllus maximus Incarnatus Giganteus, The French Carnation. It is very like to the perfane Carnation, but that it more Sprays or Spots, and fewer Sprays or Stipes of White in the Leaves, which has the Maltary of the White, but more Blues.

X. 7. Caryophyllus maximus Incarnatus Grandis, The Great Carnation. "It is almost like to the Grand or Old English Carnation descerbed in Chap. 139. Sect. 9. allgeries, it is a thick Flower, but Breeds not its Leaves abroad as others do, having the middle standing higher than the outward Leaves, and runing up their brims or edges, and is a Sid Flower, with few Spikes or Stipes in it; it is very subject to break its Husk or Pods, fo that the Flower seldom comes fair and right; the green Leaves are as great as the Husk, or Landscape Red.

XI. 8. Caryophyllus maximus crystallinus, The Crystal, or Crystalline. It is a very delicate Flower when it is well marked, but it is incotinent in the marks, being sometimes more filled with White and crimson Red, and sometimes Red, or little or nothing at all, and changing sometimes to be wholly Red, or wholly Blush.

XII. 9. Caryophyllus maximus Flore Rubra, The Red Flower. The Red Flower which is changed, is the most Orient Flower of all other Red Gillyflowers, because it is both the greatest, as coming from the Crystal, as also, that the Red hereof is a most excellent, not commonly dished at large in Chap. 139. Sect. 9, a foregoing of this Book, and is the very Head and Principal, as well as the greatest and largtest of all the Carnations that are yet known, and to the place now cotted, it serves to lay out the whole design, and serves to all the nineteen foregoing.

XXI. 10. Caryophyllus maximus Giganteus ruber, The great Landscape Red. It is a great Red Flower, fiddle and thick of Leaves, that most commonly breaks its Husk or Pod, and seldom stays or gives one a faire Flower, and in the Blus of the Blades or green Leaves are as large as the Husk.

XXII. 11. Caryophyllus maximus Angius, The greatest English Carnation, or Old Carnation. It is steady dished at large in Chap. 139. Sect. 9, a foregoing of this Book, and is the very Head and Principal, as well as the greatest and largtest of all the Carnations that are yet known, and to the place now cotted, it serves to lay out the whole design, and serves to all the nineteen foregoing.

XXII. 12. Caryophyllus maximus Subcaeruleus, The striped Savoy. It is for form and bigness equal with the Crystal, or White Carnation, but as inconform as either of them, changing into Red or Blush, so that few Branches with Flowers contain their true mixtures, which are a whitthus, fairly filled with a Crimson Red Color, thick and thin, with some spots also among them.

XXII. 13. Caryophyllus maximus Subcaeruleus Carneus, The Blush, or White striped Savoy. It is the same with the former, the same Root of the striped Savoy, as aboved, yielding one side or part, whole Flowers will be wholly bluish, or having some small sprays, or sometimes few or none in them.

XXII. 14. Caryophyllus maximus Subcaeruleus ruber, The red Savoy. It is like the bluish, when the color of the Flower is wholly Red, without the mixture of any Stripes or Spots, and so abides long, yet it is sometimes seen, that the Lame side or part, or Root, being figure from the fist or Mother Plant, will give fribled and well marked Flowers again.

XXII. 15. Caryophyllus maximus Oramatetus, The Oxford Carnation. It is very like to the French Carnation, as well for Form as bigness and color, but that this is of a fader Red color, so finely mixt with White thereto, that the Red having the Maltary, it shows it like a very Red Flower, not having any Husks or Stripes at all in it.

XXII. 16. Caryophyllus maximus Regius, five Brighten of major, The King's Carnation, or Ordinary Britail. It is a reasonable great Flower, deeply jagged, of a fad Red color, very finely fripped and express with White, some of the Leaves of the Flower on the one side will run up their brims or edges, the green Leaf in this is very large.

XIII. 17. Caryophyllus maximus Granatus, The greatest Grano. It is a very fair large Flower, being the largest of the Crystal, and almos as big as the Blue Hog, it is almos equally divided, and fripped with Purple and White, but the Purple is fader than in the Ordinary Grano Gillyflower, else it might be fad to be the same, but greater, several have taken this Flower to be the Grand Perre, but the difference will manifestly appear in the description of the next Flower.

XX. 17. Caryophyllus maximus distus Cornflower, The Cornflower. It is a fair great Flower, red colored, and well marked or fripped with White, some what like unto a Savoy, as some say, but that the Red is not Crimson, as the Savoy is, or something like to the Damas, as others say, but not so gallant, and sweet a form, the Leaves of the Flowers are many, chaffing together, without any due form of fripling.
The Gilliflower.

III. The Descriptions. 1. Caryophyllus Hortensia major Virtu pleno marice, The yellowish red Gilliflower, called also Caryophyllus Silesianus, The Silesian Gilliflower, but it has been now to long Planted in England, that it is become perfectly a Native of our own Country, see its Description at large in Chap. 139. Sect. 6. following, which is also a general Description to all the following enumerated in this Chapter.

IV. 2. Caryophyllus major Westmonterienfsis, The Gallant, or Westminister. Some would make this Flower to be two, one bigger than the other, others again make it but one; it flows at first blooming open of the Flower, to be of a reasonable Size and Beauty, but after it has stood open some time it flows smaller and thinner, and is of a bright red Color, much striped and speckled with White.

V. 3. Caryophyllus major Brilhiffiensis Purpuraceus, The Brilhiff Blue or Purple. It has large green Leaves, so large, that it would seem to bring forth a greater or Flower than it doth, yet the Flower is of an in- different Size, and very like unto the Ordinary Granado Gilliflower, striped and flaked in the same manner, but that the White of this is purer than that, and the Purple is more light, and tending to a Blue. This Flower does not abide constant, but changes ins to a Purple or Bludh.

VI. 4. Caryophyllus major Britelefenos Curso, The Britifh Blue. It is very like the last both in Leaf and Flower, the Color only shews the difference, which seldom varies, to be spotted, or to change its Color.

VII. 5. Caryophyllus major Canter\j The fair one of Kent, or Ruffing Bohn. It is a very beautiful Flower, and almost as large as the White Carnation, the Flower is white, thick pointed with Purple, in which the White has the Millery by much, which makes it so much the more pleasant and delectable.

VIII. 6. Caryophyllus Sileficus magnum, Caryophyllus fatoes magnus, The great Tawny. It is for form of growing, in Leaf and flower alone, the like unto the Ordinary Tawny, the Flower only, because it is the fairest and greateft, makes the difference, as also that it is of a deep Scarlet Color.

IX. 7. Caryophyllus falaris variabilis, The variable Tawny. There are several Tawnes, some lighter, or some fudder, either lef or more double, so as they are scarcely to be numbered, all rising from growing the Seed of some of them, besides the diversitie of other Colors, both simple and mixed, every Year and place yielding some variety not soon before, which I leave to curious Spectators to give proper Names to, as they shall see fit.

X. 8. Caryophyllus major Carusus variabilis. The variable Bludh colored. Of this there are many sorts, as the deep Bludh, the pale Bludh, the Infants Bludh, the great Bludh, and the Bludh inclining to a Red, but the great Bludh is the first and most double of all the other Bludhes, of which there are many, both single and double.

XI. 9. Caryophyllus Ruber variabilis, The variable Red. Of Reds there are some varietie, but not so many as of the other Colors, for as they are molt dead or deep Reds, and very few of a bright Red, or Scauf Color, to neither Purple nor White rise from this Seed, that any one has observed; they are either single, like Pink, either speckled with Black, or more double, striped and speckled variously.

XII. 10. Caryophyllus Herina, altius Elegans, The Lady, called the Beautiful or Noble. This may compare for Beauty with most of the Gilliflower, the Flower is very neat and tho' small, with a fine small Jig, and of a fine white Color on the under side of all the Leaves, as also all the whole Bag for a pretty compass, and the bottom or middle part of the Flower on the upper side also, but each Leaf is of a fine bright pale red Color on the under side, from the edge to the middle, which mixture is wonderfully delectable.

XIII. 11. Caryophyllus major Regimen, The Queens Gilliflower. It is a reasonable fair Flower, altho' very common, and is striped Red and White, large and some small, with long Thripes.

XIV. 12. Caryophyllus major Cornu, The Bleth Gilliflower. It differs most from the Red colored, or Scauf, as to its majestie or form, but only in the color of the Flower, which is Bludh.

XV. 13. Caryophyllus Albus Landinefis optimus major, The greater and best London White Gilliflower. It is admirable to look upon, grows upright, and very double, the bladges grow upright also, not crawling on the Ground.

XVI. 14. Caryophyllus Albus Landinefis vulgarius, The common White London Gilliflower. This is greater and whiter than the Common White Gillflo- wer, and is indeed wholly of one color.

XVII. 15. Caryophyllus major Dorobornienfis Ru- her, The Red Dorer. It is a reasonable large Gillflower, and constant, being of a fair Red, thick pointed with white spots, and thows something like the Ground Carnation.

XVIII. 16. Caryophyllus major Dorobornienfis Di- latus,
Salmon's Herbal

Lib. I.

Leaves, see Althea, The Lily, or White Flower. It is for form and all other things more beautiful or pretty than the former, the color of the Flowers is bluish, thick spotted with very small spots, that from all away, and is very delightful to look on.

XXV. Caryophyllus major 'Brachylophiis.' The Broom-Colewort. It is but of a middle size, being of a pale purple color, thick powdered and speckled with White, the Purple therein, is the chief, which makes them the fleshier, it is unconfus'd, varying much, and often to be all purple, the green Leaves eye meeting on the Ground.

XXV. Caryophyllus Refugis remandus, The round Gilflower. It is of the Kindred of the Tawnyw, being raised from the Seed of some of them, yet it is a different sort from all others, in that its Leaves are round, without any jag at all upon the edges, of a pale Stained dull color, without any spot or blemish therein, very like unto a small Rose, or rather much like unto the Red Rose Compion, both for form, and color, and roundnes, but larger for its lace.

XXXIV. Caryophyllus Silefiacus fruticos, The Rose-Coverliflower. It is either greater or leffer, deeper or lighter in its Flowers, there being above twenty varieties of them, all striped with smaller or larger stripes, or equally divided into a deeper or lighter color, and some sort for the shape or form will be more near, close and round, others more looke and unequal.

XXXV. Caryophyllus Silefiacus paucifloris, The Froebel's Leucos. It is of divers sorts, some bigger some leffer, some more and some less spotted than others, usually it is of a deep Scarlet, speckled or spotted with White, having also some stripes among the Leaves, and some more striped than others.

XXVII. Caryophyllus major, 'Elegant, The Pheasant or Pelo Flower.' It is a noble fine Flower, albeit it be not great, and for the smallness and thinness of the Flower, being red, is finely marked, striped and speckled, that for the Hands of the Colors, it becomes delectable to the Eye, and much to be desired, being inferior to very few Gillflowers.

XXVIII. Caryophyllus major Grandiflorus, The Great Gilflower. It is Purple and White, striped and striph'd very much, this is also much lefser than the Purple, there is of this kind a greatle and a leffer, besides the greatle, which is formerly decribed.

XXVIII. Caryophyllus Silefiacus Plenifloris, The Abundant Silefiacus. This is more rare to meet with than many of the others, it is most usually a large flower, and double, equaling the Lambourd Red in its perfection, the Color hered is commonly a little darker, or rather very curiously feathered, and streaked with White thro' the whole Leaf.

XXIX. Caryophyllus Silefiacus Marmor eunucus, The Mark'd Leucos. This has not to many varieties as the Striped, it is of as great beauty, and as delectable as it, or more, the Flowers are greater or smaller, deeper or lighter colored one from another, and the Veins or Marks more confi- derous or more frequent in some than in others, but the most beautifull of all is the Princes following.

XXX. Hersacons Holarum Radolfius Imperatis, The Princes. This is the grandest and finest of all their sorts of Variable Tawnyw, or Silef Flowers, being as large fully as the Prince of Crystal, or something greater, having coldly and round, not show of calyx, nor showing the Red or Hask, as some other sorts will, the making of the Flowers is in this manner, it is of a Stamped Color, striph'd and striph'd with white Stripes and Veins quite three or four kind, which are exactly jagged as the Hole, sometimes it has more Red than White, and sometimes more White than Red, and sometimes so equally match'd or marked, that you cannot discern which is the color of the Flowers in this Case, by the Con- traries, the Flower is still very beautiful and delightful to behold.

XXXI. Caryophyllus Silefiacus albiflorus, The trailer Tawnyw. This is another diversity of those variable or mixt colored Flowers, being of a pale reddish color, haked with White, not always down right, but oftentimes stainwr the Leaves, some more or less than others, the making of them is much the like the Crystal, these also, as well as the others, will be greater or otherwise, and of greater or leffer beauty than others.

XXXII. Caryophyllus Turricus, The Turky Gilflower. This is a small Flower, but of great delight, by reason of the well marking of the Flower, being most equally striph'd with Red and White.

XXXII. Caryophyllus purpureus carinis, The blue Gillflower. This is neither very double nor very great, nor round and handsome, with a jag at the edge, and is of an exceeding deep Purple Color, tending to a Tawny, it differs from all other sorts, in that the Leaf is as green as Grass, and the Stalks are like to that, and the Leaves may be known in the Winter as well as in the Summer.

XXXII. Caryophyllus Cambricus Postel, The Contery, or Pole Flower. It grows naturally upon the Rocks, near Cambricus, in the Isle of Wight, it is a small Flower, but very delectable to the Eye, because of the sweeter and beautifull proportion thereon, it is of a bright pale Red, thick speckled, or very small, with White, so that it seems to be but one color; the Leaves of the Flower are at the bottom jagged about, and it keeps constant to its form.

XXXII. Caryophyllus Veronica Vincit, The Gredeline Gillflower. It is a very neat and handsome Flower, of the biped of the Red Clove Gillflower, of a fine pale reddish Purple, or Peach color, continuing to a Brown or Violet, which is that Color which is usually called a Gredeline Color, it has no affinity with either Purple, Granado, or Pur- flo.

XXXII. Caryophyllus Pegasio dilution, The light or pale Pegasos. It is a Flower of a middle size, very pleasant to behold, and is both conftant and beautifull, if it was not for common, it would be as much a perfection of the kind, as it is, the Flower is of a pale bright Purple, thick powdered, and very equaly, with White, which has the Millaty, and makes it much the more pleasant and graceful.

XXXII. Caryophyllus major & minor, The Purple Gillflower greater and leffer. The Stalk of it is as flender, and the Leaves upon it as many and thick, that it lays and tralls on the Ground, the grandest is almost as large as the Crystal, but not so double, the leffer is a smaller Flower.

XXXII. Caryophyllus Pegasio sataravus, The full or deep colored Pegasos. It is the same with the former in Sect. 32. foregoing as to its form and biped, the difference is chiefly in the Color, for the Purple in this is the chief, which makes it so bold, that it resembles the Brusil for color, but not for large as it by half.

XXXII. Caryophyllus ruber major & minor, The Stemed Gillflower greater and leffer. It is well known, aloud to every Body, and differs little from the Common Red Caryophyllus, but only in its be- ging of a brighter or light red color, of this Kind there is both a greater and a leffer.

XXXVII. The Places. These all grow in the Gardens of Inditions Herbs in many parts of this Kingdom,
Kingdom, and are to be found in the Flower Gardens of most other parts of Europe.

XXXVIII. The Times. They begin to Flower about the end of June, and keep on flowering thro' all July and August, and many times thro' all September, even almost to the latter end of October, if the Weather is mild.

XXXIX. The Qualities, Specificalion, Preparations and Virtues, are the same with those of the Cowslipflower in Chap. 139. from Sect. 9. to Sect. 20. to which I refer you; but thse wanting that wonderful deep Red, cannot give so admirable a Tincture to a Syrup, as the Cowslipflower can do, and therefore (the full as Cordial, yet) are left unied in Physick.

XL. Nota. It is said by our Moderns, that none of these Flowers were in the least known to the Ancients, and yet some will have them to be the Conherbia Plantis, others to be the Iphion Theophrasti, mentioned in Lib. 6. Cap. 6. and 7. among his Gardens and Summer Flowers; others to be his Dios Arctius, or Fove Foliis, mentioned in the former and other places, we will not determine the Controversie, but leave every one to his Conjectures.

GLADDON Stinking. See FLOWER-DELICIE Wild Chap. 294.
GLADIOLUS. See CORN-FLAG Chap. 154.

CHAP. CCCXIX.

OF GOATS-BEARD, or, NOON-FLOWER.

I. The Names. It is called in Greek, *Teposbazon* a *Teposbazon* in Latin Tragopogon, Barbula Hirci, Barbula Hirci, also Tragopogon Barba Senis, in English Goats-Beard, Noon-Flower, Noon-Tide, Purple Flower, and Star of Jerufalem.

II. The Kinds. There are several Kinds hereof; viz. 1. Tragopogon luteum, Garden Yellow Goats-Beard. 2. Tragopogon purpureum, Purple Goats-Beard. 3. Tragopogon luteum amethystos, Common Goats-Beard with narrow Leaves. 4. Tragopogon Floris cerealis, Blov Goats-Beard. 5. Tragopogon Auranti fuscus rubens, Tragopogon Americanum, American or Yellow colored Goats-Beard. There are two or six other Kinds, but not being found growing in our Country, or in our Gardens, nor in any of our American Plantations, we shall here pass them by.

III. The Descriptions. The First, or Garden Yellow Goats-Beard, has a Root which is long and round, somewhate like unto a Turpentine, but for smaller, blackish on the outside and white within, which being broken yields a milky Juice, as all the rest of the Plant does, and of a very good and pleasant taste, from which Root rises up a Stalk, or Stalks, of two or three Feet high, smooth and hollow, bearing many long and narrow Leaves, broader at the bottom, and thiner at the end, with a ridge down the back of the Leaf, and of a pale green color, the higher the Leaves grow on the Stalks, the thinner and shorter they are. The Flowers grow on every Branch, and are of two both kinds, one having a great double yellow Flower, like almost to the Flower of a Dandelion, which turns into a head, and are of such a color as to excite every one to pluck it, and to make it into their Gardens; and long whitish Seed therein having on the head of every one some part of the Down, which (if neglected) is carried away with the Wind.

**Goats-Beard Yellow.**

IV. The second, or Purple Goats-Beard, has a Root which is long and finge, (much like to the former) with few few Threads thereto adjoining, which when it is perfected its Seed, yielding a great quantity of a milky Juice when it is cut or broken, as does all the rest of the Plants, from whence rises a hollow Stalk, or Stalks, smooth, and of a whitish green color, which spreads it self out into other Branches, on which Stalks and Branches do grow long Leaves, crested down the middle with a swellling Rib, and sharp pointed, yielding a milky Juice when it is broken, and in fume like those of Gard SUR, from the bottom of which Leaves small tender Stalks spring forth, fat with the like Leaves, but thinner, the Flowers grow at the tops of the Stalks, consisting of a number of Purple Leaves, deftined over, as it were, with a little yellow dust, fat about with nine or ten sharp pointed green Leaves; the whole Flower resembles a Star when it is spread abroad, for it flutters its self at Twelve of the Clock, and shows not its open face until the next day, but doth make it spread its self, or open, for which reason it was called Noon-Flower, and for some go to Bed at Noon: when these Flowers are come to their fall maturity, they grow into a Downy Head, like those of Dandelion, which is carried away with the Wind, the Seed is long, having at its upper end some small portion of that downy matter affixed to it.

V. The third, or Common Goats-Beard with narrow Leaves, is very much like to the first Yellow Kind, it has a thick Root full of a milky Sap, from which rises up many Leaves spread upon the Ground, very long, narrow, thin, and like unto those of Goats, saving that they are thicker and greener, arising from amongst which rise up tender Stalks, on the tops of which
Salmon's Herbal. Lib. I.

would be hard not to scarce yellow flowers, like to
the left stone described, but lesser, the whole Plant
yields a milky juice, as the others do, it perishes
slowly, or else does, after it has perfected its Seed.
Naked it is very much like to the former Tellow
Kind, but that it is not so great, nor rises so high,
but much narrower Leaves, evert like to Goats-grass, and
much smaller, but not so manifold, the Flower only
very differing in its magnitude, as above.

V. The fourth, or Blew Goats-Beard, has a Root
which is long, and not very great, perishing as fast
as it has been Seed, flowering up again of the falling
Seed, and so remaining green all Winter, and Flower-
ing the next Year following. From this Root rises
up a Stalk greater and stronger than that of Scorr-nera,
or Pipers-Grass, it is replenished with long,
new, and somewhat hollow, whitish green Leaves,
with a white Line down the middle of every one,
on the upper side, at the top of the Stalk grows
a great long Head or Husk, composed of nine or ten
large Leaves, the sharp points or ends of
which rise above the Flower in the middle,
which is thick and double, somewhat broad and large, breed
of a yellowish Alth COLOR, with some whitish Thread
among them, flushing or cloathing itself within
the green Husk every day at Noon, (for so long time
is the Flower constant) and not opening again un-
til the next Morning; after the Flower is past, the
Head or Husk, the seed being near ripe, opens it
itself; the long Leaves thereof, which cloathed not
before now, falling down round about the Stalk, and
flowing the Seed, standing at the first close together,
and the Down at the top of them, but after a while
it spreads it self round, and if not gathered, will
be carried away with the Wind, the Seed is long,
round, and rough, like the Seed of Pipers-Grass,
but greater and blacker.

VII. The fifth, or American, or Rote colored
Goats-Beard has a Root which is long and slender,
and is the smallest Root of all the Goats-Beards, white
downwards, and somewhat hard, but more reddish
at the top, which lends forth many long and narrow
Leaves, like unto Goats-grass, with a white Line in
the middle of them, smooth and soft if you brook them
upwards, but as rough as Barley Leaves breaking them
downwards, and broadened at their joining to the
Stalk; the Stalk is about two feet high, easily
dividing itself into any Branches, but bears at the
Top one great and a large head, (which is great in
respect to the Plant) parted into eight long Leaves
or Boards, in the middle of which is the Flower,
consisting of ten or twelve Leaves, of a pale pur-
ple, or rather of a blutl color, near unto a Darnisk
Role, having several blackish blow Threads in the
middle, with a mealy dust upon them, which being
past, the Head or Husk grows somewhat narrow, with
a long Neck, containing within it the Seed, which
is not fashed into a round Globke like form, with
Down at the heads of the several Seeds, as in all the
former, but it has five longer and greater Seeds on
the outside, with little or no Down at the ends of
them, and some leamer seeds in the middle, which
be a little Down on their heads, being yellowish
and smooth, but the leaff of all others.

VIII. An Observation. These Goats-Beards are
very like to the Scornerae, or Pipers-Grass, in their
outward form and manner of growing, and
therefore are Species eftimis generis, but the Tri-
gogen, or Goat’s-Beard, is the Gems or Standard.
and the Scornerae are Species of the General Kind,
but herein they chiefly differ, that whereas all the
flowers of Trigogenae are Annual Plants, perishing
every Year, although they have born their Seed; it is
evident that all the flowers of Scornerae are Perenni-
plantis, enduring after Seed time for many Years,
as in their proper place we shall hereafter at large
mention.

IX. The Places. The first and third grow in Gar-
dens with us, but are also found wild in many pla-
ces of this Land, Gerard says they grow in Mea-
depths and fields and here and there, in June
they grow plentifully in most of the Fields about
London, as at Billington, and in the Meadows by
Redriff, Depford, and Parmy, and in divers other
places, the third is found in Meadows as aatarial
about London, and many other places of the King-
dom, but not so plentifully as the first kind, the
second, or Purple Kind, came to us from Italy,
where it is said to grow wild, but it has also been
found growing wild in some parts of Lancashire,
on the Banks of the River Chalder, near to the Houses
formerly the Lady Hesketh, two Miles from Whalley,
but it is now Sown in Gardens almost everywhere
for the beauty of the Flowers; the fourth, or Blew
Kind, came to us also out of Italy, where it is sup-
possed to grow wild, but to us is only aulty to use in
Gardens, for its plentiful Flowers; the fifth Kind
is found growing on the Hills in Napier, as Columna
reports, and I have found it growing wild in sev-
eral parts of Florida, but with us in England is it
purely a Garden Plant.

X. The Times. They all of them Flower from
the latter end of May thro’ all June and July, and
the Seed comes to perfection in the mean time, be-
ing ripe in July and August.

XI. The Qualities. Goats-Beard is temperate
in respect of heat or cold, drinks or moisture, a little
Alfortigen, Stomachatick, Hepatick, Alcopenick, and
Alopecia.

XII. The Specification. They are all Reproductive
in Conceptions, and expel Gravel from the Reins
and Bladder.

XIII. The Preparations. You may have there-
from, 1. The boiled Roots, or Roots roots. 2. A De-
coction. 3. A distilled Water from the Root. 4.
Sanguis, or Blood of the Root, there being no other
part of the Plant useful.

The Virtues.

XIV. The Root is self. The Roots of any of the
Kinds being boiled, but more especially the root
Yellow Kind, and of the third also, and drasted as
Porphyra, are much more delcate and pleasant to
the Tastes in eating, they comfort the Stomach,
are good against Heart-burnings, strengthen the whole
Body, and jolte in Conceptions, the Roots of the
Yellow kind are many times eaten raw, as a Sal-
ter, being filed, and so eaten with Peppers, Salt,
and Vinegar, by which means the Stomach is also
strengthened, and they are rostred which are going
into a Conception, or are become Spore and Lean
by long Sickned, the Yellow Kinds is chiefly used
as Porphyra, and for Salting, the other Kinds are
not altogether suited for that purpose, being more
bitter, alfortigen, and additifive, having a more clean-
ring and binding quality than the others have,
and therefore are mostly used in a Medicinal way, the
Yellow Kinds make a pleasant Dish of Food, far far-
passing the Porphyra.

XV. The Decoction. It is good against the pain
of the Stomach, and to expel the malignity of the
Plague, and all sorts of Pestilential Diseases, it pre-
verts against Heartburnings, and a debilitated Appetite,
exciting and flushing it up, and it is good also a
against Affections of the Breast, Liver, Reins, Urcaers
and Bladder, expelling Sand, Gravel, Stones, and
Curious Maladies, and those by which reason the
Italians call it Saggi Ericì, Break-Stone.

XVI. The
Chap. CCCXX.

OF GOATS-RUE, OR, GOATS-SHREW.

I. THE NATURE. It is an Herb which was unknown to the Greeks, but is called by the Latin Galgala, and Ruta Caparia, some have erroneously called it Graege, and Francefioras called it Herba Gallica, and some only Caparia, (from the Goats eating it) some call it Thora, or Taurina, Sarracena, and Capagata, alfo Giarga, as Broadfooted faith, and by us in English Goats-Rue.

II. THE KIND. There are two Kinds of this Plant, one Call Goats-Rue sprightly, Rutacaparia vulgaris, Our Common Goats-Rue. 2. Galgala Montana Dalechampii Laguimaris, Mountain Goats-Rue.

Goats Rue

III. THE DESCRIPTION. The first, or Common Goats-Rue, has a Root which is white and Woody, spreading well in the Ground, and abounding several Years; from this Root come forth many round hard Stalks, four or five Feet high, on which grow one above another at several Joints, long winged Leaves, viz. many smaller Leaves set on each side of a middle Rib, which Leaves are small, yet somewhat broad and long, and sharp pointed at the ends, and smooth on the edges, without any hairs, something like unto the Leaves of Vetinches or Tors, and of a faint green color, at the tops of the Stalks stand many small Leguminous Flowers, one above another, of a pale yellow purple color, and in some Plants purely white, which being put away, small round Pods or Cores come in their places, about an Inch and half long, a little bunched out in some places, but nothing so much as the Ordin, or Bitter Vetch, in which by three, four, or five pale Seeds, like unto those of the Vetch or Tors.

IV. The second, or Mountain Kind, has a Root which is somewhat great and black, sending forth every long Strings, whereby it Roots itself deep in the Ground, from which several round hard Stalks shoot forth, but nothing so high as the former, on which grow fuch like winged Leaves at every Joint, but broader, and thicker far together, smooth on the edges, but having the middle Rib of every Leaf raised up a little high; at the tops of the Stalks stand divers fuch like Flowers as the former, but all on one side, of a pale color, tending to yellow, which afterwards yield small long blackish Pods, in which lie small filthy Seed, like to Lentils.

V. The Plants. The first grows commonly wild by the Way siles of moift Fields and Meadows in Italy, Spain, and other Southern Climates, it is also found growing wild in England, as in the Meadows by Linton in Cambridgshire: the second grows on the tops of Mountains, where any Planes are found, and I am informed by a very good Botanist, that he has met with it upon some of the Mountains in Wales.

VI. THE TIMES. They Flower about the latter end of June, and thro' all July, and the Seed is ripe in August.

VII. THE QUALITIES. It is temperate in respect of heat and cold, dry and moistures, it is weak, Atterfave, and Carminative, Cephalick, Neuritics, Stomarex, and Cardiack, Sudorific, and Alexipharmic.

VIII. THE PREPARATIONS. It curts all sorts of Poysons, whether inwardly taken, or outwardly received, by the Bitings of Serpents, as Vipers, Rattle-Snakes, or other venomous Creatures; or impalp’d by Contraction, as that of the Plague, Spotted Fever, or any other kind of Pelliiential Distemper.

THE VIRTUES.

X. The Salt. The Herb it self is eaten, being boiled with Flesh, as we use to boil and eat Cabbage and Celerwetes, it is also eaten as boiled Spinage, and other Salters, with Pepper, Salt, Vinegar and Oil, and being so eaten, it is said to be excellent against all sorts of Poysons, and the malignity or infection of the Plague or Pestilence, or the Bitings of venomous Creatures, &c.

XI. The Liquor Juice. It is effectual against the Bitings of Vipers, Rattle-Snakes, or other Serpents, Bitings of Mad Dogs, the Stinging of Scorpions,
or the Portion of other venemous Creatures; it is also effectual against Vegetable Poisons, as also the malignity of the Plague, or Pestilence it felt, and the malignity of other Pestilential or Contagious Diseases, as Purples, Mastits, Small Pox, Spotted Fever, and Calfantries, against all these Diseases it is admirable, for it both prevails from the infection, and by acting upon the parts such as are infected. Dole two or three Spoonfuls every Morning fasting in a Glass of Glenther Wine, and as much at Night going to Bed, by way of prevention, but for Cure, it ought to be given in Angelica Water, in the Face, or larger Dole, according to the Age and Condition of the Patient, and to be repeated as often as the necessity or veneration of the Diffice requires. This Juice given also in a Morning Eating, kills Worms in Children, or Elter People, and cures the Falling-Sicknes if given before it grows too old and strong upon the Patient, when it is given in the Plague, if the Patients ought to be in their Naked Bed, and made to Sweat thereupon for two or three Hours or more together.

XII. The Eirebus. It has the Virtues of the Liquid Juice, but acts more perfectly and powerfully, it expels the Poyson and Malignity by Perpiration, and so defends the Heart and Vital Powers; it is an extraordinary thing to see, when given, the Wit, as alive and running Ulcers, putrid Sores, and violent Ffits, destroying the malignity, hindering their eating and spreading, and defending the Principal Parts and Vital Powers from danger, it is a regular good Cordial, suppressest Vapors, refits Melancholy, is good against Trumblings and Convulsions, purifies against Sweating Fits, revives the Spirits, and cheers the Heart, preserving it from Palpitations, and other illnesses which appalls it, Dole one or two Spoonfuls in a Glass of Canary, or other fit Vehicle.

XIII. The Infusion or Decotion in Wine or Water. Either of them may be given in all the Cakes in which the Juice or Eirebus are given in, but as they are much weaker in their Efficacies, so they must be given in much greater Dole, as from a Quarter of a Pint to Half a Pint, and able to be often repeated, as the necessity may require.

XIV. The Electuary. Take Powder of Goats-Roe from any Scincophora in Powder, Contragyna, Vergina, Sacchero, all in one Powder, of each one Ounce, Saffron, Clove-weed, of each two Drasms, Rob of Goats-Roe twenty Drasms, mix and make an Electuary. It is good against all sorts of Poxes, both Vegetable and Animal, as also against the Plague, and all other infectious Diseases, and has indeed all the Virtues of the Liquid Eirebus and Juice, Dole from one Dram to two Drasms, in any proper Vehicle.

XV. The Cataplasm. It is made of the bruised Herb, fried or made hot with Vinegar, and then brought to a confection with Mithridate and Powder of Roy Berries, adding also a little Aloe in fine Powder, applied to the Region of the Heart, it is good against the infallion of the Plague, and other malign Diseases, applied to the Navel, and over the whole Abdomen, it calms the Cholick, and is very effectual to kill Worms in Children; applied to, and bound pretty hard upon the Palp of the Writhe, it is good against remitting Fittes, and cures Ague Fittes, hindering their return, applied to pestil and malign Ulcers, it cleanses them, destroys the malignity, drops the flux of Humors, dries them, and in a very great measure induces their healing; and besides, it frequently brings it stops their proceeding.

XVI. The Distilled Water. It has the Virtues of the Juice and Efficiency, but in a much lower degree, and therefore must be given in a much larger Dole, however it is useful as a Vehicle to convey the former Preparation in, where the Physician shall judge Wine to be too hot, to nice and delicate Palates the Distilled Water is other given than either Juice or Efficiency.

XVII. The Acid Tincture. It has all the Virtues of the Juice and Efficiency, whether inwardly taken, or externally applied, it is a Specific against the Plague, as also against all other Malign and Pestilential Diseases, and cures the most violent burning Fevers in a very short time, taking away the violence of their burning heat in the Space of an Hour, Dole to every drops as to make the Vehicle pleasantly sharp, and to be given in all that the Patient craves.

XVIII. The Oil Tincture. It is good against the Biting of Venemous Creatures, being taken from ten to twenty drops in any proper Vehicle, it is also good against Convulsions, Palpitations, Lamefies, Numbedness, Tremblings, weakens of the extrem Parts, Grapings of the Bowels, Wind, Stone, Grip, Sin, and Tartarous Matter obstructing the Urinary parts, as also against the Cold, Goit in Hands, Arms, Hands, or Feet, being inwardly taken, and outwardly applied to the parts affected, as the Skilful Physician shall direct; in the Palp, heches giving it inwardly, and applying it to the affected parts, and outwardly upon the Rake Bone every Morning and Evening.

XIX. The Spirituous Tincture. It has all the Virtues of the Juice, Efficiency, and Electuary, and it is finer and more Spirituous; so it is more Subtil and penetrating, and when diluted with double refined Sugar, more pleasant to be taken, and more delicate Cordial, and therefore more fit to be given to the more curious and nice Palates, it may be taken a Spoonful or more at a time, (as you may, if you conveniently) either alone by itself, or mixt with some other Vehicle, as Canary, White Leber, or other like Generous Wines, it is indeed an excellent thing against Scincophoras at Heart, as also against Fainting and Sweating Fits, it is indeed good against all cold and mild Diseases of the Head, Brain, Nerves, Joints, Jowels, Reins, and Worms, it retifies and enlivens the depraved parts, revives the Spirits, ther’o’ never to much opprèssé, and gives relief in the most profound Melancholy; it is good against a Vertigo, and Magrin, and is effective against a Cough, Carus, and Leuktrin, or when the Patient is inclined to Slackiness and Drowsiness; and it is given with a few drops of the Acid Tincture, it expresse Vapors, and effectually cures Frets of the Mother.

C H A P. CCCXXI.

of GOATS-STONES, or, HARIES-STONES.

I. The Name. This Plant is called in Greek, Tenylos, in Latin, Tragorchis, Tettelbares Hisocrates, Scinophora, and Orchis fardius; in Eng- lish, Goats-Roome, and Haries-Roome.

II. The Kinds. There are two principal kinds hereof, viz. 1. Tragorchis mar, Tettelbares Hisocrates mar, Scinophora mar, The Male Goats-Roome. 2. Tragorchis fem, Scinophora fem, The Female Goats-Roome. Thses Orchides are thus named, not only
only because they have a foul strong Scent, like that of the Goat, but also that most of them have long Tails, like Beards, hanging down from them.

III. Of the Male kind, which is the Greater Goats-flower, there are two Species, viz. 1. Tragarcbis maxima, The great Male Goats-flowes. 2. Tragarcbis equa magis, Tragarcbis vulgaris magnit., The common great Goats-flowes.

IV. Of the Female kind, which is the Lesser Goats-flower, there are three Species, viz. 1. Tragarcbis femina minor, Tragarcbis minor varior, The true lesser Goats-flowes. 2. Tragarcbis Batavica Clafia, Tragarcbis minor Batavica, The Dutch Goats-flowes, or Hares-flowes. 3. Tragarcbis Aubriaca, Tragarcbis altera purpurifæ, Aubrian Goats-flowes, Goats-flowes with purple Flowers.

V. The Descriptions. The first, or Great Male Goats-flowes, has Roots consisting of two Testicles, like to other Orchidales; but greater, from above ris'd up Leaves, lying upon the Ground, which are broad, large, and ribbed in some sort like to our Plantains, but somewhat shorter. From among these Leaves grows up a stalk, about half a yard high, for with such like great Leaves, but growing a little narrow, er as they grow higher, growing up even to the top of the Stalk by equal Distances. The Bath of Flowers grows at top of the Stalk in Spike-fashion: the Flowers are small and thin, open, and wholly of a purple color, set in a Row, and in an excellent Order; each Flower has a long crooked Thread or Stinging proceeding from its middle part, and hanging down, which twine themselves one in another, like to the small Tendrils of the Vine, or rather the Laces or Strings which grow upon the Herb Savory: both the Hood and the Tail are spotted, and have a strong Scent.

Great Common Goats-flowes.

VI. The second, or Common great Goats-flowes, has a double tuberous or tuberculous Root, like the first, growing in the Earth, and rising up a Stalk, about half a yard high, for with such Leaves, but growing a little shorter, as they grow higher, growing up even to the top of the Stalk by equal Distances. The Bath of Flowers grows at top of the Stalk in Spike-fashion: the Flowers are small and thin, open, and wholly of a purple color, set in a Row, and in an excellent Order; each Flower has a long crooked Thread or Stinging proceeding from its middle part, and hanging down, which twine themselves one in another, like to the small Tendrils of the Vine, or rather the Laces or Strings which grow upon the Herb Savory: both the Hood and the Tail are spotted, and have a strong Scent.

VII. The third, or True lesser Goats-flowes, has its Root or Testicules much less than either of the former, with several narrower and long Leaves (a little ribbed) rising from the same, which do as it were enclose a single Stalk, which is also enclosed about with like but smaller Leaves, to the beginning of the frizzled Head of Flowers. These Leaves are much less than those of the two first described, and the Flowers are without Spurs or Tails, and somewhat like in Shape to those Insects called Sows or Wood Lice for their Proportion, and they are somewhat of a brownish color. Gerard says, That the Flowers much resemble our common Flies. The Smell of the whole Plant does much more resemble the rank Smell of a Goat, than any of the other kinds.

VIII. The
Salmon's Herbal.

Lib. I.

VIII. The fourth, or Dutch Goats-tufts, is a very small Plant, not much above a Spans long, or in Herba, being a small fabled Root, like the 26th from which rises up a Stalk eight or nine Inches high, having three of four Leaves accompanying it. The top of the Stalk ends in a small fabled Head of Flowers, of a fine purple red color on the outside, and pale without, having a Belly or Lip hanging down, which is terminated in three short and equal parts.

IX. The fifth, or Austrian Goats-tufts, has, like all the former, a fabled Root, which sends forth Lily like Leaves, of a pale green color, with some fandler about the Stalk, which is about a Span high, towards the top it has a fabled Head of Flowers, which are either of a white or pale color, without any Spots, or else purple, with some purple Leaves under them, each of which is hooded and curled, with a hanging Belly, notched as it were at the bottom. The whole Plant smalls of a rank Goat like Smell, for which Reason it is brought into the Cliffs or Rank with the four former.

X. The Places. All the sorts grow chiefly in fat Chry Grounds, and are seldom to be found in any other Soil. The fourth has been found not only in England, but also in Holland, about the Hague, as also in other Parts, about their Sea Coasts. The fifth is a Native of Austria, and not to be found with use, except in Gardens of the most celtic Florists.

XI. The Times. They flower in May and June, when other sorts of Orchids flower.

XII. The Qualities, Specification, Preparations and Use, are the same with the Gymnorchis or Dayflowers in Chap. 226, after which, so that no more need be said thereof in this place: but Lagenaria from Dobosius says, that the Roots of these Orchids are preferable to all others.

CHAP. CCCXII.

OF GOLD-LOCKS, OR GOLDEN-TUFTS.

I. THE Names. It is called in Greek, Korobone; in Latin, Chrysorchis, and Corn aureus; and in English, Gold-locks, or Golden-tufts.

II. The Kinds. Authors make several sorts hereof, but the following three are chief, viz. 1. Chrysorchis aurea, Corn aurea Dioscoridis, The true Gold-locks of Dioscorides. 2. Chrysorchis lutea, Corn aurea, & Amarantus luteus Lobelii & Sibelli, Yellow Tufts, or Calycerum. 3. Chrysorchis pretiosus, Corn aureus. Chrysanthemum Cirtus alter, Wild Gold-tufts. The first of these is called the True Chrysorchis of Dioscorides and Pliny, but is called by several other Names by later Authors, as, Linaria aurea Rigii, Linaria auricula Canerti, Ophris auricula Cliffi, Linaria imperator Lobelii, &c.

III. The Description. The fifth, or True Goldlocks of Dioscorides, has a Root which is hard and woody, at its Head flowing forth many blackish Fibris into the Ground. From this Root spring forth many hard round Stalks, half a Foot high, somewhat thick fat, but tenderly, with narrow, long, green Leaves up to the tops, where they branch forth into divers small Sprigs, with smaller and shorter Leaves thereon than on those below, and bearing round Heads of Flowers, composed of Gold-yellow Threads, rising from the middle of a few green Leaves, which are as a Husk to each of them, and adding a long fabled Head of Flowers, of a fine purple red color on the outside, and pale without, having a belly or Lip hanging down, which is terminated in three short and equal parts.

IV. The second, or Yellow Tufts, or Calycerum, has a small and black Root, with some Fibres adjoining to it, from which spring up one or more Stalks, eight or nine Inches in Height, spread out into several heavy Branches, with long and narrow white Stalks, differently growing thereon, up to their tops, where the Flowers appear in Umbels, each Branch bearing a large Tuft of fealy, yellow Flowers, like a hoose or tufted Umble, keeping their color long before they wither, and being gathered in a fit dry time, when they are in their Perfection, will abide, and be kept a long time after. The Seed is red, smaller than that of Marjoram, and sharper. The whole Plant is of a strong Sweet Smell, and very pleasant.

V. The third, or Wild Gold-tufts, has a long, small, slender Root, black and woody, with a pretty many Fibres adjoining thereto, from which springing up sometimes but one stalk, and sometimes more, growing up to be about half a Yard high, covered over with an hairy Durance, having several long and narrow Leaves on them, sometimes differently fat, and sometimes more near together, green on the upper side, and hoary underneath, the tops grow small Branches, bearing one or two feally long Heads of yellow Flowers, somewhat like to those of Medon, and consisting of many Threads. The woody
Chap. 323. English Herbs.

woolly leaf of this Plant, resembles Gnaphalium vulgare, but that it is somewhat broader in the middle. The Flowers grow clustering together upon the tops of the branches, of a yellow color, and almost like those of Maudlin, as aforesaid.

VI. Note 1. These Plants are known also by the Name of Golden Flower Gentle; and by reason of the long continuance of its Flower in Perfection, they are also called (but more especially the first and second,) Yellow Everlasting, and Flower Everlasting, also Flower Never-fading, because it scarcely seems to die.

VII. Note 2. Johnsgear upon Gerard has another sort of our second kind, having a long slender Root, very full of small Fibres; from the Head of which Root spring forth three, four, or more Stalks, a Foot or more in Height, which are all of them (almost up to the tops) very well replanted with roots, yellow, downy Leaves, like the former, saving that they are somewhat broader. The Flowers are longer, but in larger Umbels, every way greater, and seem to be of a more shining Gold color. These Flowers being gathered also in their Beauty and Perfection, will be of as long Continuance, and carry their Glory to as late a Date as those at Seft, 4. foregoing. Whether this be any differing Species from that second kind aforementioned, I can hardly determine, they being so very much like one another, and seem to me to differ chiefly in their Magnitude, which may probably be from the differing Goodness of the Soil in which they may be found growing, which well-faine Difference (from the same Reason) may be observed in many other Plants, which Authors will never admit to be various Species or Kinds of the same Plant.

VIII. The Places. They grow in most untilled places of Greece, Spain and Italy; in Meadows where the Soil is barren, as also about the Banks of Rivers. The first grows not only in Greece and Italy, but also in several places of Germany, in most Sandy Borders of unmanured Fields, as Fracis says. They are all Strangers in England, and only grow with us in Gardens, being nurtured up by the Curious. The second and fourth grow in Candy and Spain. The third Climates found in Spain and Portugal, and Labeled about Hambacher in France.

IX. The Times. Too' these Plants in their native Countries may flower earlier than in our colder Climes, as in April or May, with us in our Gardens they flower much later, viz. not till July and August, and sometimes later still.

X. The Qualities. They are hot and dry in the latter end of the second Degree, or beginning of the third; are both Aperitive and Afflurant, Pectoral, Hysterick and Nephrick, and also Aleophr microscopic.

XI. The Specification. They provoke the Terms, and force away the After-birth; refill Poyton, and prevail against Convulsions.

XII. The Preparations. You may have thereof, 1. The Herb is self. 2. A Decoction of the Herb and Flowers in Wine. 3. A Powder of the dried Flowers. 4. A Bath of the Herb and Flowers.

The Virtues.

XIII. The Herb is self. It is used to be laid in Chefts and Wardrobes, to preserve Garments from Moths and Worms.

XIV. The Decoction of the Herb and Flowers in Wine. Being drunk to fix or eight Ounces once or twice a day. It is laid to expel all sorts of Poytons, help Cramps, Convulsions and Ruptures, dissolve congested Blood in the Thorax and Bowels, provoke the Terms in Women, and expel the After-birth.

XV. The Powder of the Flowers. It may be given to two Drams in any convenient Vehicle, as in the Tincture of Catechu made in Water, or in a Red Wine, or in a Mixture of Wine and Water. This being taken first in the Morning fasting, and last at Night going to Bed, it thickens a thin Rheum, prevals against Coughs and Colds, and fops Catarrh, or Distillations of Rheum down the Throat, which sometimes is laid to fall upon the Lungs.

XVI. The Bath made of the Herb and Flowers, either in Water or Wine. It is good to sit three Hours in warm Fumes thereof, for so it opensObstructions of the Womb, and eases Pain thereof: it gives eafe also in the Piles, causing them to be diffolved: it eases them also who are afflicted with Pain in the Reins, gives eafe in the Sciatica, and is very efficuial to draw down Vapors, and prevent Fits of the Mother.

C H A P. CCCXXIII.

OF GOLDEN-ROD.
Salmon's Herbal. Lib. 1.

Common Golden-Rod.

III. The Descriptions. The first, or Common Golden-Rod, has a Root consisting of a Bunch of very small Fibres, which ran not deep into the Ground, but shot all the Year therein. From this Root spring up several small round, brownish Stalks, half a Yard, or so high, (but higher, if it grows in a fat Soil, or in a Garden well manured) having upon them many narrow and long dark green Leaves, very feldom with any darts about the edges, and as feldom with any Spots or white Spots upon them, and yet sometimes, and in some places, they are found, divided at the tops into some small Branches, with several small yellow Flowers on evey one of them, which are turned one way, and not looking finely, at once, which being ripe, do run into Down, and are carried away with the Wind. The old Stalks die away and perish every Year, and new ones spring up every Spring following.

IV. The second, or Golden-Rod with dented Leaves, has a Root like the other, small, and composed of many Strings or Threads, from which rise up Stalks, as in the other, not so high as the former, but feth a great deal of the Roots. The Leaves are small and thin, but broader and shorter than those of the preceding, smooth, sharp-pointed, and dented about the edges, like a Saw, of a hot and harsh Taffe in the Throat, being cleaved in the Mouth, which Leaves grow upon three red-brown Foot-stalks. The Branches bear six like Flowers as the first, facing one side of their Stalks, as the former does. These growing at the tops, are of a Gold-yellow color, from whence the Plant takes its Name. The Flowers being puffed away, the Heads turn into Down, and are carried away with the Wind, as the other are.

V. The third, or American Golden-Rod, has a Root not much unlike in the former, composed of a Bunch of Fibres or Strings, which abide under Ground all Winter, in the same manner, losing all its old Stalks. From this Root springing up Leaves as high as those of the first, but not run up to Stalks, being long, but not very broad, and broadest in the middle, and very sharp-pointed at the ends, and a little dented about the edges, not so much as the second; they grow upon Foot-stalks, and are of a dark green color. The Stalk or Stalks are a little hairy, rising higher than the Iaff, not above a Foot and half high at most, bearing upon their various tops yellow Flowers, of a Gold-yellow color, facing all on one side, as the others do; which being palled away, turned into Downy Heads, and are carried away with the Wind, as all the others are. This Plant is so like to the second, that the Figure of that may very well serve for this, without any confedible Error.

Golden-Rod with dented Leaves.

VI. The Places. The first grows plentifully enough in several Places of England, in open places of Woods and Copses, both in marsh and dry Grounds. It grows plentifully in Hampsed-Wood, near unto the Gate which leads out of the Wood to Kentish-Town, not far from London; in a Wood by Rayleigh in Essex, near to a House formerly Mr. Leonard's, dwelling upon Down-Heath, also in South-east, and in Southwark-Wood near to Gravesend. The second also grows in many places of this Land, but not so plentifully as the former; it is to be found in some places in Hampsed-Wood, but more sparingly than the former. The last has been brought to us from America, but from what parts of the Continent, is not known. It grows with us in Gardens.

VII. The Times. The first flowers later than the second, but they both flower and broom in July and August. The American kind flowers indeed very late in the Year.

VIII. The Qualities. Golden-Rod is hot and dry in the second Degree, Explosive, Aftertaste, Antitoxic, Diuretic and Traumatick or Venenous, Neurotic, 

Leaves unfilght or smooth on the edges. 2. Virginiana, an inferior Common, American Golden-Rod, which is not very much unlike to the second kind.
The Virtues.

XI. The *liquid Juicé*. It is of good Use to be given against Sand, Gravel, Stone or surrouning Matter in the Urine, Ureter or Bladder, for it provokes Urine in abundance, and in forces away that surrouning Matter which obstructs the Stone or Gravel in the Urinary Pass, and cures Sand and Gravel to be voided with the Urine. Dose from two to four Spoonfuls, Morning, Noon and Night, in a Glass of White Port Wine, or other fit Vehicle.

XII. The *Efficence*. It has all the Virtues of the Liquid Juice; it also evacuates all raw and tough vitious or freckled Humors, carrying them off by Urine. It is very effectual against all inward Bruises, as also to be outwardly applied to the Same. It helps Bleeding in any Part of the Body, and is an excellent thing for the Cure of Wounds. It helps the overflowing of the Teemst in Women, the Flux of the Whites, and heals the Bowels in a Diarrhac, Dysterica, Lertiata or Hepatrick Flux. It helps Catarrhs, and a Flux of Humors falling down upon any Part of the Body; and it is prevalent in curing all sorts of Ruptures in Man or Woman, this being drunk inwardly, and the Cataplasm outwardly applied. It is one of the most foreign to all Wound-Herbs, and therefore the Efficence thereof, for the curing of Wounds inward or outward, will do as much as any other can: green Wounds, it quickens them; and old Sores and Ulcers, it digests, cleanses, dries, and speedily induces their healing, drying up, stopping, or removing that Mofiture and Flux of Humors which hinders their Cure. Dose two, three or four Spoonfuls in Wine, or any other proper Liquor.

XIII. The *Decotion in Wine*. It is made of either green or dried Herb: it has all the Virtues of the Juice and Efficence, having that it is not so powerful, and therefore may be given from four to eight Ounces, distilled with a little white Spirit, and that morning and Night. It is an excellent thing to wash filthy, foul and running Sores or Ulcers with, and makes a good Loction for Sores and Ulcers in the Mouth and Throat, or Palsy Parts of Man or Woman; and being often used, it is Gold to sete loose Teeth.

XIV. The *Puder of the Herb*. Given to one or two Doses in Red Wine, it stops all inward Bleedings; as also all sorts of Fluxes of the Bowels. Sweated upon old, moist Ulcers and running Sores, it cleanses and dries them, strengthens the Part, and if need be, incarnates them, and heals them.

XV. The *Ointment*. It is made as all other Ointments are made; but before it is quite cold, you are to mix with every Pound of the Ointment, two Ounces of the Puder of the Herb, or an Ounce and half of Toluaco in the Puder. It is a famous Vulnerary, curing green Wounds in a very short time: and as for Fitches’s old and inventurate Ulcers, and malignant running Sores, it brings them (if need be) to Digestion, cleanses, incarnates, dries and heals them after an admirable manner, and doth strengthen the Part, as to hinder the future Afflux of Humors. It is not inferior to any other Vulcmary Ointment.

XVI. The *Balsam*. It has all the Virtues of the Ointment, but more powerfully cleanses and heals: it ripens Apoplectic; and is effectual against Ruptures, being externally applied, and renewed as often as need requires. It is also a very excellent thing to heal Wounds and Ulcers of the Head, being applied.

XVII. The *Cataplasm*. It is made of the green Herb, with some Powder of the same, and a little Red Wine. Outwardly applied, it stops Bleedings, as also the Afflux of Humors upon any Part. It strengthens weak Limbs; and is profitable, being applied to Ruptures.

CHAP. CCCXIV.

OF GOLD OF PLEASURE, OR, OILY-SEED.

I. *The Names*. It is called in Greek, *Melantron*, and from hence, also *malamentum*, as *Depercival* says: in Latin, *Myagrium*, *Myagrum* and *Melantron*, and in English, *Gold of Pleasure*, and Oily-Seed.

Garden Gold of Pleasure.
Salmon’s Herbal. Lib. I.

The two or them only are properly called by this Name; the third is called, Common and English Oyster-Folk, and under the Title of Water-foot English you may meet with it, which is in proper place.

There are two Sorts of Seaweed, one of which we shall handle in this Chapter, and this is said to be the Myriogram tercera Deltopora, dit. 2. Myriogram flovella. Pleiophymagum, Willy, Gold of Pleasure, or Wild Oily-feet. There is a great Convent in Authors about the Names of these Plants, which is both troublesome and unprofitable to be read; and therefore, being of no Use to me, I shall wholly decline it.

III. The Descriptions. The first, or Garden Gold, has a Root which is small and long, perishing every Year after Sowings; from this Root rise up one or more upright round Stalks, about two Feet high, for each several long, and somewhat narrow Leaves, of a yellowish green color, and something deeply dent’d about the edges, or deeply waved, compassing them at the bottom. The Stalk or Stalls are spread from the middle upwards into several Branches, bearing at their tops very small yellow Flowers, which having ripe, there proceed in their places small flat Seed-Veils, containing within them Seed, which, when ripe, is of a Gold-yellow color, somewhat long in their middle, round, and very fat or oily.

IV. The second, or Wild Gold, has a small long Root, with four Fibres, or Strings adhering to it, from whence springing up but one Stalk, which is round, and little, a Foot high, and is far about with long and somewhat narrow Leaves, much resembling those of Wood, but longer and smaller pointed, broad at the bottom, where they compass the Stalk about, with a point and flesing out on each side, flowering forth many Branches from the very bottom almost; at the tops of the Stalk and Branches come forth divers whither Flowers, very like unto those of Fleece, which being puffed away, small round Heads rise up, with a Small Point at the top, very like in Fallion to the former, and full of small yellow Seed, like unto what of Crosser, exceeding bitter when it is green or fresh, (as the green Herb also is,) but when dry, sweet in Taffes, without any Acrimony, and very fat and oily.

V. The Places. The first grows in some places of Italy Wild, but yet both they and we do sow it in Gardens for Pleasure, and in Fields for the Seeds sake, out of which is pressed an Oil, which serves the Foot to Eat, and the Rich for Lamps, and serves also, with strong Lyre of Per Athes, to make Soap withal; for which last Purpose, in Germany they root many whole Fields therewith. The second is frequent in Germany, most thinly in all their Field Grounds, which being in Stalk like it, (the not of that Life) is accounted a Weed, and cast away, except of such as love the Seed, to give to small Birds, when it is ripe. This Seed, whith green, is bitter beyond Exprefion, but being ripe and dry, it looses its Bitterness, and becomes very sweet and pleasant, and is very acceptable to small Birds, as Larks, Linnets, Finsches, &c, to feed on; also by Exprefion, it yields as sweet an Oil as the former.

VI. The Times. They flower in the latter end of May, and that June and July, and in August, and the Seed is ripe in August and September.

VII. The Qualities. These Plants are hot and dry in the third Degree; the Oil is only hot in the first, and rather moist than dry. The Oil is also Difficultive, Emollient and Emplastick, Apyenom, Arystlectic and Amuletick.

VIII. The Specification. It is proper to cure the Colick, and help the Contraction of the Nerves.

IX. The Preparations. You may have therefrom,
1. The Decoction of the Herb and Seed.
2. The Seed it self.
3. The Oil of the herb by Exprefion.

The Use.

X. The Decoction of the Herb or Seed, or both, in Wine or Water. The decoction with Honey, is good for those who are troubled with the Cough, Shortness of Breath, Wheezing, Difficulty of Breathing, the Plentify or hard Se analy Smellings of the Liver. It lessens the Roughness or Heat of the Throat and Voice, making it clear and easy. The Decoction in Water is good for Women to sit in, whose Wombs are hard or infirm, and to bring down their Childs when foop, as also to wash their Heads with, who are troubled with Scuff, Dandruff, Mor-pheny or dry Scabs.

XI. The Seed it self. If it is bruised and taken in an Egg, it open Vomiting, and secrecy Seed, to also the Powder of the Herb. If the Seed is eaten in Bread, it makes it sweet and pleasant, and gives it a good Relish.

XII. The Oil of the Seed by Exprefion. Used in Clysters, it inflates the Belly, and is good against the Colick: taken in by the Mouth, it is very fat, and not very easy of Digestion, (being eaten as Oil) and by the Olive) except by the Olive, and is accustomed to it. It yields a great Nourishment, relieves in Consumptions, and quickly makes fat and fleshy. It is good against Coughs, Heartiflents, Shortness of Breath, and Pleurisy or Scinches in the Body, being given from one or two Ounces, to four, fix, or eight. It breeds Fifth and encreas Seed, and is of great Use to round the Face or Hands, or any other Part of the Body, to cleanse the Skin, and to take away Sun-burnings, Morpbe, Freckles, Spots, Scars, or any other Deterrition of the Skin. It is good also against Barnings with Fire, or Scalding with Water, and causes an Extortion or Relaxation of these Nerves or Sinews which are hard, contracted, or flunk up.
Common Goose-foot.

IV. The second, or more jagged Goose-foot, has a root almost like the other, but more fibrous, from whence rises up a stalk, replenished with Branches and Leaves, not much differing from the Common, saving that the Leaves are sharper cut, and more divided; and the Flowers and Seed (which grow in a spiked form) are much smaller: the whole Color of the Plant, is of a darker green.

V. The Places. They grow plentifully in fields, moits and flinking places, as upon Dung-hills, and by Highway-sides.

VI. The Times. They spring up and flourish in the Spring Months; flower in June and July, and their Seed is ripe soon after.

VII. The Qualities. They are cold and moist in the third Degree: Anodyne or something Narcoticke, Reproductive, Anitirritive, and (as some Authors think) Detergent; or Vomitif, as I suppose, because it is found certainly (as they say) to kill Swine.

VIII. The Specification. It certainly cures Ignis facer or Anodynes Fire, and gives cafe to the Gout.

IX. The Preparations. You may have therefrom, 1. A liquid Facet. 2. An Ointment. 3. A Cataplaam.

The Virtues.

X. The Liquid Juice. Bathed upon the parts affected, it softens inflammations, and cures Anodynes Fire; if it is mixed with Vinegar and Nitre, and parts affected with the Gout be bathed there-with warm, it eases the pains thereof, and is very prevalent against Deadly Falls, and Debile Heals.

XI. The Ointment. It has the Virtues of the Liquid Juice, but not so fit for Ignis Facet as the Juice.

is, because of its unctuous body, which makes it agreeable not withal, it easeth all Aches or Pains proceeding from a Herculean dry canle, and is very beneficial to be applied to hot Affections, and Dificates of the Joints, chiefly the Gout and Swellers.

Chap. CCCXXVI. Of GOUTWORT; or, HERB GERARD.

T HE Names. It does not appear to have any Greek Name, unless Arctocarpus Dioscorides be it. Euonymus called it Parnassus, Glicet Cordnum quabbam Cordus on Dioscorides Elaphofoes similis, Tabernamontanus Repudiam Tragus Olufriam Syfiea, & Angiene Vitam, Camerarius Angelica Syfiea Communis, Thalhus Angelica Eryntius, Bamburnus Angelica Syfiea minor, fine Eranth, Dodonaeus Herba Gerard, because in the Low Countries it is called Gerarit, Lobel Pedagogaria Germanarum, & Herba Pedagogaria, in English it is called Adderweed, Adder-foot, Gout-Wort, and Herb Gerard, from the Low Country Name.

Herb Gerard.
Salmon's Herbal. Lib. I.

III. The Description. The left, or Common Herbage, has a Root which runs and creeps in the Ground like Quitchgrass, from spreading over a good deal of room, this is but a base Plant, following half a yard high, having several like Leaves branching upon brown great Stalks by threes, as in Madderroot, but they are squaller and narrower, and not cut deep in, but only tipped about, and of a strong unpleasant Smell, at the tops of the Stalks and Branches grow Umbels of Flowers, which are white, which being put away yields blackish Seed, something like to, but less than that of Mechower.

IV. The second, or Hairy Herbage, has a thick Fleshy Root, of a blackish brown or Color on the outside, but white within, enduring many years, and of a good Smell, from whence springs up a Stalk about a Cuft high, blackish at the bottom, and a little Hairy spreading into several short Branches, bearing Leaves twelve or more divided, like to Wild Angelica, or the former Herber Gerard, saying, that they are more deeply gathered, and of a green Color, and Hairy all over. The Pedicels, as also the Umbels of Flowers, are small and white, and followed with blackish Seed.

V. The Places. The first grows by Hedges and Walls fides, and oftentimes in the Borders or Corners of Fields, and sometimes also in Gardens, if it is not pluck'd up, or Weeded out, it is so fruitful in its flowers, that where it has once taken Root, it will hardly get been out again, spoiling the Ground every Year more than other, the other grows in some parts of Germany, and it has been found also, upon the Borders of Wales, and other places.

VI. The Times. They both Flower from the beginning of June to the end of August, the Seed ripening in the mean Season.

VII. The Qualities. It is temperate in respect to heat or cold, and drying in the fifth degree; it is not apt to cause Cramps, Pains, or Anemias, but it is a little Reproductive, Perturbative, Antispasmodic, and Antifeptic.

VIII. The Specification. It is said to cure the Gout and Sciatica, Weaknethes, and all Diforders of the Nerves and Joints.

IX. The Preparations. You may have therefore, 1. A Liquor Tinct. 2. An Elixir. 3. An Acid Tincture. 4. An Oily Tincture. 5. An Ointment or Balsam. 6. A Cataplasm.

The Virtues.

X. The Liquid Juice. It may be given inwardly as a Wound Drinks, for it mightily contributes to the curing of all Carolina Wounds, old Ulcers, running Sorets, and Ulcers, also outwardly washing them therewith it contributes to the same purpoze, for it cleanses, incrusteth, dries, and heals. Gouty parts also being dressed with warm two or three times a day it easeth the pain, but more especially if it be taken inwardly from three to six Spoonsfulls Morning and Night. In any proper Vehicel, Ulcers in the Lungs, Guts, or other Bodez, it likewise comes.

XI. The Efficacy. It has all the Virtues of the Liquid Juice, but more effectuall, and better to be taken than it, because of its fyrnctse, it cureth Drarther's, Draper's, Luminaries, as also the Hapricht Flue, being tyme given in a Glass of Spirit of Angelica, the greater Composition. Do it three or four Spoonsfulls Morning and Night.

XII. The Acid Tincture. It vertifies the Juices in the Stomach and interior Vessels, detroyeth their Thers and Vifcera, which being thrice bathed into the Joints, breeds the Gout and Sciatica; it comforteth the Stomach, causing a good Digestion; opens Obstructions, cleanseth, and evacuath the Flumy matter by Urine. Do it from twenty to forty drops in a Glass of Ale or Wine, as often as the Patient has an occasion of Drinking.

XIII. The Oily Tincture. Inwardly taken from the roots to twenty five, according to Age and Necessity, in a Glass of White Port Wine, or other fit Vehicle, it powerfully opens the Obstructions of the Biliary parts, causing a free Pilling, and thereby carries off the tumourous, viles, or flamy Matter which breeds the Gout, Sciatica, Stone, and Gravel, bathed upon the Punkath of any Nerve, it eathes the pain and Soon cures it, it is good also against Convolvuls, Cramps, Pains, numbethes of any Member, &c. being well bathed upon the Back Bone Morning and Evening, and likewise upon the part affected, rubbing it well in before a good Fire.

xiv. The Ointment or Balsam. It cures Simple Green Wounds, and old Ulcers, of what kind it be, it absters, incrusteth, and heals them after an admirable manner, it draws Splinters out of Wounds, and Thorns or Prickles gotten into any part of the Flesh, applied to any part affected with vehement pain it instantly gives ease, and being continued upon Joints affected with the Gout it cures it, and strengthens the part afflicted.

XV. The Cataplasm. Applied to Simple Contusions it dissolves them, and prevents their Apoplexy, gives ease in the Gout, althes Inflammations, dissolves the poison matter, and prevents Distinctions of Humours, it is an extraordinary thing to be applied to the Forehead, to cure Pains, running and watery Eyes, &c.

CHAP. CCCXXVII.

Of GRASS, or HERBAGE.

I. The Natures. It is called in Greek Κυπερια, &c Grammar, Agrostis, in English Grasses, it is true that Some Ome Grasses Herba comprehendeth, yet Neatho figures Gramineum, a Grassy place, or Ground over spread with Grass, from whence Graze is also called with us Herbage.

Chap. 327. English Herbs.

Descriptions of all which Species, with their various parts, you shall have in the following Sections.

Gramen Acorum veni Spicce, Gramen Scopula, vel Scopularium, Bent-Grals, or Bents

III. The Descriptions. This is a singular Plant of its kind, and called by Gerard Heranadzianum, because its bulbous top has Pannicles resembling those of Common Reed, it has a small and Fibrous Root, and grows up to be a Yard or an Ell high, with many thin Grassy Leaves here and there jointed, and its tufted Heads or Pannicles, spread almost like unto the Spigs of Feathers, standing for the most part all one way, and hanging down their Heads, of a fine brown shining green Color, which are, being fine and slender, easily shaken with the Wind, from whence some call this in English Windlegrafs, this is that Grafs which the vulgar commonly call Bentz, of which many Country People make Beorns, and is many times you'd in rows together, and leaves in Summer time to be set against the backs of Chimneys, to deck up, cool, and refresh the Room; it is Gramen Pruynse tertiis Dodoneu, and Gramen Arundinaceum engrafted Tornamentani.

Graminis Phalaris, Canary-Grals, seven Species, three true and four bastard.

Canary seed

IV. 1. Phalaris vulgaris, Common Canary-Grals, has a Fibrous Root, dying with us every Winter, and therefore is but an Annual Plant, to be sowen every Year; it has jointed Stalks half a Yard high, with Grassy Leaves on them like Barley, and at the top a long round Chaffie Head, somewhat pointed above, whole Bloomers are yellowish, wherein lie flat, round, shining Seed, bigger than Millet, and less than Linseed, of a yellowish Color, and somewhat like to the Seed of Sofoenam.

V. 2. Phalaris Semina nigra, Canary-Grals with blackish Seed. The Root hered is like, and perishes as the other, it differs not from the former, but in being somewhat lefser, both in Stalk, Leaf, and Head, but chiefly in the Seed, which is of a pale, blackish, shining Color.

VI. 3. Phalaris bulbofa Semina Albo, White bulbou-nd Canary-Grals, has a Root consisting of many small white Bulbs, or rather Tubers, growing in Tufts together, with long Fibres depending from them, whereby they are taffled strongly in the Ground, and do not every Year, as the others do, but encroche into great Tufts; the Grafs grows very like the former, but with smaller, tenderer, and taller jointed Stalks and Leaves on them, and at the Roots are more soft and gentle, the spikied Heads are smaller, and a little longer, and grow not full out to close together, but are softer in handling, and bring forth smaller and whiter Seed than the others.

Bastard Canary Grafs

VII. 4. Phalarodes majus, Gramen Phalaroides, and Alphacurudas, five Indicum majus. The greater Bastard Canary-Grals, has a Root small and Fibrous, perishing every Year, and grows up very like to the true Phalaris, or Canary-Grals, both in Stalk, Leaf, and Head, but that the Stalks are lighter, and with fewer Leaves on them, the Head also or Ear is smaller, hoary, and softer, and the Seed not much unlike.

VIII. 5. Phalarodes minus. The lesser Bastard Canary Grafs, is in all things like to the last; but the Ear or Head is smaller and longer, and the Leaves do not encompass the Stalk at bottom, that it seems to run thro' them, as they a Trunk.

IX. 6. Phalarodes Spica mollis, Gramen Phalarides Germanicum, Soft headed Bastard Canary-Grals, has a Fibrous Root, from which springs a Stalk, or Sulks, of a Foot and half high, somewhat larger than the last, with a Joint or two thereon, and thence Leaves at them, encompassing the Stalk at the lower end; the Head is shorter and smaller than the last, of a thinning Alth Color, and soft to the feeling.

X. 7. Phalarides Spica Hirsutis, Bastard Canary-Grals with a more hairy Spike or Ear. It has a Perennial Fibrous Root, from whence spring up Stalks and Leaves like the last, but furnished with a greater flux of Leaves and Stalks; the Spiky Head
Salmon's Herbal. Lib. I.

XI. The Places. All the three first sorts have been found growing in Spain, and brought to us by boat, with some of the Barl; and the sort, the first has been known many Years, and was brought from the Canary Islands with those sweet Singing Birds called Canary Birds, which feed upon this Seed. Label first that it grows in 

Frowfence in France, the second Boonine fays came to us from Malta, where thefe Birds feed on it, and the third three grow with us in our Gardens: the fourth grows as well in our Fields in England, as in other Countries, the fifth and sixth grow about Ulmer, where they are frequent, and call them Onoords, from their color: where the seventh grows is uncertain.

XII. The Times. They all of them flourish in the Summer Months, and their Seeds are ripe in July and August.

XIII. The Virtues. Canary Seed in some Places and Islands is made into Bread, which nourishes much like that of Miller, or rather less, and therefore to mend it, some mix it with Wheat, that the Bread may be the fitter, which otherwise would be apt to crumble and dry. The Lapland Juice, or Essence of the Herb, are good to eafe the pains of the Stone and Gravel, open Obftructions of the Urinary parts, and abate the fcalcing heat thereof. The Capsules of the Seed has the Virtues of that of Miller, and is good to dry and repel the flux of Humors upon any part.

Gramen Typhinnim, Catstail-Grass, three sorts.

XIV. 1. Gramen Typhinnim, or Typhinnim maximun, The greatest Catstail-Grass, has very small Roots, composed of many small Skins or Threads, which may be easily taken from the whole Root, from which rise up very fair large Leaves, like the Longing-tongue, and if two Feet high, or more, on which grow long, round, spiked Heads, four times larger than those of the following Kind, and almost of an equal height. Rounding from the bottom of the Spike to the top, this plant is sometimes found with Stalks four or five Feet high, and the Spike somewhat shorter, and smaller at the top.

Small common Cats tail Grass

XV. 2. Gramen Typhinnim minus vulgatissimum, The leffer most common Catstail-Grass, has Roots which have small round Heads, like Tubers or Bulbs, from the Heads of which spring forth the Leaves and Stalks, this is the most common with us, and differs not from the former but in the Roots, this being bulbed, as before, and in magnitude, the Stalks in this rising not above a Foot high, and the round Spike not being above two or three Inches long.

XVI. 3. Gramen Typhinnim minus, The small Catstail-Grass, has for its Root a little Bulb, or Bulbs, from whence rises up the Stalk, about two Feet high, fat at each Joint with long Grassy Leaves, with a Spike or Ear four or five Inches long, clothed and handsomely made, like the former, it differs not from the last, but in having a greater ftole of narrow green Leaves, a longer Stalk, and larger spiked Heads.

XVII. The Places. They are all of them found in many places of England, but mostly in watery places, and near Water, the third is found growing plentifully in many places about London, as by the Bridge leading into Chelsea Field, as you go from St. James's to little Chelsea.

XVIII. The Times. They flourish and Seed in June and July, keeping the same time with other Grasses.

Gramen Segetum, or Segetales, Gramen Triticum, Corn-Grass, or Wheat-Grass, fix Kinds.

XIX. 1. Gramen Segetum vel Triticum lefifolium Syna commoda, Bread-Lean'd Wheat-Grass close Ear'd, has from a Flavous Root a Stalk, or Stalks springing up, about half a yard high, having two or three
three joints, and fair Wheat-like Leaves at them a Foot long, bearing at the tops a longer Spike or Head, which have several parts, like the Husks of Corn, but separated more slender, thereby theoret'ing it to be a Grass, and not true Corn, yet the Spike grows closer than the next, and without any leave of Arves or Barley.

XX. 2. Gramen fogetole, vel Triticeum angui-fulifolium Spica compta, Broad-fool'd clofe-card'd red Wheat Grafs. It has a Stalk which is smooth and round, two Feet high, fit with long narrower white Leaves, rough and pointed. The Spike is about a Span long, Somewhat like unto Red Wheat, closely fit, but each of the Husks has a thump rough Awne therein.

XXI. 4. Gramen fogetole, vel Triticeum angui-fulifolium Spica compta, Narrow-fool'd or Broad-fool'd Stalks, without Awnes. It has a Root which is white, knotsy and creeping, from whence spring up Leaves which are long and round, like Ruffes, and pointed at the ends, fit on round Stalks, short, and half high, white-fil'd tops are narrow and thick, and without any Awnes at the tops of the Husks, and Somewhat like unto White Wheat without Beards.

XXIV. 3. Gramen fogetole, vel Triticeum major Spica Brizae, The greater Spelt Wheat Grafs. Its Roots and Stalks are like unto Corn, four or five Feet high, or more, fit with narrow Leaves: the tops of the Stalks and Leaves are also pointed about a Hand breadth long, fit on both side of them, one above another, each whereof is very like a small Ear of Wheat, armed with small Awnes, but very thin.

XXIV. 6. Gramen fogetole, vel Triticeum minor Spica Brizae, The lesser Spelt Wheat Grafs. It grows not above an Hand breadth high, with small, short, soft and hoary Leaves, and at the tops of the Stalks there is sometimes but one, and sometimes two or three Spikes or Ears, of an Inch long, and bearded.

XXV. The Places and Time. They grow in most parts of England, in Fallow Corn and Grounds in Kent, not far from the Thames, and flourith and seed in the Summer Months, when other Grafs do.

V. 4. Bakenh, Yfchemon & Gramen Yfchemon, see Deyhblude, Cocks-foot or Finger Grafs, Six kinds.

XXVI. 1. Iademof fulvifolium folio lato, Com- mon Cocks-foot Grafs. It is called, Galli Cru Apulei, and has a Root conflitfing of a gall, or many small Fibres, from whence spring forth several clear, red-dish, jointed Stalks, with hair Grassly Leaves on them, a little dent'd on the edges, broad at the bot- tom, and fuller at the end, of a hair or binding them. At the tops of the Stalks grow divers long, slender, rough Spikes, of a glittering purple, or rather Violet color, but of a brownish color when they are ripe, and are divided into four or five Spikes, which are spread or fhretched out abroad, like a Cock's Foot, when it is fett down upon the Ground, or the Fingers of a Man's Hand, when they are spread about.

XXVII. 2. Iademof fulvifolium folio vilfide, Wild Cocks-foot Grafs, with a bearded or hairy Spike or Ear. Its Root is a Bush of Fibres, like the other: it has purplish Stalks, a Cubit high, with fewer and much narrower Leaves on them. The Spilted Heads are in more number than the former, and more hairy, having, as it were, then yellow Beads, fit on both sides of the PANICLES, in which lye the Seed.

XXVIII. 3. Iademof fulvifolium, see Gramen marine, Efiher entum, Gramen acutifolium, Asper, Prantrimum Germafiic Grafs, (upon Despofites) because they account it Organ Spicæ, Sanguinaria, Sars- panella, and Capsula Bifca, Hess Grafs. It has a Root greater and more bully than any of the former, the whole Plant differing from the two fore- going no otherwife almoft, than a Manifold Plant from a Wild. It has fair jointed purplish Stalks, and large Grafs or Reed like Leaves on them, some- what hairy or woolly at their bottoms, and about the Joints at the tops of the Stalks fland larger Spikes or PANICLES, and more alfo fit together than in the former, which are made of many small, chiefly Husks, with long white Seeds in them, some- what greater than Millæ, and longer than Rite, flanding all, as it were, on one side.

XXIX. 4. Gramen fogetole Iademof, Bejum or Brafs Grafs. It has a Root conflitfing of many very long hard Fibres or Thernels, a Root and Stalks greater, wider, and half long, or more, (whereof are made, in France, where it grows naturally, short kinds of Brothes with which we ually birth our Heads, &c.) the Stalks are hard, flender, and jointed, about a Cubit high, with small long Leaves on them, like unto the second Iademof alfo going, but fweter in tafe, at the tops of the Stalks Brand five or fix, or more, bright long PANICLES, like unto the Cock-foot, but larger, flatter, and less dent'd.

XXX. 5. Gramen fogetole Iademof Canarium, Dog- Grafs like Cock-foot. It has running jointed Roots, like to the Common Quickel-graft, and grows in meadows, and Leaves somewhat reddish, in that it might have as well been enumerated among the Quickel-graft, or Dog-graft, as among the Cock-foot-grafts, because it is, as it were, indifferent between them both: but the Head is dispers'd or spread into fuch like flender long PANICLES as the Cock-foot-grafs is, the small Chaffie Husks whereof contain the Seed.

XXXI. 6. Gramen Dailyfyon repens, Creeping Cock-foot-grafs. It is a burft'd thready Root, which finds forth many long, flender, and weak Branches, trailing or creeping upon the Ground, and shocking forth Roots at the Joints, the Leaves which are of the former are very long, and narrow, and at the tops of the Stalks, which rife not much above a Span high, four or five Smal, flender, backslip Spikes or Ears come forth, within the Husks whereof the Seed is found to ly.
Salmon's Herbal. Lib. I.

The Virtues.

XXXIII. 1. The Liquid Juice. Put into the Eyes which run and water, or where a Dystopia of Rheumat, causing redness or blearedness, and drunk, chiefly the Juice of the Dew-Grafs, it sufficiently takes out the hair of Women's Beards, especially being applied to them. 2. The Cockfoot Quack-Grafs, has all the Virtues of Quack-Grafs, to be discovered of in some of the following Chapters of this Book. 3. The Decoction. It is of use (made of the Roots in White Port) to expel the Tumors, and it drives forth the Mummies, Small Pox, and is good in the P'tulps, Spotted, and other Pestilential Fevers. 4. The Ointment or Balsam of the Roots and green Grafs, is good for the Biting of Mad Dogs, diffolves hard Tumors, and not only heals green Wounds, but also old Ulcers. 5. The Copulation of Herb and Roots applied to any place which bleeds, stops the Blood presently, whether it be from the Nole, or a Wound.

VI. *Asiadoraen*, Gramen narrboundi *Spica longiflora*, Gramen *Spica natante longiflora*, Cimnornastr-Grafs, or Grafs with a long bending Spike, a single Species.

XXXIV. The Gramen narrboundi *Spica natante* is a singular Plant, which has a thorny or thorny Root, from which arises Leaves long and narrow, like other Grafs Leaves, which by Time and Age growing old, grows somewhat rounder, as those of *Sparianum*, or *Marwood*, from among these Grafs Leaves there grows up a tender Stalk about two Feet high, scarcely standing upright, but oftentimes hanging down its Head, or top of its Ear, after the manner of a Caper's Tail, this Stalk has two or three small Leaves at the Joints up to its top, where grows a very long Spike, bending a little downwards, composed of small and hairy Tufis, which grow of a greyish or whitish Color being ripened within them small whitish Seed. This was found out by Mr. Good-
ev.

XXXV. The Place and Time. This Elegant Grafs Mr. Goodyere found growing upon the Walls of the Ancient City of Winchester, and was not de-
tected by any Author before him, he gave it the Name, *Gerard* had some of the Seed thereof, which he did sow, which grew up, took root, and flour-
rished, Seeding in the Summer Months.

VII. *Kastubhrogen quaranthum*, Gramen *Tomentosum vir Tomentatum*, Cotton-Grafs, or Cotton Head- Grafs.

XXXVI. It is a singular Plant of the Kind, hav-
ing a Root somewhat hard and rough, very tough, small and thready, with many long fibres issuing from it. This Cotton Head-Grafs is in rugged, dry and, and form of the Leaves, not much unlike to Footed-Grafs, called *Pfunfaccus*, but much greater, and not Downy; the Stalks rise up to the Heavens, long, or more Feet high, and has with few Joints, which are rough, garnished with many hard Grafs Leaves bearing at the top Heads, which are Spiked, set all along a Pushe, reddish for some time, but growing to ripeness, are of a shining Sil-
ner like whiteness, and as soft as Wool in hand-
ing, from whence it took the Name. This De-
scription is according to the Dutch Copy, translated by Label himself.

XXXVII. The Species. It grows in the borders of dry Fields, and by Hedge holes, in many Coun-
ties of England, especially in Dorsetshire. Gerard says it grows upon Boggy and such like Moonish places, and is to be seen in Boggs upon *Hampsted Heath*, it grows likewise in Holgate Park, near London. This with little Spikes Heads is double, the Gramen *Tomentosum Aristinmum* of Gerard, described in Lib. 1. Cap. 9.

VIII. *Kastubhrogen quaranthum*, Gramen *Grisla-

tam*, Cotton-Grafs, or Cotton Heed-Grafs, four Species.

XXXVIII. 1. Gramen *Grislata longa*, Smooth, Crooked, or Cockcomb-Grafs, has white Roots, which Mix themselves in the Ground very much, from whence spring up, divers smooth slender Stalks, two Feet or more high, with few, or no Joints on them, and with small short green Leaves at them, the tops of the Stalks have slender long Spiked Heads, divided into many parts, each whereto is like the Crest of a Bird; this Ear, says Gerard, is small, long, of a pale green Color, somewhat bending, so that in some feet it resembles the Comb of a Cock, (whence the Name) or the Seed Vellie of that Plant which is called *Caput Gallinacum*; the Spike or Ear is of a pale yellowish green, and sometimes of a reddish Color, which made *Bouinian* to compare it to *Grisla Galli*, or Cock-Comb. This is Gramen *Protenus Grislata*, Gramen *Spica Grisusta Bouinian*

XXXIX. 2. Gramen *Grissatam Sabulatam*, White Crooked-Grafs. This seems to be a Species of the former, and differs from it only in this par-
culars, the Roots are of a reddish yellow color, the Stalks are lower and smaller, and a little Hair, or Woolly at the bottoms, with longer Leaves, and a more sparsely white Head, not so finely set toge-
ther, and grows rather among Hedges and Bushes.

XL. 3. Gramen *Grissatam Alligatam*, English Crooked-Grafs. This has fewer and longer Roots, not marling and increasing in the former manner, the Stalks are straight, with longer and narrower Leaves on them, the Spiked Head differs from the former, in being longer and closer set, and not spread
Chap. 327. English Herbs.

443

XLI. 2. Gramen Crisufiium Spica multipliici; Double English Crested-Grafs. This is very like the left in its Roots, Stalks, and Leaves, and seems to be a variety of the same, but differs in this, that it is spread out in its top, and parted or divided into several smaller Stalks from the greater main one, otherwise very little differing from it in any thing else.

XLIIT. The Places and Times. The first of these is ordinarily to be found in Meadows about Midsummer time, then, as also the second, usually growing in Fields and Pastures, and near Hedges and Bushes, and places near them, the third grows plentifully in many By-places near London, not far from London, the fourth being a variety of the left, is found growing always not far from the places where the third grows.

IX. Rumex acucutus, or Cyperus cuneatus, Gramen Cyperoides, Cyperus-Grafs, twenty-two Species.

Cyperus Grafs

XLIII. 1. Cyperus Typhina Gerardi; Cyperus Typhina Tabernamontani, Gramen Typhoides Spica multipliici Baudini, Curtail Cyperus-Grafs. It has a Bulby Root, from whence spring forth many long, narrow, three figure, hard, green Leaves, among which rise up first green Stalks, half a yard, or two Feet high, or better, with some Joints and Leaves at them, not much unlike to the Common Reed, and towards the tops of these Stalks grow two or more long slender rough Heads, growing one above another, Sickle fashion, almost resembling a Car's Tail, very choice, rough and rugged, of a dark Green, tending to Purple.

XLIV. 2. Gramen Cyperoides angustifolium major, The greater narrow Lead'd Cyperus-Grafs. It has a reasonable long Fibrous Root, from whence first, long, and narrow Leaves, like those of other Gyp-

Cyperus-Grafs springs, the Stalks also, (as it is proper to all the Plants of this Kindred) are three figure, bearing at their tops three brownish Ears, soft and chaffy, like the sell of this Kind, standing upright, and not hanging down, as some others do.

XLV. 3. Gramen Cyperoides Trigonum Species, Lead'd Earch Wood Cyperus-Grafs. It has a great yellowish and fibrous bulby Root, from whence spring three figure Stalks, a foot or more high, with fair, but hard and rough Grafs Leaves, four or five Inches long, the Spiked Heads which grow at the tops are many, one above another, slender and long, yet some more than an Inch; some one Inch, some two Inches, or less, of a yellowish green color, with long yellowish Seeds in them.

XLVI. 4. Gramen Cyperoides elegans Spica multipliici, A fine or beautiful Cyperus-Grafs with many Heads. It has a thick fibrous Root, which sends up slender triangular Stalks, about two Feet high; the Leaves are long and narrow, with a long pointed Spiked Head, made of many small ones, in close tap together, that they seem to be but one Spike or Head.

XLVII. 5. Gramen Cyperoides hispinus Montanum, Mountain prickly Cyperus-Grafs. It has a thick bully fibrous Root, as the former, which sends up three figure Stalks, about a Foot long, or not much more, the Leaves below and in them are very long and narrow, the Heads are short, with many rough Bars on them, some squared and some close.

XLVIII. 6. Gramen Cyperoides sempervirens Panicula, Lead Cyperus-Grafs with a differed Taff. It has a Root which is full of Fibres, which sends forth long Leaves, of a brown green color, and somewhat flat, between a Rath and a Grafs, the Stalk is also somewhat more flat than figure, sometimes but half a yard high, sometimes three, four, or five feet high, the top whereof is furnished with many coarse and spread Panicle, made of many parts, and each small prickly Head standing on a slender Footstalk, which is sometimes bent down with the weight of the Heads.

XLIX. 7. Gramen Cyperoides parum Lusitanum, Cyperus-Grafs a little Woolly. It has a Fibrous Root, which sends forth slender Stalks, about two Spans high, the bottoms of them being a little Wooly, and having at the middle only a Joint with a Leaf; the lower Leaves are set close upon the Ground, three or four Inches long, somewhat like those of the Grafs-Cyperoides, the heads of the Stalks have small round shining Spikes or Ear's on them, of a pale brown Color, with a small long Leaf under every head: This is Gramen Cyperoides parum.

L. 8. Gramen Cyperoides Norvegicum, Norway Cyperus-Grafs. It has a number of long narrow Leaves, some three or four Inches, others fix or seven Inches long; the Stalks are clear and smooth, half a Yard high, bearing at the top many Cone like Heads, for close together.

LI. 9. Gramen Cyperoides Speculum Lusitanum, Breed Lead'd Cyperus-Grafs. It has long black creeping Roots, with many Fibres at them, very like unto the sweet long Cyperus, and has broad Leaves, almost a Foot long, among which come forth the Stalks, being about a Foot high, which bear three Chaffy Spiked Heads at the top, or an Inch, or Inch and half long, of which the middlemost is the longest, each of them like unto the small Curtail-Grafs.

LII. 10. Gramen Cyperoides latifolium altemus, The higher breed Lead'd Cyperus-Grafs. It has a Root which is somewhat long, but pale, with many long Fibres adjoining thereto, the Leaves are as long as the Leaf, but the Stalks are much higher, bearing at the tops four or five small long Ears of Spikes.
Spikes one above another, as much as two or three long, with a small Leaf at the foot of each of them.

L.III. 11. Gramen Cyperoides Paludinis, Graminum

The Root is compact of matter long and tough Strings, or Threads, the Leaves are long and broad, like unto the Sedge, called Cyperon, from among which rise up several long spikes. The top of each of which there is a Spire or Ear, like to a Plantain Head, commonly of a yellowish green color, and very prickly.

L.IV. 12. Gramen Cyperoides Paludinis, Graminum

It has a thick fibrous black buffer Root, from whence rise divers Ear, long, and somewhat broad, 450 thicker than Leaves, pale than those at Sedg., above, from among which arise three square Stalks, like those of Cypers, about half a yard high, set with Leaves from the bottom to about 12, or 15 inches high of the Stalk, and compassing the Stalk also at their bottoms, the tops are furnished with a Large Tufted Head, (not like the True Cypers) and greater than is proper to the Plant, where two or three square large Leaves come forth, between which rise up many small Footstalks, very much Branch'd, which bear many thick Seeds, somewhat like Alliis, or Raphis.

L.V. 12. Gramen Cyperoides Paludinis, Graminum

It has a Root which spreads somewhat like the True Cypers, but harder, fuller of blackish Fibres, and without small, the Leaves are long, and somewhat narrow, hard, and curving on both edges, the Stalk is triangular, tall, without any Leaves therein to the top, where, between two long Leaves, and very narrow, divers short Footstalks spread forth, bearing each of them four or five small rough Heads.

L.VI. 14. Gramen Cyperoides Paludinis, Graminum

It has a Root which spreads somewhat like the True Cypers, but harder, fuller of blackish Fibres, and without small, the Leaves are long, and somewhat narrow, hard, and curving on both edges, the Stalk is triangular, tall, without any Leaves therein to the top, where, between two long Leaves, and very narrow, divers short Footstalks spread forth, bearing each of them four or five small rough Heads.

L.VII. 15. Gramen Cyperoides Paludinis, Graminum

The Root of this is like unto the former, but is fatter, as is the whole Plant, the Stalk being rather, rough, spiked heads, four or five together, one above another, on both sides thereof, with a long Leaf at the foot of them.

L.VIII. 16. Gramen Cyperoides Paludinis, Graminum

It has a Root which spreads somewhat like the True Cypers, but harder, fuller of blackish Fibres, and without small, the Leaves are long, and somewhat narrow, hard, and curving on both edges, the Stalk is triangular, tall, without any Leaves therein to the top, where, between two long Leaves, and very narrow, divers short Footstalks spread forth, bearing each of them four or five small rough Heads.

L.IX. 17. Gramen Cyperoides Paludinis, Graminum

It has a Root which spreads somewhat like the True Cypers, but harder, fuller of blackish Fibres, and without small, the Leaves are long, and somewhat narrow, hard, and curving on both edges, the Stalk is triangular, tall, without any Leaves therein to the top, where, between two long Leaves, and very narrow, divers short Footstalks spread forth, bearing each of them four or five small rough Heads.

L.X. 18. Gramen Cyperoides Paludinis, Graminum

It has a Root which spreads somewhat like the True Cypers, but harder, fuller of blackish Fibres, and without small, the Leaves are long, and somewhat narrow, hard, and curving on both edges, the Stalk is triangular, tall, without any Leaves therein to the top, where, between two long Leaves, and very narrow, divers short Footstalks spread forth, bearing each of them four or five small rough Heads.
small, short, rough, and cleft like Tongues, sharp at their ends, set at the Joints, 

**Phoenix multiplicis spinosa Paniculata.**

LXIX. *Phoenix multiplicis spinosa Paniculata.* It has slender jointed Stalks, half a yard or more high, with narrow Leaves; the spiked head is as it were branched into others, in which confits the chiefest difference.

LXX. *Phaenix multiplici spinosa mutans.* Double Darnel-Grass with a bowing top. It differs little or nothing from the last, but in the spiked heads, which are thicker for together, and the tops of them bow down, or turn a little round.

**Darnel-Grass upright.**

LXXII. The Places and Times. All these grow either in Fields of Corn, or in the Borders or Pathways of other Fields which are Fallow, and the last sometimes in Marsh and Wet Grounds, as well as in the edges of Ploughed Grounds.

**Darnel-Grass low bending.**

LXXIV. *Graeno Caninnium longissimum Rodiculatum, Darnel-Grass with a longer Root and more stately Panicle.* The Root is fuller, larger, longer, and further spread, the whole Plant differs but very little from the former, but in the Tuft or Panicle, which is more spread into Branches, with shorter and broader husks.

LXXV. *Graeno Caninnium Flavum Paniculatum.* The finer Darnel-Grass with a stately Tuft. The Root is small, and jointed, but creeps not so much as the former, and has many more Fibres among them than the others have, and is a little browner, and not so white, but more sweet; it is a small sort of Grass, and has slender Stalks, about six or seven inches high, with many very narrow Leaves, both below and on the Stalks, the Tuft or Panicle at the top is small, according to magnitude of the Plant; and spreads into several parts or branches.

LXXVI. *Graeno Caninnium vulgaris, Common Darnel-Grass.* It creeps far about water Ground, with long white jointed Roots, and small Fibres at every Joint, very sweet in taste, as the rest of the Herb is, and interlacing one another, from whence flow forth many fair and long gramineous Leaves, small at the ends, and sharp or curving on the edges; the Stalks are jointed like Corn, with the like Leaves on them, and a long spiked head, with long husks on it, and hard rough Seed in them.
Salmon's Herbal.

Lib. I.

Wheat-Grafs with a creeping Root. Its Root is blackish, and spreading abroad, from which spring forth many small Stalks, a Foot high, bending or crooking, with a few narrow Whitish Leaves on them, at whose tops stand small white Panicles, of an Inch and half long, confiding of many small chaffy Husks.

It has for its Roots three, or four, or more round white Bulbs or Knobs, one set upon the head of another, with several Fibres underneath them, from the uppermost of which spring forth several long hard grassy Leaves, sharp at the edges, and in the middle of them a jointed Stalk, with three or four such like Leaves upon them, at the top of which is a long Panicle, spread into many parts, like to that of Oats, whereunto some have compared it. Label has another sort hereof, differing little in any part but the Roots, which are small and round, and far at distances all along the Roots, and tall as sweet as the other. The sort of this is the Gramen nodosum avendae plantae subulatae, who questions whether it be not the Aeglops Plani, which has a kind of bulbous or tuberous Root.

LXXIX. 5. Gramen Centamin tuberum fistulae popularis. Tuberoii or Knotted Grafs with a small round spike. It has a small whitish round Bulb or Knot for the Root, with small Fibres under it, shooting forth from the head thereof another, something like unto a Bulb, but much smaller, and like a slender knob, with a small jointed Stalk above it, and a long narrow pointed Leaf at each of them, being four or five inches long, and at the top one short flat pointed head, something like to the head of Canaan-Grafs.

LXXX. 8. Gramen Centamin sieberi annuus. The greater Kernd Grafs. It has a large fibrous bulky Root, from whence spring many long trailing Branches upon the Ground, with several great joints on them, and shooting out Fibres from those joints which rise next the Ground, so that it does sometimes run twenty Foot in length, with one long Leaf at each joint, small at the end, but broadest below, from which, as well as at the top, come forth divers small long spikes of chaffy husks, of an over worn color, which Stalks and Joints are to full of a most pleasant Juice, that it feeds Cattle much better than any other Hay, and therefore those Husbandmen who have is growing in their Grounds do keep the Hay thereof for their chief Winter store, and instead of Provender, this is that which is commonly called Dutch Grafs, and grows very plentifully in Plantations in Florida, and other parts of the West Indies.

LXXXI. 9. Gramen Centamin minus, The lesser Kernd Grafs. The Root is fibrous or thready, like the former, this Grafs creeps not so much on the Ground as the greater does, but stands more upright with its Stalks, whose joints are altogether to great as the other, and have at their tops linked heads, which are somewhat larger than those of the greater Kind, and of a ficker over worn color.

LXXXII. 10. Gramen Centamin Multiflorum glicanthum, Sea spikaed Dogs-Grafs. It has a long creeping Root, full of joints, with many small Fibres running from the joints, and creeping much under Ground. From several of the Joints of this Root springing up several jointed Stalks, about a Foot high,
The Hill type of tide and the main type of tide have divided the land into two main types, one for the main type of tide and the other for the hill type of tide. The Hill type of tide is common to the land along the coast, and the main type of tide is common to the land along the coast. The Hill type of tide is common to the land along the coast. Alopecuros, Caude Vulpis, Gramen Tomentojum Alopecuros vera Pluny, Foxtail-Grafs, three Kinds. A'jew ammonjpin. Gramen Alopecuroides, Baltard Foxtail-Grafs, nine Kinds.

Foxtail Grafs true. The true Foxtail Grafs, has a parsley-like Fibrous Root, grows up with two or three Fott hoary Stalks, a Foot high, with small, long, narrow, fott Leaves, as hoary as the Stalks, on the tops of which grow somewhat long, round, loft, woolly or hoary heads, for with fott hairs, of a pale Straw Color, refembling a Fox Tail.

C. II. Alopocurus altius Anglo & Francica, Another English and Flemish Foxtail Grafs. In Roots and Leaves it is much like the former, but the Stalks grow not so high, the heads are also shorter and rounder, and not so Woolly or hoary.
that the spik'd head is longer, and springing upwards, is small at the top, but something broad below, with Queen-like Husks on them; the Leaves also are more, and much finer.

CVI. 7. Gramen Alpecorumides Spica offerfa brevis. Short rough Earl'd Baffard Footail-Grafs. It has a small white pettish Root, from whence springing up two or three upright small Scafts, with some what narrow and pointed Leaves on them, at whose tops stand thick short rough heads, an Inch and half long, not fully out, but as it were half round the Scaft, the backside being as it were bare, so that they seem to stand but on one side; in these Heads is contained the Seed, which is small and white.

CVII. 8. Gramen Alpecorumides Spica longa majus & minus. Baffard Footail-Grafs long Earl'd great and small. Thick Grafs are much like one another, one being greater, the other smaller, both in Stalk and Leaf, the spik'd heads are long and fender, and of a whitifh color.

CVIII. 9. Gramen Alpecorumides minus Spica offerfa longa. Small Baffard Footail-Grafs long rough Earl'd. It differs from the last, in being greener, more replented with Stalks and Leaves, the spik'd heads being more fender, long alfo, and rougher.
